MAGIC SQUARES, a species of puzzle which occupied the attention of many celebrated mathematicians from the earliest times down to the 18th century. The magic square is a square divided by lines parallel to the sides into a number of smaller equal squares or cells, in which are inserted numbers which form the terms of one or more progressions (generally arithmetical), in such an order that each line of numbers, whether added horizontally, vertically, or diagonally, shall amount to the same sum. This arrangement is effected in three different ways, according to the number of cells in the side of each square, and can be most easily effected when this number is odd, or evenly even (divisible by 4), but becomes a problem of considerable difficulty when the number of cells is oddly even (divisible by 2, and not by 4). The following are examples of the first two methods:

The arrangement for the oddly even squares is the same as that for the evenly even ones, with the exception of a few transpositions. The only exception is when the number of squares or cells is four. Dr. Franklin invented a similar puzzle to this, called the "magic circle." See Hutton's Recreations in Mathematical Science, vol. i.

MAGILP, or Megellup, a composition used by artists in oil-colors as a vehicle for their "glazes." It is made of linseed oil and mastic varnish, and is thinned with turpentine as required for the painting.

MAGILUS, a very curious genus of gasteropodous mollusks, of the order tubulibranchiata, inhabiting the Red sea and the Indian ocean. They have, at first, shells of the ordinary form of spiral univalves, and establish themselves in little hollows of madreporites, where they remain, enlarging the shell into a long tube as the madrepor grow, and thus preventing themselves from being shut in. The tube is sometimes 3 ft. long, and the animal deserts entirely the spiral part of the shell, and lives in the mouth of the tube, which it closes against danger by an operculum, the upper part being wholly or partially filled up with solid matter.

MAGINDANAO, or MINDANAO. See Philippine Islands, ante.

MAGINN, WILLIAM, LL.D., 1733-1842; b. in Cork, Ireland, d. at Walton on Thames, near London. In youth he had such precocity of talent that he was admitted to Trinity college at the age of ten. He became a valued contributor to Blackwood's Magazine; a Paris correspondent in 1824; editor of the London Standard in 1829; of
Fraser's Magazine in 1830; of the Lancashire Herald in 1839, and the Magazine of Miscellaneies in 1840; and was an occasional contributor to the Quarterly Review, Bentley's Miscellany, and Punch. His style was noted for its brilliancy and wit. A collection of his works was published in the United States, 1855-57, in 5 vols., edited by Dr. R. S. Mackenzie.

**MAGISTRATE.** See Justice of the Peace.

**MAGLIABECHI,** Antonio da Marco, an Italian scholar of extraordinary attainments, and court librarian, b. at Florence in 1683, of a respectable but indulgent family. From his earliest years he displayed an inordinate passion for the acquisition of book-knowledge. Having speedily mastered the Greek, Latin, and Hebrew languages, he literally entombed himself among books, of which disorderly piles encumbered every portion of his dwelling, and lay in a heterogeneous litter around his feet. In his daily habits Magliabechi grew regardless of the requirements of social and sanitary life; and such was his avidity of study that he finally denied himself even the requisite intervals of repose. His memory was prodigious, and not only enabled him minutely to retain the contents of his multitudinous books, but also to supply, on occasion, the most exact reference to any particular page or paragraph, the place of each book being indicated with precision in the midst of their apparent inextricable masses. Magliabechi was regarded as the literary prodigy of his times. He was appointed court-librarian by the grand dukes of Florence; and the many tributes of respect tendered by royal and distinguished personages to his wonderful erudition, fostered in an inordinate degree his love of fame and praise, which rendered him intolerant of literary merit in others, and involved him in several bitter literary squabbles. He died at Florence on July 12, 1714, in the 81st year of his age, leaving no written record of his immense encyclopedic knowledge.

His valuable library of 50,000 vols. he bequeathed to his native city of Florence, with funds for its future care and extension; it is now a free library, and bears the name of its collector.

**MAGNA CHARTA,** the great charter which was granted by king John of England to the barons, and has been viewed by after-ages as the basis of English liberties. The oppressions and exactions of a tyrannical and dastardly sovereign called into existence a confederacy of the barons or tenants-in-chief of the crown, who took up arms for the redress of their grievances. Their demand was for the restoration of the laws of Henry I., laws which might probably be characterized as an engratting of Norman feudalism on the "ancient custom of England," or previously existing Saxon and Danish free institutions, in which "ancient custom" were comprehended the laws of Edward the confessor. A conference between the sovereign and the barons was held at Runnymede, near Windsor, a place where treaties regarding the peace of the kingdom had often before been made. King and barons encamped opposite each other; and after several days' debate John signed and sealed the charter with great solemnity on June 15, 1215.

The great charter reared up a barrier against the abuse of the royal prerogative by a series of provisions for the protection of the rights and obligations of the feudal proprietor. It redressed a variety of grievances connected with feudal tenures, some of them now so long obsolete as to be with difficulty intelligible. There are minute provisions regarding the relief of heirs, wardship, marriage of heirs and of their widows. No scutage or aid is to be imposed without the authority of the common council of the kingdom, except on the three great feudal occasions of the king's captivity, the knight-ing of his eldest son, and the marriage of his eldest daughter. The liberties of the city of London and other towns, boroughs, and ports are declared inviolable. Freedom of commerce is guaranteed to foreign merchants. Justice is no longer to be sold, denied, or delayed. The court of common pleas, instead of, as formerly, following the king's person in all his progresses, is to be permanently fixed at Westminster; assizes are to be held in the several counties, and annual circuits are established. Regulations are made for the efficiency of the inferior courts of justice. The protection of life, liberty, and property from arbitrary spoliation is the most important feature of the charter. "No Freeman shall be taken or imprisoned, or be disseized of his freehold, or liberties, or free customs, or be otherwise damaged, nor will we pass upon him, nor send upon him, but by lawful judgment of his peers, or by the law of the land"—a provision which recognized a popular tribunal as a check on the official judges, and may be looked on as the foundation of the writ of habitus corpus. No one is to be condemned on rumors or suspicions, but only on the evidence of witnesses. Protection is afforded against excessive amerceaments, illegal distresses, and various processes for debts and services due to the crown. The funds raised are all to be proportioned to the magnitude of the offense, and even the villain or rout is not to be deprived of his necessary chattels. There are provisions regarding the forfeiture of lands for felony. The testamentary power of the subject is recognized over part of his personal estate, and the rest is to be divided between his widow and children. The independence of the church is also provided for.

These are the most important features of that charter which occupies so conspicuous a place in history, and which establishes the supremacy of the law of England over the will of the monarch. A charter was at the same time granted to mitigate the oppressions of the forest laws (q.v.). The terms dictated by the barons to John included the sur-
render of London to their charge, and the Tower to the custody of the primate till August 15 following, or till the execution of the several articles of the great charter. Twenty-five barons, as conservators of the public liberties, were invested with extraordinary authority, which empowered them to make war against the sovereign in case of his violation of the charter. Several solemn ratifications were required by the barons both from John and from Henry III.; and a copy of the great charter was sent to every cathedral, and ordered to be read publicly twice a year. The copy preserved in Lincoln cathedral is regarded as the most accurate and complete; and a fac-simile of it was engraved by order of the late board of commissioners on the public records. The great charter and charter of the forests are printed with English translations, and prefixed to the edition of the statutes of the realm published by the record commission.

MAGNA GRECIA (Gr. Ἑνεράδε Ηλλας), the name given in ancient times to that part of southern Italy which was thickly planted with Greek colonies. When it first obtained this appellation is unknown, but it must have been at an early period. Polybius says it was so called in the time of Pythagoras. Some writers include under the term the Greek cities in Sicily; others restrict it to those situated on the gulf of Tarentum, but in general it is used to denote all the Greek cities in Italy, exclusive of those in Sicily. The oldest settlement is believed to have been Cumæ—though it is doubtful whether it and its colonies, Dicearchia and Neapolis, were really embraced under the designation Magna Grecia; while the period assigned to its foundation—viz., soon after the Trojan war—is obviously fanciful. If we fix about the 9th or 8th c. before Christ, we will perhaps not be far wrong. Of the other Greek settlements in Italy the names of not all of which were later than the 8th c. B.C., the most important are—Syracuse (founded by the Corinthians, 733 B.C.); next, Croton (by the Achaeans, 710 B.C.); then Tarentum (by the Spartans, 708 B.C.); Locri (by the Locrians, 708 B.C., according to others, 30 or 40 years later), Rhegium (by the Chalcidians; date of origin not known, but believed by some to be older than even Sybaris), Metapontum (by the Achaeans, 700-680 B.C.), and Velia (by the Phocæans, 540 B.C.). These cities became, in their turn, the parents of many others.

Of the earlier history of Magna Grecia we know almost nothing. The settlements appear to have risen rapidly to power and wealth, partly by the brisk commerce which they carried on with the mother-country, and partly also, it is conjectured, by an amalgamation with the Pelasgic (and therefore kindred) natives of the interior. This, we are told by Polybius, actually happened at Locri, and most probably elsewhere also. About the year 590 B.C. Pythagoras, the philosopher arrived at Crotona, and soon acquired an influence in Magna Grecia which was quite wonderful, though it did not last long. The quarrels between the different cities were often bitter and bloody; and finally 372–271 B.C., the Romans conquered the whole of Lower Italy.—Long before this several of the cities had disappeared. Sybaris, for example, was destroyed by the Crotonians as early as 510 B.C., and now the rest more or less rapidly sunk into decay, and were, in the time of Cicero, with a few exceptions, reduced to utter ruin.

MAGNAN, BERNARD PIERRE, 1791–1865; b. Paris; son of a notary; entered the army in 1809, and served under Napoleon till the defeat at Waterloo; left. cot. in the campaign in Spain 1820–27; was in the expedition to Algiers in 1830. Censured for lack of energy in dealing with an insurrection in Marseilles in 1831, he entered the service of Belgium as gen. of brigade; in 1839 returned to France; was implicated in the first attempt of Louis Napoleon to make a rising of the people in his favor at Boulange; in 1848 tendered his services to Louis Philippe after his dethronement, but was unsuccessful in bringing the army of the Alps to Paris in June of that year to repress a formidable insurrection under the republic, and another at Lyons in 1849. He allied himself with Louis Napoleon when president of France, and was his efficient instrument in overthrowing the republic by the treacherous coup d'état of Dec. 2, 1852, which made Napoleon emperor. The emperor made him a grand marshal of France.

MAGNE, PIERRE, 1806–78, b. France; was employed when a young man by the prefect of Dordogne; and afterwards pursued the study of jurisprudence at Toulouse. Returning to Périgueux, his native place, he entered upon the practice of his profession. His talents did not escape the notice of the government, which made him, in 1835, a councillor to the prefecture of the Dordogne. He was elected to the chamber of deputies in 1848, and soon came to be considered an authority in its financial discussions, in which he took part as a member of the committee on the budget. He became an under-secretary in the war department in 1847, but resigned upon the outbreak of the revolution in 1848, and retired to Périgueux, whence, the following year, he was recalled to take the place of under-secretary in the ministry of finance. He was transferred to the department of public works in 1850. He withdrew from the cabinet in consequence of the dissension among its members in regard to the confiscation of the estates of the Orléans family. He was chosen senator in 1852, and in July of that year re-entered the cabinet, in his old position as minister of public works. In 1853 he was appointed minister of commerce and agriculture, and in 1856 minister of finance. His knowledge of and talent for finance were remarkable, and though he occasionally resigned or was transferred to some other department, on account of his inability to agree with his colleagues, or to carry out some favorite financial scheme, he was always sure to be recalled.
Magnesia. 

Magnesium. 

He was out of office from 1863 to 1867, when he was re-instated as the only man who could successfully place the great loan, whose negotiation France was then contemplating. When Émile Ollivier was invited by the emperor, Dec. 27, 1869, to form a new ministry, Magne went out of office; and his place was taken by M. Buffet. He returned to the treasury when the duc de Broglie took office; April 24, 1873, and went out with the de Broglie ministry, May 16, 1874. At the time de Broglie formed his cabinet, Magne was serving in the national assembly, to which he had been returned from the department of the Dordogne. His last public office was that of a senator for the Dordogne, to which office he was elected in 1876.

MAGNENTIUS, FLAVIUS POPILII, Roman emperor of the west. He was of barbarian extraction, but soon rose to the rank of count under the emperor Constantine the great. Entering the service of Constans, son of Constantine the great, emperor of the west, he was put in command of the troops that defended the Rhine, and plotted the overthrow of that prince. With the aid of Marcellinus, count of the sacred largesses, his plot was successful. Marcellinus having invited the officers of the army, stationed near the city of Autun, to a banquet in honor of the birthday of his son, at a late hour introduced Magnentius arrayed in robes of royalty. The cry "Long live Augustus" was raised by several conspirators. Constans was assassinated, and Magnentius took possession of the palace at Autun. In a short time Gaul, Italy, and most of the western provinces, acknowledged the usurper as emperor. Constantius, the brother of Constans, and emperor of the east, hastened to avenge the death of his brother, and totally defeated Magnentius before the town of Mursa on the Drave, 351. He fled to Gaul, thence to Gaul, where Constantius followed him, and again in 353 defeated him in the Cottian Alps. On the eve of being captured by his enemies, and deserted by the countries that had acknowledged him, he committed suicide at Luddunum, Aug., A.D. 353. Constantius thus became master of the whole empire.

MAGNESIA. See MAGNESIUM.

MAGNESIA, a district of Thessaly, Greece, the narrow and mountainous portion between the river Peneus and the Pagassaean bay to the n. and s. and between the chain of Ossa and the sea on the w. and east. The Magnesians submitted to Xerxes, but afterwards were subdued by the kings of Macedon, who succeeded Alexander, and were declared free by the Romans after the battle of Cynoscephalae. Their government was then republican.

MAGNIFICIUS, the name of two ancient cities of Asia Minor. The first was in the northern part of Lydia, near the Hermus, at the foot of Mt. Sipylus, and was called Magnesia near Sipylus, to distinguish it from the other. Its founder and early history are not known, but it was first brought into notice by the victory of the Romans over Antiochus the great, in 187 B.C. It was one of the 12 cities destroyed by the earthquake in the time of Tiberius, which he soon rebuilt. It is now Manissa. The second was in Caria on the river Letheus in the valley of the Meander, and called Magnesia at the Meander, to distinguish it from that near Mt. Sipylus. It was 15 m. from Ephesus. It had a famous temple of Diana, the remains of which Hamilton discovered in exploring the ruins of the city.

MAGNESIAN LIMESTONE. See DOLOMITE.

MAGNESIUM (symb. Mg. eq. 12—new system, 24—sp. gr. 1.74) is generally ranked with those metals whose oxides form the alkaline earths (laryta, stroncia, lime), but in many respects it more closely resembles zinc. It is a malleable, ductile metal, of the color and brilliancy of silver. It fuses at about the melting-point of tin (about 442°), and if heated in dry air or in oxygen gas, it burns with extraordinary brilliancy, and is oxidized into magnesia. In dry air it undergoes little change, and is less oxidizable than the other metals of the same group. It does not decompose cold water; but if the water be heated to about 90°, there is a slight evolution of hydrogen; and if the temperature is raised to 212°, hydrogen is given off rapidly and abundantly. When thrown into strong hydrochloric acid, it inflames and becomes converted into chloride of magnesium, while hydrogen is given off. It is obtained from its chloride either by the action of sodium or potassium, or by simple electrolytic decomposition; but the ordinary processes are difficult, and yield the metal only in minute quantities. A patent has, however, been taken out by Mr. Sonstadt for improvements in its manufacture, by which it can be produced by the pound.

Magnesia (MgO) is the only oxide of magnesium. It is a white bulky powder, devoid of taste or smell, and having a sp. gr. of 3.65; it is infusible, and almost insoluble in water; and when placed on moistened test paper, is seen to have an alkaline reaction. When mixed with water; it gradually forms a hydrate (MgO·H2O), without, as in the case of lime, any sensible elevation of heat, and this hydrate slowly absorbs carbonic acid from the atmosphere. Magnesia does not occur native, and is usually obtained by the prolonged application of heat to the carbonate. Hydrate of magnesia occurs naturally in a crystalline form in the mineral brucite.

Magnesia alba, the common white magnesia of commerce, is a mixture of the hydrate of magnesia and of hydrated carbonate. It is obtained by the precipitation of a hot
solution of sulphate of magnesia by a hot solution of carbonate of potash or soda, and by then collecting and drying the deposit.

Of the magnesian salts, some are soluble and some insoluble in water. The soluble salts have a peculiar and very bitter taste, and hence the German name, bittererde (bitter-earth), for magnesia. All the salts which are insoluble in water, except the silicate, dissolve in hydrochloric and nitric acids.

Carbonate of magnesia occurs native in the mineral magnesite, and in association with carbonate of lime in dolomite, from which it may be manufactured in a very pure state by Mr. Pattinson's process, which consists essentially in the following steps: Finely ground dolomite is exposed for some time to a red heat, by which the carbonate of magnesia is decomposed; the powder is then introduced into a very strong vessel, where it is mixed with water, and carbonic acid gas forced in under heavy pressure till it ceases to be absorbed; the carbonate of magnesia becomes dissolved as bicarbonate, while the carbonate of lime remains unchanged; on boiling the clear liquid, carbonate of magnesia is deposited, and carbonic acid expelled.

Sulphate of magnesia, or Epsom salts (MgO, SO₄•7Aq), is the most important of the magnesian salts. It is obtained from sea-water; or from magnesian limestone (dolomite), or from the mother-liquor of alum-works, by processes into which we have not space to enter; and is a common ingredient in mineral waters (see Epsom Salt). It is soluble in three times its weight of water at 60°, and in less water at a higher temperature, the solution having a bitter, disagreeable taste.

Nitrate of magnesia (MgO, NO₃•6Aq) occurs in certain mineral waters, but is of no special importance.

A phosphate of magnesia, having the formula H₂O, 2MgO, PO₄•14Aq, is obtained by the mixture of solutions of sulphate of magnesia and of ordinary phosphate of soda. It occurs either in an amorphous state or in six-sided prisms, according as the solutions are more or less concentrated. This salt is a constituent of the seeds of wheat and the other cereals, of bones, and of various morbid concretions. The phosphate of ammonia and magnesia, known also as ammoniaco-magnesian phosphate and as triple phosphate (NH₄, O₂MgO, PO₄•12Aq), is a more important salt than the preceding. It occurs either in minute crystalline grains or in beautiful transparent four-sided prisms of considerable size, and with a very characteristic appearance. The formation of the salt, which is only slightly soluble in pure water, and is quite insoluble in water containing free ammonia or its hydrochlorate, not only furnishes a very delicate test for the presence of magnesia, but enables us to determine its quantity.

This phosphate of ammonia and magnesia is readily formed by mixing a solution of a magnesian salt with hydrochlorate of ammonia, phosphate of soda, and a little free ammonia. It is an occasional constituent of urinary calculi, and crystallizes in beautiful prisms from urine and other animal fluids, when they begin to putrefy. It is also frequently present in the excrements in cases of diarrhoea.

The silicates of magnesia are numerous. A large number of minerals are formed either wholly or partly of them, among which may be mentioned olivine or chrysolite, talc, steatite or soapstone, meerschaum, serpentine, augite, hermbnlede, etc.

The haloid salts of magnesia—the chloride, iodide, and bromide—are of no special interest, except that the chloride of magnesia is, next to chloride of sodium, the most abundant of the salts existing in sea-water.

The compounds of magnesiam employed in medicine are magnesia, its carbonate, and its sulphate.

Magnesia is presented in small doses (from 10 grains to a scruple), as an antacid, in cases of undue acidity of the stomach, heart-burn, and abnormal acidity of the urine; in larger doses (from a scruple to a dram), it produces distinct purgative effects. It is useful, especially when combined with rhubarb and a little ginger (in the form of compound rhubarb powder or Gregory's mixture), as a purgative for children, in acid conditions of the alimentary canal.

Carbonate of magnesia (magnesia alba) acts in the same manner as magnesia, except that it is less active, since more than half of it consists of water and carbonic acid. D inneford's solution of magnesia, and other fluid preparations of the same nature, are made by dissolving this salt in water charged with carbonic acid. A dram of carbonate of magnesia, the juice of one lemon, and a wine-glassful of water constitute an agreeable laxative, a citrate of magnesia being thus formed. The compound of magnesia is a purgative in very general use. It is much employed in febrile affections, and when the portal system is congested; but it may be used in almost any case in which a mild but efficient laxative is required. Its dose varies from 2 to 4 or 6 drams. In combination with the infusion of senna, it forms the ordinary black draught. See Magnesium and the Magnesium Light.

MAGNESIUM AND THE MAGNESIUM LIGHT. Although the discovery of the metal magnesium was made by Sir H. Davy in 1808, it was looked upon as little more than a chemical curiosity for about half a century. In 1830 a French chemist, Bussy, obtained globules of the metal by fusing globules of potassium, in a glass tube, with anhydrous chloride of magnesium. Bussy's labors were followed by somewhat improved methods, adopted by Bunsen, and subsequently by Matthiessen, who succeeded in pressing some
grains of the metal into wire. The first great advance on Bussy's labors was in 1858, when Deville and Caron effected the reduction of the pure chloride of magnesium by mixing it with fused chloride of sodium in clay crucibles, using fluoride of calcium as a flux, and throwing in fragments of sodium; they thus obtained magnesium on a larger scale than any of their predecessors. The most important part of their investigations was the discovery of the volatility of the metal. All these were, however, mere laboratory experiments. In 1859 Bunsen of Heidelberg, and Roscoe (now of Manchester), published a memoir on the great importance of magnesium for photographic purposes, owing to the high refrangibility and the great actinic power of the light emitted by burning magnesium-wire. The study of this memoir led Mr. Sonnadt to consider whether, the magnesium salts being so abundant, the metal might not be obtained, on a comparatively large scale, at a moderate price. After a prolonged series of expensive experiments he succeeded, in 1862, in producing specimens of the metal varying in size from the size of a pin's head to that of a hen's egg. Although it burned freely enough, it was still wanting in ductility and malleability, in consequence of the presence of certain impurities; but by May, 1863, these difficulties were overcome by a process of purification by distillation; and by the close of that year he considered it safe to begin manufacturing. The magnesium metal company was consequently organized, and operations commenced at Manchester, where magnesium is now made on a considerable scale, as well as by an American magnesium company at Boston. One great advantage of Sonnadt's method is its simplicity; it can be accomplished by the hands of ordinary workmen ignorant of all chemical knowledge. The process of manufacture may be thus described: 1. An anhydrous chloride of magnesium is prepared by saturating lumps of rock-magnesia (carbonate of magnesium) with hydrochloric acid, and then evaporating the solution to dryness. 2. One part of metallic sodium cut in small pieces is placed in an iron crucible, and covered with five parts of the chloride. The crucible is covered, and heated to redness; which, when the chloride leaves the magnesium and unites with the sodium for which it has a strong affinity. When the crucible has cooled, and its contents are removed en masse, and broken, the magnesium—in that state known as crude magnesium—is seen in nuggets of various sizes, varying from granules to masses as large as a hen's egg. 3. The distillation of the crude metal is effected in a crucible through which a tube ascends to within an inch of the lid. The tube opens at the bottom into an iron box, placed beneath the bars of the furnace, where, on the completion of the operation, magnesium is found in the form of a heap of drippings, which may be melted and cast into ingots or any desired form. The difficulty of obtaining a metal with so little ductility in the form of wire—the only form that was originally used for yielding light—had still to be overcome; and after various partially successful attempts to press small quantities into wire by Matthiessen and others, Mr. Mather of Salford devised a piece of machinery by which the metal is pressed into wire of various thickness. Mr. Mather was also the first who obtained the metal in ribbons, in which form, from the larger exposed surface, combustion takes place more completely. The apparatus for making the ribbons is of the simplest nature. "To effect this, a piece of magnesium of it is a small hollow cylinder, adapted to receive a ram at one end, and covered at the other by an iron screen perforated with two or more holes opposite the chamber. This press, as the cylinder is called, is subjected to the action of gas from a blow-pipe, and the heat employed is only sufficient to soften the metal in the press. The pieces of magnesium are thrust into the chamber, the ram is placed in the mouth of the press, and a pressure of between two and three tons—obtained by hydraulic apparatus or by steam—forces the ram against the softened metal, and the latter ooze into continuous strings of wire through the perforations already named. To make ribbon, the wire thus obtained is passed between two hollow heated rollers, and is received in a flattened state upon a reel."—Richardson & Watts' Chemical Technology. To Mr. Mather is also due the credit of having constructed the first magnesium lamp, in which the end of the wire or ribbon is presented to the flame of a spirit-lamp. A concave reflector sent the light forward, and protected the eyes of the operator. A photograph taken by this light was at Manchester in the spring of 1864 by Mr. Brothers and Dr. Roscoe. That the magnesium light, in a more or less modified form, must prove of extreme utility to photography cannot be called in question. Besides overcoming the obstacle of unsuitable weather for the employment of sunlight, it may be applied both for the exploration of various dim structures, underground regions, etc., such as the interior of the pyramids, of catacombs, natural caverns, etc., which could not otherwise be examined or photographed. Prof. Piazzi Smyth, the Scottish astronomer-royal, dating from the east tomb, great pyramid, Feb. 2, 1865, writes as follows: "With any number of wax candles which we have yet taken into either the king's chamber or the grand gallery, the impression left on the mind is merely seeing the candles and whatever is very close to them, so that you have small idea whether you are in a palace or a cottage; but burn a triple strand of magnesium, and in a moment you see the whole apartment, and appreciate the grandeur of its size and the beauty of its proportions." M. Madar is said to have taken a series of photographs of the catacombs of Paris; various artists are busy practicing on monuments in obscure recesses of continental churches; and in different parts of England leaves of prehistoric interest either have been, or are about to be, photographed by this
light. For portraiture, it is found to be less successful than was at first expected, owing to the intense light within a few feet of the sitter's eyes causing a contraction of the facial muscles.

Objectors to the application of such lights for the lighting of large buildings and thoroughfares maintain that, while light derived from oil or coal-gas, in which carbon constitutes the ignitable solid, possesses a power of diffusibility which renders objects not directly opposed to the course of the rays more or less distinctly visible, the electric, line, and magnesium lights possess less of this diffusiveness; their rays being apparently projected with a force and velocity which interfere with the power of diffusion. As object placed in the direct course of the rays is splendidly illuminated, and the rays are projected to an immense distance; but the shadows cast by intervening objects are intensely black, and the rays seem to pass through the atmosphere without producing much effect, except upon those parts on which they directly fall.

We may now state some of the advantages which arise from the use of the magnesium light. Its color approaches very much nearer to daylight than that of the light from oils, candles, or coal-gas. As compared with the sun, its luminous intensity is \( \frac{3}{4} \), but its chemical intensity is \( \frac{1}{10} \), and this high actinic power makes it especially valuable for photographic purposes. Although it does not nearly equal the electric light as an illuminating agent, like it the magnesium light gives off no noxious vapors. But as it burns, white clouds of the vapor of magnesia are formed which would be more or less troublesome in private rooms. This objection is said to be to some extent removed, without diminishing the brilliancy of the light, by alloying with zinc; and at any rate, it would scarcely at all interfere with its use in large public buildings. Still less would it do so when the light is burned in the open air.

There is, however, not much hope of the magnesium light successfully competing with the electric light for the illumination of large buildings, streets, or even of ocean steamers. Recent trials with the electric light at the British museum and other places have now proved conclusively that wherever a great deal of light is required, gas is beaten out of the field on the score of economy. As respects the maintenance of an equal amount of light, gas is 20 times more costly, a difference which will speedily cover the original expense of the necessary electrical apparatus. The magnesium light, on the other hand, is much more costly than gas; and although the ores which could be used as a source of magnesium are very abundant, yet any probable cheapening of the process of extracting the metal from these is not likely to make the light a very economical one. Still, for any purpose where, for a comparatively brief time, a very intense light is required, magnesium wire or ribbon has about it almost the simplicity of a wax taper; nor are the lamps at all complex by which the metal may be burned for hours continuously.

Two kinds of magnesium lamps are made. In one of these kinds, wire or thin ribbon of the metal is coiled about a reel or bobbin. From this reel the ribbon is drawn by means of two small rollers and projected through a tube to the focus of a metallic reflector, where it passes through the flame of a spirit-lamp to insure its continuous combustion. These rollers are kept in motion either by an operator turning a small wheel, or in the more expensive forms by clock-work. In the other kind of lamp the magnesium is used in the form of dust, which is mixed with fine dry sand in the proportion of one of the former to two of the latter. This mixture is placed in a funnel-shaped reservoir, and conducted, by means of a narrow tube provided with a stop-cock, to the flame of a spirit-lamp which serves to ignite and maintain the flame of the powdered magnesium. If nitrate of strontia be substituted for sand, a splendid red light is produced, and in this way, by using other chemicals, various colors can be obtained.

It was about the year 1864 that magnesium was first made on a commercial scale, and it is found that the demand for it, although not decreasing, is scarcely at all extending. It is almost wholly used for burning in photographic lamps, for flash lights, and for fire-works. It has been attempted to make magnesium useful for other purposes. Various alloys have been made with it and other metals, such as lead, tin, zinc, cadmium, and silver; but they are all brittle and liable to change. It is very doubtful, therefore, if any of these alloys will become useful in the arts, and the metal itself is scarcely likely to be available in the construction of objects of ornament or utility, since, when exposed to damp, it soon becomes coated with a film of hydrate of magnesium.

MAGNETIC CURES. It was held by physicians of old that the magnet exercised an important influence on the human body, or on the bodies of certain persons; this being shown in the alleviation of headache, toothache, cramp, etc. It has, however, been proved that the magnet as such has no influence on animal organisms, and that accordingly all cures professedly resting on such action have been due to delusion or deceit. But it is quite otherwise with magneto-electricity and galvanism. See ELECTRICITY, MEDICAL.

MAGNETIC IRON ORE. See Loadstone, ante.

Magnetism (said to be derived from the city Magnesia, where the loadstone was first discovered), is the power which the magnet has to attract iron. Under dia-Magnetism it is stated that every substance is more or less affected by the magnet, but as
iron is *par excellence* magnetic, the term is chiefly used with reference to it. Magnets are of two kinds, *natural* and *artificial*. Natural magnets consist of the ore of iron called magnetic, familiarly known as lodestone. Artificial magnets are, for the most part, straight or bent bars of tempered steel, which have been magnetized by the action of other magnets, or of the galvanic current.

**Polarity of the Magnet.**—The power of the magnet to attract iron is by no means equal throughout its length. If a small iron ball be suspended by a thread, and a magnet (fig. 1) be passed along in front of it from one end to the other, it is powerfully attracted at the ends, but not at all in the middle, the magnetic force increasing with the distance from the middle of the bar. The ends of the magnet where the attractive power is greatest are called its poles. By causing a magnetic needle moving horizontally to vibrate in front of the different parts of a magnet placed vertically, and counting the number of vibrations, the rate of increase of the magnetic intensity may be exactly found. Fig. 2 gives a graphic view of this increase. N S is the magnet; the lines $n N$, $a a$, etc., represent the magnetic intensities at the points N, a, etc., of the magnet; and the curve of magnetic intensity, $N a M a', n'$, is the line formed by the extremities of all the upright lines. It will be seen from the figure that the force of both halves, taking M as the dividing-point, is disposed in exactly the same way, that for some distance on either side of the middle or neutral point there is an absence of force, and that its intensity increases with great rapidity towards the ends. The centers of gravity of the areas $M N n$ and $M S n'$ are the poles of the magnet, which must therefore be situated near but not at the extremities.

A magnet has, then, two poles or centers of magnetic force, each having an equal power of attracting iron. This is the only property, however, which they possess in common, for when the poles of one magnet are made to act on those of another, a striking dissimilarity is brought to light. To show this, let us suspend a magnet, N S, fig. 3, by a band of paper, M, hanging from a cocoon thread (a thread without torsion). When the magnet is left to itself, it takes up a fixed position, one end keeping north, and the other south. The north pole cannot be made to stand as a south pole, and *vice versa*; for when the magnet is disturbed, both poles return to their original positions. Here, then, is a striking dissimilarity in the poles, by means of which we are enabled to distinguish them as *north pole* and *south pole*. When thus suspended, let us now try the effect of another magnet upon it, and we shall find that the pole of the suspended magnet that is attracted by one of the poles of the second magnet is repelled by the other, and *vice versa*; and where the one pole attracts, the other repels. If, now, the second magnet be hung like the first, it will be found that the pole which attracted the north pole of the first magnet is a south pole, and that the pole which repelled it is a north pole. We thus learn that each magnet has two poles, the one a north, the other a south pole, alike in their power of attracting soft iron, but differing in their action on the poles of another magnet, like poles repelling, and unlike poles attracting, each other.

It might be thought that, by dividing a magnet at its center, the two poles could be insulated, the one half containing all the north polar magnetism, and the other the south. When this is done, however, both halves become separate magnets, with two poles in each—the original north and south poles standing in the same relation to the other two poles called into existence by the separation. *We can therefore never have one kind of magnetism without having it associated in the same magnet with the same amount of the opposite magnetism.* It is this double manifestation of force which constitutes the polarity of the magnet.

The fact of the freely suspended magnet taking up a fixed position has led to the theory that the earth itself is a huge magnet, having its north and south magnetic poles in the neighborhood of the poles of the axis of rotation, and that the magnetic needle or suspended magnet turns to them as it does to those of a neighboring magnet. All the manifestations of terrestrial magnetism give decided confirmation of this theory. It is on this view that the French call the north pole of the magnet the south pole (pole...
Magnetism.

362

aestral), and the south the north pole (pole boreal); for if the earth be taken as the standard, its north magnetic pole must attract the south pole of other magnets, and vice versa. In England and Germany the north pole of a magnet is the one which, when freely suspended, points to the north, and no reference is made to its relation to the magnetism of the earth.

**Properties of Magnets.** - Artificial magnets are either bar magnets or horse-shoe magnets. When powerful magnets are to be made, several thin bars are placed side by side, with their poles lying in the same way. They end in a piece of iron, to which they are bound by a brass screw or frame. Three or four of these may be put up into the bundle, and these again into bundles of three and four. Such a collection of magnets is called a magnet magazine or battery. A magnet of this kind is more powerful than a solid one of the same weight and size, because thin bars can be more strongly and regularly magnetized than thick ones. Fig. 4 is a horse-shoe magnet magazine. The central lamina protrudes slightly beyond the other, and it is to it that the armature is attached, the whole action of the magnet being concentrated on the projection. A good form of magnet is a parallel-piped of magnetic iron ore, with pieces of soft iron, bound to its poles by a brass frame encircling the whole. The lower ends of the soft iron bars act as the poles, and support the armature. The magnetic needle is a small magnet nicely balanced on a fine point. See Compass.

**Magnetic Induction.** - When a short bar of soft iron is suspended from one end of a magnet it becomes for the time powerfully magnetic. It assumes a north and south pole, like a regular magnet, as may be seen by using a small magnetic needle; and if its lower end be dipped into iron filings, it attracts them as a magnet would. When it is taken away from the magnet the filings fall off, and all trace of magnetism disappears. It need not be in actual contact to show magnetic properties; when it is simply brought near, the same thing is seen, though to a less extent. If the inducing magnet be strong enough, the induced magnet, when in contact, can induce a bar like itself, placed at its extremity, to became a magnet; and this second induced magnet may transmit the magnetism to a third, and so on, the action being, however, weaker each time.

If a steel bar be used for this experiment, a singular difference is observed in its action; it is only after some time that it begins to exhibit magnetic properties, and, when exhibited, they are feebler than in the soft iron bar. When the steel bar is removed, it does not part instantly with its magnetism, as the soft iron bar, but retains it permanently. Steel, therefore, has a force which, in the first instance, resists the assumption of magnetism; and, when assumed, resists its withdrawal. This is called the coercive force. The harder the temper of the steel, the more is the coercive force developed in it. It is this force also, in the loadstone, which enables it to retain its magnetism.

**Magnetization.** - By single touch (Fr. simple touche, Ger. einfacher strich): The steel bar to be magnetized is laid on a table, and the pole of a powerful magnet is rubbed a few times along its length, always in the same direction. If the magnetizing pole be north, the end of the bar it first touches each time becomes also north, and the one where it is laid south. The same thing may be done by putting, say, the north magnetizing pole first on the middle of the bar, then giving it a few passes from the middle to the end, returning always in an arch from the end to the middle. After doing the same to the other half with the south pole, the magnetization is complete. The first end rubbed becomes the south, and the other the north pole of the new magnet. By divided touch (Fr. touche séparée, Ger. getrennter strich): The bar to be magnetized is placed on a piece of wood with its ends abutting on the extremities of two powerful magnets. Two rubbing magnets are placed with their poles together on the middle, inclined at an angle rather less than 30° with it. They are then simultaneously moved away from each other to the ends, and brought back in an arch again to the middle. After this is repeated a few times; the bar is fully magnetized. This method communicates a very regular magnetism, and is employed for magnetic needles, or where accuracy is needed. The magnetization by double touch is of less practical importance, and need not here be described. It communicates a powerful but sometimes irregular magnetism, giving rise to consecutive poles—that is, to more poles than two in the magnet.

For horse-shoe magnets, Hoffer's method is generally followed. The inducing magnet is placed vertically on the magnet to be formed, and moved from the ends to the bend, or in the opposite way, and brought round again, in an arch, to the starting-point. A soft iron armature is placed at the poles of the induced magnet. That the operation may succeed well, it is necessary for both magnets to be of the same width. The same method may also be followed for magnetizing bars. The bars with the armatures are placed so as to form a rectangle; and the horse-shoe-magnet is made to glide along both in the way just described.

**Magnetization by the Earth.** - The inductive action of terrestrial magnetism is a striking proof of the truth of the theory already referred to, that the earth itself is a magnet. When a steel rod is held in a position parallel to the dipping-needle (q.v.), it
becomes in the course of time permanently magnetic. This result is reached sooner when the bar is rubbed with a piece of soft iron. A bar of soft iron held in the same position is more powerfully but only temporarily affected, and when reversed, the poles are not reversed with the bar, but remain as before. If when so held it receive at its end a few sharp blows of a hammer, the magnetism is rendered permanent, and now the poles are reversed when the bar is reversed. The torsion caused by the blows of the hammer appears to communicate to the bar a coercive force. We may understand from this how the tools in work-shops are generally magnetic. Whenever large masses of iron are stationary for any length of time they are sure to give evidence of magnetization, and it is to the inductive action of the earth’s poles acting through ages that the magnetism of the loadstone is to be attributed.

Preservation and Power of Magnets.—Magnets, when freshly magnetized, are sometimes more powerful than they afterwards become. In that case they gradually fall off in strength till they reach a point at which their strength remains constant. This is called the point of saturation. If a magnet has not been raised to this point, it will lose nothing after magnetization. We may ascertain whether a magnet is at saturation by magnetizing it with a more powerful magnet, and seeing whether it retains more magnetism than before. The saturation point depends on the coercive force of the magnet, and not on the power of the magnet with which it is rubbed. When a magnet is above saturation, it is soon reduced to it by repeatedly drawing away the armature from it. After reaching this point, magnets will keep the same strength for years together if not subjected to rough usage. It is favorable for the preservation of magnets that they be provided with an armature or keeper. For further information, see article ARMATURE.

The power of a horse-shoe magnet is usually tested by the weight its armature can bear without breaking away from the magnet. Hacker gives the following formula for this weight: \[ W = \frac{1}{4} a^2, \] where \( W \) is the charge expressed in pounds; \( a \) a constant to be ascertained for a particular quality of steel; and \( a \) is the weight in pounds of the magnets. He found, in the magnets that he constructed, \( a \) to be 12.6. According to this value, a magnet weighing 2 oz. sustains a weight of 8 lbs. 2 oz., or 25 times its own weight; whereas a magnet of 100 lbs. sustains only 271 lbs., or rather less than 8 times its own weight. Small magnets, therefore, are stronger for their size than large ones. The reason of this may be thus explained: Two magnets of the same size and power, acting separately, support twice the weight that one of them does; but if the two be joined, so as to form one magnet, they do not sustain the double, for the two magnets being in close proximity, act inductively on each other, and so lessen the conjoint power. Similarly, several magnets made up into a battery have not a force proportionate to their number. Large magnets in the same way may be considered as made up of several laminæ, interfering mutually with each other, and rendering the action of the whole very much less than the sum of the powers of each. The best method of ascertaining the strength of bar magnets is to cause a magnetic needle to oscillate at a given distance from one of their poles, the axis of the needle and the pole of the magnet being in the magnetic meridian. These oscillations observe the law of pendulum motion, so that the force tending to bring the needle to rest is proportionate to the square of the number of oscillations in a stated time.

Action of Magnets on each other.—Coulomb discovered, by the oscillation of the magnetic needle in the presence of magnets in the way just described, that when magnets are so placed that two adjoining poles may act on each other without the interference of the opposite poles, that is, when the magnets are large compared with the distance between their centers, their attractive or repulsive force varies inversely as the square of the distance. Gauss proved from this theoretically, and exhibited experimentally, that when the distance between the centers of two magnets is large compared with the size of the magnets, that is, when the action of both poles comes into play, their action on each other varies inversely as the cube of the distance.

Effect of Heat on Magnets.—When a magnet is heated to redness it loses permanently every trace of magnetism; iron, also, at a red heat, ceases to be attracted by the magnet. At temperatures below red heat the magnet parts with some of its power, the loss increasing with the temperature. The temperatures at which other substances affected by the magnet lose their magnetism differ from that of iron. Cobalt remains magnetic at the highest temperatures, and nickel loses this property at 66° F. Ampere’s Theory of Magnetism.—This theory forms the link between magnetism and galvanic electricity, and gives a simple explanation of the phenomena of electro-magnetism and magneto-electricity. We shall therefore preface the short discussion of these two subjects by a reference to it. Ampere considers that every particle of a magnet has closed currents circulating about it in the same direction. A section of a magnet according to this theory is shown in fig. 5. All the separate currents in the various particles may, however, be considered to be equivalent to one strong current circulating round the whole (fig. 6). We are to look upon a magnet, then, as a system, so to speak, of rings or rectangles, placed side by side, so as to form a cylinder or prism, in each of which a current in the same direction is circulating. Before magnetization the currents run in different directions, so that their effect as a system is lost, and the effect of induction is to bring them to run in the same direction. The perfection of magnetization is to render the various currents parallel to each other. Soft iron, in consequence
of its offering no resistance to such a disposition, becomes more powerfully magnetic under induction than steel, where such resistance exists. Experiment very strongly confirms the truth of this theory. Helices of copper wire, in which a current is made to circulate, manifest all the properties of a magnet. Such are shown, in skeleton, in figs. 7 and 8. Each convolution of the spiral may be taken as a substitute for one of the rings above spoken of. In helix fig. 7, the current, after entering, goes from right to left (contrary to the hands of a watch), and it is hence called left-handed; in fig. 8 it goes with the hands of a watch, and is right-handed. The extremities of both helices act on the magnetic needle like the poles of a magnet while the current passes. The poles are shown by the letters N and S, and this can be easily deduced from Ampère's rule (see Galvanism), for, suppose the little figure of a man to be placed in any part of the helix fig. 7, so that, while he looks towards the axis of the helix, the current enters by his feet, and leaves by his head, the north pole will be at his left hand, as shown in the figure. In the left-handed helix (fig. 8), the poles are reversed according to the same rule. If either of these helices be hung so as to be capable of horizontal motion, which, by a simple construction, can easily be done, as soon as the current is established, the north and south poles place themselves exactly as those of the magnetic needle would do; or, if they were hung so as to be able to move vertically in the magnetic meridian, they would take up the position of the dipping-needle (q.v.).

These movements can be still further explained by reference to the mutual action of electric currents on each other. It is found that when two currents are free to move, they endeavor to place themselves parallel to each other, and to move in the same direction, and that currents running in the same direction attract, and those running in opposite directions repel. The apparatus fig. 9 is intended to prove this. The rectangle c d e f is movable round the pins a and b, resting on two mercury cups. The arrangement is such that while the rectangle c d e f is movable about its axis, a current can continue steadily to flow in it. Further description is unnecessary, the diagram explaining itself. If a wire in which a current passes downwards be placed vertically near c d, c d is attracted by it; but if the current pass upwards, it is repelled, and e f attracted. Place, now, the wire below and parallel to e f. If the current passes in the direction d to e, no change takes place, as the attraction cannot show itself; but if the current moves from e to d, the whole turns round till it stands where e was, and both currents run the same way. If the wire be placed at right angles to d e, the rectangle turns round and comes to rest, when both currents are parallel, and in the same direction.

According to Ampère's theory, the earth, being a magnet, has currents circulating about it, which, according to his rule, must be from east to west, the north pole of the earth being, in our way of speaking, a south pole. A magnet, then, will not come to rest till the currents moving below it place themselves parallel to and in the direction of the earth's currents. This is shown in fig. 10, where a section of a magnet is represented in its position of rest with reference to the earth-current. The upper current being further away from the earth-current, is less affected by it, and it is the lower current that determines the position. A magnetic needle, therefore, turns towards the north to allow the currents moving below it to place themselves parallel to the earth's current. This also is shown by the rectangle in fig. 9, which comes to rest when d and e lie east and west.

Electro-magnetism includes all phenomena in which an electric current produces magnetism. The most important result of this power of the current is the electromagnet. This consists (fig. 11) generally of a round bar of soft iron bent into the horse-shoe form, with an insulated wire coiled round its extremities. When a current passes...
Magnetism.

Through the coil, the soft iron bar becomes instantly magnetic, and attracts the armature with a sharp click. When the current is stopped, this power disappears as suddenly as it came. Electro-magnets far outstrip permanent magnets in strength. Small electro-magnets have been made by Joule which support 3,500 times their own weight, a feat immeasurably superior to anything performed by steel magnets. When the current is of moderate strength, and the iron core more than a third of an inch in diameter, the magnetism induced is in proportion to the strength of the current and of the number of turns in the coil. When the bar is thinner than one-third of an inch, a maximum is soon reached beyond which additional turns of the wire give no additional magnetism; and even when the core is thick, these turns must not be heaped on each other, so as to place them beyond influencing the core. It follows from the above principle, that, in the horse-shoe magnet, where the inductive action in the armature must be taken into account, the weight which the magnet sustains is in proportion to the squares of the strengths of the currents, and to the squares of the number of turns of the wire. This maximum is in different magnets proportional to the area of section, or to the square of the diameter of the core. The electro-magnet, from the ease with which it is made to assume or lay aside its mag-

netism, or to reverse its poles, is of the utmost value in electrical and mechanical contrivances. The action of the electro-magnet is quite in keeping with Ampère's theory, as the current of the coil, acting on the various currents of the individual molecules, places them parallel to itself, in which condition the soft iron bar acts powerfully as a magnet. The direction of the current and the nature of the coil being known, the poles are easily determined by Ampère's rule.

Electro-Magnetic Machines.—These take advantage of the facility with which the poles of an electro-magnet may be reversed, by which attractions and repulsions may be so arranged with another magnet as to produce a constant rotation. The forms in which they occur are exceedingly various, but the description of the apparatus in fig. 12 will suffice to illustrate their principle of working. X S is a fixed permanent magnet (it could be equally well an electro-magnet); the electro-magnet, n s, is fixed to the axis e e, and the ends of the coil are soldered to the ring c, encircling a projection on the axis. The ring has two slits in it dividing it into two halves, and filled with a non-conducting material, so that the halves are insulated from each other. Pressing on this broken ring, on opposite sides, are two springs, a and b, which proceed from the two binding-screws into which the wires, + and −, from the battery are fixed. In the position shown in the figure, the current is supposed to pass along a, to the half of the ring in connection with the end f, of the coil, to go through the coil, to pass by g to the other half of the ring, and to pass along b, in its return to the battery. The magnetism induced by the current in the electro-magnet, makes s a south, and n a north pole, by virtue of which N attracts s, and S attracts n. By this double attraction, n s is brought into a line with N S, where it would remain, had not just then the springs pass to the other halves of the ring, and reverse the current, making s a north, and n a south pole. Repulsion between the like poles instantly ensues, and as is driven onwards through a quarter-revolution, and then attraction as before between unlike poles takes it through another quarter, to place it once more axially. A perpetual rotation is in this way kept up. The manner in which a constant rotary motion may be obtained by electro-magnetism being understood, it is easy to conceive how it may be adapted to the discharge of regular work. Powerful machines of this kind have been made with a view to supplant the steam-engine; but such attempts, both in respect of economy and constancy, have proved utter failures.

Magnetoelectricity includes all phenomena where magnetism gives rise to electricity. Under Induction of Electric Currents (q.v.), it is stated that when a coil in which a
current circulates is quickly placed within another coil unconnected with it, a contrary induced current in the outer coil marks its entrance, and when it is withdrawn, a direct induced current attends its withdrawal. While the primary coil remains stationary in the secondary coil, though the current continues to flow steadily in the primary, no current is induced in the secondary coil. It is also shown that if, while the primary coil is stationary, the strength of its current be increased or diminished, each increase and diminution induces opposite currents in the secondary coil. Change, in fact, whether in the position or current strength of the primary coil, induces currents in the secondary coil, and the intensity of the induced current is in proportion to the amount and suddenness of the change. In singular confirmation of Ampere’s theory, a permanent bar magnet may be substituted for the primary coil in these experiments, and the same results obtained with greater intensity. When a bar magnet is introduced into the secondary coil, a current is indicated, and when it is withdrawn, a current in a contrary direction is observed, and these currents take place in the directions required by Ampere’s theory. A change of position of the magnet is marked by a current, as in the former case. If we had the means of increasing or lessening the magnetism of the bar, currents would be induced the same as those obtained by strengthening or weakening the current in the primary coil. It is this inductive power of iron at the moment that a change takes place in its magnetism, that forms the basis of magneto-electric machines. The manner in which this is taken advantage of will be easily understood by reference:

to fig. 3. N S is a permanent horse-shoe magnet, and let us suppose it to be fixed; C D is a bar of soft iron, with coils A and B wound round its extremities, and may be looked upon as the armature of the magnet. C D is capable of rotation round the axis E F. So long as C D remains in the position indicated in the figure, no currents are induced in the surrounding coils, for no change takes place in the magnetism induced in it by the action of N S. The moment that the poles of C D leave N S, the magnetism of the soft iron diminishes as its distance from N S increases; and when it stands at right angles to its former position, the magnetism has disappeared. During the first quarter-revolution, therefore, the magnetism of the soft iron diminishes, and this is attended in the coil (for both coils act, in fact, as one) by an electric current, which becomes manifest when the ends e, e, of the coil are joined by a conductor. During the second quarter-revolution, the magnetism of the armature increases till it reaches a maximum, when its poles are in a line with those of N S. A current also marks this increase, and proceeds in the same direction as before; for though the magnetism increases instead of diminishes, which of itself would reverse the induced current, the poles of the revolving armature, in consequence of their change of position with the poles of the permanent magnet, have also been reversed, and this double reversal leaves the current to move as before. For the second half-revolution the current also proceeds in one direction, but in the opposite way, corresponding to the reversed position of the armature. Thus, in one revolution of a soft iron armature in front of the poles of a permanent magnet, two currents are induced in the coils encircling it, in opposite directions, each lasting half a revolution, starting from the line joining the poles.

Magneto-electric Machine.—The general construction of a simple magneto-electric machine is shown in fig. 14. N S is a fixed permanent magnet. B B is a soft iron plate, to which are attached two cylinders of soft iron, round which the coils C and D are
Magnetism...

Magnetism, Magneto.

wound. C B D is thus the revolving armature, corresponding to C D in fig. 13. A A is a brass rod rigidly connected with the armature, and also serving as the rotating axle. F is a cylindrical projection on A A, and is pressed upon by two fork-like springs, H and K, which are also the poles of the machine. The ends, m, n, of the coils are soldered to two metal rings on F, insulated from each other. When the armature revolves, A A and F move with it. F, H, and K are so constructed as to act as a commutator, reversing the current at each semi-revolution. By this arrangement, the opposite currents proceeding from the coil at each semi-revolution are transmitted to H and K in the same direction, so that these, which constitute the poles of the battery, so to speak, remain always of the same name. When the armature is made to revolve with sufficient rapidity, a very energetic and steady current is generated. Of late years immense progress has been made in the construction of such machines. In 1866 Wilde of Manchester surprised the scientific world by a machine of unprecedented power; and more recently, Gramme of Paris has constructed another still more astonishing. These are driven by steam-engines, and completely eclipse both in power and constancy the largest galvanic battery hitherto put together. See Magneto-electric Machine. See also Armature, Declination Needle, Dipping Needle, and Rotation, Magnetism of.

Magnetism, Animal. See Animal Magnetism, ante.

Magneto-electric Machine (More recent forms of). Of late years, quite a new era has arisen in the construction of magneto-electric machines. The compactness, simplicity of construction, and marvelous power which the new machines possess, give them quite a novel importance in practical electricity. The names chiefly associated with the new improvements are Wilde of Manchester, Siemens and Wheatstone, and Gramme of Paris. Mr. H. Wilde, in 1866, patented a magneto-electric machine, founded on the principle that a current or a magnet indefinitely weak can be made to induce a current or a magnet of indefinite strength. A general description will show how this is proved and applied.

Wilde's original machine is shown in front elevation, fig. 1. It consists of two machines very similar to each other, the upper one M M', and the lower E E'. The upper and smaller machine consists of 16 permanent magnets, placed one behind the other. The front one only is seen. The poles of these are fixed at g, g (fig. 2), to what is termed the magnet cylinder. This consists of a hollow tube, made up of heavy masses of cast-iron, c, c, at each side, separated from each other by brass rods, b, b, the whole being knit firmly together, above and below, by brass bolts at r, r'. The cast-iron side pieces thus form the poles of the magnetic battery. The armature, which revolves within the tube of the magnet cylinder, is a long piece of soft iron, a a, and in section resembles an "H." In the hollows of the "H" the wire is turned longitudinally. This armature is shown separately in fig. 3, part of the wooden tops which cover in the wire being removed to show how the wire is turned. This form of armature was first constructed by Siemens. The ends of the armature wire are soldered to two insulated iron rings. n, n (fig. 3), against which the springs, s, s (fig. 1), press, which convey the current from the revolving armature; m is the pulley of the driving-belt. If the cross-bar of the "H" stand upright (it lies horizontally in the figure), and the armature be turned round, while wires leading from the binding-screws, r, r' (fig. 1), are connected with a galvanometer, it will be found that the current induced by the motion is in the same direction till the cross is again upright, but inverted. If the motion be continued beyond that point, a current in the opposite direction will ensue, lasting till the cross-bar is in its first position. The right half of
the armature gives off always one kind of electricity, and the left the other. The right and left springs, $s$, $s$, are thus always like poles, for they change from $n$ to $n'$ (fig. 3) when the current in the armature changes. We come now to describe the singular peculiarity and merit of Wilde's machine. The magneto-electric machine is not directly made use of, but is employed to generate an electromagnet some hundreds of times more powerful than the magnetic battery originally employed, by means of which a corresponding increase of electricity may be obtained. This electro-magnet, $E$ $E'$ (fig. 1), forms the lower part of the figure, and by far the most bulky portion of the entire machine. It is of the horse-shoe form, $E$ and $E'$ forming the two limbs of it. The core of each of these, shown by the dotted lines, is formed by a plate of rolled iron, 36 in. in height, 26 in. in length, and 1 in. in thickness. Each limb of the electro-magnet is thus a flat reel of covered wire wrapped round a sheet of iron, the rounded ends alone of which are seen in the figure. The upright iron plates are joined above by a bridge, $P$, built up also of iron-plate, and are fixed below the whole way along with the iron bars $s$, $v$ to the sides of a magnet-cylinder of precisely the same construction as the one already described. The iron frame-work of the electro-magnet is shown by the dotted lines. The depth of the bridge is the same as the breadth of the bars $s'$, $v'$, which are of the same size as the bars $s$, $v$. The various surfaces of juncture in the frame-work are planed, so as to insure perfect metallic contact. The upper and lower machine are in action precisely alike, only the upper magnet is a permanent magnet, and the lower one an electro-magnet. We have the same magnet-cylinder, I, I, the same armature, $A$, and springs, $S$, $S'$, and the same poles, $Z$, $Z'$; the size is, however, different; the caliber of the magnet-cylinder is 7 inches. The diameter of the lower armature gives the name to the machine—viz., a 7-inch machine. Figs. 2 and 3 are on the scale of the lower machine (fig. 1). The length of the wire on the lower armature is 330 feet. It is 35 in. in length, and is made to rotate 1800 times a minute. The cross frame-work attached at $g$ $g$ to the magnet-cylinder, in which the front journal, $f$, of the armature rotates (at Q), is shown in the lower machine (fig. 1). When the machine is in action, both armatures are driven simultaneously by belts from the same countershaft. For the electric light, the currents conveyed to the springs, $S$ and $S'$, need not be sent in the same direction. In that case, the separation between $a$ and $a'$ is vertical; and each spring-conductor presses against only the right-hand ribbon, receiving and transmitting each revolution two opposite currents. Oil for the journal and commutator is supplied from the cup C.

A Wilde's machine 1½ ton in weight, measuring about 5 ft. in length and height, and 20 in. wide, driven by a steam-engine produces a most brilliant electric light, and exhibits the most astonishing heating powers.

Wheatstone and Siemens gave a new interpretation to Wilde's principle. Their important discovery is of the following nature: Suppose the upper machine in fig. 1 removed, and that we have nothing but the electro-magnet and armature left. If the wires proceeding from the binding-screws of the armature be joined up with the electro-magnet, we might fancy that, there being no permanent magnetism, no result would follow on the armature being moved. Such, however, is not the case. If the armature be moved at any velocity, it will soon be brought to a halt by the mutual action ensuing. In the electro-magnet there is always some magnetism left. This induces a feeble current in the coil, but this is sufficient to make the magnet stronger and able to induce a stronger current, and this reciprocal action continues until it grows to an enormous intensity. So great, indeed, would it become, that if we had sufficient mechanical energy at our disposal to persist in the motion, the coils of armature and electro-magnet would be melted, and the machine destroyed. This startling discovery may, however, be thought of little value, as a machine that consumes its own electricity is of no external use. All machines now
Magneto.

work on this reciprocal principle, and a description of them will best show how it is
turned to account. Ladd was the first to construct a machine on Wheatstone and
Siemens's principle. In the armature there are two unequal coils, the larger for fur-
nishing the external current, the smaller for exciting the electro-magnet. These two
coils revolve together, the one at right angles to the other, in the same magnet-
cylinder. In large machines he uses two magnet-cylinders, one at each end of the
electro-magnet; or rather, he uses two electro-magnets, and the two armatures com-
plete the magnetic circuit. Ferguson of Edinburgh alters Ladd’s arrangement in
using only one piece of iron for the armature of the machine with two grooves
cut in it, a larger one for the coil giving the external current, and a smaller one for
the exciting current. This offers the advantage that the heating of the solid iron of
the armature by repeated magnetism is lessened by being transformed into an electric
current. The electro-magnet is thus fed by a current obtained not by an additional
expends of energy, but by the utilization of force that would be otherwise converted
into useless or even hurtful heat.

The great drawback of all the forms of the machine just described is the enormous
velocity at which they rotate—some 2,000 or more revolutions in the minute. At this
speed a machine soon wears itself out. Another disadvantage is the heating of the
armatures in Wilde and Ladd’s machine. Ferguson’s has never been tried on a large scale.
It is found necessary to keep the armatures cool by a flow of cold water. This heat, how-
ever removed, is manifestly a mere squandering of the energy of motion, and a loss to the
current given off. A third objection is the loss that always takes place when the side-
springs change from the one ring to the other, sparks more or less bright accompanying
the change. For the electric light, however, the alternate currents are used, and this
source of loss is not experienced. These defects are removed in the latest form of the
electro-magnetic machine by Gramme of Paris. In it, instead of a solid armature of
iron, a ring is employed on which a great number of bobbins of wire are set. Fig. 4 is
intended to explain the rudimentary prin-
ciple of it. The ends of the wires of two
 contiguous bobbins are soldered to strips
of metal called sectors. These are shown
as radii in the figure. In the machine
itself they are first brought down radially,
then turned at right angles so as to be
parallel to the axis of the machine. They
are very numerous (though few in the
figure), and being separated from each
other by sheets of silk, form a compact
whole. Metallic brushes, B, B, rub on
the end face of the sectors, and form the
poles of the revolving armature. The
principle of action may be thus under-
stood: Suppose we first ascertain what
takes place in the coil of one bobbin as it
revolves in the presence of the magnetic
poles, P, N. If we start from the equa-
torial line, E E’, and go by successive
impulses, we find that, when the bobbin
is joined with a galvanometer, the current induced is always in one direction until we
come again to the equatorial line; but when we pass this, the current is reversed on the
other side. This is much the same as what is found in the Siemens armature. But
there is this difference here; The armature wire with the sectors is continuous from
end to end. On each side of the equatorial line we have two equal and opposite elec-
tric forces or batteries, and these, if left alone, would neutralize each other. But if, in
the equatorial line, we introduce brushes to act as poles, we have, as it were, two gal-
vanic batteries joined up, as it is called, in quantity, with both positive poles together
and also both negative. The brushes embrace several sectors at once, so there is no
spark when they leave any particular sector, contact being established with the others.
The condition of the machine never alter, and hence the current is perfectly steady,
and the sectors being always of the same sign at the points where the brushes rub, the
current is always in the same direction. Siemens and Wheatstone’s principle is
employed in Gramme machines. There are two fixed electro-magnets, and two arma-
tures on the same spindle; one electro-magnet and one armature being set apart for
exciting both electro-magnets, and the other armature and electro-magnet for sending
out the external current. Astonishing as were the effects produced by Wilde’s machine,
those obtained from Gramme’s seem quite to eclipse them. In comparing two magneto
electric machines, we must take into account the kind of wire used for the revolving
armature. For tension purposes, a thin and long wire gives the best results; for quan-
tity or heating purposes, a short and thick wire does best. To compare a tension with
a quantity armature, the same test even in the same machine would give most contra-
dictory results. But comparing, so far as possible, machines intended for the same
purpose, Gramme seems to have the advantage of all others. In the first place, the

U. K. IX.—24
speed of revolution seldom exceeds 800 revolutions per minute; 300 is sufficient for most purposes. A Gramme machine driven by the hand will melt 10 in. of an iron wire 3/8 of an inch in diameter, a feat not accomplished by any other arrangement. The electric light got by a 3-horse-power engine working a machine a ton in weight is equal to upwards of 8,000 sperm candles. A signal-light of this kind has been constructed for the house of lords, under the superintendence of the eminent engineer Conrad W. Cooke, who has rendered no small service in perfecting the machine. The carbons consumed last for four hours, and when burned out are instantaneously replaced. A Gramme machine adapted for electro-plating, and worked by a 1-horse-power engine, deposits nearly 27 oz. of silver per house, and, achieved at far less speed than the similar process on other machines. Among the heating wonders of the Gramme machine we are told of a file half an inch in diameter being burnt up in 5 minutes, of 15 ft. of No. 18 platinum wire being brought to a glowing heat, and of 8 ft. of iron wire .051 inch in diameter being fused.

MAGNIFICAT, a musical composition in the evening service of the Roman Catholic church, and also of the Lutheran and English churches. The words are taken from Luke i. 46-55, containing the "song of the Virgin Mary," which, in the Vulgate, begins with Magnificat. In the Roman Catholic church, the Magnificat is a grand hymn, powerful in melody and harmony, mixed with pompous fugues, and with full instrumentation. In modern time there have been few attempts in the Roman Catholic service to supersede the older music of the Magnificat (by Palestrina); but in the service of the church of England, where the music is of a less elevated character, new compositions are frequently written for the Magnificat, by composers strictly of the English school.

MAGNIFYING-GLASS. See Microscope, ante.

MAGNIN, Charles, 1793-1862; b. Paris; received a superior education, and at the age of 20 became an assistant in the imperial library, and in 1832 a director. He wrote for the Paris press, theatrical criticism, essays, and sketches, and attracted the favorable notice of leading French writers. He also delivered lectures at the Sorbonne on the origin of the modern stage, and gained a sufficient reputation as a man of letters to obtain a seat in the academy of inscriptions and belles-lettres. His published works include Considérations et Méditations Historiques et Littéraires; Les Origines du Théâtre Moderne; Le Théâtre des Hrweitha; and Histoire des Marionettes.

MAGNOLIA, a genus of beautiful trees of the natural order magnoliaceae, having a calyx of 3 sepals, a corolla of 6 to 12 petals, and carpels in spikes arranged in cones, and opening at the dorsal suture. They are natives chiefly of North America, the Himalaya mountains, China, and Japan. The flowers are large and solitary; the leaves large. The wood is in general soft, spongy, and of little value. M. grandiflora, sometimes called the Big Laurel, has white flowers sometimes a foot in diameter. It is a lofty and magnificent evergreen tree, conspicuous at a great distance, found in the lower districts from North Carolina to the gulf of Mexico. It succeeds well as an ornamental tree in the s. of England, but in Scotland requires a wall and some protection in winter. M. tripetala is found on the Alleghany mountains, and extends as far n. as lat. 43°. From the radiated manner in which its leaves are disposed at the extremities of the branches, it has received the name of Umbrella Tree. It has very large white flowers. It is one of the species most commonly cultivated in Britain, but in Scotland it requires a wall. M. acuminata inhabits the same districts, and is a lofty tree with greenish-yellow flowers. It endures the climate of Britain well, but its flowers are not so much admired as those of some of its congeners. M. glauca, a native of Pennsylvania, Virginia, and Carolina, is known by the names of White Bay, Beavewood, and Swamp Sassafras. It is a tree or shrub of 15 to 20 ft. in height, with very beautiful and fragrant white flowers. The Yulan, or Chinese magnolia (M. yulan or conspicua), has been much cultivated in China for more than 1200 years, on account of its beautiful and fragrant white flowers, which it produces in great profusion. It is one of the finest ornamental trees we possess, and succeeds well in the s. of England, and against a wall in Scotland. It is a deciduous tree, and the flowers expand before the development of the leaves. M. excelsa, one of the finest species known, is a predominant tree in some parts of the Himalaya mountains, at an elevation of 7,000 or 8,000 ft., the mountains when it is in blossom appearing as sprinkled with snow. M. Campbellii, another native of the same region, produces great rose-colored flowers, and is described by Dr. Hooker as the most superb of the genus. Allied to the genus magnolia is Michelia, some of the species of which are amongst the most valuable timber trees of Nepal, and very ornamental. The bark of some of them is used medicinally, and the fragrant flowers of a species is the delight of the people of Hindustan. Mangletia is another closely allied genus, to which belong valuable timber trees of Nepal and of the Indian islands. The natural order magnoliaceae is closely allied to ranunculaceae, differing chiefly in the arborescent habit, and in the large stipules which envelop the young leaves before they open, but soon fall off. The leaves are simple. Aromatic properties are prevalent. To this order belong the tulip tree, star anise, and winter's bark.
MAGNUS, HEINRICH GUSTAV, 1802-70; b. Berlin; educated at the university of Berlin, where he devoted himself to the study of natural science. He also studied chemistry with Berzelius at Stockholm. At the age of 26 he had already made important discoveries in chemistry, and in 1854 was made extraordinary, and in 1845, ordinary professor of physics and technology in the Berlin university. He made important experiments on the transmission of heat through gases, which were published in 1860.

MAGNUSSEN, FINN, a distinguished scholar and archaeologist, was b. in 1781 at Skafftholt, in Iceland, where his family, both on his mother's and father's side, had for many generations been distinguished for learning and integrity. In 1797 Magnussen entered the university of Copenhagen with a view of studying for the law; and although he so far fulfilled the original intention of his education as to practice this profession for some years in Iceland, his strong bent towards archaeological pursuits led him, in 1812, to return to Copenhagen, where he devoted himself with much zeal to his favorite studies, under the direction of his distinguished countrymen, Thorkelin and Thorlachus. In 1815 he obtained a chair of literature in the university; and in 1819, at the solicitation of the academy of fine arts, he gave a course of lectures on ancient northern literature and mythology. From this, or even an earlier period, to the close of his life, Magnussen devoted himself to the elucidation of these subjects with a success that was generally commensurate with the great ability and acute learning which he brought to bear upon it, although in some few instances his zeal led him to adopt too hasty conclusions. Among his earliest and most noteworthy works are his papers on the aboriginal home and earliest migrations of the Caucasian races (1818); his contributions to northern archaeology (1820); the indices, glossaries, and lexicon which he compiled for the elucidation of the 2d and 3d of the Arne-Magnussen editions of the Eldas (1818 and 1829); his comprehensive translation of the Elder Edda (Aldre Edda, oversat og forklaaret, Kopen, 1824); and his exposition of the same work (Edda laren og dens Opfyldelse, Kop. 1824).

Among his later works, his Runaer og Runaerlæring (Kop. 1841) has given rise to much angry discussion; and although many of his interpretations of assumed runes have been proved to be utterly untenable, the learning and acumen which he brought to bear on the subject of runes generally, have thrown great light on this branch of archaeology, both in regard to North American and ancient northern remains. In conjunction with Rafn, Magnussen elucidated the history and antiquities of Greenland in an able work (Grønland's Historiske Mindeanker, Kop. 1838-43); and he subsequently prosecuted a similar course of inquiry in regard to Russia in Antiquités Russes (Cop. 1850-53). In addition to these works, Magnussen annotated nearly all the most important remains of old northern literature, as the Heimskringla, Hakonarmál, Laxdœla-Saga, etc.; and besides numerous monographs on archaeological and historic subjects of interest, made many valuable contributions to current Icelandic literature. During his latter years, Magnussen sat in the Danish landsting as deputy for Iceland and the Faroe Isles, in which capacity he gave evidence of considerable political knowledge and patriotic zeal. At his death, in 1847, he held the office of Gehejmarchiekar in the royal chamber of archives.

MAGO, a common Carthaginian name; no less than 14 different persons bearing it occur in history; of whom the most distinguished is Mago, the son of Hamilcar Barca, and a younger brother of Hannibal (q.v.) and Hasdrubal.

MAGOFFIN, an e. co. of Kentucky, drained by the Licking river, and bounded on the e. by mountain ranges. The surface varies in character, being fertile in parts; 600 sq. m.; pop. 80, 6,943. The productions are not abundant; wheat, Indian corn, wool, potatoes, oats, and butter, are the most important. Co. seat, Salyersville.

MAGOON, ELISHA L., D.D., b. N. H. 1810; at first a bricklayer, but in 1840 ordained to the ministry of a Baptist church, and settled at Richmond, Va. After a tour in Europe, and pastures at New York and Albany, he removed in 1860 to Philadelphia, where he remains. He has published Orators of the American Revolution, 1848; Living Orators of America, 1849; Republican Christianity, 1849; and Westward Empire, 1856. He has shown broad literary taste and culture.

MAGPIE, or Pie (Pica), a genus of birds of the family Corvidae (q.v.), differing from the true crows chiefly in the long and graduated tail. They are also of smaller size and brighter colors, the most prevalent color being blue with bars of black and white. The only British species is the COMMON MAGPIE (P. corvus), the Kitta of the Greeks, and Pica of the Romans; a common bird in Britain, and almost all parts of Europe, and too well known to require particular description; its bright but not finely mingled colors—black, white, and blue—making it always conspicuous, and its dissonant, harsh cry equally attractive attention. The magpie is generally to be seen in pairs throughout the year. It builds its nest in high trees; the outside being formed of thorny sticks strongly interwoven, the inside plastered with earth and lined with fibers and dry grass; the top a dome, and one aperture left on the side for the parent bird. The magpie is shy and vigilant in an extreme degree, notable for cunning, both in eluding enemies, and in seeking its own food, as to which it may be said that nothing comes amiss to it, grain being not unacceptable, but eggs or carrion preferable. In Britain, it is persecuted by gamekeepers; in Norway, it is encouraged in the neighborhood of human habitations, and

371 Magnificat. Maple.
consequently often makes its nest under the caves of churches and other buildings. The magazine is easily tuned, becomes impudently familiar, and learns to articulate a few words. Both in a wild and tame state, it has a propensity to seize and carry off bright or glittering articles. It abounds in most parts of Europe and the north of Asia, and in the northern parts of America, but is rare in the parts of America near the Atlantic.—The other species are mostly natives of the eastern parts of Asia.

MAGRUDER, JOHN BANKHEAD, 1810-71; b. Va.; graduated at the military academy in 1830, and was appointed second lieut. in the infantry. He was promoted first lieut. in 1835; and capt. in 1846. He served with distinction through the Mexican war, at the head of the light battery attached to the division of gen. Pillow. He was brevetted maj. after Cerro Gordo, and lieut.col. after Chapultepec, where he was wounded. He resigned from the army April 2, 1861, to enter the confederate service, in which he was made successively col., brig.gen., and maj.gen. He was at first attached to the army of Virginia, commanding at Yorktown till its evacuation in May, 1862, when he joined the campaign on the Chickahominy. In October of the same year he went to Texas to take command of the department of the west, embracing, besides Texas, Arizona and New Mexico. He resumed in active service in Texas throughout the war, conducting a number of military operations, of which the most brilliant resulted in the abandonment of Galveston by the federal forces. After the war he lived for a time in Mexico, but afterwards settled in Texas.

MAGUIRE, JOHN FRANCIS, 1815-73, b. Ireland: a lawyer and journalist. He sat in parliament as member for Dungarvon from 1852 to 1865, and for Cork from 1865 till his death. He was mayor of Cork for several years, and owned and edited there the Cork Examiner. He was the author of The Industrial Movement in Ireland in 1852; Rome and its Ruler; The Irish in America; Life of Father Mathew, and The Next Generation.

MAGYAR. See Hungary.

MAHABHARATA (from the Sanskrit maha—changed to swah—great, and Bhārata) is the name of one of the two great epic poems of ancient India. For the other, see the article Rāmāyana. As its main story relates to the contest between two rival families, both descendants of a king, Bharata, the word Mahābhārata probably implies "the great history of the descendants of Bharata;" for another explanation of the word, which connects it with bhāra, weight, was obviously invented merely to convey an idea of the enormous extent of this poem. According to this explanation, it would mean the "very weighty (poem)," because, "when weighed, it was found to be heavier than all the four Vedas together with their mystical writings." However devoid of grammatical value this popular account of the word Mahābhārata may be, it does not exaggerate the bulk of this epos, which, in its present condition, consists of upwards of 100,000 verses, each containing 32 syllables; while, if a tradition, reported in the introduction to the work itself, could be trusted, it was formerly known in other recensions of a still greater extent. In its actual shape, it is divided into 18 parvams or books, the Haricarana (or) being composed as a supplement to it. That this is not the work of one single individual, but a production of successive ages, clearly results from the multifariousness of its contents, from the difference of style which characterizes its various parts, and even from the contradictions which disturb its harmony. Hindu tradition ascribes it to Vyāsa; but as Vyāsa means "the distributor or arranger," and as the same individual is also the reputed compiler of the Vedas, Purāṇas, and several other works, it is obvious that no historical value can be assigned to this generic name. The contents of the Mahābhārata may be distinguished into the leading story and the episodical matter connected with it. The former is probably founded on real events in the oldest history of India, though in the epic narrative it will be difficult to disentangle the reality from the fiction. The story comprises the contest of the celebrated families called the Kauravas and Pāṇḍavas, ending in the victory of the latter, and in the establishment of their rule over the northern part of India. Kuru, a descendant of Puru, is traced back to the descent of Parashu, and Pāṇḍu. The descendants of Kuru are commonly called the Kauravas; those of Pāṇḍu—the Pāṇḍavas—were five, Yudhishthira, Bhima, Arjuna, and the twins Nakula and Sahadeva. Pāṇḍu having resigned his throne, Dhritarāṣṭra, though blind, assumed the government, and ultimately divided his kingdom between his sons and the sons of Pāṇḍu. The former, however, coveting the territory allotted to the Pāṇḍu princes, endeavored to get possession of it. A game of dice was the means by which they bound over their cousins to relinquish their kingdom, promising, however, to restore it to them if they passed twelve years in the forests, and a thirteenth year in such disguises as to escape detection. This promise was faithfully kept by the Pāṇḍavas; but the term of their banishment having expired, the Kuru princes refused to redeem their word. A war ensued, ending in the complete destruction of the Kauravas. These are the meager outlines of the leading story of the Mahābhārata, where, as may be inferred, Duryodhana and his brothers are pictured as the type of all conceivable wickedness, and the Pāṇḍu princes as paragons of virtue and heroism. That the latter are the incarnations of sunyār deities—that the gods take an active part in the development of the plot, in short, that Hindu mythology is always interwoven with these stirring
events of semi-historical Hindu antiquities, requires no further remark to any one but slightly acquainted with Hindu poetry. It is necessary, however, to observe that out of the 100,000 verses which constitute the great epos, barely a fourth part is taken up by this narrative; all the rest is episodical. The matter thus, as it were, incidentally linked with the main story, may be distributed under three principal heads, passing over such minor additions as fables, genealogical lists, geographical enumerations, and the like. One category of such episodes comprises narratives relating to the ancient or mythical history of India, as, for instance, the episodes of Nala and Sakuntala; a second is more strictly mythological, comprising cosmogony and theogony; a third is didactic or dogmatic—it refers to law, religion, morals, and philosophy, as in the case of the celebrated Bhagavadgîtâ, and the principal portions of the 12th and 13th books. By means of this device, which is common in all ancient literature, the Mahâbhârata gradually became a collection of all that was needed to be known by an educated Hindu; in fact, it became the encyclopedia of India. "There is no narrative on earth," the Mahâbhârata says of itself, "that is not founded on this epos. . . . The twice-born, though knowing the four Vedas and their supplementary sciences, has no wisdom unless he knows this great epos. . . . It is the great manual of all that is moral, useful, and agreeable." Yet it should be noticed that the Brahmanic authors of the great epos intended it especially as an encyclopedia for the Kshatrya or military caste; for it is chiefly the history, the interests, the religion, and the duties of the second caste which are taught in it, always, of course, with a view of establishing the superiority of the Brahmanic caste. Sectarian religion is for this reason not emphasized in the Mahâbhârata, though the later sectarian works (see PERÂNA) have largely drawn, for their purposes, on the mythological material afforded them by the great epic work. The text of the Mahâbhârata has been published in the West in four quartos volumes (1804-39), to which is added a fifth volume, containing a table of contents. Two other editions are in the course of publication at Bombay. The best researches on the Mahâbhârata are those of Lassen, in his Zeitschrift für die Kunde des Morgenlandes (1837, ff.), and in his Indische Alterthumskunde. A sort of analysis of the leading story of the Mahâbhârata (not of the episodes) is given in Eichhoff's Poésie Héroïque des Indiens (Paris, 1860), and by Prof. Monier Williams (Indian Epic Poetry, London, 1863). See also Talboys Wheelers History of India (1867).

**MAHÁDEVÁ** ("the great god") is one of the usual names by which the Hindu god Siva is called. (His consort, Durgâ, is similarly styled Mahâdev, (=the great goddess.)) In Buddhist history, Mahâdeva, who lived 200 years after the death of the Buddha Sâkya-muni, or 343, is a renowned teacher, chief of the Buddhist church. His adversaries accuse him of every possible crime, but as he is ranked among the Arhats, his eminence cannot be matter of doubt. The school founded by him is called Pârâsarna. See W. Wissêlje, Der Buddhismus, etc. (St. Petersburg, 1860).

**MAHÁKÁS YAPA**, one of the most renowned disciples of the Buddha Sâkya-muni. He arranged metaphysically the portion of the sacred writings of the Buddhists called Abhidharma; and tradition ascribes to him also the origin of the Sthavira division of the Buddhist church. Many legends are connected with his life.—See E. Burnouf, Introduction à l'Histoire du Bouddhisme Indien (Paris, 1844), and his posthumous work, Le Lotus de la Bonne Loi (Paris, 1852).

**MAHÁN, ASA, D.D.,** b. in Vernon, N.Y., in 1799; graduated at Hamilton college in 1824; and at Andover theological seminary in 1827; in 1829 became pastor of a Presbyterian church in Pittsford, N.Y., and of a church of the same denomination in Cincinnati in 1831; became president and professor of philosophy at Oberlin in 1838; was president of Cleveland university from 1830-56; pastor of a Congregational church in Jackson, Mich., from 1856-58, and of another at Adrian from 1858-61; and president of Adrian college from 1861-71. His principal works are, The Scripture Doctrine of Christian Perfection; the Science of Intellectual Philosophy; the Doctrine of the Will; the Science of Moral Philosophy; the Science of Logic; and Modern Mysteries Explained and Refuted—the latter directed against spiritualism. He has written also a work of some size in the department of military criticism.

**MAHÁN, DENNIS HART, LL.D.,** 1802-71; b. N.Y.; educated at West Point, and appointed to the army in the engineer corps. In 1825 he was made assistant professor of mathematics at the academy; and in 1832, after four years of study abroad, professor of military engineering, and remained at West Point in that capacity till his death, which occurred by suicide in a fit of temporary insanity. He stood high in his profession, and he wrote a number of text books on civil and military engineering, which came into general use in schools and colleges in the United States. His Treatise on Field Fortifications appeared in 1836, and was supplemented in 1865, by Military Mining and Siege Operations, the two constituting parts I. and II. respectively, of An Elementary Course of Military Engineering. He also published An Elementary Course of Civil Engineering in 1857, which he rewrote and revised in 1868; Advanced Guard, Outpost, and Detachment Service of Troops, 1847; Elementary Treatise on Industrial Drawing, 1858; Descriptive Geometry, 1864; and an edition of Moseley's Mechanical Principles of Engineering and
MAHAN, Milo D.D., 1819-70; b. Suffolk, Nansemond co., Va.; was educated at St. Paul's college, Flushing, L.I.; took orders in the Protestant Episcopal church in 1843; became rector of Grace church, Jersey City, in 1848; and in 1850 assistant minister of St. Mark's church, Philadelphia; was elected professor of church history in the Episcopal general theological seminary in New York in 1851, which position he held for 13 years. In 1864 he became rector of St. Paul's church, Baltimore. His published works are The Exercise of Faith; History of the Church the First Three Centuries; Reply to Colona; Pulmon, a Free Inquiry; Comedy of Canonization. The Rev. J. Hopkins collected and published his works, with a memoir, in 3 vols.

MAHANUDDY (more accurately, MAHANADI), a river of India, rises on the s.w. border of the presidency of Bengal, in lat. 20° 20' n., long. 82° east. After an eastward course of 530 m., 300 m. of which are navigable, having divided into several branches at the town of Cuttack, which forms the head of its delta, it flows e. and s.e. through the district of that name, and falls by several mouths into the bay of Bengal.

MAHANOWY CITY, a t. in Schuylkill co., Penn.; 80 m. from Philadelphia; pop. 5,553; situated in the valley of the same name and in the neighborhood of extensive coal fields, in the mining of which and trades connected with it the people of the city are mainly occupied.

MAHAŚĀNGHIKA is the name of one of the two great divisions of the Buddhist church which arose 200 years after the death of the Buddha Sâkyamuni, or about 483, caused, as it seems, by the schism of Mahâdeva (q.v.). For the other division, see STHÂVIRA. Out of the Mahâsânghika school arose, in the course of the next centuries, numerous sects. For the tenets common to all, and for those peculiar to each of these sects, the special student of the Buddhist religion will at present most advantageously consult the work of prof. W. Wasmilc, Der Buddhamsus, seine Dogmen, Geschichte und Literatur (St. Petersburg, 1860).

MAHASKA, a co. in s.e. Iowa, watered by the Des Moines and forks of the Skunk rivers, and traversed by the Central and Des Moines Valley railroads; 576 sq.m.; pop. '80, 39,301. The surface is chiefly prairie land, with wooded intervals. The soil is fertile, producing hemp, wheat, Indian corn, oats, hay, and potatoes. Considerable wool is grown; the number of cattle, sheep, and swine is large, and there are some quite important manufactories. Co. seat, Oskaaloosa.

MAHAVANSA is the title of two celebrated works written in Pâli, and relating to the history of Lâka, or Ceylon (q.v.), from its earliest period down to the reign of Mahâsena, who died 302 after Christ. The older work was probably composed by the monks of the convent Uttaravîhâra at Anurâdhapura, the capital of Ceylon. Its date is uncertain; but it has apparently preceded the reign of Dhâtusena (459-477), as that monarch ordered it to be read in public, a circumstance which seems to prove the celebrity it enjoyed already at his time.—The later work of the same name is an improved edition and continuation of the former. Its author, Mahâdnama, was the son of an aunt of the king Dhâtusena, and he brings down the history of Ceylon, like his predecessor, to the death of Mahâsena. A first volume of the text of the latter work, "in Roman characters, with a translation subjoined, and an introductory essay on Pâli Buddhistic literature," was published by the Hon. George Turnour (Ceylon, 1887). See also Lassen, Indische Alterthumskunde, vol. ii. p. 15, ff. (Bonn, 1859).

MAHAVIRA (literally, "the great hero"), also called Vîra and Varhâmàna, is the 24th or last Jina, or deified saint, of the Jainas (q.v.), described as of a golden complexion, and having a lion for his symbol. His legendary history is given in the Kaṭapa-Siṭra (q.v.) and the Mahâvira-Châritra, two works held in great authority by the Jainas. According to these works, Mahâvira's first birth occurred at a period infinitely remote; it was as Nâyaśrâ, head man of a village, that he first appeared in the country of Vîjaya, subject to Sâtrumardana. He was next born as Marîch, the grandson of the first Jina saint Râhâna; he then came to the world of Brahmâ, was reborn as a worldly-minded Brahmân, and after several other births—each being separated from the other by an interval passed in one of the Jain heavens, and each period of life extending to many hundreds of thousands of years—he quit the state of a deity to obtain immortality as a saint, and was incarnate towards the close of the fourth age (now past), when 75 years and 84 months of it remained. After he was 30 years of age he renounced worldly pursuits, and departed, amidst the applause of gods and men, to practice austerities. Finally, he became an Arhat or Jina; and at the age of 72 years, the period of his liberation having arrived, "he resigned his breath," and his body was burned by Indra and other deities, who divided amongst them such parts as were not destroyed by the flames, as the teeth and bones, which they preserved as relics; the ashes of the pit were distributed amongst the assistants: the gods erected a splendid monument on the spot, and then returned to their respective heavens. At what period these events occurred is not stated, but judging from some of the circumstances narrated, the last Jina expired about 500 years before the Christian era. Other authorities make the date of this event about a century
MAHMUD II, Sultan of Turkey, and younger son of sultan Abdul-Hamid, was b. July 20, 1785, and on the deposition of his brother, Mustafa IV., by Ba'hrakar, pasha of Ruschuk, was raised to the throne, July 28, 1808. Ba'hrakar became his grand vizier, and vigorously aided him in his attempts to reform the constitution of the Turkish army. But the Janizaries, emboldened by their successful opposition to the same attempt on the part of Selim III., rose in rebellion, and the murder of the vizier put a stop for the present to the carrying out of any military reforms. Mahmud was also attacked by the rebels, but he secured his life and throne by the destruction of all the other members of the royal house of Osman. The war with Russia now commenced vigorously; but after a conflict of three years' duration, which completely prostrated the strength of Turkey, peace was concluded at Bucharest (q.v.). The daring and energetic Mahmud now applied himself to the subjugation of the semi-independent pashas of the outlying provinces, and to the promotion of radical reforms in all departments of the government. The rebellion of the Wahabis was crushed through the instrumentality of Ibrahim Pasha in 1818, and Ali Pasha (q.v.), "the lion of Janina," was overthrown in 1822. Greece revolted in 1821, and its independence was secured by the battle of Navarino in 1827, but it was not recognized as a separate kingdom by Turkey till April, 1830. During the progress of the Greek revolution, Mahmud had been steadily though secretly maturing his plans of military reform, and in June, 1826, the success of his schemes was crowned by the destruction of the Janizaries (q.v.). The consequent confusion into which Turkey was thrown was immediately taken advantage of by Russia for obtaining fresh concessions. Mahmud, however, despite these interruptions, proceeded with iron resolutions in those plans of reform which he judged essential for the defense of his country and the disastrous termination of the succeeding war with Russia (1828-29), far from interfering with his projects, only stimulated him to renewed exertion. The successful revolt of the Greeks, and the late triumph of the Russians, together with the disaffection manifested by the Christian population of Turkey, excited in the ambitious mind of Mehemed Ali, pasha of Egypt, the desire for independence. See MEHEMED ALI. The war which ensued was from first to last in favor of the Egyptians; but the intervention of Russia compelled both parties to agree to a treaty (1833) which was satisfactory to neither. Mahmud was now forced to grant fresh concessions to his "good friend and ally" the czar, by the treaty of Unkhar-Skelessi (q.v.), July 8, 1833, and by another treaty in the following year. He was again at liberty to pursue his reforms in the civil administration, the principal improvements being the modification and readjustment of the more oppressive taxes, the formation of a militia on the principle adopted by England, the establishment of schools of anatomy and painting, increased privileges to Frankish merchants, and the abolition of the export duty on grain, measures of sound policy, which tended largely to consolidate the new-born prosperity of Turkey. In 1838 he concluded with Great Britain a commercial treaty, which both strengthened the connection between the two nations and advanced their mercantile interests. In 1839 he renewed the war with Mehemed Ali, but died before its conclusion, July 1, 1839, after an eventful reign of 31 years.

MAHOGANY, the wood of the trunk of the swietenia mahagoni, a tree of 80 to 100 ft. high, belonging to the natural order ecdrosecæ, a native of the West Indies and of South America. It has pineapple leaves with 3 to 5 pairs of leaflets, and panicles of small whitish or yellow flowers, the stamens united into a tube which is toothed at the summit, and set round on the inside with 8 to 10 anthers. The capsule is 5-celled, about the size of a man's fist, hard, woody, and oval, and the seeds are winged at the apex. It
attains an immense size, second to few others, and its timber is generally sound throughout in the largest trees. The slow progress which it is observed to make, clearly indicates that the trees which are cut for use must have attained a great age: 200 years has been assumed as an approximation. It is most abundant on the coast of Honduras and around Campeachy bay, whence the greater portion of that used in Europe is exported. St. Domingo and Cuba also yield a considerable quantity, which is of a finer quality than that obtained from the mainland, which is frequently called bay wood, to distinguish it from the Cuba mahogany, usually called Spanish. The occupation of cutting this timber and removing it to the coast for shipment is exceedingly laborious, and employs a large number of men and oxen. The wood varies much in value, according to the manner and degree of curv; single logs have occasionally realized as much as $1000 for cutting into veneers, in which state it is very generally used, its great weight and value unfitting it for being always employed solid. It was first introduced into England by accident in 1597, having been used to repair one of sir Walter Raleigh's ships at Trinidad; but although the wood so employed was much admired, it did not become an article of commerce until rather more than a century later, when another accidental circumstance brought it into demand, and it became an article of luxury, and has since maintained the highest position as a cabinet-maker's wood. The annual imports into Britain are over 30,000 tons, exceeding half a million sterling in value. The bark has a faint aromatic smell, and a very astringent bitter taste, and in the countries where the tree grows is used as a medicine. In England it has been recommended and used under the name mahogany bark, or anarancar bark, as a substitute for Peruvian bark.—EAST INDIA MAHOGANY is the timber of the rokuna tree (soymida febrifuga), and AFRICAN MAHOGANY of the kuta or seneqadensis, both of the order ceudetableae.

MAHOMET. See MOHAMMED, ante.

MAHON, Viscount. See STANHOPE, EARL, ante.

MAHONE, William, b. in Southampton, Va., about 1827, and graduated at the Virginia military institute in 1847; adopted the profession of a civil engineer; constructed the Norfolk and Petersburg railroad; assisted in the capture by the rebels of the Norfolk navy yard, April 21, 1861; raised and commanded a regiment of Virginia soldiers in the confederate army; was in most of the battles of the peninsular campaign, and in command at Bermuda Hundred at the time of Lee's surrender. He was promoted to the rank of maj. gen. in 1864. After the war he was engaged in the management of several lines of railroad in Virginia. In 1880 he was elected to the senate of the United States as the successor of Robert E. Withers. The question of the extinguishment of the public debt, which was complicated by the relations of Virginia and West Virginia, had been at issue during every year since 1873, when terms for its equitable adjustment had been agreed upon. These terms, however, not proving satisfactory to a large proportion of the population of the state of Virginia, were not carried out, and two strong parties were formed under the names, respectively, of "debt-payers" and "readjusters," of the latter of which gen. Mahone became the leader and the most active spirit. The "readjusters," while recognizing the just liability of Virginia for her just debts, denied the right of her taxation for that portion of the debt which should attach to West Virginia, opposed over-taxation, declared in favor of the protection of the public free schools, and advocated reform and economy.

MAHONIA. See Barberry.

MAHONING, a co. in n.e. Ohio, watered by the Mahoning and Little Beaver rivers, and intersected by the Atlantic and Great Western, and Pittsburg, Fort Wayne, and Chicago railroads; 422 sq. m.; pop. '80, 42,867. The surface is undulating, and the soil very fertile. The productions are: wheat, Indian corn, potatoes, oats, hay, wool, butter, flax, and flax-seed. There are a number of iron foundries and furnaces, rolling mills, flour mills, saw mills, and tanneries. Co. seat, Canfield.

MAHO NY, Francis, 1803-66; b. Ireland; educated at the Jesuit college in Paris, and at Rome, where he entered the priesthood of the Roman Catholic church. He tried, but in vain, to 2nd employment in his profession; and he then went to London, and devoted himself to literature and journalism. He contributed to Fraser's Magazine for 1856, under the pseudonym of "Oliver Yorke," a series of papers which were afterwards published in book form as The Belgics of Father Prout. They are conceived in the spirit of Wilson's Noctes Ambrosianae, and show considerable learning and humor, and a talent for comic verse and parody. He was the first Roman correspondent of the Daily News, and his letters from Rome to that journal were published in 1849 under the name of Facts and Figures from Italy. He lived at Paris for many years as correspondent of the London Globe, but in 1864 he entered a monastery, where the last two years of his life were passed.

MAHOPAC, LAKE, one of a group of 22 lakes in Putnam co., N. Y., 1800 ft. above the level of the sea, 9 m. in circumference, a favorite resort for summer excursionists. It is in the midst of picturesque scenery, and offers advantages of good boating and fishing.

MAHRA T T A S, a people of Hindu race, inhabiting central India, s. of the Ganges, from Gwalior to Goa, and supposed by many to be the descendants of a Persian or North
Indian people, who had been driven southwards by the Mongols. They are first mentioned in history about the middle of the 17th c., when they possessed a narrow strip of territory on the w. side of the peninsula, extending from 15° to 21° n. latitude. The founder of the Mahratta power was Sivaji, a freebooter or adventurer, whose father was an officer in the service of the last king of Bejnpur. By policy or by force he eventually succeeded in compelling the several independent chiefs to acknowledge him as their leader, and with the large army then at his command overran and subdued a large portion of the emperor of Delhi's territory. His son and (1680) successor, Sambaji, after vigorously following out his father's policy, was taken prisoner by Aurungzebe in 1689, and put to death. The incapacity of the subsequent rulers who reigned under the title of rafmrajah ("great king"), tempted the two chief officers of state, the peishwa, or prime minister, and the paymaster-gen., to divide the empire between them. This was effected about 1749, the former fixing his residence at Poonah, and retaining a nominal supremacy over the whole nation of the Mahrattas; while the latter made Nagpur his capital, and founded the empire of the Bejar Mahrattas. This paction, of course, required the sanction of the more important among the minor chiefs and officers of state, who gave their consent on condition of receiving a share of the spoil. The ultimate result was the partition of the Mahratta kingdom into a great number of states, more or less powerful and independent; chief among which were, besides the two above mentioned, Gwalior, ruled by the Rao Scindia; Indore, by the Rao Holkar; and Baroda, by the Guicowar. It was to be expected that the usual intestine wars would supervene, and ultimately the East India company was compelled to interfere. The invasion of the Delhi empire by Nadir Shah afforded these wild and warlike mountaineers an opportunity, of which they eagerly availed themselves, to wrest additional territory from the feeble grasp of the Mogul emperor. From this time they discharged the office of arbiters in the quarrels between the emperor, his vizier, and his rebellious subjects; but the frightful defeat (Jan., 1761), they sustained at the hands of Ahmed Shah Abdali, the ruler of Afghanistan, on the field of Paniput, where they lost 50,000 men, and all their chiefs except Holkar, weakened their power for a time. They still, however, continued to be the hired mercenaries of the Delhi emperor, till the growing influence of the British compelled them to look to their own safety. After many long and bloody contests with the British and their allies, in which sometimes the whole, but more frequently a portion of the Mahrattas joined, they were one by one, with the exception of Scindiah, reduced to a state of dependence. This last-mentioned chief, having raised a powerful army, officered by Frenchmen, and disciplined after the European method, continued the contest for a number of years, till his power was finally broken in 1843. The dignity of Peishwa was abolished in 1818, and his territories were occupied by the British, with the exception of a portion which was made over to another Mahratta chief, the Rajah of Sattara, their faithful ally; Nagpur and Sattara subsequently reverted to the British government, but the other chiefs still possess extensive dominions, under British protection.

The Mahrattas are a vigorous and active race, and though diminutive and ill-formed are distinguished for their courage. They are of a cruel and perfidious disposition, and have exercised a most disastrous influence upon the inhabitants of the countries they have conquered. Though devout worshipers of Brahma, no distinctions of caste exist among them.

MAI, ANGELO, CARDINAL, a distinguished editor and scholar, was born in the village of Schilpario, in Lombardy, Mar. 7, 1782. He was educated and lived till 1808 in establishments belonging to the Jesuils; but obtained an appointment, first as associate, and ultimately as doctor, in the celebrated Ambrosian library at Milan. His career as an author dates from this appointment. In 1813 he published a translation and commentary of Isocrates, De Permutatione, but his reputation is due much more to his publications of the palimpsest or re-written manuscripts, the first specimens of which he issued at Milan (see PALIMPSEST). His earliest publications in that line were fragments of Cicero's Orations; of the Vidularia, a lost play of Plautus; of Letters of Fronto, Marcus Aurelius's preceptor; the Chronicon of Eusebius, and other less important works, which, however, were entirely eclipsed by his well-known edition and restoration of the De Republica of Cicero, published in 1829. Meanwhile, Mai had been invited to Rome by Pius VII., and named to the charge of the Vatican library, together with other honorable and emolumentary appointments. He at once turned his attention to the unedited MSS. of the Vatican, and after a short examination of this noble collection, undertook, as the mission of his life, the task of publishing those among them which had been overlooked by earlier editors, or had escaped their notice. This task he steadily pursued; and although he was appointed, in 1833, to the onerous office of secretary of the propaganda, and, in 1838, to the cardinalate itself, his Roman publications form a collection of an extent and importance almost unexampled in modern times. His first series was in 10 4to vols., entitled Scriptorum Veterum Nova Collectio, e Vaticanis Codicibus edita (Rome, 1825). It consists, like the great collections of Mabillon, Montfaucon, D'Achery, and others, of miscellaneous unpublished works, partly sacred, partly profane, and indifferently in the Greek and the Latin languages, comprising an entire volume of palimpsest fragments of the Greek historians, Polybius, Diodorus, Dion,
Dionysius, and others. The succeeding collections, viz., *Classici Auctores ex Codicibus Vaticanis* (10 vols. 8vo, 1838), *Spicilegium Romanum* (10 vols. 8vo, 1839-44), and *Nova Patrum Bibliotheca* (6 vols. 4to, 1853), are all on the same plan, and all equally replete with new and interesting materials. For many years, too, he was engaged in preparing an edition of the celebrated *Codex Vaticanus* which he had printed, but the publication of which was postponed, awaiting the preparation of his intended preliminary dissertations. He died, however, rather unexpectedly, at Albano, Sept. 8, 1854; and as no trace of the expected preliminary matter was found among his papers, the edition was published (1857) entirely without critical matter. It has, in consequence, disappointed expectation. His library, which he directed to be sold for the use of the poor of his native village, was purchased by the pope for the Vatican library.

MAIDEN, *The*, a name given to a machine for beheading criminals, which was in use in Scotland from about the middle of the 16th c. to nearly the end of the 17th century. It is said to have been introduced into Scotland by the regent Morton, who had seen it at Halifax, in Yorkshire, and was himself the first to suffer by it, whence the proverb, "He that invented the maiden first handselled it." Morton, for anything that is known to the contrary, may have introduced the maiden; but he certainly was not its first victim. Fifteen years before he was put to death by it (1581 A.D.) it was employed to behead Thomas Scott of Cambusmichael, one of the murderers of Rizzio (1566 A.D.). It would seem at first to have been called indifferently "the maiden" and "the widow"—both names, it may be conjectured, having their origin in some such pleasantry as was glanced at by one of the maiden’s last victims, the earl of Argyle (1681 A.D.), when he protested that it was "the sweetest maiden he had ever kissed." A frightful instrument of punishment used in Germany in the middle ages was called "the virgin." But it had no resemblance to the maiden, which was exactly like the French guillotine (q.v.), except that it had no turning-plank on which to bind the criminal. The maiden which was used in the Scottish capital is now in the museum of the antiquaries of Scotland at Edinburgh. A figure of it is given in the article GUILLOTINE.

MAIDENHAIR (*Adiantum Capillus Veneris*), a small, delicate, and graceful fern, with bipinnate fronds, alternate obovate and wedge-shaped membranaceous pinnules on capillary stalks, and marginal sorii hidden beneath obtlong *industria*; growing on moist rocks and old walls, especially near the sea; rare in Britain, but very abundant in the south of Europe, where it covers the inside of wells and the basins of fountains (as at Vaucuse) with a tapestry of the most delicate green. Another species of the same genus, *A. pedatum*, a native of North America, with *pedate* leaves, has a sweet, fragrant root-stock, of which *Capillare* (q.v.) is made. It is supposed that the name maidenhair originated in the use of a mucilage made from this fern by women for stiffening their hair. This name is sometimes applied also to some species of spleenwort (*Asplenium*), as *A. adiantum-nigrum* and *A. trichomanes*.

MAIDENHEAD, a municipal borough and market-town of England, in the county of Berks, is situated amid beautiful scenery, on the right bank of the Thames, 26 m. w. of London. It carries on some trade in meal, malt, and timber, and has a large brewery. Pop. '71, 6,178.

MAIDS OF HONOR. See LADIES OF THE QUEEN’S HOUSEHOLD.

MAIDSTONE (old form, Medestpton), the county town of Kent, England, on the right bank of the Medway, 43 m. from London by the south-eastern railway. It is a municipal and parliamentary borough, and return 2 members to parliament. It stands in a noted corn-district; its grain-market is the most important in the county; and in the vicinity are the famous hop-grounds known as "the middle growth of Kent." The parish church, built toward the close of the 14th c., in the perpendicular style, contains many interesting tombs. The remains of the college or hospital of All-Saints, which grew out of a hospital founded in 1260 at the entrance of the town for the benefit of pilgrims traveling to Canterbury, are highly picturesque. Maidstone has numerous educational and other institutions. An extensive oil, and several paper mills, sacking and twine manufactories, and several breweries, are in operation. Pop. of parliamentary borough '71, 26,237.

MAIGRE, *Scina aquila*, a fish of the acanthopterous family scionidae, common in the Mediterranean sea, but a rare visitant of the British shores. It attains a large size, being seldom taken less than 3 ft., whilst it is sometimes 6 ft. long. In general appearance it much resembles a large bass, but the head is shorter and more rounded, and the tongue and roof of the mouth are destitute of teeth. The maigre is in very high esteem for the table, and the head is a favorite delicacy of epicures. The strength of the maigre is such that a stroke of its tail will throw down a man; and when it is taken, the fisherman must be quickly stun it by a blow on the head. It is one of those fishes which emit a peculiar sound, which it has been described as a kind of purring or buzzing, and has been heard from a depth of 120 feet. Fishermen have been guided by this sound to let down their nets so as to incluse a number of maigres. The maigre appears to be the *umbrina* of the Romans, and was highly esteemed by them. The stones of its ears were formerly set in gold, and worn on the neck, imaginary virtues being ascribed to them,
particularly in the cure of colic; but it was requisite that they should be obtained as a gift, and not by purchase.

MAIL (Fr. maille, It. maglia; from the Lat. maena, a spot, hole, or mesh of a net) signifies a metal net-work, and is ordinarily applied to such net-work when used as body defensive armor. Well-made mail formed an admirable defense against all weapons except firearms, and its pliability and comparative lightness gave it favor over the more cumbersome plate-armor.

MAIL. See Post-Office.

MAILED CHEEKS, Sclerogenaia or triglidae, a family of acenthopterous fishes, distinguisliingly characterized by an enlargement of certain bones of the head and gill-covers to form a bony armor for the cheeks. They exhibit great variety of forms; some of them are remarkable for their elegance and for their delicate or splendid hues, other for their extreme ugliness. Gurnards (q.v.) are among the best known and most valuable of this family. To it belong also bull-heads (q.v.) and soorpanae (q.v.). Stickle-backs (q.v.) are sometimes referred to it. The species are widely distributed in the seas of all parts of the world; a few inhabit lakes and rivers.

MAIMONIDES, or rather Moses ben Maimon (RamBAm=RabbI Moses ben Maimon) b. Joseph b. Isaac b. Joseph b. Obadiah, etc.; Arab. Aben Amian (Amian) Musa Ibn Abdallah Ibn Maimon Al-Kortobi, was b. at Cordova, Mar. 30, 1135. Little is known of his early life, which fell in the troublous period of the Moravide rulers. His first instruction he received at the hand of his father, himself a learned man, and author of several important works in Arabic and Hebrew. Under the guidance of the most distinguished Arabic masters of the time, Maimonides then devoted himself to the study of Greek (Aristotelian) philosophy, the science of medicine, and theology. When, in 1148, Abd-al-Mumen, the successor of Abdallah, in the newly established reign of the Al-Mohads (Unitarians), took Cordova, and, shortly afterwards, subjected all Andalusia, both Jews and Christians residing there were forced either to profess Islam or to emigrate. Maimonides's family, however, together with many others to whom emigration was well-nigh impossible, outwardly embraced the Mohammedan faith, or rather for the time being renounced the public profession of Judaism, all the while remaining faithful to it in secret, and keeping up a close communication with their co-religionists abroad, an arrangement in which the government readily acquiesced, since it fully answered their purpose. For more than 16 years Maimonides thus lived together with his whole family under the assumed character of Mohammedans; but when the death of the reigning sovereign brought no change in the system of religious intolerance, they resolved to emigrate. In 1165 they embarked, went to Acre, and, by way of Jerusalem, to Cairo, where Maimonides's father died. Maimonides settled in Fostat (Old Cairo), where for some time he gained his livelihood by the jewel-trade, until his great medical knowledge procured him the high office of physician to Salah Eddin, the reigning sultan of Egypt. Maimonides's importance for the religion and science of Judaism, and his influence upon their development, is so gigantic, that he has rightly been placed second to Moses, the great law-giver, himself. He first of all brought order into those almost boundless receptacles of tradition, and the discussions and decisions to which they had given rise, which, without the remotest attempt at system or method, lie scattered up and down the works of Haggada and Halaacha—Midrash, Mishnah, Talmuds. Imbued with the spirit of lucid Greek speculation, and the precision of logical thought of the Arabic Peripatetics Maimonides, aided by an enormous knowledge, became the founder of rational Scriptural exegesis. The Bible, and all its written as well as implied precepts, he endeavored to explain by the light of reason, with which, as the highest divine gift in man, nothing really divine could, according to his theory, stand in real contradiction. The miracles themselves, though not always traceable to their immediate cause, yet cannot be wrought in opposition to the physical and everlasting laws in nature. Where literal interpretation seems to jar upon the feelings of reverential awe towards the Highest Being, there an allegorical explanation is to be adopted unhesitatingly. Respecting Maimonides's philosophical system, we can barely hint in this place at its close similarity with that of Avemonds; both drawing from the same classical sources, and arriving independently, and with individual modifications, to nearly the same views on the great problems of the universe. Holding reason in man—if properly developed and tutored by divine revelation—to be the great touch-stone for the right or wrong of individual deeds, Maimonides fully allows the freedom of will, and while he urges the necessity, nay, the merit of listening, to a certain degree, to the promptings of nature, he rigorously condemns a life of idle asceticism, and dreamy, albeit pious contemplation. No less is it, according to him, right and praiseworthy to
pay the utmost attention to the healthy and vigorous development of the body and the

pay the utmost attention to the healthy and vigorous development of the body and the
care of its preservation by the closest application to hygienic rules. Providence, Maim-

ondies holds, reigns in a certain—broad—manner over humanity, and holds the sway

over the destinies of nations; but he utterly denies its workings in the single case,

may befall the individual man, subject above all to the great physical laws, must learn to

understand and obey them, and to shape his mode of life and action in accordance

with existing conditions and circumstances—the study of natural science and medicine

being therefore a thing almost of necessity to everybody. The soul, and the soul

only, is immortal, and the reward of virtue consists in its—strictly unobtrusively—bliss

in a world to come; while the punishment of vice is the "loss of the soul."

Maimonides's first work of paramount import (several of his earlier minor writings

treat of subjects of general science), begun in his twenty-third year, and finished ten

years later, is his Arabic commentary of the Mishnah [translated in Hebrew by Judah

Alcharisi, Tibbon (father and son), Saifen Jacob, Net, Almali, Jak, Akkas, and others],

which forms an extensive historical introduction to Tradition, or the Oral Law: tracing its
development, its divisions, the plan of the Mishnah, and its complements, etc.; and this
introduction has now, for more than five hundred years, been deemed so essential a part
of the Talmud itself, that no edition of the latter is considered complete without it.

This was followed by the Sefer HaMaznithoth, or Book of the Precepts, in Arabic (trans-

lated into Hebrew by Abr. Ibn Chasidai, and, from the author's second edition, by

Moses Tibbon), which contains an enumeration of the 613 traditional laws of the Halacha,
together with 14 canons on the principle of numbering them, chiefly directed against
the authors of certain liturgical pieces called Asharoth (Warnings); besides 13 articles of
belief, and a psychological fragment. This book is to be considered chiefly as an intro-
duction to the gigantic work which followed in 1180, under the title of Mishne Torah
(Second Law), or Yad Chasakah (Strong Hand), a Hebrew compendium in 982 chapters,
embracing the entire Halacha, even those of its parts no longer in practical use, such as
precepts regarding the soil of Judea and the like, and which, with the most astounding
minuteness, lucidity, and precision, places the results of the legal disquisitions gathered
from the Talmudical labyrinths systematically arranged before the reader. The summit
of his renown, however, Maimonides reached, Debrot Al-

HaLachot (Heb. Moreh Nebuchim, "Guide of the Erring"), a philosophical exegesis (trans-

lated into Hebrew by Samual Tibbon, edited for the first time in the original by Munk,
1856, etc.), which, while on the one hand it has contributed more than any other work
to the progress of rational development in Judaism, has on the other hand also become
the arena for a long and bitter fight between orthodoxy and science—carrying out, as it
did, to its last consequences the broad principle, that "the Bible must be explained
metaphorically by established fundamental truths in accordance with rational con-
clusions." So bitter, indeed, was the contest which broke out between the subsequent
spiritualistic Maimonidian and the "literal Talmudistic" schools, that the fierce inves-
tives were speedily followed by anathemas and counter-anathemas issued by both camps;
and finally, about the middle of the 13th c., the decision was transferred into the hands
of the Christian authorities, who commenced by burning Maimonides's books, continued
by bringing to the stake all Hebrew books on which they could lay their hands, and
followed this decision up by a wholesale slaughter of thousands upon thousands of Jews,
men, women, and children, irrespective of their philosophical views. Under these cir-
cumstances, the antagonistic parties, chiefly through the influence of David Kimchi and
others, came to a reconciliation, and withdrew their mutual anathemas; and, as time
wore on, Maimonides's name became the pride and glory of the nation, who bestowed
upon him terms like the "Great Eagle," the "Light of Two Worlds," etc. Nor was
his immense celebrity confined to the narrow pale of his own creed; as early as the 13th
c. already, portions of his works, chiefly the Moreh (Doctor Perplexorum), became, in
Latin versions, the text-books of European universities.

Maimonides himself only witnessed the beginning of the conflict, the proportions
and violence of which he certainly never anticipated. At his death, which took place
Dec. 13, 1204, the grief at the loss of the "Light of the Age" was universal in the east as
well as in the west. And he has ever since been recognized universally as one of the
noblest and grandest men of all times: gifted with the most powerful and brilliant quali-
ties, the result of the most exquisite training both in book-learning and knowledge, and imbued with

great piety and true religion, borne aloft by undaunted energy and glowing zeal. His
body was brought to Tiberias, and his tomb became a place of pilgrimage, even to his
early foes.

Of Maimonides's smaller works, we may enumerate, in conclusion, a translation of
Avicenna's Canon; an extract from Galen; several medical, mathematical, logical, and
other treatises, spoken of with the highest praise by Arabic writers; legal decisions,
thetical disquisitions, etc. Portions of his great work, Moreh, have lately been
translated into modern European languages, chiefly into German (Scheyer) and French
(Munk).

Main.
Maine. 380

Main (from the Latin magnus, great), the name applied on shipboard to the principal
mast, and to all the parts belonging or adjacent to it—as, main-topmast, main-yard,
main-stay, main-shrouds, main-hatchway, main-chains, etc.
MAIN, a river of Germany, the largest affluent the Rhine receives from the right, is formed by the union of two branches, the White and Red Main, 4 m. below Kulmbach, in Bavaria. The more important of these, the White Main, rises in the Fichtelgebirge, 2,800 ft. above sea-level. The Main has a winding westward course 300 m. in length, to the Rhine, into which it falls at Mainz. It is navigable for the last 220 miles. The principal towns on its banks are Schweinfurt, Würzburg, Aschaffenburg, Offenbach, and Frankfort; and its chief affluents are, on the right, the Saale, and on the left, the Regnitz. The Main is one of the most picturesque of German rivers; it flows through a beautiful country, where the hill-slopes are frequently covered with vineyards, and surmounted by castles. Its waters communicate with those of the Danube by means of the Ludwigs-Kanal. See BAVARIA.

MAINE, the most eastern of the five New England states in America, extends from lat. 42° 57' to 47° 32' n., and from long. 66° 52' to 71° 8' w., being 303 m. from n. to s., and 212 from e. to w., with an area of 33,500 sq.m., or 22,400,000 acres. Maine is bounded n. by Quebec, e. by New Brunswick, s. by the Atlantic ocean, and w. by New Hampshire and Canada. It lies, on the s., a coast-line of 278 m. in a line, but so indented with bays as to make 2,486 miles. The largest of these bays are the Penobscot, Machias, Saco, Passamaquoddy, etc. Into these empty the rivers Penobscot Kennebec, Saco, Androscoggin, etc. Numerous islands stud the coast: the largest, Mount Desert, remarkable for its scenery, contains 60,000 acres. In the northern portions of the state are numerous lakes; the largest, Moosehead, being 53 m. long, and the source of the Kennebec river. The country is hilly, with a range of mountains stretching n.e. from the White mountains of New Hampshire; Mount Katahdin, near the center of the state, is 5,250 ft. high. On the coast are fine granite quarries; interior, most valuable products are minerals, and the chief agricultural products are potatoes, maize, oats, hay, barley, and apples. The rivers and coast abound in fish. One of the chief exports is lumber, and one-third of all the ships of America are built on the rivers and harbors of this state. The falls of the rivers furnish immense water-power for saw-mills and factories. Maine has over 1000 m. of railway, 64, banks, 4,565 public schools, 5 colleges, a theological hall, and 2 medical schools. The government consists of a governor, senate, and house of representatives, elected by universal suffrage. Maine was settled in 1621, and was a part of Massachusetts until 1820. In its early history it is said that every 20th settler was killed by the Indians. A controversy respecting the north-eastern boundary of Maine, which threatened to produce war with England, was settled by a compromise of claims in 1842. The chief towns are Portland, Augusta (the capital), Bangor, Bath, Hallowell, etc. Pop. in '60, 628,276; in '70, 628,913.

MAINE (ante). The Northmen discovered the coast, as is now generally conceded, as early as 990, visiting it occasionally until the middle of the 14th c., but founded no settlement upon it. From 1350 to 1498, the time of Cabot's second expedition, there is no evidence that the coast was seen by any European. In 1324 it was visited by a French expedition, under Verrazano; in 1525 by the Spaniards, under Gomez, and, in 1527, by the English, under Rut; but none of these made any settlement. In 1556 a Roman Catholic priest, André Thevet, entered Penobscot bay, remaining five days, and holding numerous conferences with the natives, but without any immediate result. The first attempt to settle upon the territory was that of the French, under Du Mont, who in 1604 planted a colony on Neutral island in the river St. Croix, which was abandoned the following year. In 1605 capt. Weymouth explored a part of the coast, and was followed in 1607 by the expedition sent out by sir John Popham and sir Ferdinando Gorges, which, under a charter from king James, made a settlement at the mouth of the Kennebec. This colony, however, returned to England in the following year. In 1618 the French Jesuits established a mission on Mt. Desert island, but were soon driven off by the English. In 1616 Richard Vines, an agent of sir F. Gorges, went with a small company to Saco, to remain during the winter and explore the surrounding region; while a company of fishermen, under capt. John Smith, took possession of Monhegan island, ranged the whole coast to Cape Cod, and prepared a map of the country, to which he gave the name of New England. In 1620 James I. divided the territory conveyed by the charter of 1606, granting to the Plymouth company the portion lying between the 40th and 45th degrees of n. lat., and to the Virginia company the whole region s. of the 45th degree. In 1623 Gorges and capt. John Mason obtained from the English crown a charter of the territory stretching from Plymout to the Kennebec rivers, and in 1623 planted a colony at the mouth of the Piscataqua, which was the first permanent settlement of the main land in Maine. Gorges and Mason divided these possessions between them, the former taking the portion e. of the Piscataqua, and the latter that w. of the same river. In 1624 Gorges established a colony at York, and in 1625 Pemaquid was occupied under grants from the Plymouth company. After 1630 settlements were made at Saco, Biddeford, Cape Elizabeth, Portland, and Scarborough, which flourished until 1675, when they, in common with those between the Kennebec and the Penobscot, were destroyed by the Indians. The whole colony e. of the Penobscot was claimed by the French, and little improvement was made there until after the revolutionary war. In 1635 the
portion of the Plymouth company's territory lying between the Piscataqua and the Kennebec was assigned to Gorges, who, after 1629, established a government over it under the name of Maine. In 1639 King Philip's territory was taken into the province of Massachusetts for the sum of £1230. King Philip's Indian war began in Maine shortly before this time, and was attended with all the horrors of a conflict with an uncivilized and deeply angered people. During the next eighty-five years the white settlers were in constant terror of Indian raids. In 1647 Gorges died, and in 1664 the territory between the Kennebec and the Penobscot was granted by Charles II. to his brother James (then duke of York, afterward James II.), who established a government at Pemaquid, where he erected a strong fort. This country, however, was surrendered to Massachusetts in 1684, and its title thereto and to all the territory e. to the St. Croix and Nova Scotia was confirmed by the provincial charter of 1691. Between 1687 and 1689, Andros, the royal governor of the New England colonies, visited Maine, and practiced great exter-
tion upon the inhabitants. By the treaty of 1783, at the conclusion of the revolutionary war, the United States ceded to France, to the exclusion of the territory and exercised jurisdiction over it as "the district of Maine" (often known as "the province of Maine") until 1820, when it was admitted to the union as an independent state. Its population at that time was 298,269.

The growth of the state was steady from that time forward, the census of 1870 showing a population of 626,915, of whom 313,108 were males, and 313,812 were females; number of families, 131,017; of dwellings, 121,953; of persons over 10 years of age who could not read 13,486, and of those who could not write 19,052. The number of persons engaged in all occupations was 208,225, of whom 82,011 were engaged in agriculture, and in professional and personal services, 36,092, including 890 clergymen, 558 lawyers, 818 physicians and surgeons, and 4,188 teachers.

The surface of the state is much diversified, the sea coast being in large part flat, and at some points marshy. The chief exceptions to this are Mt. Agamenticus, 670 ft. high, near the s.w. coast; the Camden hills, 1500 ft. high, on the Penobscot, and the numerous peaks of Mt. Desert island and its vicinity, some of which rise to a height of over 2,000 ft. Back from the coast the country is hilly or mountainous. The great Appalachian chain, of which the White mountains of New Hampshire are a part, originates in the British province of New Brunswick, enters Maine at Mars hill in lat. 46° 30', crosses the state in a s.w. direction, and joins the White mountain range at the New Hampshire line. The highest elevation of this range in Maine is Mt. Katahdin, near the geographical center of the state, which is 5,285 ft. in height. The other principal elevations are Mt. Abraham, Mt. Blue, Sugar Loaf, Chase's mountain, Mt. Mattatuck, Mt. Puzzle, and Mts. Saddleback and Bigelow. The Ebene and Spencer mountains, trending south-
ward, and the highlands on the n., are spurs of this range. The n. portion of the state is drained by the Walloosook and the Aroostook, which empty into the St. John. The St. Croix forms a portion of the boundary between Maine and New Brunswick and empties into Passamaquoddy bay. The largest river of Maine is the Penobscot, which, with its branches and connecting lakes, drains the center of the state, flows into Penobscot bay, and is navigable for large vessels to Bangor, more than 50 m. from its mouth. West of the Penobscot is the Kennebec, navigable to Bath, and furnishing unlimited wood and fish. Iron still abounds in the Saco, and vast tidewater, which latter separates Maine from New Hampshire. One of the most striking natural features of the state is presented in the great number of lakes, both small and large, whose surplus waters go to swell the volume of the principal streams. These lakes, together with the rivers, are estimated to cover an area of 3,200 sq. miles. The largest is Moosehead, 35 m. long and from 4 to 12 in breadth. Among the others are the Sebago, Umbagog, Chesuncook, Baskakegan, Eagle, Portage, Long, Madawaska, Pame-
dumcook, Millinocket, Sebec and Schoodic. The soil in the valleys is generally fertile, but comparatively sterile in the mountains. The winters are long and severe, but of uniform temperature, the snow lying upon the ground from three to five months of the year. The thermometer ranges in the course of the year from 30° below to 100° above zero. The most unpleasant feature of the climate are the n.e. winds of the spring and early summer, usually accompanied by chilly fogs.

The state, especially in Aroostook, Piscataquis, and Washington counties, is well supplied with timber, copper, zinc, iron, lignite, and manganese are found in consider-
able quantities, while the manufacture of alum, copperas, and sulphur might easily be made profitable. Marble, slate, and limestone are abundant, while granite of the finest quality is obtained in blocks weighing more than 100 tons each. The metallic ores have not been much worked. The principal state quarries are in Piscataquis county.

The great forests which long covered the central and northern portions of the state are fast falling before the lumberman's axe, with the effect, as some believe, of a very serious diminution of the rain-fall. The principal forest trees are the pine, spruce, hem-
lock, maple, birch, beech, and ash, and in some parts of the state the butternut, poplar, elm, and sassafras. Apples, pears, and plums are raised with success; but the summer is too short for the growth of peaches.

The forests are inhabited by the moose, bear, deer, wolf, catamount, wolverine, beaver, sable, weasel, squirrel, etc., while among the birds may be mentioned eagles, wild geese and ducks, owls, hawks, partridges, pigeons, crows, quails, and humming-
birds. Trout, salmon, and pickerel are abundant in the lakes and rivers; while the waters off the coast abound with cod, mackerel, herring, halibut, etc.

The number of farms in 1870 was 58,904, containing 2,917,793 acres of improved and 2,920,365 acres of unimproved land. The cash value of these farms was $102,961,951; of farming implements and machinery, $4,850,118; wages annually paid, $2,905,392; total value of farm products and improvements, $83,470,044; value of other products, $874,569; of produce of market gardens, $906,397; of forest products, $1,581,741; of home manufactures, $450,988; of animals slaughtered or sold for slaughter, $4,939,071; of all live stock, $23,357,129. The amount of wheat raised in 1870 was 278,798 bushels; of corn, 1,089,888 bushels; of oats, 2,351,334 bush.; of rye, 34,115 bush.; of barley, 658,816 bush.; of buckwheat, 466,635 bush.; of potatoes, 7,771,363 bush.; of wool, 1,774,168 lbs.; of hops, 296,850 lbs.; of butter, 11,636,482 lbs.; of cheese, 1,152,590 lbs.; of maple sugar, 160,805 lbs.; of honey, 153,640 lbs.; of milk sold, 1,374,091 gallons. Number of horses, 71,514; of milch cows, 139,259; of other cattle, 142,802; of sheep, 43,666; of swine, 45,760.

The production of lumber is the leading industry. In 1870 the forests were estimated to cover nearly one-half the entire surface of the state; but so extensive is the lumber trade, that this area of forest is constantly diminishing. Bangor, on the Penobscot, is the chief lumber mart. The amount surveyed there in 1870 was estimated at 200,000,000 feet. The counties which are the chief centers of the traffic are Penobscot, Washington, Hancock, and Piscataquis. In the first two of these counties the capital employed amounted to $3,500,000. The number of sawmills was 1,099, employing 8,500 men and $6,614,875 of capital, and dispensing in wages $2,449,132, while the products amounted to $11,395,747. The other chief industries are ship-building, boots and shoes, fisheries, ice-gathering, tanning and currying, vegetable canning, brick, cotton goods, flouring and gristmill products, lime, machinery, mining, and quarrying, paper manufacture, and woolen goods. In 1873 the whole number of manufacturing establishments was 6,072; number of persons employed, 55,614, of whom a little less than one-third were women and children; capital invested, $48,908,418; wages paid, $16,584,164; annual value of products, $90,209,190. The products of the Maine fisheries in 1870 amounted to $979,610. In 1873, 861 vessels of 40,196 tons were engaged in the cod and mackerel fisheries, affording employment for 2,000 men. Lobsters and clams are taken in immense quantities along the coast. The canning of vegetables, lobsters and clams is extensively carried on, the whole value of such products in 1875 being estimated at $1,842,000. The product of cotton goods in the same year amounted to $13,151,750.

The numerous harbors of Maine offer the best facilities for commerce. Several of these harbors are among the best on the whole Atlantic coast; that of Portland especially is easy of access, deep, large, and well protected, and is often unobstructed by ice when harbors farther west and south are frozen over. The ports of entry are Houlton, Eastport, Machias, Ellsworth, Castine, Bangor, Belfast, Waldoborough, Wiscasset, Bath, Portland, Falmouth, Saco, Kennebunk, and York. The imports from foreign countries in 1873-74 amounted to $8,628,425; amount of exports in the same year, $5,872,102. The chief articles of import were coal, fish, sugar, iron, molasses, and wool; while those of export were cotton goods, canned vegetables, etc., boots and shoes, lumber, bacon, hams, and lard. The whole number of vessels entering from foreign countries in the same year was 750, of 893,196 tons burthen; number of clearances, 1,489, of 512,287 tons; number of registered, enrolled and licensed vessels, 5,221, of 855,412 tons. In the coasting and fishery trade were entered at the same time 2,291 vessels of 1,124,127 tons, and cleared 1,526 of 847,178 tons. In 1873 there were built in the state 276 vessels of 89,817 tons.

In 1875 Maine had 945 m. of railroad, controlled by 19 different corporations. The most important of these roads are the Atlantic and S. Lawrence, European and North American, Maine Central, Portland and Kennebec, and the Portland, Saco, and Portsmouth. Lines of steamers ply regularly between the largest cities of the state and Boston; also between Portland and New York, St. John, N. B., and Halifax; and in the winter between Portland, Liverpool, and Glasgow.

In 1874 Maine had 64 national banks, with a capital of $9,840,000, and an outstanding circulation of $7,946,576. The number of savings banks was 58, with $51,051,963 of deposits. There were at the same time 120 insurance companies doing business in the state. The public indebtedness of the state in 1875, after deducting the sinking fund held for its payment, was $5,574,373. The cash value of real and personal property in the state in 1874 was estimated at $254,000,000.

The public institutions are the insane hospital at Augusta, the state prison at Thomaston, the reformatory school for boys, the industrial school for girls in Hallowell, the orphan asylum in Bangor, the military and naval orphans' asylum at Bath, and the Maine general hospital at Portland. There are no state institutions for the care of the deaf and dumb or the blind, but the state arranges for their care in the institutions of other states.

The permanent school fund, derived from the sale of wild lands belonging to the state amounts to about $370,000. The revenue for the support of public schools is derived in part from this fund and in part from taxation. The cost of maintaining
the schools in 1874 was $1,237,778, the sum being apportioned among the several towns according to the number of persons therein of school age. According to the latest reports, the number of persons in the state of school age was 225,219; registered in summer schools, 123,458, with an average attendance of 98,744; in winter schools, 132,353, with an average attendance of 108,478; number of school districts, 4,043; value of school property, $9,079,311; male teachers in summer, 161; in winter, 1,928; female teachers in summer, 4,966; in winter, 2,367; average wages of male teachers, per month, $36.17; of females, per week, $4.05. The legislature, several years since, established a system of free high schools throughout the state, defraying one-half the expenses of instruction in said schools. The system has worked wonders. The number of pupils enrolled in these schools in 1874 was 14,820; the amount paid by the state for their support, about $40,000. There are two normal schools, the western at Farmington, the eastern at Castine; tuition being free to those who agree to become teachers within the state. In 1873 the state appropriated $17,500 for the support of these schools. Maine has four colleges—Bowdoin college at Brunswick, founded in 1801; Colby university at Waterville (Baptist), founded in 1820; Bates college at Lewiston (Freetwill Baptist), founded in 1863; and the state college of agriculture and the mechanic arts at Orono, founded in 1868, and receiving the avails of the public lands appropriated by congress for the purpose. The Congregationalists have a theological seminary, founded in 1820, at Bangor. There are also in the state several flourishing seminaries under the patronage of different religious sects. The number of libraries in the state in 1870 was 3,934, containing 884,520 volumes; of these, 1872, containing over 450,000 volumes, were private. Important institutions in the state are the state library in Augusta, and those of Bowdoin college, the Portland institute, the Bangor theological seminary, the mechanics' association of Bangor, Colby university, and Bates college, respectively. The number of newspapers and periodicals was 65, of which 7 were daily, 1 tri-weekly, 47 weekly, 1 semi-monthly, 8 monthly, and 1 quarterly. In 1874 the daily papers had increased to 9, the weeklies to 56. The religious organizations in 1870 numbered 1326, having 1102 edifices, and property valued at $5,196,833. The principal denominations were the Baptist, Congregational, Methodist, Freewill Baptist, Protestant Episcopal, Jewish, Christian, Roman Catholic, Second Advent, Unitarian, and Universalist. The legislature, composed of a senate of 31 members and a house of representatives of 151 members, elected on the 21st Monday of September, annually, meets at Augusta, the capital, on the first Wednesday in January. The governor (salary $2,500) is elected annually, and has the advice of a council of 7 members elected by the legislature on joint ballot. The supreme court, composed of 8 judges, is appointed by the governor and council for a term of 7 years, each judge receiving a salary of $3,000. The county of Cumberland, embracing the city of Portland, has a superior court of one judge, appointed in the same way. Probate judges are elected by the people of each county for terms of 4 years. Judges of inferior courts are appointed by the governor and council for terms of 7 years. The laws of Maine against the manufacture of and the traffic in intoxicating liquors are very strict, and supported by severe penalties. Liquors for medicinal, mechanical, and manufacturing purposes are sold in the several towns and cities by state agents appointed for the purpose. Husbands are not liable for debts contracted by their wives in their own name, but the latter may be sued for them. A wife may hold real and personal estate separately from her husband, and may convey or devise the same by will. The electoral votes of Maine for president and vice-president of the United States have been as follows: 1820, 9 for Monroe and Tompkins; 1824, 9 for Adams and Clay; 1828, 1 for Jackson and 8 for Adams for president, and 1 for Calhoun and 8 for Rush for vice-president; 1832, 10 for Jackson and Van Buren; 1836, 10 for Van Buren and R. M. Johnson; 1840, 10 for Harrison and Tyler; 1844, 9 for Polk and Dallas; 1848, 9 for Cass and Butler; 1852, 8 for Pierce and King; 1856, 8 for Fremont and Dayton; 1860, 8 for Lincoln and Hamlin; 1864, 7 for Lincoln and Johnson; 1868, 7 for Grant and Colfax; 1872, 7 for Grant and Wilson; 1876, 7 for Hayes and Wheeler; 1880, 7 for Garfield and Arthur.

MAINE, one of the ancient provinces of France, immediately s. of Normandy, corresponds to the modern departments of Sarthe and Mayenne. Its chief town was Le Mans, now the capital of the department of Sarthe.

MAINE, Sir Henry James Summer, LL.D., b. England, 1822; educated at Pembroke college, Cambridge, and afterwards a tutor in Trinity college. In 1847 he was appointed regius professor of civil law in the university, but resigned in 1854 to become reader on jurisprudence at the middle temple. From 1892 to 1890 he resided in India as law member of the supreme government. This office he filled with high distinction, introducing many important legislative reforms. On his return to England he was elected professor of jurisprudence at Oxford, and the next year he was made a member of the council of the secretory of state for India, and was knighted. In 1873 he published as a pamphlet a lecture delivered at Cambridge on The Effects of Observation of India on Modern European Thought. In 1877 he was elected master of Trinity hall, and in 1878 resigned his professorship. Sir Henry published in the Cambridge Essays in 1856, Roman Law and Legal Education; but his other works are devoted to subjects upon which he is
of the highest authority, the origin and development of institutions, the condition of primitive society, and the growth of law and legal conceptions. His Ancient Law appeared in 1801; his Village Communities in 1871; Lectures on the Early History of Institutions in 1873; and Modern Theories of Succession to Property in 1878.

MAINE DE BIRAN, François Pierre Gonthier, 1760-1824: b. France; was attached to the body-guard of Louis XVI., and in the latter part of 1789 was involved in some of the disturbances in Paris, but was not concerned in the revolution which followed. Under the first empire he was appointed to a sub-prefecture, and was a member of the legislature. He opposed the policy of Napoleon during the latter part of his reign, and became a legitimist with the advent of the restoration. He was made a deputy and a councilor of state, retaining his seat in the legislature from 1818. He wrote much in a philosophical vein, contesting the views of Condillac, and developing a system of his own which achieved a considerable reputation. M. Cousin edited an edition of his works which was published in Paris, 1841, in 4 vols.; and an account of his life and opinions appeared in 1857, written by Naville.

MAINE-ET-LOIRE, an inland department of France, forming a portion of the lower basin of the Loire, is bounded on the w. by the department of Loire-Inférieure, and on the e. by that of Indre-et-Loire. Area, 2,745 English sq. miles. Of which about 1,057,634 acres are arable, 197,748 in meadow, and 95,435 in vineyards. Pop. 72, 518,477. The surface is gently undulating. The soil is fertile, producing the usual crops, white and green, and a variety of excellent fruits. Wines, red and white, the latter comprising several highly esteemed varieties, are extensively cultivated; 11,000,000 gallons are made annually. Iron and coal mines are worked; and there are numerous mills and factories for the production of cotton, woolen, and linen goods. The department is divided into the five arrondissements of Angers, Baugé, Segré, Cholet (formerly Beaupréau), and Saumur. Capital, Angers.

MAINE LIQUOR LAW. See Temperance, ante.

MAIN NOTES, the inhabitants of the mountainous district of Maina, a peninsula between the bays of Kolokythia and Koron, forming part of the province of Laconia, in Greece. They have been regarded as the descendants of the ancient Spartans, whose land they now occupy; but more probably they are of Slavonic origin. They number about 60,000, and are a wild and brave race, but superstitious, and addicted to robbery. While the Turks held possession of Greece, the Mainotes were almost completely independent; and when not engaged in a common struggle against the Turks, their chiefs were at war with each other. The Mainotes, under their principal chief or bey, took a prominent part in the war for the liberation of Greece; but after the death of Mavrokalliotes, their last bey, their independence was destroyed.

MAINPRIZE, in English law, was a term denoting a security by which the bailer or mainpernor took the party bailed under his own personal charge or friendly custody, giving security to produce him at the time appointed. The practice is now obsolete, and superseded by bail (q.v.).

MAIN TENANCE is a law term commonly used to denote an illegal succoring of a person, as by lending money to a stranger in carrying on law suits. Contracts are sometimes held to be illegal on this ground.

MAINTENANCE (ante), in law, an intermeddling by a person in a suit in which he is not concerned, as by giving money to another to carry on such suit, by hiring counsel for him, or assisting him in any unauthorized way. But persons between whom a certain relationship, or a certain relation created by law, exists, may give assistance to each other in suits in which they have respectively no interest. Thus, a husband may assist his wife, or a landlord his tenant. A lawyer may give professional assistance to a party in such suit, but he is not justified in giving pecuniary aid. The old common law rule in regard to the prohibition of maintenance has been greatly relaxed; and aid of the party to a suit is not now generally illegal. For instance, an agreement between a lawyer and his client to share the sum recovered in a particular suit is good, as a rule, in this country, though strictly prohibited by the older law. See Champaigne.

MAINTENANCE, Cap or, sometimes called cap of dignity, a cap of crimson velvet lined with ermine, with two points turned to the back, originally only worn by dukes, but afterwars assigned to various families of distinction. Those families who are entitled to a cap of maintenance place their crests on it instead of on a wreath. According to sir John Fearne, the wearing of the cap had a beginning from the duke or general of an army, who, having gotten victory, caused the chiefest of the subdued enemies whom he led to follow him in his triumph, bearing his hat or cap after him in token of subjection and captivity. Most of the reigning dukes of Germany, and various families belonging to the peerage both of England and of Scotland, bear their crests on a cap of maintenance.

MAINTENON, Françoise d'Aubigné, Marquise De, was the daughter of Constant d'Aubigné and of Jeanne de Cardillac, and granddaughter of Théodore Agrippa d'Aubigné, well-known for his writings, his attachment to Protestantism, and his energetic character. Françoise was born Nov. 27, 1635, in the prison at Niort, where her U. K. IX.—35
father was then imprisoned. On obtaining his release, he went (1639) with his wife and daughter to Martinique in the West Indies, where he died in 1645. After her father's death, Françoise returned, with her mother, to France; and her mother also dying, her father's sisters took her under their care, and educated her in a convent, where her conversion to the Roman Catholic religion was accomplished at the age of about 14 years—after an obstinate resistance, in which the brave little child, to use her own words, \textit{fut} \textit{quait les prêtres la Bible à la main}. It is singular to reflect what a zealot she afterwards became. When she was 16, she became acquainted with the poet Scarron (q.v.), who, struck by her beauty, intelligence, and helpless condition, offered her his hand; and if she should prefer it, a sum of money for her entrance into a nunnery. Although Scarron was lame and deformed, she chose to marry him, and now lived in the midst of the refined and intellectual society which frequented the house of the poet. On his death, in 1660, she was reduced to great poverty, and proposed to go as a governess to Portugal, when Madame de Montespan (q.v.) obtained her a pension from the king. Four years afterwards, she was intrusted with the education of the two sons whom Madame de Montespan had borne to Louis XIV., and in this capacity displayed a patient tenderness and sleepless care that no mother could have surpassed; and now becoming acquainted with the king, soon fascinated him, so that he bestowed on her 100,000 livres, with which she bought the estate of Maintenon; and at last she succeeded in supplanting Madame de Montespan. It is difficult to describe her relation to the king. She was not, it is believed, his mistress in the ordinary sense of the term, but from that time to the end of his life, she exercised an extraordinary ascendency over him. She had a passion for being thought "a mother of the church," but while she confessed the strength of her desire to Romanize the Huguenots, she earnestly denied that she approved of the detestable dragonnades. In 1684, about 18 months after the death of the queen, Louis privately married her. She was much disliked by the people, but the courtiers sought her favor, and her creatures were made ministers and generals. In the midst of splendor, and in the possession of great power, she was confessedly very unhappy. She carefully brought up the children of Madame de Montespan; and it was at her instigation that Louis attempted to legitimize them. When he died in 1715, she retired to the former abbey of St. Cyr, which, at her wish, had been changed 30 years before, into a convent for young ladies. Here she died, April 15, 1719. She received to the end of her life, the honors of a king's widow. Her pretended memoirs are spurious, but her Lettres (9 vols. Amst. 1736, etc.) are genuine. By far the best edition is that published by M. Lavallée (1854 et seq.), entitled \textit{Oeuvres de Mme. de Maintenon publiées pour la première fois d'après les Manuscrits et Copies authentiques, avec un Commentaire et des Notes}.

\section*{Mainz (MAYENCE, ancient \textit{Moguntiacum})} The most strongly fortified city in the German empire, is situated in 50° n. lat. and 8° 10' e. long., in one of the most fertile of the wine-bearing districts of Germany, having for its site a gentle slope on the left bank of the Rhine, near the junction of the Main. The pop. was in 1871, 53,918, including the garrison: in '75, 57,817. A floating bridge, resting on 49 pontoons, connects Mainz with the Rheinish village of Castel; as also a handsome railway bridge of iron, finished in 1864. The fortifications, which extend a length of nearly 10 m., consist of 14 principal and numerous lesser bastions, in addition to the four forts of Castel, Mars, Montebello, and Petersau. In accordance with a decree of the congress of Vienna, Mainz was surrendered to the grand duchy of Hesse-Darmstadt in 1814, on condition that it was to constitute a German federal stronghold, and be garrisoned in common by Austrian, Prussian, and Hessian troops. In 1816, it became a Prussian fortress, and Prussia obtained all the rights that had hitherto belonged to the German confederation. By the treaty concluded at Versailles Nov. 15, 1870, the fortress of Mainz was declared an imperial fortress. Mainz which is one of the most ancient cities of Germany, retains many evidences of mediaeval taste, and consists principally of narrow crooked streets; but of late years a new town has sprung up on the site of the ancient Roman city, and numerous sanitary improvements have been effected under the joint direction of the grand-ducal and civic authorities. Mainz has one Protestant and 10 Catholic churches, among the latter of which the most noteworthy are that of St. Ignatius, with its beautifully painted roof, and the cathedral, a memorable building, which was begun in 978, and after having been six times destroyed by fire, or through war, was restored by Napoleon. It has one great tower, 400 ft. in height, and 6 les-ez towers, 14 altars, and 20 minor chapels. Mainz possesses numerous Roman remains, the most remarkable of which are the \textit{Eichedeiten}—a mass of stones supposed to be a memorial erected in honor of Drusus and his chums. It wasaqueducted at Zalbach. Mainz has a gymnasium, a seminary for priests, a normal school, a picture-gallery, museums, and a library containing about 100,000 volumes. Among the industrial products of Mainz, which include artificial pearls, insignia, tobacco, vinegar, soap, carriages, musical instruments, furniture, and articles in leather, the first and the last have acquired special reputation. Mainz from its position, necessarily enjoys a very important transit-trade, both by railway and river steam-navigation; and since the abrogation of many onerous restrictions, it has become one of the great internal ports for the corn and wine trade. The history of Mainz connects it with Rome from the year 13 B.C., when Drusus built on its site
Mainz. During the confederacy of Moxos, their administration in South America entitled them to distinguished physicians and authors of medical works; commenced practice in Paris in 1830; in 1835 opened a school for surgical practice; and in 1840 became one of the surgeons of the hospitals and member of the society of surgeons. He has since been surgeon of the hospitals of Cochin de la Pitié, and in 1875 surgeon of the Hôtel-Dieu. He ranked at the head of the brilliant school of modern surgery in France. His operations, inventions, and improvements in surgical instruments have been remarkable. Though his courses in the hospitals are the most prized instructions in surgery, he has the disadvantage of being deficient in the use of language orally, though remarkably clear and concise in writing. His works are numerous, and of the highest authority of their date.

MAISONNEUVE, Jules Germain François, b. Nantes, France, 1810. A distinguished physician and author of medical works; commenced practice in Paris in 1830; in 1835 opened a school for surgical practice; and in 1840 became one of the surgeons of the hospitals and member of the society of surgeons. He has since been surgeon of the hospitals of Cochin de la Pitié, and in 1875 surgeon of the Hôtel-Dieu. He ranked at the head of the brilliant school of modern surgery in France. His operations, inventions, and improvements in surgical instruments have been remarkable. Though his courses in the hospitals are the most prized instructions in surgery, he has the disadvantage of being deficient in the use of language orally, though remarkably clear and concise in writing. His works are numerous, and of the highest authority of their date.

MAISONNEUVE, Paul de Chomedey, Sieur de, b. in Champagne, France, early in the 17th c.; d. in Paris, 1676. In 1641 he led a colony of the clergy to Canada and left them in Quebec; was himself made governor of Montreal, and founded that city in 1642, though the point had been named by Jacques Cartier seven years before. His administration was marked by energy and ability, and the good-will of the Indians. He resigned in 1669 and returned to France.

MAISTRE, Joseph de, Comte, b. 1753, in Chambéry, of a noble French family, which had settled in Savoy. While Savoy was occupied in 1792 by the French, Maistre, who was a member of the Senate, withdrew from the country; and when the king of Sardinia, in 1799, was compelled to retreat to the island of Sardinia, Maistre accompanied his court, and in 1805 was sent as ambassador to St. Petersburg. In this post he remained until 1817, when he was recalled to occupy a place in the home government, and continued to reside in Turin till his death, Feb. 25, 1821. Maistre was an ardent advocate of legitimacy, and in his later career became one of the most eminent writers of the new (or liberal) conservative school in politics and religion, of which Chateaubriand may be regarded as the head. He had obtained some reputation as a writer at a very early period. His first work of note, Considérations sur la France, appeared in 1796. His later works were written either at St. Petersburg or after his return to Turin. They are: Essai sur le Prince Générateur des Constitutions Politiques (St. Petersburg, 1810); Du Pape (Lyons, 1821); De l'Eglise Gallicane (Paris, 1821-22); Souvenirs de St. Peters- bourg (2 vols. 1822); and a posthumous work, Examen de la Philosophie de Bacon (Paris, 1836).

Maistre, Xavier, Comte de, 1764-1802; b. in Chambéry, Savoy. When Savoy was conquered by the French during the first revolution, Maistre entered the Russian service and remained in it. During a visit to Italy in 1794 he was occupied with work in water-color and India ink drawings, and began in a desultory way the composition, entitled Voyage autour de ma Chambre, which has taken a place among the classics of French literature. In 1811 his work entitled Le Lépreux de la Cité de l'Aosta exhibited his genius and his sympathy with real misery. Prisônières de Carcasse and Prazesavon, ou la Jeune Siberienne, were translated and published in Philadelphia in 1826. The Expedition nocturne autour de ma Chambre, published 1825, was his last work. An edition of his works in three volumes appeared in Paris in 1829. He d. at St. Petersburg.

Maitland, a. of New South Wales, in the co. of Northumberland, on the Hunter river, 95 m. n. Sydney, and 20 m. n.w. of Newcastle, to which it is joined by railway. It is divided by the river into East and West Maitland. Pop. of Maitland, '61, 7,528; '71, 13,642. In either division are handsome banks, churches, and other public buildings. In West Maitland (much the more populous part of Maitland) are several coach-building factories, tobacco manufactories, and three mills (including a paper-mill). Good coal abounds in the neighborhood. The district has been called the "Granary of New South Wales."

Maitland, the name of a Scottish family, celebrated both in the literary and political history of their country. The first who acquired distinction was Sir Richard Maitland of Lethington, son of William Maitland of Lethington and Thirlestane, who fell at Flodden, and of Martha, daughter of George, 1st Earl of Marchmont. In 1496, studied at St. Andrews, and in France, and on his return to Scotland was successively employed by James V., the regent Arran, and Mary of Lorraine. About 1551-52, he received the honor of knighthood, became a lord of the court of session in 1561 (before which, however, he had the misfortune to lose his sight), and lord privy seal in 1563. He died Mar. 20, 1586, at the age of 90. Maitland was one of the best men of his
time. In an age of violence, fanaticism, and perfidy, he was honorably conspicuous by his moderation, integrity, and anxiety for the establishment of law and order. He merits consideration not only as an eminent and upright lawyer, but as a poet, a poetical antiquary, and an historian. All his own verses were written after his 60th year, and show what things he had most deeply at heart. For the most part they consist of lamentations for the distracted state of his native country, the feuds of the nobles, the discontent of the common people, complaints "against the lang proce in the courts of justice," and the depredations of "of the border robbers." A complete edition of Maitland's original poems was first published in 1830 (1 4to vol.) by the Maitland club, a society of literary antiquaries, taking its name from Sir Richard. His collection of early Scottish poetry was a work undertaken, if not completed, before his blindness attacked him. It consists of two MS. vols.; the first containing 176, and the second 96 pieces; they are now preserved in the Pepysian library, Magdalen college, Oxford. Maitland's principal historical performance is the Historie and Cronicle of the Hous and Surename of Seytoun, etc.

Maitland, William, better known as "secretary Lethington," was the eldest son of Sir Richard Maitland of Lethington, and was born about 1525. Like his father, he was educated both at St. Andrews and on the continent, and quickly displayed great aptitude for a political career. He became aconvert to the reformed doctrines about 1558, but could not have been a very violent partisan, since in 1558 he was appointed secretary of state by Mary of Guise. In the following year, however, he openly joined the lords of the congreagation, and was one of the Scotch commissioners who met the Duke of Norfolk at Berwick to arrange the conditions on which queen Elizabeth would give them assistance. In 1561, after the arrival of queen Mary from France, he was made an extraordinary lord of session. He strongly objected to the ratification of Knox's Book of Discipline, and in 1563 conducted the prosecution raised against Knox for treason: from this time he appears to have split with the reformers. In 1564 he held a long debate with Knox on the claims of the Reformed church to be independent of the state. In 1566 he took part in the conspiracy against Rizzio, after whose assassination he was proscribed, and obliged to seek shelter for some months in obscurity. He was, it is believed, cognizant of Bothwell's scheme for the murder of Darnley; yet, when he saw the hopeless nature of Bothwell's designs, he immediately joined the confederacy of the lords. While Mary was still a prisoner at Loch Leven, he is said to have written to the bishop of St. Andrews, expressing his admiration of King James VI., 1567; and although he secretly aided in the escape of the queen, he fought against her on the field of Langside. In 1568 he accompanied the regent Moray to the conferences held at York regarding the Scottish queen; but even here he tried to further her interests, and is said to have been the first to propose to the Duke of Norfolk a union between him and Mary. The Scottish lords now felt that he was a dangerous enemy to the commonwealth, and in 1569 he was arrested at Stirling, but was liberated shortly after by an act of Kirkaldy of Grange. After the murder of the regent Moray, he and Kirkaldy became the soul of the queen's party, in consequence of which he was declared a rebel, deprived of his offices and lands by the regent Morton, and besieged, along with Kirkaldy, in Edinburgh castle. After a long resistance, the castle surrendered, and Maitland was imprisoned in Leith, where he died, "some," says Melville, "supposing he took a drink and died, as the said Romans were wont to do." Buchanan has drawn his character with a severe pen in his Scottish tract entitled The Chamelson.

Maitland, John, Duke of Lauderdale, grandson of John, first lord Thristane, brother of the famous secretary Lethington, and son of John, first earl of Lauderdale, and of Isabel, daughter of Alexander Seaton, earl of Dunfermline and chancellor of Scotland, was b. at the ancient family seat of Lethington, May 24, 1616. He received an excellent education, being skilled, according to bishop Burnet, in Latin, Greek, Hebrew, history, and divinity, was carefully trained in Presbyterian principles, and entered public life as a keen and even a fanatical Covenanter. In 1648 he attended the Westminster Assembly of divines as an elder of the church of Scotland, and was a party to the surrender of Charles I. to the English army at Newcastle. Shortly after, however, he changed his politics altogether, and became a decided royalist. When Charles II. came to Scotland from Holland, Lauderdale accompanied him; but being taken prisoner at the battle of Worcester in 1651, was kept a prisoner for nine years. Set at liberty by gen. Monk, in 1660, he hastened to the Hague, and was warmly received by Charles. After the removal of Middleton in 1662, and of Rothes in 1667, Lauderdale was practically the sole ruler of Scotland, and for some time displayed a spirit of moderation, and an apparent regard for the religious feelings of his countrymen; but he soon became a bitter persecutor, sent multitudes of the Covenanters "to glorify God at the Grassmarket," and repelled in blasphemous language the remonstrances which many distinguished persons ventured to make. In 1672 Charles showed his appreciation of Lauderdale's conduct by creating him marquis of March and Duke of Lauderdale; two years afterwards he was raised to the English peerage as viscount Petersham and earl of Guilford, and received a seat in the English privy council. He was one of the famous "cabal;" but having, by his domineering arrogance, excited the disgust and hatred of his colleagues, as well as of the nation, he fell into disgrace, was stripped of
all his offices and pensions in 1853, and died Aug. 24 of the same year. Lauderdale, according to Burnet, "was in his principles much against popery and arbitrary government," and his infamy consists in his shameless sacrifice of his convictions to his interests. He was a rude, blustering, passionate man, with what the duke of Buckingham called a "blundering understanding." Burnet has also given us a picture of his appearance. "He was very big, his hair red, hanging oddly about him. His tongue was too big for his mouth, which made him bedew all that he talked to; and his whole manner was very unfit for a court."

MAITLAND, SAMUEL ROFFEY, D.D., 1792-1866; b. London; studied at Trinity college, Cambridge, without graduation, as he was not a member of the church of England; studied law, and admitted to the bar at the Inner Temple in 1816; studied theology and was ordained in 1821; held perpetual curacy of Christ church, Gloucester. 1823-29. Resigning this he devoted himself to literature. In 1837 he was appointed librarian to Dr. Howley, archbishop of Canterbury, and keeper of the Lambeth MSS., retaining the office until the death of the archbishop in 1848. He edited for several years the British Magazine, in which he wrote valuable articles, chiefly on prophecy, church history, criticism, etc. His principal works are: An Inquiry into the Grounds on which the Prophetic Period of Daniel and St. John has been supposed to consist of 1260 Years; Letters on the Voluntary System; The Dark Ages, a Series of Essays intended to illustrate the state of Religion and Literature in the 9th, 10th, 11th, and 12th centuries; Essays on the Reformation in England; Erasmian, or Miscellaneous Essays on Subjects connected with the Nature, History, and Destiny of Man; An Essay on the Mystical Interpretation of Scripture; Stereotypes on Milton's Church History; Facts and Documents illustrative of the Doctrines and Rites of the ancient Albigenses and Waldenses; Sacred Art; Realism in Modern Art; Superstition and Science; Illustrations and Inquiries relating to Mesmerism. He wrote also numerous pamphlets, letters, and reviews. He showed "great erudition, great power of reasoning, precision, and perspicuity of statement, and a style of masculine strength, simplicity, wit, and polish."

MAITREYA was, according to the Buddhists, a disciple of the Buddha Sakyamuni and a Bodhisattwa, or a man of pre-eminent virtue and sanctity. He is classed in their mythology amongst the gods called tushitas, or "the happy," and has generally the epithet ajita, or "unconquered." The Buddhists believe that he will become incarnate as their future Buddha. In Thibetan he is called Jampa. A faithful representation of this Buddha, surrounded by the (Thibetan) goddesses Dolma, the Mantas or Buddhhas of medicine, two ancient priests, and various saints, will be found in the atlas of Emil Schlahtweit, Buddha, Buddha (London and Leipzig, 1883), where an interesting sketch is given (p. 207, ft.) of the esoteric types of Buddhist images, and of the measurements of Buddha statues made by his brothers in India and Thibet.

MAIZE. Zea, a genus of grasses, having monocious flowers; the male flowers forming a loose panicle at the top of the culm; the female flowers in axillary spikes, inclosed in large tough spathes, from which only the extremely long styles—in the common species 6 to 8 in. long—hang out like tufts of feathers or silken tassels. The grains are large, roundish, compressed, naked, and arranged in parallel rows along the upright axis of the spike. The COMMON MAIZE, or INDIAN CORN (Z. mays), is generally believed to be a native of the warmer parts of America, where it was cultivated by the aborigines before the discovery of America by Columbus. But a representation of the plant found in an ancient Chinese book in the royal library in Paris, and the alleged discovery of some grains of it in the cellars of ancient houses in Athens, have led some to suppose that it is a native also of the east, and has from a very early period been cultivated there, and even that it is the "corn" of Scripture; although on this supposition it is not easy to account for the subsequent neglect of it until after the discovery of America, since which the spread of its cultivation in the old world has taken place with a rapidity such as might be expected from its great productiveness and other valuable qualities. Columbus himself brought it to Spain about the year 1520. It is now in general cultivation in the United States, Europe, and supplies a principal part of the food of the inhabitants of many countries of the New and Old World. It is the most productive of all the cereals; in the most favorable situations yielding an increase of 800 for one, whilst an increase of 350 or 400 for one is common where irrigation is practiced, and even without this the return is large. Maize succeeds well in tropical and sub-tropical climates; and, being a short-lived annual, is cultivated also where the heat of summer is intense and of sufficient duration, whatever may be the cold of winter. Thus, its cultivation extends to the northern parts of the United States, and is pretty common in Germany; although the want of sufficient summer heat renders it a very uncertain crop even in the southern parts of Britain. Some of the varieties of maize require about five months from the time of sowing for the ripening of their grains; whilst others, which, of course, are preferred in countries having a comparatively short summer, ripen in six weeks, or even less, but they are much less productive. The varieties are very numerous, of taller or humbler growth, from 3 to 10, or even 14 ft.; with yellow, white, brownish-red, or purple, glassy-like, somewhat translucent grains, which vary very much in size. The culm is stout and erect; the leaves from 1 foot to 2 ft. long, and 2 or 3 in. broad; the ears cobs generally 2 or 3 in number, situ-
ated below the middle of the stem; in the large varieties, often above a foot long, and thicker than a man's wrist, in the smallest varieties, 4 or 5 in. in length. Maize succeeds best in light, rich, deep, and rather moist soils; and dislikes shady situations. It is very generally planted in little hilly fields, at intervals, and to each of which 5 or 6 seeds are allotted. North American settlers generally make it their first crop on newly cleared and very partially tilled ground. The grains of maize make a very applicable kind of grain, and afford an excellent meal for baking purposes. The meal is not, however, adapted for making bread without a mixture of wheat flour, or rye, owing to its deficiency in gluten; although in oily or fatty matter maize is richer than any other grain, and is very nutritious. Maize meal mixed with rye meal forms the common brown bread of New England. Maize very coarsely ground and boiled forms the hominy of the southern states of North America. The porridge made of maize meal is called mush in North America; and the entire grains are used under the name of hulled corn or samp. The unripe grains, slightly roasted, burst and turn inside out, assuming a very peculiar appearance; in this state, they are known as pop-corn; and in this state are a favorite article of food in America, and have recently become common in shops. The cobs of maize, ripe or unripe, are gathered with the hand. The unripe cobs are often picked; they are also often boiled for the table. A kind of beer called chicha (q.v.) is made from maize, also a spirituous liquor, and vinegar. The starch of maize is a good substitute for arrow-root, and is now well known in Britain under various names, as Oatsina flour, etc. The pith of the culm, before the flowers are pro-
duced, is a sweet diuretic drug, which, when dried, has been largely employed in the United States to furnish sugar; it is also fermented and distilled, and yields a good spirituous liquor. The small young stalks of thickly sown crops are cut over by the Mexicans, as an article for the dessert. In countries where maize does not ripen well, it is sometimes sown to afford food for poultry, or to be mown as green fodder for cattle. Where it is cultivated for its grain, the dried leaves are used as winter fodder. The tops, cut off after flowering are stored for the same use. The stalks are used for thatch and for fuel, and for making baskets. The fibers of the culm and leaves afford a durable kind of yarn; and the bracts or spathes which surround the ear are elastic, and can be applied to the stuffing of chairs, saddles, etc., and to the manufacture of good durable mattresses, which have become a profitable article of trade in Paris and Strasbourg. The spathes are also much used for packing oranges and lemons; and in South America for making cigarettes. Good paper has been manufactured from them. There are few plants of which the uses are more various than the maize, and few which are of greater importance to man. For separation of the grains of maize from the ears, a particular kind of thrashing-machine is used. Another species of maize, called Chili maize, or Valparaiso corn (Z. eur transitional) is distinguished by its serrated leaves. It is a smaller plant, a native of Chili, and has won a superstitious regard, because its grain when roasted split in the form of a cross.

MAJESTY, a title of honor now usually bestowed on sovereigns. Among the Romans majestas was used to signify the power and dignity of the people; and the senatorial, consular, or platonic majestas of a man was spoken of, in consequence of his deriving their power from the people. After the overthrow of the republic, majestas became exclusively the attribute of the emperors, dignitas being thenceforth that of the magis-
trates. The majestas of the emperors of Rome was supposed to descend to those of Germany as their successors; but the adoption of the attribute by other European sovereigns is of comparatively late date. Its use began in England in the latter part of the reign of Henry VIII., up to which time "your grace" or "your highness" had been the appropriate mode of addressing the sovereign. Henry II. was the first king of France who was similarly styled, and Louis XI. and his successors became entitled, in virtue of a papal bull, to call themselves by the title of "most Christian majesty." Ferdinand and Isabella of Spain similarly obtained for themselves and their successors the title of "most Catholic majesty;" and Stephen, duke of Hungary, and Maria Theresa, of "apostolic majesty." The emperor of Austria is now styled his imperial royal majesty; in German, "K. K. (abbreviated for kaiserliche königliche) majestät." Emperors, kings, and queens are now generally addressed as "your majesty," not including the sultan of Turkey, whose proper style is "your highness." The sovereign of the United Kingdom is per-
sonally addressed as "your majesty," and letters are addressed to "the king's" or "queen's" "most excellent majesty."

In heraldry, an eagle crowned and holding a scepter, is blazoned as an "eagle in his majesty."

MAJOLICA, a name at first given by the Italians to a certain kind of earthen-ware, because the first specimens that they saw came from Majoreca; but as subsequently a large manufacture of the same kind of earthen-ware was carried on at Faenza, the name majolica was dropped, and "faience" substituted. The term majolica is now used to designate vessels made of colored clay, and conted with a white opaque varnish, so as to resemble "faience;" it is of much less value, and is very common in Italy.

MAJOR, a term in music, applicable to those intervals which are susceptible of being lowered a semitone without becoming false. See INTERVAL. Major is chiefly used as applied to the mode, key, or scale, which is said to be in the major when the thr
MAJOR, in the army, is the second field-officer in a battalion of infantry or regiment of cavalry. He ranks next to the lieut.col., and commands in his absence; is mounted; and is responsible, with the adjutant, that the men are properly drilled and equipped. The pay of a major ranges from £1 4s. 5d. a day in the household cavalry, to 16s. a day in the infantry of the line. There are no majors in the royal marines; and it was only in 1872 that, in the royal artillery and royal engineers, the first-captains were converted into majors to put their promotion more on a par with the line. In the artillery, the major commands a battery. Used adjectively, the word major, in the army, signifies a superior class in a certain rank, as sergeants-major, who are superior sergeants; except in the case of general officers, in which its significance is arbitrarily limited to maj. gen., the third of the four classes of generals.

MAJOR, GEORG, D.D., 1502-74; b. Nuremberg, Germany; studied theology under Luther and Melanchthon; was successively rector at Magdeburg in 1529; superintendent at Eiselen in 1536; professor of theology and court-preacher at Wittenberg in 1539; represented the Protestants in colloqy at Regensburg in 1546. When the Smalcald war broke out he left Wittenberg, and was appointed superintendent and court-preacher at Merseburg; but at the close of the war, the next year, he returned to Wittenberg. In 1562 he was made superintendent of Mansfeld churches. In 1551 he actively supported the doctrine of the Leipsic interim, that good works were necessary to salvation, in opposition to the strict Lutherans who denied that proposition. Amsdorf assailed him, declaring that good works were or might be detrimental to salvation. He was joined by the clergy of the district, and the count of Mansfeld being of the orthodox party. Major removed to Wittenberg. The doctrines advocated by Major were finally branded as heretical in the Corpus Doctrinae Prutenicum, and were rejected by the compilers of the Formula Concordiae. Towards the close of his life he became involved in the Crypto-Calvinistic controversy (q.v.). A portion of his works, comprising homilies and commentaries on the Gospels and Pauline epistles, was published in 1569 in 3 folio volumes.

MAJOR, RICHARD HENRY, b. in London, 1818; was made keeper of the maps and charts in the printed book department of the British museum, 1844; served as honorary secretary of the Hakluyt society from 1849 to 1858, editing therefore the Select Letters of Christopher Columbus; the Historie of Traveile into Virginia Britannica, and Notes upon Russia, from the Latin of Herberstein, and writing introductions to Mendoza's History of China and the earl of Ellesmere's Travies Conquerors of China. At a later period he edited for the same society India in the Fifteenth Century and Early Voyages of Terra Australia. In 1861 he brought to light documents in the British museum showing the discovery of Australia by a Portuguese navigator in 1601, for which he was knighted by the king of Portugal. In 1868 he published the Life of Prince Henry of Portugal, Surnamed the Navigator—a work of great value. In later years he has been honorary secretary of the Royal geographical society and a frequent contributor to its Journal.

MAJORANA, GAETANO. See Caffarelli, ante.

MAJORCA (Spanish, Mallorca), the largest of the Balearic isles (q.v.), lies 107 m. a.e. of the main, of the Ebro, the nearest point of the Spanish coast, and 171 m. n. of Algiers. Its greatest length (from e. to w.) is 64 m., and its breadth (from n. to s.) 48 m., with an area of about 1386 English sq. miles. The n.e. half of the island is mountainous; the other parts are finely diversified with hills, valleys, and plains. The climate is healthful, the sea-breeze preserving a nearly equable temperature over the whole island. The inhabitants, who much resemble the Catalans in their appearance and manners, number above 200,000, are hospitable and industrious, and mostly employ themselves in agriculture. The chief products of the island are marble, slate, plaster, the common cereals and legumes, oranges, silk, lemons, oil, wine of excellent quality, olives and aromatic herbs. The chief town is Palma (q.v.), the capital. The Spanish government makes use of Majorca as a place of banishment for political offenders.

MAJORITY is the age at which a person in this country acquires a status of a person sui juris—i.e., is able to manage his or her own affairs. This age, in the United Kingdom is 21. Under that age, persons in England and Ireland are called infants, and are more or less subject to guardians, who manage for them their property. In Scotland, young persons are called minors between 12 (if females) or 14 (if males) and 21. It is chiefly with respect to the management of property that the distinction of majority is fixed upon, as it is assumed that persons under that age have not discretion and firmness to enter single-handed into contracts. It is also a common period fixed upon in wills at which guardianship is applied for, on the assumption that the major is liable for crime, when they have discretion enough to know that particular acts are criminal. A minor can, in Scotland, make a will of movable estate, but cannot do so in England.

MAKALLAH, a seaport on the s. coast of Arabia, 300 m. e.n.e. of the port of Aden. It has a well-protected harbor, and is much frequented by vessels for the purpose of
Laying in stores. It exports gum, hides, and senna, and is an extensive slave-market. Pop. about 4,500.

MAKART, Hans, b. Salzburg, 1840; studied art in Munich, following the school of Piloty; first became noted as a historical painter about 1868. He is a member of the Munich academy, and a professor of art in Vienna, where he has established his studio. His first great work was his "Catharine Cornaro," which was exhibited in the Austrian collection in Memorial hall, during the Centennial exhibition. It was sold for $12,500, and is now in the possession of the Berlin national gallery. His next most important work was the "Entrance of the Young Emperor Charles V. into Antwerp," which was exhibited in 1878, and attracted general attention. He also painted "The Gifts of Sea and Earth," two paintings of still-life, which were in the Centennial exhibition. Makart's work is characterized by a mastery in the use of color, warmth in the combinations effected, and startling contrasts; strongly reminding one of the Venetian school of Giorgione and Tintoretto. The Portfolio concluded some severely critical remarks on his "Catharine Cornaro" as follows: "There are few painters of the present day who have enough daring to handle such vast material, to dispose fearlessly and with proper relation so large a number of figures; and there are still fewer who possess the skill in execution which renders Herr Makart's picture a surprising and, in some sense, admirable performance." Another critic, writing for the same publication, says: "Herr Makart, by birth Austrian, but trained under Piloty, is imbued with the romance and voluptuousness of Venezia. He is, in fact, the Veronese of Vienna."

MAKI. See Lemur, ante.

MAKIAN, one of the Moluccas (q.v.).

MAKO, a market-town of Hungary, on the right bank of the Maros, 16 m. e.e. of Szegedin. Pop. '70, 27,449, many of whom are Jews. The town contains numerous mills, and is famous for its breed of oxen, which are of unusually large size.

MAKRIZI, Taki Addin Abu Ahmad Mohammed, an eminent Arabic historian and geographer, was b. in 1569 A.D., in Makriz, near Baalbec. He early devoted himself to the study of history, jurisprudence, tradition, astrology, etc., at Cairo, where also he afterwards held the offices of mutisub, or inspector of weights and measures, and of khatib and imam at different mosques. The most important of his numerous works are a Topographical History of Egypt, a History of the Mameluke Sultans, and two treatises on Moslem (Kufic) coins, weights, and measures, which have been edited and translated by Tychsen (into Latin), and by Silvestre de Sacy (into French). Makrizi also commenced a work On the important Personages who had visited Egypt, intended to fill 80 vols.; but only a small portion of these (one autograph volume is in the imperial library at Paris) was really accomplished. He died at the age of 82 years, in 1442 A.D.

MALABAR, a marit世家 district of British India, in the presidency of Madras, is bounded on the e. by the district of Coimbatore, while on the w. its shores are washed by the Arabian sea; and it extends in lat. from 10° 15' to 12° 18' north. Area, 6,003 sq.m.; pop. (July, '71) 2,261,250. The surface is occupied in the e. by the Nilgherriers, and the western Ghauts cover a great portion of the district. The name of this district is applied to the whole south-western coast of southern India.

MALABAR (ante), a country lying on the western coast of India, and extending from cape Comorin to the river Chandragiri in 12° 30' n. lat. The British province of Malabar is a portion of this tract between 10° and 13° n. lat., bounded n. by the province of Canara; s. by the territories of the rajah of Cochin; w. by the ocean, and e. by the chain of the western Ghauts. Between these and the sea Malabar lies, extending 200 m. along the coast, with an average breadth of 40 miles. The country may be divided into two parts, the first of which lies on the sea-coast about 3 m. wide, and consists of a poor sandy soil, covered with coconut trees. Near the termination of the low hills, which are offsets of the Ghauts, the soil is better, and is planted with rice. The sandy coast is remarkably intersected by inlets of the sea, which often run for great lengths parallel to the coast, receiving the various mountain streams, and communicating with the ocean by different narrow shallow openings. In other places the fresh water descending from the mountains into the low lands within the downs upon the sea-coast in the rainy season, totally overflows them as they have no outlet, and when the water is evaporated, these lands are cultivated and yield rich crops of rice. The second and most extensive portion of Malabar is in the vicinity of the Ghauts, and consists of low hills with narrow valleys between, which are rendered very fertile by the fine particles of mud washed down from the hills. The hills are low, their summits are level, dry and bare, presenting large surfaces of naked rock, with remarkably steep sides. These sides having the best soil are formed into terraces, and highly cultivated. The uplands are barren, and not much cultivated, and the inhabitants reside chiefly in the valleys and extensive ravines, upon the banks of the rivers and inlets. There are no large rivers, but innumerable small streams water the country. The climate though hot is generally healthful. The thermometer generally rises to about 90° in the shade, and seldom falls below 70°. The hot season is from February to May, and the wet from May to October. The low
country of Malabar and the whole region under the western Ghauts are excessively hot in February, and the vapors and exhalations are so thick that objects can with difficulty be distinguished at a distance of 5 miles. At the commencement of the western monsoon the rains fall very heavily both in the low country and on the mountains. These rains wash away the soil, leaving nothing but loose stones and sand on the hills. Forest trees abound, sometimes intermixed with corn-fields and plantations of fruit trees. The teak is produced in great abundance. Sandal wood not produced in Malabar, grows e. of the western Ghauts, and is exported from the ports of Malabar. Coconuut trees abound. Black pepper is grown extensively, and is the chief export by Europeans who purchase about five-eighths of what is raised, and send it either directly to Europe, or to Bombay and China. The remainder is exported by native traders to the bay of Bengal, Surat, Scinde, and other places in n.w. India, and a portion is sent to the Arabian ports of Muscat, Mocha, and the British port of Aden. Ginger, betel-nuts, cardamoms, turmeric, and pepper are also grown on the slopes of the mountains in forest lands. Within a few years the English have cultivated coffee on the plains of Travancore on the slopes of mountains 2,000 ft. above sea-level. They obtain land either of the government or of natives, and not much capital being required, and the wages of native laborers being small, the profits are large. Rice is raised, but not enough for home consumption. Ginger is largely cultivated and exported to Europe. The animals are the elephant and bison in the forests, and some tigers, leopards, deer, bears, hogs, porcupines, monkeys, and squirrels. There is an animal of the ox species, called the gajal, found in the recesses of the mountains, 10 ft. high, with beautiful horns. There are but few horses. There is a small bullock used for tilling the ground and drawing vehicles, but not much in the transportation of goods, that being done by porters. Poultry has been introduced by Europeans, and common fowl now are abundant. Slavery existed in Malabar until a legislative act was passed in 1843 abolishing it throughout the British possessions. Malabar being intersected by many rivers, and inclosed by high mountains has been less disturbed than other parts of India by Mohammedan invasion, until in 1763 it was invaded and conque on, by Hyder Ali. On this account the manners and customs of the Hindus here have been less changed than in other parts of India. The population consists of Hindus, Mohammedans, Christians, and some Jews. The Hindus constitute the great proportion. They are divided into the following castes: The Brahmins called Namburies are the highest, and another more numerous class of Brahmins called Puttars. The Nairs are the next, and then the Teers or Tiars who cultivate the land, and are freemen. Lastly the Patiars or Poliars, who were formerly slaves. The most remarkable caste is the Nairs who claim to be born soldiers, though they are of various ranks and professions. They are of 11 ranks, and form the militia of Malabar under the Brahmins and rajahs. They are very arrogant and formerly a Nair did not hesitate to strike down a cultivator or a fisherman who defied him by touching his person, or a Pattar who did not turn aside when meeting him. The ancient Hindu state of property prevailing in Malabar, most of the land cultivated or uncultivated belongs to individuals, who have an absolute control of it. The Brahmins, Nairs, and Tiars are well proportioned, handsome, and of olive complexion. The Mohammedans, called Moplays, are about one-fourth of the population, and are descendants of Hindu mothers and Arab fathers who settled in Malabar about the 7th or 8th century. The aboriginal nates generally live in separate houses, surrounded with gardens; but the villages are the work of foreigners, the houses being built of mud, neatly smoothed, and whitewashed or painted. The chief towns are Calicut, Tellichery, Cananore, and Ponany. Beypoor, 7 m. s. of Calicut, where Gama landed in 1498, is connected by a railway with Madras. The Portuguese then settled in Malabar, and the Dutch in 1663. The original name for Malabar in Sanskrit was Kevala. It is supposed that Malabar was very early conquered by a king from beyond the Ghauts, and that the Nairs were established there by the conqueror or brought in by the Brahmins as a military body to support the government; that in time they obtained settlements, and the chief became rajahs who governed the country like independent princes, until the invasion of Hyder Ali in 1763. He conquered and plundered the country, and expelled all the rajahs except those who submitted to him. In 1782 he appointed a deputy who made further progress in subduing and settling the country. In 1788 his son Tippoo proposed to the Hindus to accept the faith of the prophet, and began to levy large contributions on them compelling many Brahmins, Nairs, and others to be circumcised. This produced a revolution which his vigor soon suppressed. When the war broke out between Tippoo and the English in 1790, the rebellious rajahs and Nairs, who had fled from his persecution to the jungles, joined the British army, and Tippoo was driven from the country. In 1803 Malabar was incorporated in the Madras presidency. Christianity early made considerable progress in this part of India. The Nestorians established churches there in the 5th or 6th century. When the Portuguese landed in 1500 they found not only a Christian king, but a large body of professing Christians, and upwards of 100 churches. Buchanan at his visit in 1807 found 44 churches. The Romanists from Goa established themselves here in the beginning of the 16th century. The whole number of Christians on the Malabar coast, including the Nestorians or Syrians at the present time, is computed at 200,000. There are also about 30,000 Jews. The population in 1850 was 1,614,909. The country is tranquil and prosperous.
MALAB'ATHRUM, a name given by the ancient Greeks and Romans to aromatic leaves, which were in high repute among them, both as a medicine and a perfume, and with which they sometimes flavored wine. These leaves were brought from India, whence they were often called Indian leaves; and from the value in which they were held, sometimes simply leaves, just as the term bark is now used to designate the medicinal bark of the chunonas. Many fabulous accounts were current of their origin. They are now pretty certainly known to be the same with the leaves sold in every Indian bazaar under the name of tej-pot, the produce of two nearly allied species of cinnamon (cinnamomum tamala and c. abiflorum), growing in the dense forests of the Himalayan valleys; and the name Malabathrum is regarded as a corruption of tamalaputro, tamala leaf. They are aromatic, fragrant, and gently stimulant.

MALACCA, a British maritime settlement on the s.w. coast of the Malay peninsula, extends in lat. from 2° to 3° n., and long. from 102° to 103° e. It is 40 m. in length, and, including the district of Nanning, about 25 m. broad. Area, about 1000 sq.m.; pop. 71,775. Near the coast, which is washed by the strait of Malacca, the surface is flat and swampy, producing rice. Inland, there are low hills, Mt. Ophir rising to 3,920 feet. Although little agriculture is carried on, and the greater portion of the country is still in the condition of jungle, the soil is fertile in rice, sago, pepper, fruits, vegetables, rattans, and timber. In the district of Nanning are tin mines of some value. The climate is remarkably salubrious; the land and sea breezes are regular; and the thermometer ranges from 72° to 85°. The town and seaport of Malacca, capital of the district of the same name, is situated in lat. 20° 11' n., long. 102° 16' e., at the mouth of a small river which runs into the strait of Malacca. It is hilly and well built, and presents a fine appearance from the sea. Its most interesting building is the church of our Lady del Monte, the scene of the labors and supposed miracles of St. Francis Xavier, "the apostle of the east." Pop. variously estimated at from 5,000 to 15,000.

Malacca was taken by the Portuguese under Albuquerque in 1509; became a Dutch possession in 1642; fell in 1795 into the hands of the British to whom it was finally ceded in 1824. In 1867 Malacca, together with Singapore and the Prince of Wales island, were transferred from the control of the Indian government to that of the colonial secretary.

MALACCA, STRAIT OF, separates the Malay peninsula on the n.e. from the island of Sumatra on the s.w. Length, 529 m.; breadth varying from 25 m. at the s.e. to 200 m. at the n.w. extremity. In this strait are the British settlements of Singapore, Malacca, and Penang.

MAL'ACHI (probably an abbreviated form of malachyah, meaning "messenger of Jehovah;" the Seventy and the Vulgate have malachias), the name given to the last canonical book of the Old Testament. Regarding its author, nothing whatever is known. It has even been doubted whether Malachi is a proper name or only an appellative; the Seventy, the Chaldee, Jerome, and many modern scholars—Vitringa, Hengstenberg, Umbreit, etc.—favor the latter view. The period when the writer of Malachi composed his prophecies is conjectured to have been during the governorship of Nehemiah, or about 410 B.C. The book of Malachi exhibits that strict regard for the proper observance of the ceremonial law, and that hatred of foreign marriages, etc., which marked the religious Jews after the return from exile, but has little of the old prophetic fire, freedom, and dramatic force.

MALACHI, PROPHECY of (ante), has a place in the canon of Scripture which has never been disputed and is explicitly confirmed by at least six quotations in the New Testament. I. As to the time when it was written. That Malachi was contemporary with the latter part of Nehemiah's administration is argued from the similar state of things mentioned in the prophecy and the history. 1. Malachi speaks of the governor of the Jews by the same name as that given to Nehemiah by the Persian king. 2. Malachi reproves the priests for having neglected, despised, and profaned the worship of God; and Nehemiah relates that, on his return a second time from Persia to Jerusalem, he found that a grandson of the high-priest had married a daughter of Sanballat, the notorious adversary of the Jews' religion; that the high-priest had established Tobiah the Ammonite in the precincts of the temple; that the priests and the Levites were defiled, their sacred covenant despised, and the Sabbath profaned. 3. Malachi charges the whole nation of the Jews with having robbed God by withholding the tithes and other appointed offerings; and Nehemiah relates that during his absence the portions of the Levites had not been given them, and the conquerors, as they and the singers appointed to conduct the services had gone home to their fields. 4. Malachi denounces judgments on the nation for dealing treacherously with the wives of their youth and marrying strange wives; and Nehemiah relates that the Jews had married wives of Ashdod, of Ammon, and of Moab, and that their children spake half in the speech of Ashdod, having lost the knowledge of their fathers' language. II. These indications of the time when the prophecy was written explain also its contents, which are. 1. A declaration of God's love to Israel as proved by their history; 2. An address to the priests rebuking them for their heartless, mercenary, and corrupt services, threatening them with judgments if they persisted in their sins, and describing the character of a true priest in bright contrast with their own; 3. A rebuke of the people for their mar-
riages with the heathen and their rejection of the lawful wives of their youth, who were left to weep at the altars of God, the institutor of marriage at the beginning as a perpetual covenant; 4. An announcement of the sudden coming of the Lord, whom they claimed to seek, but who in an unexpected coming would sit in judgment against all transgressors, supplying by his own omniscience swift testimony against them; 5. A call to repentance, with the promise of abundant blessings to all who obey; 6. A testimony that there were some who feared God, and an assurance to them that they would always be precious in his sight; 7. A renewed announcement both of the appointed judgment and of the promised Savor, before whose great and dreadful day one in the spirit and power of Elijah the prophet would come calling fathers and children to repentance as the only way of avoiding the hastening doom.

MALACHITE, a mineral, essentially a carbonate of copper, of a green color, often found as an incrustation or stalactitic along with other ores of copper; often in large masses, and often also crystallized in rather oblique four-sided prisms, beveled on the extremities, or with the beveling planes truncated so as to form six-sided prisms. It is often of a fibrous structure. It is valuable as an ore of copper, although seldom smelted alone, not only because it is found along with other ores, but because the metal is apt to be carried off with the carbonic acid. It is sometimes passed off in jewelry as turquois, although easily distinguished by its color and much inferior hardness. It is used for many ornamental purposes; slabs of it—chiefly from the mines of Siberia—are made into tables, mantel-pieces, etc., of exquisite beauty. In 1835 a mass of solid malachite was found in the Ural mountains of more than 17 ft. in length, and weighing about 25 tons.

MALACHY, IMAR, Archbishop of Armagh, in Ireland, and a saint of the Roman Catholic church, is remarkable not only for his connection with a very important period of Irish church history, but also from the circumstance of his biography having been written by Baronius. St. Eugene, the former Archbishop of Armagh, in the end of the 11th c., of a noble family, and having been educated by a hermit, named Malimor, received orders at an early age from the hands of Celsus, archbishop of Armagh. His reputation for learning and sanctity was unexampled in that age, and Celsus had early designed Malachy as his successor in the see of Armagh; but Malachy protested against it, in consequence of an abuse similar to that of lay improvidence (q.v.), by which the temporalities of the see were held by laymen, called coarbs. In the end, however, he was elected, with the full rights of his see, and soon afterwards, in his capacity of primate, took measures for the reform of the many abuses which prevailed in all the churches of Ireland. He went to Rome during the pontificate of Innocent II., and having in vain sought permission to resign his see, and retire to Clairvaux, returned to Ireland invested with extraordinary powers as legate of the pope. In this capacity, he made a visitation of Ireland, and many of the controversies as to the ancient religious usages of the Irish church, which would be out of place in this publication, turn upon this period. Malachy again repaired to France in 1147, in order to meet the pope, Eugene III. during his visit to that country; but before his arrival, the pope had returned to Rome, and Malachy, during a visit to his friend, St. Bernard, at Clairvaux, was seized with an illness which ended in his death in the year 1148. A curious "prophecy concerning the future Roman pontiffs," is extant under the name of Malachy. It designates, by a few brief phrases, the leading characteristics of each successive reign, and in some instances these descriptive characteristics have proved so curiously appropriate as to lead to some discussion. The characteristic of Pío Nono, Croix de Cruce (cross after cross), was the subject of much speculation. That the prophecy really dates from the time of Malachy, no scholar now supposes; it was unknown not only to St. Bernard, but to all others, until the 16th century. It is first noticed in the end of that century, but it may be a sufficient indication of its worth to state that neither Baronius nor any of his continuators deemed it deserving of attention.

MALACOLOGY (Gr. malakos, soft), a name now not unfrequently employed to designate that branch of natural history which has mollusks (called malakia by Aristotle) for its subject. Linnaeus, and the naturalists who preceded him, devoted some attention to this study; but until the time of Cuvier the shells of the shell-bearing mollusks received a disproportionate share of attention, and the animals themselves were little regarded. Conchology (q.v.) has now, however, sunk to a very small place in the natural historian's cognizance, and this branch of science has been prosecuted during the present century by many eminent naturalists with great zeal and success. The names of Oken, Savigny, De Blainville, Van Beneden, Milne-Edwards, and Owen perhaps deserve to be particularly mentioned.

MALACOPTERYGI, MALACOPTERYGI (Gr. malakos, soft; and pterys, a wing), or MALACOPTEROUS FISHES, one of the two primary divisions of osseous fishes in the system of Cuvier, distinguished by soft or spineless fins, the rays of which are jointed. Spiny rays are occasionally found in the first dorsal and the pectoral fins. Cuvier subdivided the malacopterygi into orders according to the position or absence of the ventral fins; malacopterygi abdominates having the ventral fins beneath the belly, as the salmon and herring; malacopterygi sub-brachiati having the ventral fins beneath the shoulder, as the cod and haddock; and malacopterygi apodes wanting ventral fins, as eels. Müller, however—followed in this by Owen and others—has separated from the malacopterygi an order of
fishes to which he has given the name of Anacants (anacanthi; Gr. spineless), differing from acanthopterygian fishes merely in the absence of spinous rays in the fins. Among the anacants are the important families gadiida (cod, etc.) and pleuronectida (flat-fish).

MALACOSTRACA (Gr. malakos soft, ostraken, shell), Aristotle's name for crustaceans. The malacostracans are now classified as a sub-class of crustacea, which comprises two divisions, edriophthalma, and podopthalma. In the first division the eyes are sessile, and the body not generally protected by a carapace. It comprises two orders, amphipoda and isopoda. The eyes are generally compound, but are sometimes simple, and placed on the sides of the head, which is nearly always distinct from the body. The typical number of feet is seven pairs. The amphipoda include the whale-louse (q.v.) and the sand-hopper (q.v.). A section of this order, lamidopoda, has been regarded as a distinct order, but the pretension has been withdrawn. In isopoda the respiratory organs are not thoracic as they are in amphipoda, but are attached to the inferior surface of the abdomen. There are two eyes formed of a collection of simple eyes, or are sometimes really compound. The young isopod is developed within a larval membrane without appendages, which after a time bursts and sets free the young, which resemble the adult in most respects, but have only six pairs of limbs instead of seven. Like the amphipoda, some are aquatic, and some terrestrial. Milne-Edwards divides the isopoda into three sections, 1, natatory, 2, sedentary, and 3, cursorial. In the first section some of the animals are parasitic, and some are not. In the second section they are all parasitic, generally within the gill chambers or upon the ventral surfaces of decapod crustaceans, as súrlins and others. The third section, the cursorial, includes the wood-louse (q.v.) and limnrias (q.v.). The second division of malacostraca, podopthalma, has compound eyes, supported upon movable stalks, and a body completely protected by a carapace. There are two orders, stomapoda (q.v.) and decapoda (q.v.), see also INVERTEBRATE ANIMALS, LOBSTER, CRAB, AND SHRIMP.

MALAGA, a modern maritime province of Spain, formed out of the ancient kingdom of Granada (q.v.), is bounded on the s. by the Mediterranean, on the e. by the province of Granada, and on the w. by that of Cadiz. Area, 2,756 sq. m.; pop. '76, 505,010.

MALAGA, a city and sea-port of Spain, capital of the modern province of the same name, is situated on the shore of the Mediterranean, 70 miles n.e. of Gibraltar. Sheltered on the n. and e. by mountains, and with a climate of which dryness and constant sunshine are the characteristics, this place is superior as a resort for invalids to any other either of France or Italy. Winter, in the English sense, is here almost unknown. Malaga is purely a place of commerce, and with the exception of some fine Moorish remains, it contains little that can be called artistic. The sea is here receding, and the Moorish dock-yard and quay are now in the town, while the beautiful Alameda, or public walk, was covered with water last century. Malaga is famous for its sweet Muscatel wines, grown on the heights in the vicinity, and the richest of which are called las lagrimas. The whole produce of the Malaga vineyards is estimated at from 35,000 to 40,000 pipes, of which about 27,000 pipes may be exported. The exports consist chiefly of wines, oil, figs, almonds, grapes, sugar, and raisins; and the imports of salt fish, iron manufactures, and colonial produce. Sugar is extensively manufactured for export, the production in 1872 being 21,960,000 pounds. Besides its legitimate trade and its valuable produce of salt, cotton, and soap, Malaga is famous on an extensive smuggling traffic with Gibraltar and Marseilles. Pop. 110,000. Malaga, known to the Romans as Malacca, is a very ancient place. It was founded by the Phenicians, and has enjoyed a commercial existence and a measure of prosperity for 3,000 years.

MALAGUETTA PEPPER. See GRAINS OF PARADISE.

MALAKANS, a religious sect in the Russo-Greek church. The name in Russian is Molocani, i.e., milk-eaters, who contrary to the rule of the eastern church take milk on fast-days. The term Malakan is a term of reproach. They prefer to be called Gospelmen. A Prussian prisoner of war settled about the middle of the last century in a village of southern Russia, and spent his time visiting from house to house, and explaining the scriptures to the people. After his death they acknowledged him as the founder of their new belief. The Malakans receive the Bible as the word of God. They believe in the doctrine of the Trinity, the fall of Adam, the resurrection of Christ, receive the ten commandments, and forbid idolatry and the worship of saints. They consider the taking of an oath sinful, and enjoin a strict observance of the Lord's day. They firmly believe in the millennium. A member of their body, Terenti Beloff, a fanatic, announced in 1883 that Christ would come in two and a half years. Many Malakans abandoned their callings, and awaited the event with fasting and prayer. Beloff believed that he himself, like Elijah, would ascend to heaven on a certain day in a chariot of fire. Thousands of Malakans came from all parts of Russia to witness the miracle. He appeared seated in a chariot, ordered the multitude to prostrate themselves, and then, extending his arms as an eagle does its wings, he sprang into the air, fell on the heads of the gazing crowds, was seized and dragged to prison as an imposter. He died soon after, insaneely declaring himself the prophet of God. But many of the Malakans still believe in his divine mission. Many of his followers afterwards emigrated to Georgia, in western Asia, and settled in sight of mount Ararat, expecting the millennium.
This sect spend whole days and nights in prayer, and have all things in common. They deny the sanctity and necessity of fasts, especially for men who have to work. They oppose popes and monks. Under the late emperor Nicholas they were severely persecuted, 16,000 men and women being seized by the police, arranged in gangs, and driven with rods and thongs across the steppes and mountains into the Caucasus. A great many fled across the Pruth into Turkey, where the sultan gave them a village called Tulcha for their residence. Dixon in his Free Russia has described this sect.

MALAKHOFF, or MALAKOFF. See SEBASTOPOL, ante.

MALAMOCO. See VENICE, ante.

MALAN', César Henri Abraham, D.D., 1787-1864; b. Switzerland; educated at the Geneva academy, and ordained to the ministry in 1810. He was at once appointed preacher to the cathedral, and a regent of the academy. The Calvinistic faith in Geneva had for some years been growing more and more rationalistic, and the presbytery of Geneva had issued an edition of the New Testament in which all passages in relation to the divinity of Christ were so changed as to bear a Socinian interpretation. Malan denounced the alterations, and took high evangelical ground; and the differences between him and the ecclesiastical authorities were so great that he left the established church in 1818. For a time he preached at his own house, but after 1820 he preached in an independent church of his own called La Chapelle du Temolnage. He was also active in many other directions. He founded a theological school at Geneva, and introduced Sunday schools into Switzerland. His followers were nicknamed MÔMIERS, which see. Malan published, among other books, Les Mômières Sont-ils Invisibles, 1828; Les Chants de l'Oiseau 1828; Le Temolnage in 1829, 1830, 1831; L'Instruction Publique, 1833; and a History of Rome, published in English at New York in 1844. He was a man whose zeal for truth, fervor of spirit, and active beneficence have left a lasting impress on his own land and through central Europe.

MALAN', Solomon CÉSAR, D.D., b. England, 1812; a son of Dr. César. He was educated at Oxford, and in 1838 went to Calcutta as professor of the classics in Bishop's college. While in India he was ordained deacon, and acted as secretary of the Asiatic society of Bengal. Soon after his return to England he was ordained priest, and made vicar of Broadwindsor in 1845, where he remained till 1871, when he became prebendary of Sarum. He has published many books, of which we may mention: A Plain Exposure of the Apostles' Creed, 1847; A Systematic List of British Birds, 1848; Who is God in China? 1855; The Gospel According to St. John, translated from the eleven oldest versions, 1862; A Pica for the Authorized Version, 1869; The Liturgy of the Orthodox Armenian Church, 1870; and Original Documents of the Coptic Church.

MALAPETERURUS (Gr. malakos, soft; pteron, a fin; and ouros, the tail) is the name given to a genus of fishes of the family siluridae (q.v.), in which in place of a true dorsal fin there is a soft fatty fin near the tail, and to this peculiarity the name is due. Two species are known, viz., M. electricus and M. beninensis. See ELECTRICITY, ANIMAL.

MÄLAREN, or MALAR, a large and beautiful lake of Sweden. It stretches westward from the Baltic, and lies between the lands of Westups, Upsala, Nyköping, and Stockholm. A peculiarity of this lake is that it consists of several small lakes connected by short channels, which inclose islands to the number of 1300. Although its length is 78 m., and the average breadth 12, hardly a clear sheet of water a mile square through the whole extent can be found. It sends out many branches to the n. and s., which extend a good distance inland. One of them extending northward is 25 m. long. All of these arms and branches are navigable for boats. It is nearly on a level with the Baltic, and numerous steamers ply to and from Stockholm, which is at the eastern extremity, on both sides of the lake. The advantages of the navigation on lake Malar have been increased by the Södertelge and Strömsholms canals. The former is 2 m. long, and opens a communication with the Baltic; the latter extends from the western end of the lake 50 m. into the interior, and leads to the region of the mines in the lake of Barken, which is 827 ft. above the sea-level. The scenery of the banks is exceedingly beautiful, and there are many villas and country-seats belonging to the residents of Stockholm.

MALARIA (Miasma, ante), bad air. There are varieties of malaria, the most common or the longest known, or written about, being miasmatic malaria, or marsh miasm, which is regarded as producing the various forms of intermittent and remittent fevers, and, as many believe, yellow fever (see the articles under these titles). Since the more systematic and microscopical investigation of various diseases, it has been shown that many other diseases, some of which are contagious, are produced by poisoned, infected, or bad air—in other words, by malaria. Air impregnated or polluted by sewer gas is the malaria productive of putrid sore throat or putrid fever (diphtheria) (q.v.), and perhaps the origin of scarlet fever. A form of fever called typho-malarial appears to be caused by a mixture of putrid malaria and marsh miasm, although most authorities do not regard it as a distinct disease, but a mixture. It is thought by some that the term malaria should be restricted to marsh miasm, saying that air which is infected with the seeds of any disease, as, for instance, small-pox, might be called malaria, as well as that which produces diphtheria or putrid fever; but it is fairly conservative and proper to regard as malaria all air which is infected by the products of organic decomposition and
putrefaction, whether vegetable or animal, and which in their origin may be so traced, although after being generated they may be contagious.

MALATESTA, the name of an Italian family settled in the Romagna. The family is said to have been founded by a count Carpegna de' Bili, whose violence got him the name of malo testa, i. e. "bad head." Their principal branch was the ruling family of Rimini, of which Malatesta, count of Verrucchio, had possessed himself in 1295. He was an active Guelf in the sea. Innumerable rivers flow e. and w. from the mountains, forming bars at their mouths that render them of little value for navigation or harbors. The country between the mountains and the sea is considerable table-land, of fair fertility, and well timbered. But the timber is not of species possessing greatest commercial value. Ebony, sapan, eucalyptus, and the canes of commerce known as Malacca, are the principal. Dense jungles, the broken character of the surface, and occasional swamps, make the country difficult to explore. The Perak on the w., and Pahang, are the largest rivers. There is a small lake between the latter and the English settlement of Malacca. The products of the forests, besides those timbers already named, are caoutchouc, gutta-percha, cocoa-nuts, gums, spices, and resins. The products of the soil are rice, tobacco,
sugar-cane, coffee, cotton, bananas, yams, pine-apples, durians, and the mango—two latter large fruits. Tin mines have been worked in the mountains, but the mining is not prosecuted with increasing production; gold has been found in limited quantities.

The mean annual temperature near the sea is about 80°. There is no winter or rainy season, but rains fall frequently throughout the year, so that the climate is uniformly hot and moist, and subject to frequent fogs and heavy dews. The annual rainfall is about 100 inches. Where the land is swept by sea breezes the climate is healthful. The districts peculiarly subject to malarial disease of a virulent type are local, and are apt to be contiguous to fresh-water streams or marshes. The animals of the peninsula are numerous. There are eight species of the cat family, the largest the tiger and the leopard, both of large size, numerous, and dangerous. The Indian elephant is here indigenous, and two species of rhinoceros. The buffalo is a native, and is domesticated for riding and draught. Besides the domestic ox there are two species of wild ox peculiar to the peninsula; a wild and a domestic goat; three species of deer; one small bear; ten species of monkey; and the ant-eater. The bats are the most peculiar of all the animals of the peninsula; one of them, the kalung, or vampire, being larger than a crow, flies high in great flocks, and is destructive of fruit. Sheep, hogs, and some varieties of foreign fowls have been introduced and acclimated. Of birds there are some of great beauty. The marak, or wild peacock, the double-spurred peacock, and several species of pheasant are the most remarkable for their plumage. Partridges, snipe, sun-birds, woodpeckers, wild cock, pigeons of numerous species and great variety of size, a brilliant variety of parrots, and kites and hawks abound. Of reptiles there are forty species of snakes, several of them poisonous, particularly the cobra; and the alligator, iguana, and lizards. Fish are abundant and among the finest flavored in the world. They constitute the main food of the Malays. cocao, tobacco, and tobacco, are grown on the coast. Shells, however, do not contain animals valued for food are large, beautiful, and numerous.

The population of the peninsula is estimated at 500,000, but this is little better than a guess. It is pretty near the geographical center of population of the Malayan race, who occupy all its shores, though in the n. part, and especially away from the coast, the Siamese are numerous, and some negroes are found in the interior. The northern part of the peninsula is under the dominion of the king of Siam; the southern has mostly fallen under the sway of the British, whose colony of Malacca (see MALACCA) on the s. coast, and Singapore near the s. point, are the local centers of its power. The Dutch ceded the settlement of Malacca and Singapore to the English in 1824, in exchange for concessions in Sumatra and elsewhere. The Malays have been too long renowned for their daring as navigators, and their aggressive piracy, not to have won the consideration of all nations which have come to greatness through the same manifestations of barbarian vigor. Their cruelty and treachery are probably not greater than the cruelty and treachery of European peoples in the centuries succeeding the dark ages; and remembering that the vast and intricate coasts of the islands and countries occupied by the Malays invited all their enterprise to be expended in maritime excursions, and that a forbidding wilderness of jungles and wild beasts repelled enterprise inland, it may not be unfair to place them in the same category of bold rovers as the pirate Norsemen and Danes of our own English ancestry. As to the excessive treachery which has always been attributed to them it is hardly probable that so widespread an opinion is without good basis of fact. Yet those who have of late years had good means of studying their characteristics report that, under kind treatment and fair dealing, they are "transformed into an entirely different character, displaying gratitude, affection, fidelity, and higher sentiments of honor than are found among any other class of natives in India." The vigor and energy of the Malaya as seamen and pirates have for centuries made them the terror of the more peaceful East Indians and Mongolians, as well as of the Europeans engaged in commerce with the east. A portion of the inhabitants of the coasts lived at sea rather than upon the land. Their boats, from 20 to 50 ft. in length, were arranged for cooking near the prow, their fishing and other conveniences in the middle, and the sleeping-room in the stern. Thus, with fish for their principal food and the fruits of the shores to be had for the seeking, roving became their daily life, and piracy the natural enterprise of the warlike—as it is of the warlike everywhere—by land or sea. The more civilized of the natives are Mohammedans; the others are pagans of many shades. The former claim to be descended from Malays of Sumatra who migrated into or invaded the peninsula in the 11th or 12th c., and drove the former inhabitants into the mountains. Mohammedanism took root here in the 13th c., and Malacca was the capital for rulers who had embraced Mohammedanism from the year 1376. In the 15th c. the peninsula was an appanage of the king of Siam. In 1511 the Portuguese, under Albuquerque, overthrew the Malayian sultan, and asserted Portuguese dominion.

MALAYS (properly, MALAYUS, a Malay word, the derivation of which has not yet been satisfactorily ascertained) is the name given, in a restricted sense, to the inhabitants of the Malay peninsula, but in its wider acceptation, to a great branch of the human family dwelling not only in the peninsula mentioned, but in the islands, large and small, of the Indian archipelago, in Madagascar, and in the numerous islands of the Pacific. In the fivefold division of mankind laid down by Blumenbach, the Malays are treated of as a distinct race, while in the threefold division of Latham they are
regarded as a branch of the Mongolide. Prichard has subdivided the various representatives of the Malay family into three branches, viz. (1), the Indo-Malayan, comprehending the Malay proper of Malacca, and the inhabitants of Sumatra, Java, Celebes, the Moluccas, and the Philippines, with whom, perhaps, may be associated the natives of the Caroline islands and the Ladrones; (2) the Polynesians; and (3) the Madecasses, or people of Madagascar. Accepting this subdivision, we shall, in the present article, confine ourselves to the Malay proper—the natives of Madagascar having been already noticed under that heading; and reserving the Polynesians generally and the Maoris in particular for distinct articles.

In physical appearance, the Malays are a brown-complexioned race, rather darker than the Chinese, but not so swarthy as the Hindus. They have long, black, shining, but coarse hair; little or no beard; a large mouth; eyes large and dark; nose generally short, but rather thicker than those of the Europeans. In stature the Indo-Malays are for the most part below the middle height, while the Polynesians generally exceed it. The Indo-Malays have also slight, well-formed limbs, and are particularly small about the wrists and ankles. "The profile," according to Dr. Pickering, "is usually more vertical than in the white race, but this may be owing in part to the mode of carriage, for the skull does not show a superior facial angle." Such is the general appearance of the Malays proper, or inhabitants of the peninsula and Indian islands. But these also have their subdivisions. There are the civilized Malays, who have a written language, and have made some progress in the arts of life; then there are the sea-people, orang-laut, literally, "men of the sea," a kind of sea-gypsies or robbers; and there are the orang-bawan, or orang utan, "wild men," or "sages," dwelling in the woods or forests, and supposed to be the aborigines of the peninsula and islands. "These three classes of Malays," says Crawfurd, "existed nearly three centuries and a half ago, when the Portuguese first arrived in the waters of the archipelago, just as they do at the present day. That people describes them as having existed also for two centuries and a half before that event, as, without doubt, they did in times far earlier." Still, while so widely differing in habits, all these speak essentially the same language. The Malays are essentially islanders, and have much of the daring and enterprise for which nations familiar with the sea are famous. Their original seat is by themselves stated to have been Menangkabo, in the island of Sumatra, rather than the peninsula itself. Even the Malays of Borneo claim to have had a Menangkabo origin. Palembang, however, also in Sumatra, has been mentioned as the original seat of Malay civilization; and others, again, point to Java as the source from which both Menangkabo and Palembang received their first settlers. "The Javanese," says Crawfurd, "would seem to have been even the founders of Malacca. Monuments, which prove the presence of this people in the country of the Malays, have even been discovered. Thus, sir Stamford Raffles, when he visited Menangkabo, found there inscriptions on stone in the ancient character of Java, such as are frequent in that island; and he was supported in his conclusion that they were so by the learned natives of Java who accompanied him in his journey. The settlement of the Javanese in several parts of Sumatra is indeed sufficiently attested. In Palembang they have been immemorially the ruling people; and although the Malay language be the popular one, the Javanese, in its peculiar written character, is still that of the court." The Malay language is simple and easy in its construction, harmonious in its pronunciation, and easily acquired by Europeans. It is the lingua franca of the eastern archipelago. Of its numerous dialects, the Javanese is the most refined, a superiority which it owes to the influence upon it of Sanskrit literature. Many Arabic words have also been incorporated with it, by means of which the Javanese are able to supply the deficiency of scientific terms in their own tongue. In religion the civilized Malays are Mohammedans, having embraced that faith in the 13th or 14th century. The tribes in the interior and the "men of the sea" have either no religion at all, or such as can be regarded only in the light of most debased superstition. The oral character of the Indo-Malays generally does not stand high; they are passionate, turbulent, quarrelsome. As sailors, they are a great deal more venturesome and able to acquire wealth by legitimate commerce, they prefer piracy, and numerous have been the victims among European traders to Malay treachery and daring. Indeed, so little faith have Europeans in their professions or engagements, that they will never engage more than two or three of them in a ship's crew, for fear of unpleasant, if not disastrous, consequences.

MALAYS (ante) (Mal. lajo, Javan, orang malayu, traveling men, emigrants), a branch of the Mongoloid race which gives name to a large linguistic family, the Malayo-Polynesian. Stretching from Easter island to Madagascar, and from New Zealand to the Northern Sandwich islands, it covers about 13,000 by 5,000 miles. From the island of Hainan as a center, a curve may be described which will fall inside Borneo and cut across the Malay peninsula. If another circle be roughly drawn from Saigon as a center, including Formosa, the Philippines, Celebes, cutting Sandalwood island, and taking in the Sunda groups, including Java and Sumatra, the half-moon so formed shows the extent of the true Malay race, and thence the allied dialects spread out like a fan toward Hawaii and New Zealand. This eastern area is cut across by the Papuans, or Australians and Melanesians, from New Zealand to the Ladrones, and from New Guinea to
the eastern Fijis. To the west of the Malay archipelago, southern Ceylon, the Maladirs, and the Seychelles show the probable line of settlement toward Madagascar. It seems at present undetermined how much or how little Malay blood be present in the brown islanders, Polynesians. Wallace, probably best informed of all, considers the Papuans and Polynesians as one in race. Peschel thinks the Australians Papuans of a debased type, and the Sandwich islanders half-blood Malays. Certainly the men of the Ladrones are half-breeds, and there is a distinct mixture of races all along the curve of contact, so that brown men, as in Papua, are mixed with true Papuans, and black Fijis speak a Polynesian dialect. The whole subject can be rightly understood only by a study of the very curious distribution of the fauns, and of the complicated ocean currents. Wallace, in separating these races, thus describes the Malay by contrast: "The Malay is of short stature, brown-skinned, straight-haired, beardless, and smooth-bodied. The Papuan is taller, black-skinned, frizzly-haired, bearded, and hairy-bodied. The former is broad-faced, has a small nose and flat eyebrows; the latter is long-faced, has a large and prominent nose, and projecting eyebrows. The Malay is bashful, cold, undemonstrative, and quiet; the Papuan is bold, impetuous, excitable, and noisy. The former is grave and seldom laughs; the latter is joyous and laughter-loving; the one conceals the emotions, the other displays them. It would seem that the Malays are a nation of emigrants, who have penetrated as far south-east as New Guinea, yet there seem no traces of an indigenous population. The small and barbarous black race, said to occur at various points within the Malay limit, may easily be explained as etiolated and roving Papuans, like the Australians, while the Alfuros and other supposed differing tribes are probably only brown types of half-breeds. The black races of India differ both in language and physique, notably in the hair. There are indications that the original home of the Mongolid races, which stretch from Syria to east Greenland and from Cape Horn to north Norway, may have been in some of the large islands of the Sunda group. The few Malay traditions locate a former seat of power at Menang Kaibo in Sumatra. How far Brahmanism penetrated, if at all, is doubtful, but Buddhism was introduced probably about the 5th c., and, about the end of the 13th, Islam. Nearly at that time they settled in the Malay peninsula, and started a strong government in Malaccas, which was finally broken up by the Portuguese in the 16th century. To some 2,000,000 the relative religious proportions are now about as: Evangelical Christians, 7; Roman Catholics, 88; Mohammedans, 800; Buddhists, 60; Pagans, 45. Their language is the lingua franca of east Asia, and they penetrate everywhere as traders and pirates. Travelers differ as to their character, some representing them as gentle and polite, others as treacherous and quarrelsome; both views may not be far from the truth, the ruling races in the settlements being lazy and enervated, while many of the wild tribes are so uncivilized as to have been taken for different races. The Battaks are still partly cannibals.

The linguistic relations are thus tabulated:

**MONGOLID RACE.**

**MALAY-POLYNESIAN FAMILY.**

**POLYNESIANS,**

The Malay tongue (bahasa jawi, majarevatu, to talk Malay) is probably a dialect of north Sumatra, of which Jawa is the old name. The old literary alphabet is the Kawi, probably formed from Pali, through either a Birmani or Siamese medium, about the 6th c., is neither crumpled like the one nor rounded like the other, but is easily recognized by its square and nearly identical letters. They are h, n, ch, r, k, d, t, s, w, l, p, d thick, dh, ny, m, g, b, t thick, ng, rl, lr. Vowel sounds: a, e as in but, i, u as in boot, e as in cane, o, au as in now. Originally there were less than a dozen, with few or no aspirates or fricatives, but with the nasals. It is now written in a peculiar Arabic Neskhii, with 29 consonants and 8 vowel sounds. Other alphabets of the family are in Bugi, Manhkasar, Celebes, a new one self-evolved by the Battaks, and one in the Philippines which resembles most a true Indian. Malay literature is rich, but little original.

There is a romantic and mythological poem, founded as usual on the Mahabharata; plays and recitations like the Siamese; love songs and popular songs, simple and most
interesting of all; and tales from the Arabic and Sanskrit, including animal-myths, in which the jackal (Sans. srighala) plays the chief rôle. The Malay is not an isolated language, yet it has not now the usual flexibility of an agglutinating one, nor must the reader ever expect in such a tongue the idea of either time or regimen; the verbs appear under aspects, as in Russian, and the nouns in relation, as in Hebrew. Roots, supposedly one syllabled, are enlarged by affixes, strong consonants being precessed and the three nasals inserted or substituted whenever possible. Vowel change plays a great rôle, evolving, with precession, sometimes a dozen words. Interior contraction is the rule. Doubling, however, happens is is carried to its limit; either of the whole word with or without modification; with initial change; with a play upon similar syllables like Basque, or with insertion of a preposition. Prepositions are partly prefixed, partly suffixed, and it is not always easy to say whether they influence most, or exactly in what way, a noun or a verb, as in so-called Semitic participles. Much the same may be said of pronouns. On the whole, the language is easy, soft-sounding, with a nasal clang, and a great capacity for crude metaphor in plays upon words and expressions of complicated relations. Authorities: W. v. Humboldt, Ueber d. Kawi-spr. (1840, 3 vols.); Fr. Mueller, Ueb. d. Urspr. d. Schrift d. mal. Voelker, Bd. W. Akad (1855); Waltz, Anthropol. d. Wallace (1876, 2 vols.); The Science of Language, A. Horcaque (1877, 1 vol.).

MALBONE, EDWARD G.; 1777–1807; b. Newport, R. I.; at the age of 17 resided in Providence as a portrait-painter; removed in 1796 to Boston and pursued his profession with success; accompanied Washington Allston to Charleston in 1800, and sailed for Europe in 1801; met in London, Benjamin West, president of the royal society, who urged him to make that city his permanent residence; but he returned to Charleston. For several years he traveled extensively in the United States, and painted miniatures in the chief cities; visited the West Indies in 1806 for his health. His best picture is "The Hours," the present, past, and future, being represented by three female figures.

MALCOLM, the name of four kings of Scotland. Malcolm MacDonald succeeded to the throne on the abdication of Constantine MacAodh in 944 A.D. The most important event of his reign was the cession of Cumbria, in 946, by the English monarch Edmund I. Malcolm was slain while engaged in quelling a revolt in the north of Scotland, in 953 A.D.

Malcolm MacKenneth, grandson of the preceding, ascended the throne in 1003. His life was passed chiefly in repelling the incursions of the Danes. He died in 1033. A collection of laws, the Leges Malcolmi MacKenneth, has been attributed to him, but is obviously a work of a later age.

Malcolm MacDuncan, surnamed CANMORE (Celtic, Can-more, "Great Head"), was born about the year 1024, and ascended the throne on the death of Macbeth MacFinlegh, in Dec., 1056, or of Lulach MacGilcomgain, in April, 1057. For the first nine years of his reign, Malcolm was at liberty to devote his energies to the consolidation of his kingdom, England being then ruled by the peaceful Edward the confessor. After William of Normandy had settled himself on the English throne, many noble Saxons sought refuge at the Scottish court, and among them Edgar Atheling, nearest of kin to the confessor, with his mother Agatha, and his sisters Margaret and Christina. Margaret, who was young, beautiful, and pious, captivated the heart of the Scottish king, and a marriage quickly followed. Her biographer, Turgot (also her chaplain and confessor), tells us how earnestly and affectionately she labored to civilize the people and to "enlighten" her husband. Malcolm, although a man of vigorous intellect, could not read her missals and books of devotion, but he used to kiss them in token of reverence, and he caused them to be richly bound, and ornamented with gold and jewels. The retinae of the king began to show something of a royal magnificence, and his plate was, according to Turgot, "at least gilt or silvered over." But Malcolm's new relations, unfortunately, embroiled him with the Normans. In 1070 he crossed the border, harried Northumberland and Yorkshire, but was soon obliged to retreat. William the conqueror retaliated in 1072, and wasted Scotland as far as the Tay. At Abernethy, Malcolm was compelled to acknowledge him as his liege lord but (as the Scottish historians hold) only for such parts of his dominions as had belonged to England—viz., Cumbria and the Lothians. War broke out again between England and Scotland on the accession of William Rufus, probably at the instigation of the fugitive Anglo-Saxons and the discontented Normans, who had been pouring into the country during the iron reign of William. He had obtained large grants of land from the Scottish monarch. Nothing of note, however, happened, and peace was again concluded; but the sense of injury, caused by the English king not long after provoked a fresh rupture, and, in 1093, Malcolm again crossed the border, and laid siege to Alnwick; but while so engaged, he was suddenly attacked, defeated, and slain, Nov. 13, 1093. His wife died immediately on hearing the fatal news.

Malcolm, surnamed "The Maiden," grandson of David I., succeeded that monarch, May 24, 1153, when only in his 12th year. He had no sooner mounted the throne than a Celtic insurrection, headed by Somerled, lord of the Isles, broke out. Some years after, another insurrection broke out among "the wild Scots of Galloway," under their
chief Fergus, to crush which Malcolm had to employ a large force. In 1161 he had to chastise a revolt of the men of Moray, and to put down a second rebellion of Somerled. He died at Jedburgh, of a lingering disease, Dec. 9, 1165, at the early age of 24.

MALCOLM, Sir John, G.C.B., a British statesman and historian, was b. at Burnfoot, parish of Westerkirk, Dumfriesshire, May 2, 1769, and at the age of 14 went to India as a cadet in the Madras army. About 1790 he commenced to devote his leisure hours to the study of the oriental languages, especially Persian. He distinguished himself at the siege of Seringapatam in 1792, and was appointed to the staff as Persian interpreter. In 1800 he was sent as ambassador to Persia, to form an alliance with that country against Bonaparte, in which he succeeded. In 1802, 1807, and 1809 he was again sent as minister-plenipotentiary to the Persian court; and shortly before his final return, received from the shah the order of the "Sun and Lion," and the titles of "Kahn" and "Sepahdar of the Empire." In 1806 he had been appointed president of Mysore; and during the two following years administrative talents had been of most important service to the government in reducing to order and tranquility the newly conquered Malratta states. In 1812 he returned to England, received the honor of knighthood, and, after a lapse of five years, returned to India as the governor-general's political agent in the Deccan, and with the rank of brig. gen. in the Indian army; in the latter capacity he greatly distinguished himself in the wars against the Pindaries and Holkar. In 1827 he was appointed governor of Bombay, but finally left India in 1830. He died of paralysis at Windsor, May, 1833. Malcolm's writings are highly esteemed as authorities; they are: A History of Persia (London, 1815, 2 vols. 4to; 2d ed. 1828); Memoir of Central India (2 vols. London, 1829); Political History of India from 1784 to 1823 (2 vols. 8vo. 1829); and Life of Lord Clive (London, 1830), a posthumous work. The life and correspondence of Malcolm were published by John W. Kaye, in 2 vols. 8vo. (London, 1850).

MALCOM, Howard, D.D., LL.D., 1799–1879; b. Philadelphia; graduated at Dickeyson college in 1817; studied theology at Princeton seminary; was ordained, and settled as pastor of a Baptist church at Hudson, N. Y. In 1825–36 he traveled extensively in behalf of the American Sunday-school Union in whose organization he took a prominent part; in 1827 he was pastor of the Federal Street Baptist church, Boston; in 1833 he was sent to visit the Baptist missions in India, Burmah, Siam, China, and Africa; in 1839–49 was president of the college at Georgetown, Ky., and of the university of Lewisburg, Penn., in 1851–59, acting also as professor of mathematics and moral philosophy in both institutions. On account of throat disease he left the university and retired to Philadelphia. In 1841 he received the degree of D.D. from the university of Vermont and Union college, N. Y., at the same time, and of LL.D. from the Lewisburg institution after his resignation. He was one of the founders of the American tract society, and a vice-president from the beginning. He published a Dictionary of the Bible, which was often reprinted in this country and in England; Travels in South-eastern Asia; Index to Religious Literature; Nature and Extent of the Atonement; The Christian Rule of Marriage; Memoir of Mrs. Malcolm; edited also The Invitation of Christ; Robert Halil's Help to Zion's Travelers; Law's Serious Call; Butler's Analogy of Religion, with introduction, notes, etc. He has published also several addresses, and contributed many papers to periodicals.

MALCZEWSKI, Antoni, 1792–1826; b. Poland; educated by a French private tutor at his home in Dubno, and subsequently a student at Krzemieniec, where he showed a decided aptitude for mathematics. In 1811 he entered the Polish army in the hope of gaining a position which would enable him to marry a cousin with whom he had fallen in love—the family estate, impoverished by his father, a gen. in the Polish army, had afterwards in the Russian army, being insufficient to justify him in marrying. She married, however, a richer man, in 1812, and Malczewski's character seems to have derived from this disappointment a misanthropy, which is manifest in all his poetry. When Russia took possession of Poland he received an appointment on the suite of Alexander II., but in 1816, in consequence of a duel, left the army and spent the next five years in travel in Switzerland, Italy, and France. In 1821 he settled on a farm in the Ukrains, and during his residence there devoted himself to the study of his native language, which he had long neglected for the French. He had spent what property he had during his travels, his farming experiment proved a failure, and he was dependent on the charity of his landlord for the lodgings in Warsaw where he died. His poem Maria, in two cantos, was published at Warsaw shortly before his death. It had been written at his farm in the Ukrains. Received with entire neglect at first, then attacked on the score of its deficiencies in language and versification, it finally took a place in popular favor second only to some of the works of Mickiewicz.

MALDAH, a t. of British India, in Bengal, the chief t. of a district of the same name, is situated on the left bank of the Mahanand, about 190 m. n. of Calcutta. In the rainy season it is nearly insulated. It is a wretched place, consisting of ruined houses, forming narrow, irregular streets. Pop. '71. 5,262.

MALDEGEM, a small manufacturing t. of Belgium, East Flanders, 17 m. n.w. of Ghent. Population upwards of 6,000, who are employed in the manufacture of tobacco, and in brewing and cotton-printing.
MALDEN, a t. of Middlesex co., Mass., 4 m. n. of Boston, on the Boston and Maine railroad; pop. 7,367; the Malden river furnishes water-power for several factories. There are 2 weekly newspapers, 2 banks, and hotels, schools, etc. It is one of the suburbs of Boston, and has attracted from that city a fine class of business men, who find it a pleasant home.

MAL' DIVE ISLANDS, a chain of low coral islands in the Indian ocean, about 400 m. w.s.w. of Ceylon. They extend 500 m. in length by 45 m. in average breadth, and consist of 17 groups or atolls, each atoll surrounded by a coral reef. The entire number, including the islets, is estimated at about 50,000. Malì, the largest of the chain, and the residence of the native prince, who is called "the sultan of the twelve thousand isles," is 7 m. in circumference, and contains a population of 2,000. The population of the whole chain is estimated at 150,000. Each island is circular in form, with a lagoon in its center, and has an elevation above the sea in no case of more than 29 ft. at high-water mark. The larger and inhabited islands are clad with palm, fig, citron, and bread-fruit trees. Grain is also abundantly produced. Wild-fowl breed in prodigious numbers; fish, rice (imported from Hindustan), and cocoa-nuts constitute the food of the inhabitants, who are strict Mohammedans. The "sultan" sends an annual tribute to the governor of Ceylon.

MAL'DON, a market t., river port, and municipal and parliamentary borough of England in the county of Essex, a mile below the confluence of the Chelmer and the Blackwater, and 9 m. e. of Chelmsford. Besides the manufacture of crystallized sugar, making, burning, and iron-making, and the usual branches of industry connected with a port are carried on. In 1872, 1189 vessels (67,161 tons) entered, and 805 (36,144 tons) cleared the port. Since 1867 Maldon returns only one member of parliament. Pop. '71, 5,586.

MALEBRANCHE, NICOLAS, a French philosopher, b. Aug. 6, 1638, at Paris, where his father was president of the chamber of accounts. He was deformed and sickly, and from his childhood fond of solitude. At the age of 22 he entered into the congregation of the oratory, and devoted himself to the study of Bible history and of the fathers of the church till Descartes's treatise, De Homine, falling into his hands, attracted him to philosophy. His famous work, De la Recherche de la Vérité (3 vols. Paris, 1674, and other editions), displaying great depth and originality of thought, combined with perspicuity and elegance, had for its object the psychological investigation of the causes of the errors to which the human mind is liable, and of the nature of truth and the way of reaching it. He maintains that we see all things in God (his famous Vision en Dieu); that all beings and thoughts exist in God (Dieu est le lieu des esprits, comme l'espace est le lieu des corps); and that God is the first cause of all changes which take place in bodies and souls, which are therefore merely passive therein. His system is a kind of mystic idealism. It was immediately opposed by Ant. Arnauld, Bossuet, and many others, and was subjected to a thorough and critical examination by Locke and Liebmitz. Besides the work above mentioned, Malebranche wrote a Traité de Morale, a Traité de la Connaissance humaine, a Traité sur la connaissance des passions, and a Traité sur l'interprétation des États, which contain in the last of which he endeavored to exhibit the harmony of his philosophic views with Christianity. He died at Paris (as English critics are fond of saying) of a dispute with the subtle Berkeley, Oct. 13, 1715.

MALE FERN. See Fern, Male.

MALEHERSES, CHRÉTIEN GUILLAUME DE LAMOIGNON DE, a distinguished French statesman, was b. at Paris, Dec. 6, 1721, and educated at the Jesuits' college; he became counselor to the parliament of Paris in 1744, and succeeded his father as president of the court of Aids in 1750, where his clear judgment, strict integrity, and humane disposition enabled him to be of great service to his country. A quiet but determined opponent of government rapacity and tyranny, he watched the ministry with a jealous eye, and was indefatigable in his efforts to prevent the people from being plundered. About the same time (1750) he was appointed censor of the press. This was a most unsuitable office for him, but he appears to have accepted it lest it should fall into the hands of some mere bigot or court hireling; and so tolerant was he that French authors pronounce the period of his censorship "the golden age of letters." To Maleheres we owe, among other things, the publication of the famous Encyclopédie. In 1771 his bold remonstrances against the abuses of law which Louis XV. was perpetrating, led to his banishment to one of his estates. At the accession of Louis XVI. (1774), who esteemed Maleheres, he was recalled and entered Paris in triumph. In 1778 he resigned, on the recall of Turbigo, his official employment, and from this period on to the revolution, spent his time in travel or in the improvement of his estates. The first storms of that wild period passed by and left him unscathed; but when he heard that the unfortunate king, who had always neglected to profit by his advice, was about to be tried by the convention, he magnanimously left his retreat and offered to defend his old master. The convention granted permission, but from that day Maleheres was himself a doomed man. He was arrested in the beginning of December, 1793, and guillotined April 22, 1794 along with his daughter and her husband, M. de Chateaubriand, brother of the famous author of that name. Maleheres was a member of the French academy, an able writer.
on political, legal, and financial questions, and one of the most virtuous and high-minded statesmen of the 18th century.

MALET, Claude François de. See Mallet, ante.

MALHERBE, François de, 1555-1628; b. Caen, France; son of an untitled magistrate. His education was begun at Caen, continued in Paris, and completed by travel under the tuition of a Calvinist, Richard Dinoth, who accompanied him to Heidelberg and Basle. But religious instruction irritated him. He broke with his father, who was a Calvinist, and found favor with Henry, due d'Angoulême, to whom he became private secretary at Aix. He was already noted for his critical taste in poetry, though not for his own productions, and acquired a fame for the piquant ill-nature of his wit. Naturally it brought him ill fortune, and for many years after the death of his patron he suffered for means to live. His poem Larmes de St. Pierre, published in Paris in 1587, was his first noted work. Near 1600 the attention of Henry IV. was attracted to the poet, who soon after was called to the court, and from that time ranked as the first poet of France. Avarice, wit, in epigram and verse, and terse forms of expression, were his characteristics.

MALIBRAN, Maria Felicita, one of the most celebrated mezzo-soprano singers of recent times, b. at Paris, Mar. 24, 1808, was the daughter of Manuel Garcia, a Spanish singer and teacher of singing. When she was still very young her reputation extended over Europe. Her father attempted to establish the Italian opera in New York, but without success; and, on account of his circumstances, she married M. Malibran, a Frenchman, who was supposed to be one of the richest merchants of that city, but who soon became bankrupt, on which she went again upon the stage, and was received with great enthusiasm in France, England, Germany, and Italy. She expended, with remarkable benevolence, the great sums which she won. Her first marriage having been dissolved, she married M. Beriot, a famous violinist, in 1836; but in September of that year she died at Manchester, whither she had gone to take part in a musical festival. Malibran was a woman of great heart and high intellect, and her universality possessed an exquisite fascination. She has left a number of musical compositions, some of which are deservedly popular. A memoir of her was published in England shortly after her death, by the Countess of Merlyn.

MALIC ACID (C₄H₂O₄·2H₂O), so called from malaum, the Latin word for an apple, occurs abundantly in most acidulous fruits, particularly in unripe apples, gooseberries, and currants, in which it is found as an acid or super-salt of potash or lime, which gradually changes into a neutral salt as the fruit ripens. It crystallizes in groups of radiating acicular prisms, but, as the crystals are very deliquescent, it is usually obtained as a syrupy, semi-transparent mass, with a very sour smell, and readily soluble in water and alcohol.

The chemical changes which this acid undergoes under the influence of various agents are very singular, and serve to illustrate many points in vegetable physiology in reference to the maturation of fruits, etc. Thus, nitric acid converts it into oxalic acid; hydrated potash, into oxalic and acetic acids; ferments, into succinic, butyric, acetic, and carbonic acids and water. When heated to about 350° it loses the elements of water and becomes converted into the two isomeric acids, maleic acid and fumaric acid (q.v.). Maleic acid forms two series of salts with bases, namely, neutral and acid salts. The most characteristic of these salts are the neutral malates of lead and of lime.

MALICE. While malice, in its ordinary sense, means an evil disposition or state of mind of one person towards another, in law it denotes the intent or purpose which precedes and causes an unjustifiable, illegal act. Malice, in law, is not confined to a particular intent of an act to the injury of a particular person, but to a general intent of injury preceding the unlawful act; thus, if one shoot A., intending to shoot B., he is nevertheless guilty of murder with malice prepense. Malice, in law, is divided, for convenience of proof, into express and implied. Express malice is where the defendant's intent to commit the crime is directly proved; implied malice is where the intent to commit the crime is presumed by the law from the facts, and where a defendant is shown to have intended an act, he is presumed to have intended all the consequences of that act. In the law of torts, malice means the unjustifiable commission of an act injurious to another.

MALICIOUS PROSECUTION, a prosecution, either criminal or civil, by regular process of law, unwarranted by the proved facts, and instituted without probable cause. As the person against whom such prosecution has been brought has been arrested or imprisoned if it were by criminal suit, and has been put to expense if it were by civil suit, he has a right to sue, and, if he can establish the groundlessness of the prosecution, to recover from the person who instituted it. The person who brings an action for malicious prosecution must show that the former action was groundless and is at an end; that it was conducted in regular course of law before a court of competent jurisdiction; and that it was malicious and without probable cause. Probable cause exists when there were such circumstances as would properly justify a man of sound discretion and reason in believing that the defendant committed the act for which the prosecution was begun. In the absence of probable cause, malice will be inferred; but if it be con-
clavishly shown that the prosecutor acted in good faith, evidence of actual malice must be given. But, on the other hand, if probable cause be shown, proof of actual malice will not maintain an action. The guilt or innocence of the person prosecuted does not affect the question of probable cause, which depends upon the evidence of the existence, in the prosecutor’s mind, of a belief, founded upon reasonable grounds, of the guilt of the accused person. What constitutes probable cause is a mixed question of law and fact; that is, if there be no dispute as to the facts, the court decides whether those facts constitute probable cause; but if the facts are disputed, the jury are to find the facts, under instruction from the court as to what facts are sufficient to make out probable cause.

MALIGNANT DISEASES, a name applied to those affections of the animal system characterized by a disposition to the formation of products which have the power of propagation at the expense of the normal tissues, or which so poison the blood that it soon becomes unfit to maintain life. Some of these diseases are tumors (q.v.), and come within the province of the surgeon, while others are the subjects of the physician. The principal malignant tumors are cancer (q.v.), and there soon appears a pustule or vesicle, seated on a hard, inflamed base. When this is opened, a black slough becomes apparent. This sloughing spreads rapidly, involving the cellular tissue, and sometimes even the adjacent muscles. The disease appears to be caused by infection from horned cattle, which are sometimes affected by a similar disease, but it also arises by inoculation of diseased fluids. It is believed that flies which have alighted on the ulcers of diseased animals may occasionally convey the infection. The constitutional symptoms are much the same as those of putrid typhus fever; while the treatment consists in destroying the diseased surface by powerful caustics, in keeping up the strength by wine, brandy, beef-tea, bark with nitric acid, etc.; and in giving opiates in sufficient doses to relieve the pain during the day and to procure sleep at night.

MALIGNANT PUSTULE is a contagious and very fatal disease, common in France; where it bears the name of charbon, but of comparatively rare occurrence in England. It begins as a small, dark-red, painful spot, on which soon appears a pustule or vesicle, seated on a hard, inflamed base. When this is opened, a black slough becomes apparent. This sloughing spreads rapidly, involving the cellular tissue, and sometimes even the adjacent muscles.

The disease appears to be caused by infection from horned cattle, which are sometimes affected by a similar disease, but it also arises by inoculation of diseased fluids. It is believed that flies which have alighted on the ulcers of diseased animals may occasionally convey the infection. The constitutional symptoms are much the same as those of putrid typhus fever; while the treatment consists in destroying the diseased surface by powerful caustics, in keeping up the strength by wine, brandy, beef-tea, bark with nitric acid, etc.; and in giving opiates in sufficient doses to relieve the pain during the day and to procure sleep at night.

MALIGNANT TUMORS. See Cancer and Tumor.

MALINES, or Mechlin, one of the chief cities of the Belgian province of Antwerp, 15 m. s.s.e. of the city of that name, on the navigable river Dyle. The pop. was, in 1876, 39,029. It has fine squares, noble buildings, and wide, regular streets, but is devoid of all signs of life and industry, having lost its former greatness, and fallen far behind all other Belgian cities in commercial enterprise and industrial activity. As the see of the cardinal-primate of Belgium, it still retains a certain degree of ecclesiastical importance, and possesses numerous churches, the most noteworthy of which is the cathedral of St. Rumuald, a vast building, covering nearly two acres of ground, and adorned in the interior with many fine pictures and choice carvings. It was built between the 13th and 15th c., but one tower, 945 ft. In height, remains unfinished. The other objects most worthy of notice are the churches of St. John and of Our Lady, which contain works by Rubens; the town-hall, dating from the 13th c., and known as the Beyard; the market hall, an ancient building, with towers, erected in 1340, and now used as a guard-house; the splendid modern archiepiscopal palace; and the monument to Margaret of Austria, erected in 1849. Malines has two clerical seminaries, an academy of painting, a gymnasium, and a botanical garden. It still retains some of the important lace manufacturies, for which it has been long noted, and manufactures caps and women clothes, besides having considerable breweries. Malines constitutes an important central point of junction for the entire Belgian system of railways.

MALINGERING, a term derived from a similar French word, signifies the feigning of disease, in order to avoid duty. This offense is punished very severely in the British army. For further particulars, see Feigning of Disease.
MALL, or PALL-MALL (pr. Pell-Mell), a name given to places in London and other English towns where there were once alleys for playing tennis. See BALL.

MALLARD. See Duck, ante.

MALLEABILITY is the property which certain metals possess of being reducible to thin leaves, either by hammering (hence the corresponding German word, Hammerbarkeit) or by laminating between rollers. The order in which the malleable metals exhibit this property is as follows: gold, silver, copper, platinum, palladium, iron, aluminium, tin, zinc, lead, cadmium, nickel, cobalt. Gold far surpasses all the other metals in malleability, being capable of reduction into films not exceeding the 200,000th of an inch in thickness; and silver and copper may be reduced to leaves of great tenuity. Although gold and silver also present the property of ductility (q.v.) in the highest degree, there is no constant relation between the two properties; for example, iron, although it may be reduced to extremely thin wire, is not nearly so malleable as gold, silver, or copper.

MALLEACEAE, a family of lamellibranchiate mollusks, regarded by many as a subfamily of aviculoidea (see Pearl Oyster), and of which the typical genus malleus is remarkable—in an adult state—for the elongation of the ears of the shell, the other part of which at the same time assumes a curiously elongated, wavy, or crumpled form. The shell thus acquires the name of Hammer Shell. The species are natives of the East and West Indies and of the South seas.

MALLEET, Claude François de, b. June 28, 1754, at Dôle in Franche-Comté, became an eager supporter of the revolution, rose to the rank of a brig. gen. in 1799, was intrusted with the government of Pavia in 1805, but was removed from his office because of his extreme republicanism. He returned to Paris, and was engaged in a number of republican plots. Being, in June, 1812, thrown into confinement along with some royalists, he formed with them a scheme for overthrowing the empire during Napoleon's campaigns in Russia. He made his escape from prison on the night of Oct. 23-24, along with the abbé Lafon, and entering the barrack, informed the soldiers that the tyrant had perished in Russia. He proceeded to liberate generals Guidal and Laborie from prison; and having previously gained the support of a battalion of the Parisian guards, he called them to arms, and went to the residence of Hulin, the commandant of the city, whilst Lafon went with a platoon to the prefecture. He told Hulin of the death of the emperor, and the establishment of a provisional government, and on his manifesting doubt, drew a pistol and fired it in his face, wounding but not killing him; whereupon the adjutant, Laborde, rushing in, Hulin and he together overpowered Mallet, and took him prisoner. When interrogated, he declared that he would have made all France and all Europe his debtors if his enterprise had been successful, and maintained the same resolute coolness to the last. He was shot, along with his principal fellow-conspirators, Oct. 29, 1812.

MALLEET, Paul Henri, 1730-1807; b. Switzerland. In 1752 he became professor of French literature in the university of Copenhagen, and gave his attention to the origin, antiquities, and mythology of the ancient peoples of the north, publishing the results of his study in the Introduction à l'Histoire du Danemark; published in Copenhagen, 1753-56. Returning to Geneva in 1759 to fill the chair of history in the academy, he became a member of the council of two hundred in 1764; visited Italy and England in 1766-67, and was charged by the queen of England to write the history of the house of Brunswick; in 1792 was obliged to leave Switzerland on account of his aristocratic affiliations; returned in 1801. His works, in addition to that noted above, are: Mémoirs sur la littérature du Nord, 1759-60; Monuments de la Mythologie et de la Poesie des Celtes; De la forme du gouvernement Suedois; and several works on Swiss history, books of travel, and a Swiss dictionary.

MALLOW, Malva, a genus of plants of the natural order Malvaceae, having a 5-fid calyx, with an outer calyx of three leaves; stamens cohering in a tube; numerous styles cohering at the base; and numerous one-seeded carpels fixed in a whorl around an axis, and forming a separable orbicular fruit. The species are herbaceous plants, or more rarely shrubs.—The common Mallow (M. sylvestris) is plentiful over most of Europe, and in Britain on waysides and heaps of rubbish. It is a perennial, with rather large bluish-red flowers on erect stalks. The Dwarf Mallow (M. rotundifolia), also a common native of Britain, has smaller whitish or reddish white flowers. These two plants have a mucilaginous and somewhat bitter taste, and the leaves are used as an emollient and demulcent medicine; a decoction of them being employed in cases of irritation of the pulmonary and of the urinary organs; and poultices made of them are very frequently employed to allay external inflammation. Other species have similar properties.—The Musk Mallow (M. moschata), not uncommon in England, but rare in Scotland, has a faint musk-like smell.—The fiber of M. crispa is used in Syria for textile purposes, and the fibers of many species are probably fit for similar use, and for the manufacture of paper. The young leaves of some are occasionally used as boiled vegetables.—A species of mallow (laxaterea arborea) grows on the Bass Rock, and adjacent mainland of Haddingtonshire.

MALLOW, a market t. and parliamentary borough of Ireland, in the county of Cork, is beautifully situated on the left bank of the Blackwater, 19 m. n.w. of the
county town. On the opposite side of the river, which is here crossed by a bridge of three arches, is the suburb of Ballydahin. The town is resorted to in summer on account of its mineral waters, and contains a neat spa-house. Tanning, brewing, and the manufacture of salt are carried on. Near Mallow are large flour-mills. Pop. 7,1,416. Mallow returns one member to the house of commons.

MALMAISON, I.A., a village 7 m. w. of Paris, with many historical souvenirs. The name is derived from the fact that it was favourite with robbers in the 9th c., whose depredations in the neighborhood gave their place of sortie the name mala mouuse. In the 13th c. it was but a part of a farm; in the 14th it was attached to the property of the abbaye St. Denis. Occupied successively by families of little note during succeeding centuries, it happened to be purchased in 1798 by the widow Josephine Beauxnains, who paid about $32,000 for the property. The charms of her society there attracted not only the general Bonaparte, but much of the most elegant society of France in 1798–99. The place was tastefully improved, and became the meeting place for poets, authors, politicians, and the military celebrities of the day. Some of the most beautiful and fascinating women of France aided Josephine to make it one of the centers of a society which sought to reproduce the courtly manners of old France, with the advent of the new military era of Napoleon, who here wooed the future empress. It was largely through her fine tact in making powerful friends at Malmaison that Napoleon was enabled to make the coup d'état in 1799 which made him first consul. After her marriage Josephine continued to embellish the park with gardens, summer-houses, grottoes, waterfalls, lawns and parterres and farm and shepherd cottages; and the chateau was greatly improved in many ways and made interesting by a library and the choicest works of art and materials for pleasure, until it finally became a little palace. After Josephine became empress Malmaison was little occupied, until the divorce in 1809, when she retired to it, and kept up a little court. Alexander of Russia visited her there just before her death in May, 1814. After Napoleon's return from Elba he went to visit the scene of his first love, and two months later, after the defeat of Waterloo, he passed five days there with Hortense de Beauxnains, ex-queen of Holland. The property then reverted to her son, Eugène de Beauxnains. In 1826 it was purchased by a Swedish banker, Hagnerman; in 1842 by queen Maria Christina of Spain for 500,000 francs; and in 1861 by Louis Napoleon for 1,500,000 francs, and by him improved and restored to much of its ancient beauty.

Among the paintings most interesting at Malmaison is a portrait of Josephine by her daughter Hortense; and one of Bonaparte at Malmaison by D'Isy.

MALMEBURY, a market t. and parliamentary borough of England, in the co. of Wilts, 20 m. n.w. of Devizes, and 96 m. w. of London. Pop. (1871) of parliamentary borough, 6,979. It returns one member to the house of commons.

Malmebury is a very ancient and interesting town. Here, according to William of Malmebury, a monastery was founded before the year 670. The abbey afterwards became a cloth-factory. The remains of the abbey-church, partly early Norman, and partly decorated English, may still be seen. There are several other relics of antiquity in the place.

MALMEBURY, JAMES HARRIS, first earl of, 1746–1820; b. England; son of James Harris, the author of Hermes. He was educated at Winchester, Oxford, and Leyden, and, after traveling on the continent, was appointed, at the age of twenty-one, secretary of the Spanish embassy through the influence of lord Shelburne. He was acting as chargé d'affaires at Madrid, at the time of the dispute between England and Spain in regard to the Falkland islands, and he displayed such skill in the negotiations in this affair, that, in 1771, he was appointed minister-resident at Berlin, where he remained for four years. In 1777 he was made ambassador to Russia, and in 1789 he received the order of the bath. The state of his health compelled him to leave St. Petersburg in 1784, and he soon accepted from the Pitt ministry the post of minister to the Hague, to which it had been the intention of Fox, to whose party he belonged, to send him. There, in 1788, he succeeded in negotiating a treaty of alliance between Holland and Prussia. It is in acknowledgment of Harris's services for his country in this same year. Returning to England he entered parliament, of which, in spite of his long absences, he had been a member since 1770. He was a whig till 1793, when he became a supporter of the administration, and Pitt sent him once more to negotiate a treaty between England, Prussia, and Holland, a mission which he successfully discharged. In 1794 he negotiated the marriage between the prince of Wales and Caroline, daughter of the duke of Brunswick. In 1796 he went to Paris and in 1797 to Lisle on fruitless negotiations for peace with the French republic; and these were his last missions, as he deemed himself incapacitated by a growing deafness from taking further part in public affairs. In 1800 he was made earl of Malmebury and viscount Fitzharris.

MALMEBURY, JAMES HOWARD HARRIS, third earl of: b. England, 1807; grand-son of the first earl. He was educated at Eton and Oxford; was returned to parliament as a conservative in 1841, but succeeded his father in the peerage the same year. He was secretary for foreign affairs in lord Derby's first administration, and was efficient in bringing about the recognition of Louis Napoleon by the French empire. Lord Malmebury occupied the same position in the second cabinet of lord Derby, when he endeavored to prevent the war between France and Italy, and Austria. When Lord Derby formed his
third government in 1886 he declined to be foreign minister on account of his health, but became lord keeper of the privy seal, remaining in office till 1888. From 1874 to 1876 he was again privy seal. He edited The Diaries and Correspondence of his grandfather, 1844, and The First Lord Malmesbury and his Friends, 2 vols. 1870.

MALMESBURY, WILLIAM OF, an early English historian, was b. near the close of the 11th c., probably in Somersetshire, educated in the monastery whence he derived his name, and of which he became librarian. He died some time after 1145, but the exact date is not known. Malmesbury’s principal works, which are written in Latin, are De Gesta Regum, a history of the kings of England from the Saxon invasion to the 26th year of Henry I.; Historia Novella, extending from the 26th year of Henry I. to the escape of the empress Maud from Oxford; and De Gestis Pontificum, containing an account of the bishops and principal monasteries of England from the conversion of Ethelbert of Kent by St. Augustine to 1123. The first of these was translated into English by the rev. John Sharpe (Lond. 1815), and has been reprinted in Bohn’s antiquarian library, under the editorship of Dr. Giles (1847). Of his other works, Gale has printed his Antiquitates of Gloucester and, Wharton his Life of St. Wulstan, in his Anglia Sacra. Malmesbury gives proof in his writings of great diligence, good sense, modesty, and a true love of truth. His style is much above that of his contemporaries.

MALMÖ, or MALMÖHUUS, a Swedish province or län on the Baltic; 1853 sq. m.; pop. 78,352,175. Its capital city, bearing the same name, is 16 m. s.e. of Copenhagen, and has over 25,000 population, situated on the sound. The principal export of the province is grain; horses and cattle are bred in large numbers, and the city is well supplied with schools of a high grade, and is very prosperous.

MALMÖ, the principal town of the “län,” or district, of Malmöhus, in Sweden, is situated on the sound, nearly opposite Copenhagen, and had, in 1874, a population of 39,976. Malmö is a busy sea-port, maintaining an active steam and sailing communication with Copenhagen and all the great Baltic and German ocean ports, and has manufactures of stockings, tobacco, soap, sugar, woolen goods, etc. It is the seat of a government department, and is a lively, pleasantly situated town. The ancient fortifications, most of which are now converted into public walks, date from the time of Eric of Pomerania, who, in 1434, erected strong lines of defense on the seaside of the town, and built the castle, which still remains. Malmö was an important place of landing and embarkation as early as 1259, and through the middle ages it was extensively visited by German and other traders. In 1523 it was the scene of the signing of a treaty of peace between the Danes and Gustavus Vasa.

MALMSEY (Malvasian wine; Fr. vin de Maltoisie), a name originally bestowed on the red and white wines of Napoli di Malvasia, in the Morea, and afterwards on similar wines produced in Cyprus, Candia, and other islands of the archipelago. Malmesy wines are of a luscious sweetness, and have a most peculiar bouquet. The Malmesy wines of commerce are mostly the produce of Teneriffe, the Madeiras, the Azores, the Lipari islands, Sardinia, Sicily, and Provence. Malmesy is made from grapes grown on rocky ground, fully exposed to the sun, and left to hang on the vines for a month longer than those used to make dry wines, by which time they are partially withered.

MALONE, the capital of Franklin co., N.Y., on the Salmon river and the Ogdensburg and Lake Champlain railroad, midway between Ogdensburg and Rouse’s Point. Pop., 7,186. It is the center of a prosperous agricultural district and of a large trade. It has well-established churches, excellent schools, two banks, and two newspapers.

MALONE, EDMOND, one of the most respectable editors of Shakespeare, was b. in Dublin, Oct. 4, 1741, and educated at the university of that city, where he won a high reputation as a scholar, and took the degree of b.a. In 1767 he was called to the Irish bar; but soon after, becoming possessed of a considerable fortune, he went to London, and devoted himself to literary pursuits. His first appearance as an author was in 1780, when he published 2 vols. supplementary to Steevens’s edition of Shakespeare (1778). His next achievement—though in this he was only one of several—was exposing the splendid forgeries of Chatterton. He also contributed some notes to Steevens’s third edition of Shakespeare, published in 1785, in which he occasionally controverted the opinions of the editor. This led to a serious quarrel between the two, in which Steevens was wholly to blame. Malone’s own edition of the great dramatist (1790) was warmly received. The essays on the History of the Stage, and on the Genuineness of the Three Plays of Henry VI., have been praised in an especial manner. In this work, Malone displays extreme good sense, much acuteness, extensive research, and a becoming respect for the text of the earlier editions. In 1796 he again signalized himself as a literary detective by exposing the Shakespearean forgeries of the Irelands. In 1797 he published a posthumous edition of the works of his friend sir Joshua Reynolds. His death took place May 25, 1812. He left behind him a large quantity of materials for another edition of Shakespeare, which appeared in 1851, in 21 vols., under the editorship of Mr. James Boswell. See Life of Edmond Malone, with Selections from his Manuscript Anecdotes, by sir James Prior (Lond. 1860).

MALPIGHI, MARCELLO, an eminent Italian anatomist, was born near Bologna in 1628, and died at Rome in 1694. He held, at different periods of his life, the professorship of
Malpigiiacae.  Malv.

medicine in Bologna, Pisa, and Messina. In 1691 he was summoned to Rome, and appointed chief physician and chamberlain to pope Innocent XII.

He is now chiefly known for his discoveries in the anatomy of the skin, of the kidney, and of the spleen; and although the so-called rete Malpighii of the skin is no longer regarded as a special structure, the Malpighian bodies or corpuscles of the kidney and the spleen still retain the name of the discoverer. A great number of the worms examined with the microscope, and thus discovered the blood corpuscles. Amongst his most important works may be mentioned De Formatione Pulvis in Ovo; De Cerebro; De Lingua; De Externo Tactu Organo; De Structura Viscerum; and De Pulmonibus; and De Structura Glandularum Conglobatarum. His Opera Posthuma were edited by Petrus Regis of Montpellier; they contain a history of his discoveries and controversies, together with numerous autobiographical details.

MALPIGIIACEAE, a natural order of exogenous plants; trees, or shrubs, many of them climbing shrubs or lianas. They often exhibit an anomalous formation of the stem, great part of the woody matter being deposited in lobed zonelss ribs. The leaves are simple, generally with glands on the stalks or underside. The calyx is 5-partite, generally with very large glands; the corolla of 5 petals convolute in bud; the stamens generally 10, often monadelphous, a fleshy connective projecting beyond the anthers. There are about 600 known species, natives of tropical countries, and chiefly of South America, many of them having gaudy flowers. A few produce timber of a bright yellow color. The bark of some species of the genus Byssonima is astringent and medicinal, and at one time attracted considerable attention as a remedy for pulmonary consumption. It is known as alcornoque bark. The fruit of some, as the Barbados cherry (q.v.), is pleasant.

MALPLAQUET, a village (pop. 400) in the department of Nord, France, 20 m. e. of Valenciennes, and close to the Belgian frontier, is celebrated for the bloody defeat of the French, under marshals Villars, by the British and Dutch, commanded by the duke of Marlborough and prince Eugene, Sept. 11, 1709. The forces engaged consisted of more than 200,000 men, the allies having a slight superiority in numbers; and the loss on each side amounted to about 20,000 men, the French losing also many standards and captured arms. Marshal Villars was severely wounded early in the engagement, and the command devolved upon the old marshal de Boulers, under whom the French, after great slaughter, retreated in good order. The result of the conflict was the capture of Mons.

MALSTROM, or Moskøstrøm ("whirling stream"), the most famous whirlpool in the world, is situated on the Norwegian coast, between Moskøe and Moskenes, two of the Lofoten (q.v.) isles. The tremendous current that rushes between the Great West fjord and the outer ocean through the channels between the Lofoten islands creates many other dangerous currents, such as the Galstrøm, Napstrøm, etc.; but these are not to be compared with the famous Malstrøm. The current runs for 6 hours from n. to s., and then 6 hours from s. to n., producing immense whirls. The depth of the water has been ascertained to be about 20 fathoms, while immediately to the w. of the straits the soundings are from 100 to 200 fathoms. The whirlpool is greatest at high or low water; and when the wind blows directly against the current, it becomes extremely dangerous, the whole sea for several miles around being so violently agitated that no boat can live in it for a moment. In ordinary circumstances it may be traversed even across the center without apprehension. The stories of ships, whales, etc., being swallowed up in the vortex are simply fables; at the same time there can be no doubt that a ship, once fairly under the influence of the current, would certainly either founder or be dashed upon the rocks, and whales have often been found stranded on the Flagstad coast from the same cause.

MALT AND MALTING. See Beer.

MALTA, an island and British possession in the Mediterranean, 17 m. long by about 9 broad, with an area of about 115 sq. m.: it is of carbonaceous limestone, of the tertiary aqueous formation, and occupies a very central position in the Mediterranean sea, being distant some 54 m. from the Sicilian coast, and about 200 from cape Bon on the African coast. From its position, and also from the enormous strength of the fortifications, Malta is a possession of immense value to any commercial nation which possesses a navy strong enough to prevent it being blockaded. It happens, consequently, that Malta is one of the most important, after India, of the British dependencies, for it is not in any sense a colony. Possessing one of the most splendid harbors in the world, with such an even depth that the largest vessels may anchor alongside the very shore, the island forms at once an admirable station for a fleet to command the Mediterranean—~a military focus, where a force protecting the route to Egypt and India can be concentrated—and a useful entrepôt for receiving the manufactures of Britain, which the small craft of the Mediterranean carry to every point on the shore of that inland sea and its tributaries. By whomsoever possessed, Malta has always been held in high estimation. Between it and Gozo, or Gozo (q.v.), lies the small island of Comino; and off this last the still smaller islet, Cominotto, rears its rocky crest, while elsewhere round the shores of Malta and Gozo, a few rocks stud the sea, sustaining each a few fishermen, and affording herbage for goats on their moss-grown summits; among these are Fifi, with a
Malpighiaceous.
Malta.

Venerable church; Pietro Nero, or Black Rock; Scoglio Marfo, Salmonetta, and the 
Hagira tal general, or fungus rock, where grows the famed fungus melitensis (see Cyno-
morium). Malta and Gozo, with their adjacent islets, form together a compact little 
realm, celebrated in history, possessing a magnificent capital in Valetta, and, from the 
fact that, owing to peculiar circumstances, vast contributions came to Malta from all 
Catholic Europe, adorned with public buildings, institutions, and works out of all pro-
portion to its actual intrinsic importance.

Its physical conformation, Malta is comparatively low, its highest point not exceeding 
590 ft. above the sea-level. The surface is diversified by a succession of hill and dale, 
the land being intersected by parallel valleys, running from s.w. to n.e., the most 
considerable of which is the vale called Mellechia. Across the island stretch the Ben-
jemma hills or crags, and many spurs branch from them, which give a picturesqueness to 
the scenery. From the spong nature of the limestone of which the island is com-
posed, much of the rain falling in the wet season soaks in, and being evaporated through 
the thin alluvial covering by the heats of summer, keeps the ground moist, and gives it 
a fertility which could not otherwise be expected from so scanty and comparatively 
poor a soil. So thin, indeed, was the original surface-soil, that considerable quantities 
of earth were imported into Malta from Sicily. The productiveness of the soil must 
also be attributed to the quantity of carbonate of lime held in a minutely divided state 
above the entire face of the rock.

Malta shows no signs of volcanic formation; but the action of the sea among its 
drifts has hollowed out grottoes and caverns in almost every direction, and some of con-
siderable extent. The inhabitants are industrious, and good agriculturists, and every 
foot of the soil is diligently cultivated. On the whole, about the quantity of superior 
 kinds of grain consumed is raised on the islands, and of inferior sorts a considerable 
amount is exported. Wine, resembling that of Spain, is produced; the sugar-cane is 
cultivated. The vegetable products comprise all that flourish in Italy, as alos, oranges, 
and olives, with many plants of a more tropical growth. Malta was famed of old for 
roses. Salt and soda are manufactured; there are quarries of marble, alabaster, and 
building-stones. Mules and asses are remarkable in Malta for their strength and beauty, 
but horned cattle are small. Maltese goats are fine animals. The birds of Malta are 
renowned for their splendid plumage; and its bees produce an aromatic honey, excelled 
in no other locality.

Medina, the former capital of the island, now known as Citta Vecchia, or Notabile, 
is a handsome old town, lying inland; it contains the ancient palace of the grand 
masters of the order of St. John, the cathedral, a college, and is still the seat of the 
bishopric. Pop. 7,000. Its rival and successor is Valetta (q.v.). The numerous coasts 
or villages scattered throughout Malta and Gozo are nearly built, and generally present 
an aspect of industry and frugal happiness.

It is thought by some that Malta was the Hyperion or Opygie of Homer, but there is 
little doubt that the Phenicians colonized the island at a very early date, probably in the 
16th c. n.c. Before they were dispossessed by the Greeks in 736 n.c., they had developed 
considerable commerce. The Greeks called the island Melitès, and were driven out by the 
Carthaginians about 500 B.C. As early as the first Punic war, it was plundered by the 
Romans, but did not come finally into their possession until 242 n.c. They valued it 
highly, on account of its use as a commercial entrepôt; and also for its cotton and linen 
cloths, fabrics then, as now, manufactured of wonderful fineness by the Maltese. The 
island remained under its old laws, governed by a proprietor, subject to the pretor of 
Sicily. On the n. coast is the port of St. Paul, and here tradition fixes the wreck of the 
ship carrying that apostle to Rome. On the division of the empire, Malta followed 
the fortunes of the eastern division. During the 5th c. it fell successively under the 
Vandals and Goths, whose barbarism nearly annihilated its commerce. In 535 Belisarius recov-
ered Malta to the Byzantine empire, in nominal union with which it remained for more 
than three centuries; but its prosperity had departed, and its civilization almost vanished 
amiid constant local feuds. In 870 the Arabs destroyed the Greek power in Malta, and 
fortified the harbor as a station for their corsairs. Count Roger, of Sicily, drove out the 
Arabs in 1090, and established a popular council for the government of the island, com-
posed of nobles, clergy, and elected representatives of the people. This council, in a 
more or less modified form, subsisted for 700 years. Under a marriage-contract, Malta 
passed to the German emperor, who constituted it a marquisate, but it had ceased to be 
a place of trade, and was merely a garrison of more expense than value. Charles of 
Anjou, after overrunning Sicily, made himself master of Malta, which clung to the 
French even after they had been expelled from Sicily; but after a time the houses of 
Aragon and Castile successively held the island. Subsequently, the emperor Charles V. 
took possession of Malta, and, in 1550, granted it, with Gozo and Tripoli, in the 
sovereignty to the Knights of the order of St. John of Jerusalem. From whose the Turks 
had recently captured their great stronghold at Rhodes. The knights raised by degrees 
the stupendous fortifications which render Malta so powerful, and, moreover, spent 
their large income in beautifying the island in every way. Meanwhile, they rendered 
incessant services to Christendom in the chastisement of the ferocious Barbary pirates. 
To revenge these acts, the Turks brought immense forces against Malta in 1557, and 
again in 1565. The latter siege was carried on by the sultan Solymon himself, with the
flower of the Ottoman army; but the grand master La Valette opposed a heroic resistance, and he was forced to re-embark with the loss of more than 25,000 of his best troops. The defenders lost 260 knights and 7,000 Maltese soldiers; and their gallantry was the theme of admiration throughout the world. After this siege the knights built Valetta. In 1571 they, with the Maltese, behaved most courageously at the battle of Lepanto, where the Turks lost 30,000 men. Though waging perpetual war with the Moslem, the knights continued in possession of Malta until 1798, when overcome by Bonaparte's treachery, and disorganized by internal quarrels, the order surrendered their noble fortresses to the French. After pillage and infamous treatment by the republican forces, the Maltese rose in a few months against their oppressors, and after a siege of two years, British auxiliaries arriving, the French garrison of Valetta capitulated to the English gen. Pigot. The treaty of Amiens stipulated that Malta should be restored to the knights of St. John; but the Maltese loudly protested against such an arrangement, and preferred the peaceful government of their native British government. Consequently it was arranged to make the transfer, appreciating also, doubtless, the vast value of their new possession, and Napoleon made the refusal one of his grounds for the resumption of hostilities. The congress of Vienna recognized Malta as a British dependency, the condition in which it has since remained.

In 1874 Malta and Gozo, with the adjacent islands, together contained 145,599 inhabitants (including the British residents and foreigners, but excluding the military, who numbered 6,611). The population was increasing rapidly, but the annual rate of increase had declined from 1858. The upper classes speak Italian, but the real language of the people is a patois compounded from many sources, as must be expected from so checkered a history. Arabic, however, so far predominates that the Maltese find little difficulty in communicating with the Barbary peasants. It is alleged by some that the Maltese language—if its Italian and German elements were eliminated—would remain almost pure Arabic, and would accurately represent the speech of Carthage at the time of its destruction. The religion of the people is strictly Roman Catholic, and, considering that the British flag waves over the island, but a scanty toleration is granted to other forms of faith. There are good provisions for education; a college at Valetta, where degrees are conferred in divinity, law, and physic; 65 public schools, with 8,324 pupils, besides 114 private places for education. There is also an excellent public library, free to all.

The commandant of the garrison is governor, and is aided in the civil government by a council of 16 members, of whom 8 are officials, and 8 are freely elected. The revenue amounted, in 1874, to £175,073, while the amount of the expenditure was £161,784. Customs and excise, with a few assessed taxes, provide the former; the latter is absorbed in the charges of the civil government, and in a contribution of £6,200 towards the military expenditure. On the other hand, Great Britain maintains a considerable force in the islands, mainly for imperial purposes, at a cost of about £370,000 a year. Besides a large body of British artillery, the garrison includes the royal Malta fencible artillery, a fine native regiment of 689 officers and men. There is an extensive arsenal, and a very important dock-yard, Malta being the headquarters of the British fleet in the Mediterranean. Taken altogether, Malta is a possession the British highly value; it is nearly, if not quite, as strong as Gibraltar, and far more useful.

The public debt amounted, in 1875, to £268,248, at a very low rate of interest. In 1873 the vessels which entered and cleared the port, exclusive of the coasting-trade and steamers, had a total tonnage of 4,882,000 tons. Of this total about 4,000,000 tons are set down as representing British vessels. In the same year, the total value of the imports amounted to £10,325,000; while the exports were estimated at a total of £9,500,000—corn en route from Russia for the United Kingdom figuring very largely in the transactions.

MALTA, KNIGHTS OF. See John, St., of Jerusalem, Knights of.

MALTETBRUN, Konrad (properly, MALTHE BRUUN), an eminent geographer, b. Aug. 13, 1775, at Thisted, in Jutland, studied in Copenhagen, and at the outbreak of the French revolution, embraced with great ardor the liberal cause, so that being prosecuted upon account of political publications, he was twice obliged to flee from Denmark, and finally, in 1800, was condemned to perpetual banishment from his native country. He sought refuge in Paris, where he maintained himself by teaching and literary labors. In 1808 he began the Annales des Voyages, de la Géographie et de l'Histoire (24 vols.), which he concluded in 1814. In 1818 he began, along with Cyres, the Nouvelles Annales, etc. He devoted his pen to the support of Napoleon during his reign; and was connected with an ultra-royalist journal, and a defender of the theory of legitimacy adopted by the congress of Vienna. His principal work is his Précis de la Géographie Universelle (8 vols. Par. 1824-28, with an atlas). He took part also in the Dictionnaire Géographique Universelle (8 vols. Par. 1821), and was secretary to the geographical society of Paris. He died Dec. 14, 1826. His son, VICTOR ADOLPHE MALTEBRUN (b. 1816), is one of the most eminent living geographers of France, and has succeeded his father as secretary of the geographical society of Paris.

MALTSESE' CROSS, a cross of eight points, of the form worn as a decoration by the hospitalers (q.v.) and other orders of knighthood.
MALT, a Greek name meaning soft wax, originally applied to a mineral fat from Kirwan, having a resemblance to wax, probably composed of parafln; but now applied to certain kinds of bitumen, mineral tar, or asphalt. It differs but little from the semi-solid varieties of asphalt, although it is described as frothing more on boiling. Some specimens are said to contain a small portion of oxygen, and also nitrogen, but these are probably the traces of impurities, as well as the cause of the frothing. No satisfactory analysis has been made. See Asphalt; Bitumen; Dead Sea; ante.

MALTHUSS, Thomas Robert, the founder of those opinions concerning the relation of population to the means of sustenance which have been named after him "Malthusian," was b. in the county of Surrey, in the year 1766. He was well connected, and graduated with honors in 1788, at Jesus college, Cambridge, of which he became a fellow. He became soon after clergyman of a small parish in his native county, and divided his time between his cure and the university libraries. In 1799 he left Britain to see foreign countries, along with the eminent traveler, Daniel Clarke. The great European war was then raging, and the most interesting portions of the continent of Europe were closed to our countrymen. Malthus, however, under an evidently keen anxiety to observe mankind under a variety of conditions, wandered through Sweden, Norway, Finland, and part of Russia, making notes of what he observed. Next year he took advantage of the short peace of America to visit France and other portions of central Europe. These efforts to become acquainted with mankind are significant since. Although Malthus has the reputation of being a bold theorist, the charm of his writings consists in his practical knowledge of how men have existed and acted in various parts of the world and under diverse conditions; and his knowledge of actual human nature—his sagacity and accuracy, in short, in the details which he brought to bear on his great theory—were in a considerable measure the source of the great influence exercised by him over public opinion, and had the secondary effect of making his books readable even to those who made war on his conclusions. It was in 1798 that he first published his Essay on the Principles of Population as it affects the Future Improvement of Society; but in subsequent editions he so greatly enlarged and enriched the work, that it could hardly be identified with the first impression. The predominant idea of the book was evidently suggested by Hume's essay on the populousness of ancient nations, in which vague statements as to the vast multitudes of human beings subsisting in any place, or wandering from place to place, are brought to the test of the means of subsistence at their disposal. Where there is an accurate census, the number of people living on the portion of the globe covered by it is, of course, known to within a trifle of the truth. Such arrangements for accuracy have, however, been extremely rare in the history of the world. Where they are absent, egregious exaggerations have been made in estimates of the numbers of mankind; and in the absence of absolute facts, the best means of reducing these wild estimates to something reasonable was the skeptical philosopher's plan of comparing the estimate of the numbers with the probable amount of food at their disposal. The application of this check by Malthus was something like the application of chemistry to organic matter. He set himself to finding out how the relation of population to the means of sustenance could affect the future of the world. The result was appalling. The human race was found to increase at something like geometrical progression; while the fertility of land, by bringing in waste, and improving the methods of agriculture, only increased in something like an arithmetical proportion. Hence, if population were permitted to increase at its natural rate, it would soon overtake the means of subsistence. The theory had only one defect as applicable to the present condition of the world, that it overlooked the element of free trade. It involved a general pauperism to Britain if her people had no resource but the produce of her soil, but it made no allowance for the capacity of Britain to draw upon the fertility of the world at large. Malthus wrote other books, which got little notice in their day, and have been forgotten. He was appointed professor of political economy at the college of Haileybury in 1805. He filled his chair with great repute until his death, Dec. 29, 1836.

MALTON, a parliamentary borough and market t. in the North Riding of Yorkshire, on an elevation on the right bank of the Derwent, 18 m. n.e. of York. The parliamentary borough includes the parishes of Old Malton and Norton, to the former of which a grammar-school, founded in 1547, and having an annual endowment of £100 a year, is attached. There are also the remains of a priory, founded in 1150. Considerable trade is carried on. Pop. '71 of borough, which, since '97, returns but one member to parliament, 8,168.

Malton, called by the Romans Camulodunum, abbreviated by the Saxons into Meldun, was an important Roman military station, to which six ancient roads lead. After having been burned down, the town was rebuilt in the reign of Stephen, since which time it has been generally called New Malton.

MALT REFUSE, or MALT WASTE, is of two kinds: (1.) the corruings or small shoots and radicles of the germinated grain, which are separated before the malt is used by the brewer, often called malt dust and kiln dust; and (2.) the exhausted malt, after it has been
used by the brewer, called *draff*. Both are of use for the feeding of cattle, but the first kind is the most nutritious, being rich in nitrogenous substances which the brewer extracts from the malt used by him; draff, however, is advantageously employed, along with turnips, for the feeding of dairy cattle. Malt dust is also used as manure, chiefly as a top-dressing, and is very fertilizing and rapid in its effect.

**MALURUS**, a genus of Australian birds, giving its name to a large subdivision of the family *sylviasat*, in which are contained many Asiatic and African species, and some that are natives of the s. of Europe. They have generally a long tail; in some, very long, as in the *Emu Wren* of Australia, in which it is more than twice the length of the body, the shafts of its feathers loosely fringed on each side. The *emu wren* (*stipiturus malachurus*) is a very pretty little bird, living chiefly among long grass. One of the most noted *maluri* is *M. cyaneus*, the *Blue Wren* or *Superb Warbler* of Australia, which is gorgeously attired in black, blue, white, and brown. It hants scrubby brushwood.

**MALUS**, Etienne Louis, 1775–1812, b. Paris; educated at the school of military engineers, but falling under the suspicion of the revolutionary government, was dismissed. While serving as a private soldier at Dunkirk, he attracted the attention of Lepère, director of the fortifications there, who procured him an appointment to the *École Polytechnique*. Here he pursued the study of mathematics, and especially of the mathematical theory of optics. Appointed to the engineers, he entered the army of the Sambre and Meuse, and witnessed the passage of the Rhine, and the engagements at Altenkirch and Ukrazt. He was attached to the Egyptian expedition, and after the campaign, instead of engaging in the abstraction of its treasures, he superintended the construction of military hospitals. He fortified Damietta, was present at the siege of Cairo, and after the surrender to the English, came back to France in 1801. He now took charge of the fortifications at Antwerp and Strasburg, at the same time carrying on his scientific researches. His *Traité d'Optique*, published in 1810, treats of the refraction and reflection of light, and contains experiments in regard to the reflection of light in transparent media. In 1805 the French Institute offered a prize for the best paper on double refraction in crystals. Malus competed for this prize, and in the course of his experiments discovered the phenomenon known as the polarization of light. He advanced the theory that particles of light have poles, and that on entering a doubly-refracting crystal, some of the particles forming one of the rays may be so arranged as to be transmitted through it, while the particles which should have formed the other ray may be so arranged as to prevent the transmission in certain directions. The discovery of these phenomena introduced a new branch of physical optics. Malus published an account of his discoveries in the *Mémoires* of the institute, which at once elected him to its membership; and the English royal society gave him the Rumford medal, though France and England were then at war. In 1810 he published his *Théorie de la Double Refraction de la Lumière dans les Substances Cristallisées*, and the next year he wrote a couple of papers on some phenomena of polarized light. He was appointed examiner in physics at the *École Polytechnique*, and was about to be appointed director of its studies when he died.

**MALVA**, a natural order of exogenous plants, of which about 1000 species are known, chiefly tropical, and most abundant in America, although the most important species belong to the old world. They are herbaceous plants, shrubs, and occasionally in tropical countries trees; with alternate entire or lobed leaves; the pubescence, if any, starry; the flowers showy, generally on axillary stalks; the calyx generally of five sepals or five segments, often with an epicalyx; the petals generally five, hypogynous, twisted in bud; the stamens numerous, united by their filaments; the ovary consisting of a number of carpels around a common axis, the styles generally five, the ovules few or many; the fruit dry or fleshy. The plants of this order have a great general similarity both in their appearance and in their properties and products. All of them contain a mucilaginous substance in great quantity, which is particularly abundant in the roots of the perennial herbaceous species. This mucilaginous quality makes some very useful as emollients and demulcents in medicine. The young foliage of some is used as a bowl by the inhabitants of certain places as a substitute for glass. The inner bark of the stem often yields a useful fiber, for which species of *bilevus* and *sida* are particularly valued; and to this order belong the cotton plants, so valuable for the fiber which envelopes their seeds. Many of them are frequent ornaments of flower-gardens. See *Cotton*, *Hibiscus*, *Hollyhock*, *Mallow*, *Marsh-Mallow*, *Sida*, and *Urena*.

**MALVERN**, Great, a t. and watering-place in Worcestershire, Eng., picturesquely situated on the eastern side of the Malvern hills, 8 m. s.w. of Worcester. The purity and abundance of the spring-water, and the facilities for healthful exercise afforded by the hills, have rendered Malvern a great resort for invalids following the hydropathic treatment, for which there are several large establishments. Pop. 71, 5,693.

**MALVERN HILL**, Battle of, the last of the engagements known as the "seven days' battles," June 26–July 1, 1863, the others being those of Mechanicsville, Cold Harbor, Savage's station, and Frazier's farm. After the battle of Frazier's farm, McClellan posted the union army on Malvern hill, an elevated plateau about 1 m. from the James river, and 11 m. from Richmond. This hill is about a mile and a half in
length and three-quarters of a mile broad, flanked by thick woods, and faced with gullies, which rendered its exceedingly difficult of approach. The ground was thus exceptionally strong by nature, and it was now defended by McClellan's army of about 90,000 men; a battery of 7 heavy siege guns was placed on the crest of the hill, and the remainder of the union artillery was admirably posted in such wise that the concentrated fire of 60 guns could be directed at any point desired. Lee's army, which had persistently followed McClellan on his retreat to the James, attacking whenever it seemed practicable, had met with a serious repulse, June 30, but on the morning of July 1, with about 60,000 men, undertook to storm Malvern hill in the face of all the obstacles presented. The confederate attack was made by Jackson and D. H. Hill, and supported by Magruder, and, as might have been anticipated, resulted in their repulse, with a loss of 900 killed and 3,500 wounded. The union loss was 375 killed and 1800 wounded. McClellan did not take advantage of this success, but retired at once to Harrison's landing. The confederates continued to hold their lines for several days, when they retired to Richmond. See Chickahominy.

MALVOISINE, or MAWMOISINE, WILLIAM DE, a Scottish ecclesiastic; was educated (and as some think, born) in France. Going to Scotland, he was made one of the clerci regis, and archdeacon of St. Andrews. In 1199 he was constituted chancellor of Scotland; in 1200, bishop of Glasgow; in 1203, of St. Andrews; in 1208 he dedicated the new cemetery at Dryburgh abbey; in 1211 he and Walter, bishop of Glasgow, by appointment of the pope, convened at Perth a great council of the clergy and people, to press upon the nation the pope's will and command that an expedition be undertaken to Palestine. In 1214 he attended the coronation of king Alexander II., and is said to have placed the crown on his head. The following year he went with the bishops of Glasgow and Moray, and Henri, abbot of Kilso, to the fourth Lateran council, remaining abroad until 1218. He brought from the continent various orders of monks and mendicants before unknown in Scotland, and established convents of black friars at several places. He wrote lives of the saints Ninian and Kentigern. He was exceedingly zealous for the church. He insisted earnestly also on his own rights, for at one time he deprived the abbey of Dunfermline of the presentation to two churches, because the monks had failed to provide him wine for supper. Fordun says the monks had provided wine, but that the bishop's attendants had drunk it all up. He continued bishop of St. Andrews till his death.

MALWA, a former kingdom of India, lying for the most part n. of the Nerbbuda, and s.w. of the valley of the Ganges, is an uneven plateau varying from 1500 to 2,500 ft. above sea level. It is now divided into a number of protected states.

MAME, ALFRED HENRY ARMAND, b. Tours, France, 1811. Inheriting the publishing house of his father, of which he has become sole conductor; he has increased it to a vast establishment, employing 200 workmen in its factories, and nearly as many more outside, printing and binding upwards of 20,000 volumes per day. Religious books formerly composed a large part of its work, but works on law have been added. The Bibliothèque de la Jeunesse Chrétienne, an aggregate of little volumes for distribution in Sunday and secular schools, and primary school-books make the greater part of the publication of the house of Mame. Of late years, however, they have published elegantly illustrated works in other fields; as, Les Jardins; La Sainte Bible, illustrated by Dore; and Les Chefs d’Ouvres de la Langue Française. In 1773 he received one of the prizes of 10,000 francs accorded to the manufacturing establishments where there was found the greatest social harmony and well-being among the workmen, which was given for his establishment at Tours.

MAMELON (Fr. from Lat. mamma, breast), a mound in the shape of a woman's breast. These artificial mounds of fortifications were common in the siege of Sebastopol.

MAMELU’CO, the name given in parts of South America to a child of a negro father and an Indian mother.

MAMELUKES, MAMELOCKS, or MEMLOOKS, an Arabic word signifying slaves, the name given in Egypt in the valley of the slaves, brought from the Caucasus, and who formed their armed force. When Genghis Khan desolated great part of Asia in the 13th c., and carried away a multitude of the inhabitants for slaves, the sultan of Egypt bought 12,000 of them, partly Mingrellans and Tcherekesses, but mostly Turks, and formed them into a body of troops. But they soon found their own power so great that, in 1254, they made one of their own number sultan of Egypt, founding the dynasty of the Bahrakites, which gave place to another Mameluke dynasty, that of the Borjites, in 1382. The Caucasian element predominated in the first dynasty, the Tartar element in the second. In every place they formed able and energetic rulers, and Egypt under their sway arrived at a degree of prosperity and power to which she had been a stranger from the days of Sesostris. Selim I., who overthrew the Mameluke kingdom in 1517, was compelled to permit the continuance of the 24 Mameluke boys as governors of the provinces. This arrangement subsisted till the middle of the 18th c., when the number and wealth of the Mamelukes gave them such a preponderance of power in Egypt that the pasha named by the porte was reduced to a merely nominal ruler. The number of them scattered throughout all Egypt was between 10,000 and 12,000 men. Their number was kept up chiefly by slaves brought from the Caucasus, from among whom the boys and other officers of state were exclusively chosen.
Their last brilliant achievements were on the occasion of the French invasion of Egypt, and during the time immediately following the retirement of the French. At this time Murad Bey stood at their head. But in 1811 they were foully massacred by Mohammad Ali (q. v.), afterwards viceroy of Egypt.

MAMERS, a small t. of France, in the department of Sarthe, 25 m. n.n.e. of Le Mans. Coarse linens, calico, beer, and leather are manufactured. Pop. 72, 5,003.

MAMIANI, Count Terenzio, an Italian philosopher, statesman, and writer, b. in 1801, at Pesaro. Having taken a prominent part in the futile revolutionary outbreak which accompanied the accession of Gregory XVI., Mamiani was compelled to seek safety in flight, and repaired to Paris, from whence he promoted with energy the revolutionary tendencies of his country. In 1836, on the accession of Pius IX., he declined the offered papal amnesty, as long as its acceptance involved a disavowal of his former political principles; but on its being unconditionally granted, he availed himself of it, and even formed part of the papal ministry on the promulgation of the constitution. The inconsistent policy of the pope having compelled him to resign his post, he withdrew to Turin, where he founded, with Gioberti, a society for promoting the union of Italians. On the flight of Pius IX. from Rome to Gaeta, he re-entered the political arena, and was for a short period foreign minister in the revolutionary cabinet of Gaetani. On the fall of Rome he retired to Genoa; in 1856 he was returned member of the Sardinian parliament, and in 1860 entered Cavour's ministry as minister of Instruction. He was appointed ambassador to Greece in 1861, in Switzerland in 1865. His chief works are: Del Rinnovamento della Filosofia antica Italiana (1836); Poeti dell'età Media (1842); Dell'Ontologia e del Metodo; Principii della Filosofia del Diritto, and a number of treatises on various subjects. In 1870 he became editor of a new quarterly review, Filosofia delle Scienze Naturali.

MAMMALIA (Lat. mamma, the breast), the highest class of the animal sub-kingdom vertebrata (q. v.). This class includes man and all the animals which resemble him in the most important points of their organization; and it is naturally placed at the head of the animal kingdom because (independently of man being a member of it) it contains the animals which manifest the highest degree of intelligence, and which possess the most complex organization.

The most distinctive character of the mammals is their mode of development and of nourishment during the earliest period of life. They are all brought into the world alive (viviparous), not merely, as in certain (ovo-viviparous) reptiles and fishes, by the retention and hatching of the egg within the oviduct, but by the formation of a new connection between the embryo and its mother, while the former lies within the maternal cavities, so that provision is made for its development before birth, not, as in birds, etc., by the large yolk (see DEVELOPMENT OF THE EMBRYO), but by a constant supply of nutrient direct from the maternal blood. In mammals, the ovum on quitting the ovary is of extremely minute size, and the materials of the yolk only serve to support the embryo during its very earliest period. After undergoing certain changes in the passage through the Fallopian tube or oviduct, which it is unnecessary here to notice, the ovum reaches the uterus or womb, and connects itself by a set of root-like tufts of vessels with the maternal vessels. These tufts absorb from the mother's blood the ingredients necessary for the support of the embryo, while they convey back to it the effete particles of the embryonic tissues. Through this organ, which simultaneously increases in size with the embryo, and is named the placenta, the young animal, except in the lowest orders of the class—viz., the marsupialia (q. v.) and the monotremata (q. v.)—derives its nutrient during the whole period of gestation (q. v.); while in the two orders just named no vascular connection of the ovum with the uterus of the mother is formed, the ovum being simply retained for a time within the uterus, and the requisite nourishment for the development of the young animal being obtained by absorption through the membranes of the ovum. This remarkable difference in the development of the mammalian embryo has given rise to a division of this class into two great sections or sub-classes—the placental and the implantation or marsupial, which latter is only found in both the lowest orders named above. The milk (q. v.), a fluid secreted by peculiar glands, called the mammary glands, which become greatly developed in the female during the periods of gestation and lactation; and as this is found in no other class, it is the character by which the entire group is most positively defined, and from which it derives its name.

The mammary gland exists in both sexes, but except in very rare cases, it is only in the female that they secrete milk. Their number is never less than two, and when more, is generally nearly proportional to that of the young produced at each birth. In the monkey, the elephant, the goat, the mare, etc., there are two; in the cow, stag, and lion, four; in the cat, eight; in the rabbit, ten; in the pig, generally twelve; and in the rat ten or twelve. These glands are often blended together, as in the cow; and their number is increased by the addition of a pair of nipples or teats. Their position also varies; in the monkeys and bats, and in the herbivorous cetacea, they are situated on the chest, as in man; in most of the carnivorous animals they are situated on the abdomen as well as on the thorax; while in the mare, cow, sheep, etc., they are placed still further back, near the hip-joint.
The skin in the greater number of mammalia is covered with hair, a form of tegumentary appendage peculiarly characteristic of this class. In the cetacea, however, we have an almost entire absence of hair; one of its uses—that of keeping the heat within the body—being here provided for by the thickening of the skin and the deposition of the blubber beneath it. In the edentata, the hairy covering is almost entirely replaced by horny scales, as in the scaly ant-eater, or by bony plates, as in the armadillo. In the quills of the porcupine and the spiny bristles of the hedgehog, we have other modifications of hair which depart less from its ordinary character than those just mentioned. Moreover, the claws, nails, and hoofs of all mammals, the horn or horns on the nose of the rhinoceros, and the horns of the hollow-horned ruminants (such as the ox, sheep, etc.), are all composed of a substance which is only a modification of hair.

The skeleton, as a general rule, governs the general form of the body. In its general conformation, it shows a close analogy with that of man, which is described in the article Skeleton; the differences which are remarked among the various animals of this class mainly depending (1) upon the absence of posterior limbs in the marine mammals, such as the dugong, the porpoise, and the whale; (2) upon the diminished number of digits (see Hand and Foot), and upon the absence of the clavicle in the greater number of those species whose anterior limbs serve only for motion; (6) upon variations in the number of vertebrae; and (4) upon the inequalities in the relative sizes of the same bones (Milne-Edwards).

Although the same bones enter into the formation of every mammalian skull, great differences present themselves in different skulls, according as the face is more or less prolonged, or, on the other hand, the brain-case or cranium is more or less developed. In proportion as a mammal is removed in classification from man, we find that the cranium is diminished; that the face is prolonged by extension of the jaws and nasal cavities; that the orbits are directed outwards, and are less distinct from the temporal fossae; and that the occipital foramen (through which the spinal cord passes) and the condyles (by which the head articulates with the first vertebra of the spinal column) are placed towards the posterior part of the skull, instead of occupying the middle of its inferior surface, as in man. Among the most characteristic points in the mammalian skull generally may be mentioned (1) that the lower jaw articulates directly with the skull, there being no intervening tympanic bone, such as occurs in the other vertebrates; and (2) that the occipital bone of the skull articulates with the first vertebra by two condyles, one on each side of the occipital foramen, instead of by a single condyle, as in the other vertebrates.

The vertebral column, except in relation to its length, closely resembles that in man, where there are 7 cervical, 12 dorsal, 5 lumbar, 5 sacral, and 5 caudal vertebrae. The cervical vertebrae are almost universally 7 in number, however long or short the neck may be, the only known exceptions being two cetaceans (manetus and rytina), which have 6, and the three-toed sloth, which has 9. The number of dorsal vertebrae ranges from 11 to 23, which latter number occurs in the two-toed sloth. The lumbar vertebrae range from 2 to 9, the most common number being 5. The sacral vertebrae, which coalesce to form the sacrum and to support the pelvic arch, vary from 2 (in the monotremata and marsupialia) to 6 (in the mole), the most common number being 4. In the cetacea, the rudimentary pelvis is loosely connected with a single vertebra, and there cannot be said to be a sacrum. The caudal vertebrae, which in man and the higher apes coalesce to form the coccyx, are usually very numerous, 20 or 30 being a common number, and 40 occurring in the long-tailed ant-eater. The form and number of caudal vertebrae vary in accordance with the purposes to which the tail is applied; and the special uses of this organ are numerous. For example, in the kangaroo it serves as a third leg when the animal stands erect; in the American monkeys, and in some of the opossums, it is a prehensile organ; and in the cetacea and in the beaver it is a powerful instrument of propulsion in water. The ribs correspond in number to the dorsal vertebrae, and, as a general rule (excepting in the monotremata), they are connected superiorly not only with the bodies of two vertebrae, but with the transverse process of one of them, and hence present corresponding articular surfaces. The sternum is generally divided into three portions: the middle one, in place of being represented by a single piece, as in man, usually consisting of as many pieces as there are true ribs. It is very short in the cetacea, and is very long in the carnivora and edentata, extending in some cases nearly to the pelvis. In certain cases, in which it is necessary that the anterior members should be endowed with unusual strength, as in the bats, moles, and armadillos, there is a projecting keel upon this bone (as in birds) for the attachment of powerful pectoral muscles.

The cavity of the thorax, which is bounded superiorly by the dorsal vertebrae, laterally by the ribs, and inferiorly by the sternum, is completely separated from the abdominal cavity in mammals (but in no other vertebrates) by the muscular septum known as the diaphragm, or midriff.

The scapular arch in mammals is comparatively imperfect, its coracoid element (see Coracoid Bones) not being sufficiently developed, except in the monotremata, to reach the sternum, or to meet its fellow in the median line. Where the scapula has any bony connection with the sternum, it is through the clavicle or collar-bone, which is frequently absent. The pelvic arch is always composed of the ilium, ischium, and pubis on either
Mammalia.

side, and these bones generally coalesce together, as in man, at an early period of life; but in the monotremata they remain separate. In the implacental mammals (the monotremata and marsupialia), the pelvis presents this striking peculiarity, viz., that from the symphyses (or mesial line of union) two additional bones, termed the marsupial bones, project forwards and outwards, one of whose functions is to support the marsupium, or pouch, which is characteristic of the female marsupials. In the bat, the pelvis is greatly elongated, and the bones do not unite in the mesial line to form a symphysis, so that the lower part remains open, as in birds; while in the cetacea, which have no posterior limbs to be supported by the pelvis, that organ is extremely rudimentary or even entirely absent. As a general rule, the pelvis of mammals is never so broad as in the human subject, and its lateral walls are always relatively smaller, flatter, and longer.

The anterior extremities are always present, although their modes of conformation are very varied, according to the purposes for which they are designed; and the posterior extremities, which are also always present, except in the cetacea, closely resemble the anterior; the difference being greater in man than in any other case, in consequence of the special adaptation of the pelvic extremities for the support of his body in an erect position. The ordinary modifications of these organs are described in the articles HAND and FOOT.—See Owen On the Nature of Limbs.

The teeth of mammals constitute so characteristic a feature in their organization, and are of so much service in their classification, as to require a special notice. The only animals of this class in which teeth are altogether absent are the true ant-eaters and the monotremata. The number of teeth is generally much more restricted than in reptiles, or fishes. In most mammals it is the same as in man—viz., 32; but the typical number, according to Owen, is 44. The largest number of teeth occurs in the armadillos (in one species of which are 98 simple molars), and in the dolphins, which have from 100 to 190 teeth. When the teeth are in these excessive numbers, they are small, nearly equal, and usually of a simple conical form, but excepting in these cases, most mammals have but a few particular teeth for special purposes; thus, the fangs, from being commonly adapted to effect the first coarse division of the food, are called cutters, or incisors; and the back teeth, which complete its comminution, grinders, or molars; while the large conical-pointed teeth (of which there is never more than one in each half jaw), which are specially adapted for holding the food while the animal tears it asunder, are called holders, laniaries, or more commonly canines, from being well developed in the dog. The incisors and canines may be absent, but except in the cases previously mentioned, the molars are always present. The mode in which the teeth are implanted in the jaw is characteristic of the class. Excepting in those teeth which grow from persistent pulps (as the front teeth of the rodents, for example), the dental cavity is closed in at its extremity, and the tooth is prolonged into a fang, which is implanted in a socket lined by periosteum, to which the exterior of the fang is firmly adherent; there being never a continuous ossification or ankylosis of the tooth to the jaw. Again, the fang of the molar is usually divided into two, three, or even four divergent processes, and there is no known fish or reptile in which even a bifid fang occurs. Teeth are confined in this class to the maxillary, pre-maxillary, and lower maxillary bones, and form only a single row in each; and, in general, teeth are situated in all these bones. In all existing mammals, except man, there is a vacant space between the incisor and canine teeth. No mammal has more than two sets of teeth; most, however, have two; the first, which are called temporary, deciduous, or milk teeth, being displaced, and succeeded by the permanent teeth. For a description of the structure and principal forms of these organs, we must refer to the article TEETH, and to prof. Owen's magnificent Odontology.

The digestive apparatus (of which the teeth may be considered a portion) acquires its greatest completeness and elaboration in this group. The leading differences which it presents, and which depend mainly on the nature of the food, have been already noticed in the article DIGESTION. The organs of circulation and respiration require no special remark, as, in all essential points, they closely resemble the corresponding organs in man. See CIRCULATION and RESPIRATION.

The kidneys of mammals generally agree with those of man in their internal structure. See KIDNEYS. In some animals (especially those that live in water), they are much lobulated. In the ox, there are 20 free rounded lobules; in the bear, 40 or 50; in the seal, 70 or 100; while in the true cetacea, the separate lobules are so numerous as to give a racemiform appearance to the kidney. All mammals are provided with a urinary bladder, in which the excretion may accumulate so as only to require being discharged at intervals. This organ is largest in the herbivora, and very small in the cetacea.

The nervous system is remarkable for the large size of the brain, and especially of its hemispheres, in comparison with the rest of the nervous system. The surface of the cerebral hemispheres exhibits a more or less convoluted appearance, the number of the convolutions being to a great degree in inverse proportion to the amount of intelligence of the animal. The hemispheres are united at their lower parts (except in the implacental mammals) by a fibrous band or commissure, termed the corpus callosum, which does not occur in the other vertebrates. In the lowest mammals, the cerebellum is situated quite behind the hemispheres, so as to be visible from above; as we get higher in the scale, it is more
or less covered, in consequence of the prolongation of the hemispheres backwards; until in the highest apes and in man it is almost completely concealed.

The organs of the senses are constructed on precisely the same plan as in man. The most important variations are noticed in the articles EAR, EYE, etc.

The muscular system generally accords with that of man, but presents many remarkable deviations, according to the form of the skeleton, the use of the several organs in the act of locomotion, the natural posture of the animal, etc.

From the structural characteristics and peculiarities of mammals, we turn to that class of animals in their relations to man.

The uses to which mammals are subservient are almost innumerable, and will readily suggest themselves.

Mammals are very generally distributed over the surface of the globe. The mammalia of certain regions evince very decided peculiarities of structure and distribution, as is well exemplified by the case of the two lowest or implantal orders—themonotremata and marsupialia, both of which (with the sole exception of the opossum, one of the marsupialia, in America) are confined to the Australian province. Many other facts of equal interest in the distribution of mammals will be readily ascertained in Mr. A. R. Wallace’s Geographical Distribution (1876).

The subdivision of the mammals into these orders closely approximates to that of Cuvier, as may be seen by a reference to the following table of his sub-classes and orders of the mammalia:

This classification is given in the present article, although imperfect in many respects (for example, in placing the sloth above the horse, the bat above the dog, and the hedgehog above the elephant), it has been retained in a large number of popular works. In consequence of these obvious imperfections, subsequent attempts at new classifications have been made by several of the most eminent zoologists, some of whom, as Waterhouse and Owen, have taken the brain, and others, as Milne-Edwards, Gervais, and Vogt, the placenta, as the basis of classification. Our limited space forbids us from discussing the merits of these systems. The grounds on which prof. Owen bases his cerebral classification may be found in his essay On the Classification and Geographical Distribution of the Mammalia, 1869; while the arguments in favor of the placental classification may be found in prof. Huxley’s lectures on classification, published in the Medical Times for the year 1863.

Fossil Mammalia.—The remains of mammalia are generally found in a fragmentary condition; but there is a valuable compensation to the student of these higher organisms, for in them the parts are so differentiated that the smallest fragment—a tooth or a bone—often tells more to the comparative anatomist than the complete skeleton of some of the lower classes.

No relics of mammalia have been detected in the paleozoic rocks, the earliest we are acquainted with belong to secondary strata. These are the remains of microlestes from the Keuper, unless the jaws of the dramatherium from an American coal-bed, which is probably of triassic age, be older. The microlestes, of which the teeth only have been found in Germany and in Somerset, is considered by Owen to have been allied to the small marsupial and insectivorous myrmecobius of Australia. The next remains of this class have been found in the Stonesfield slate, a member of the oolite. They consist of teeth and lower jaws, which have been referred to four genera, three of which are thought to have been marsupial insectivora, while the other (stereognathus) was a placental mammal, probably a hoofed, and consequently a herbivorous animal, allied to the eocene.
Mammmary. Man.

Hyracoatherium. Mr. Beckles has recently found the remains of twelve or thirteen species belonging to eight or nine genera of mammal—placental and marsupial—in the Purbeck beds, the newest of the oolites. The great series of the chalk formations has hitherto yielded no mammalian fossils. We are certainly acquainted with only a small fraction of the mammals of the secondary measures. When more continued and careful research is made, greater results must follow. Mr. Beckles recently recovered 22 yards square of the very thin dirt-bed of the Purbeck, from which previously the remains of only a single species had been obtained, and this very limited space yielded up to him the remains of no less than twelve or thirteen new species.

As we rise through the tertiary deposits, the number of mammalia greatly increase. Nearly 50 species were described by Cuvier from the eocene strata of the Paris basin; and since his time, numerous additions have been made by Owen and others. They are chiefly pachyderms, belonging to the genera Palaeotherium, Anoplotherium, Hyracotherium, etc.; but with them are associated the remains of an opossum and of several carnivorous animals. Not only do the number of species increase in the miocene beds, but they represent a larger number of orders. There have been discovered two monkeys, numerous proboscidsian pachyderms, as the Dinothereum, mastodon, and elephant, two or three ceteceans, an enormous ant-eater, and several carnivora. The fossils of the pleocene and pleistocene beds are still more numerous, and represent a race of animals not unlike the living fauna, but generally of a gigantic size. The elephants, elks, and bears of Europe were the contemporaries of immense sloths and armadillos in South America, and of huge kangaroos and birds in Australasia. Associated with the bones of some of these extinct species have been found flint implements, and even the bones of man, but under circumstances that have caused great difference of opinion among observers as to their true age. See Man.

MAMMARY GLAND, ANATOMY OF. See Breast.

MAMMARY GLAND, DISEASES OF. The following are some of the most important of these affections.

Acute inflammation of the breast, which is characterized by great swelling, tenderness, pain, and fever. There is a knotty feeling in the inflamed part, and matter soon forms; but the abscess is often slow in pointing. The affection may occur at any period of lactation, and sometimes arises from very trifling causes—as a loaded state of the bowels, too stimulating a diet, etc. The bowels should at once be cleared out by sharp purgatives; leeches and fomentations should be applied; the arm on the affected side should rest in a sling; and an opening should be made where matter can be felt. The milk should also be regularly drawn off. If it can be done without extreme pain.

Some nipples are a frequent cause of the preceding disease. Among the remedies for excoriations, cracks, fissures, and ulcerations of the nipple which cause great pain in suckling, are the application of strong astringent lotions (tannin lotion, for example), touching the sore point with solid nitrate of silver (lunar caustic), and especially the application of collodion. In bad cases, a metallic shield must be placed on the nipple, to protect it from the clothes and from the child's mouth. The regular application of a liniment of rectified spirits and olive oil in equal parts will sometimes prevent this affection.

The mammary gland is also liable to hydatid disease (see Hydatid), to the morbid growth known as chronic tumor, serocystic disease, or glandular tumor, etc., and to cancer (q.v.).

MAMMEE APPLE, Mammee Americana, a highly esteemed fruit of the West Indies (where it is sometimes called the wild apricot) and tropical America. It is produced by a beautiful tree of the natural order guttifera, 60 to 70 ft. high. The fruit is roundish, from the size of a hen's egg to that of a small melon, with a thick leathery rind, and a very delicate inner rind adhering closely to the pulp, which must be carefully removed on account of its bitter taste. The pulp is firm and bright yellow, with peculiar sweet and very agreeable taste, and a pleasant aromatic odor. A similar fruit is produced by mammee Africana, an African species.

MAMMOL, a t. of south Italy, in the province of Reggio, 7½ m. from Gerace. It stands in a beautiful and fertile district on the Locano. Pop. '72, 7,804.

MAMMON, a Chaldean word denoting riches, and so used often in the Chaldean Targums and in the Syriac version. This meaning is given by Tertullian, Jerome, and Augustine; and so Christ employs it in Luke xvi. 9, 11, but Christ uses it also as a personification of the god of riches, as, "Ye cannot serve God and mammon." The derivation of the word is doubtful.

MAMMOTH, the Russian name for the fossil elephant, whose remains are so common in the recent deposits of northern Europe. For a description of it, see the article Fossil Elephant. The name is sometimes erroneously given to the mastodon.

MAMMOTH CAVE, the largest known cavern in the world, is in Edmonson co., Ky., near Green river, 130 m. S.S.W. of Lexington, on the road to Nashville. It consists of a series of caverns, and has been explored to a distance of 10 miles. In this cavern there
As a river crossed by a boat, and various eyeless animals are found, among others the "blind fish" (Amblyopsis speleus). Stalactites hang from the limestone rocks, and the earth is rich in niter. The equable temperature and nitrous atmosphere of the cavern having been recommended as a remedy for diseases of the lungs, a hotel was built in one of the larger chambers of the cave, for the accommodation of consumptive and asthmatic patients; but the use of it has been long discontinued. There are many circumstances to prove that the Mammoth cave is part of the course of a subterranean river which existed in a former condition of the surface.

MAMMOTH CAVE (ante), though the largest, is but one of a very large series of caves, lying beneath extensive districts of both Tennessee and Kentucky. It was discovered in 1809, and has always been private property. The principal stream, Echo river, is nearly three-quarters of a mile in length and has underground communication with Green river; the Styx is about 450 ft. long and is remarkable for a natural bridge of great beauty. Passages and avenues connect chambers or halls, placed at different levels; thus showing the slow progress of the stream in its course through the earth. Accurate measurement of the passages has never been permitted. The extreme length is said to be from 8 to 10 m., while the total length of passages cannot be less than 150 miles. Several of the largest chambers, called domes, extend through the entire height of the levels. Of these the most notable are the Stella, Mammoth, and Gorin's domes, each about 250 ft. high, and Lucy's dome, over 300 ft. high and 90 ft. in diameter. Cleveland and Star domes are of similar height, and about 2 m. in diameter. Of this most wonderful variety of crystals and incrustations, "some massive and splendid; others delicate as the lily."

All of the halls offer to view numbers of stalagmites and stalactites, which in their varied and fantastic shapes—sometimes exhibiting weird or grotesque resemblance to natural or architectural objects—form, in conjunction with the streams and fountains, the picturesque scenery of the cavern. Startling effects are produced by the use of lights and fireworks, the Star chamber showing on its ceiling myriads of the glistening points from which it takes its name.

Geologists assign a million years as the approximate term for the production of this series of caves. There is at present no growth, but, on the contrary, a slow but continual decrease in size by the natural causes of decay and accretion. The process of formation seems to have been as follows: In their course through the soil the streams absorb a large amount of carbonic acid gas; this possesses the chemical power of taking up considerable quantities of carbonate of lime, thus by varied action forming large cavities, and depositing the carbonate, in part, on ceiling or floor or in the stalagmite and stalactite forms, and, in part, carrying it off into the river. In this way the caverns are in succession produced and closed up.

The variations in both the insect and fish life of the Mammoth cave from the ordinary type are scientifically of the highest interest as bearing upon and, it is claimed, favoring the doctrines of evolution and natural selection. That variation has taken place to accommodate animal life to exigencies of environment cannot be doubted, when we examine the blind and the totally eyeless species of fish and crawfish here found. It is not improbable that, if more thoroughly explored, fossil testimony of great value might be discovered.

MAMUN, ABDU'L ABBAS ABDALLA AL, Caliph of Bagdad, of the Abbaside dynasty, and son of Haroun al-Raschid, was b. in Bagdad, 786, and brought up along with his brothers under the care of the most illustrious men of the time. In 800 A.D. he was invested with the government of Khorassan; and after dispossessing his elder brother, Al-Amin, who had ascended the throne on the death of their father, became caliph, Oct. 4, 813. His reign was disturbed by internal dissensions, and rebellions of the outlying provinces. Africa and Yemen declared themselves independent, the subjection of Egypt, Syria, and Mesopotamia was merely nominal, but the rest was well and beneficiently governed. Civilization advanced with rapid strides; ruined towns and devastated tracts were restored; and distributions from the royal treasury made to those who had suffered from earthquakes, drought, or any other unavoidable cause. In 827, Mamun abjured the orthodox religion, and joined the heterodox sect called Mosalas, compelling a number of his subjects to follow his example. Towards the close of his reign, a war broke out with the Greek emperor Theophilus, and soon afterwards Mamun died, Aug. 9, 834. Mamun was the most learned and liberal of the Abbaside caliphs, and is said to have expended 300,000 dinars (£137,500) on the translation of the works of the ancient Greek philosophers into Arabic, these works having been presented to him by the Byzantine emperor. He highly encouraged mathematics and astronomy, founded observatories at Bagdad and Kasim (near Damascus), caused a degree of latitude to be measured, and the obliquity of the ecliptic to be estimated. His new city of Bagdad became the abode of men of science and letters, who flocked to it from all quarters; and Mamun himself personally superintended their labors. Mamun has left three works, two of which are on religious subjects.

MAN. Under this heading, it is proposed to consider various topics relating to the physiology and natural history of man, which have not been treated of in independent
articles, such as the development of the physical qualities of man, the distinctive characteristics of man, and the antiquity of the human race. The question of the races or varieties of man has been already discussed in the article Ethnology; and for information regarding the mental and social nature of man, the reader is referred to the articles Ethics, Instinct, Intellect, Mind, etc.

In tracing the development of the physical qualities, we shall follow the arrangement pursued by Quetelet in his celebrated treatise Sur l'Homme.

It is a very remarkable fact, the true causes of which we do not know, that more boys are born annually than girls. Taking his data from the principal European states, M. Bickes (quoted by Quetelet), who has collected more than 70,000,000 of observations, finds that in Europe generally 106 males are born to 100 females. In Great Britain, the ratio is not quite so high, being 104.75 to 100. To some extent, the age of the parents influences the sex of the children, and Mr. Sudler was led to the conclusion, that "the ratio in which the sexes are born is regulated by the difference of age of the parents, in such a manner that the sex of the father or the mother will preponderate beyond the average of the members of births, according to the party which has the excess of age."

The probable value or duration of life immediately after birth is, in general, about 25 years in Belgium (Quetelet), 32.2 in France, 33 years in England (Rickman), and 47.2 in Geneva (Lombard). Towards the age of five years, the chances of prolonged life for both sexes is greatest, ranging from 48 to 50 years. It is impossible to state with scientific precision what is the natural length of a man's life, when all abnormal disturbing causes are removed; but so few persons exceed the age of 100 years that a century may be taken as the limit of man's existence.

The development of the height, weight, and strength, at different ages, has been studied by Quetelet, J. D. Forbes, Danson, and others. From a large number of observations made by Quetelet in Belgium, he deduces the following conclusions:

1. From birth there is an inequality both in weight and height between children of the two sexes: the average weight of a boy at birth being 3.20, and of a girl 2.61 kilograms (1 kilogram = 2.205 pounds); the height of a boy being 46.6, and of a girl 45.8 centimeters (1 meter = 39.37 inches). 2. The growth of a child begins to diminish slightly towards the third day after birth, and does not begin to increase sensibly until after the first week.

8. At equal ages, the boy is generally heavier than the girl. It is only at about the age of 12 that the individuals of both sexes are of the same weight. Between 1 and 11 years the difference in weight ranges from a kilogram to a kilogram and a half; between 16 and 20, it is nearly 6 kilograms; and after this period, 9 to 10 kilograms. 4. When man and woman have attained their full development, they weigh almost 20 times as much as at birth; while their height is about 3½ times greater than it was at that period.

5. In old age, man and woman lose about 6 or 7 kilograms in weight, and 7 centimeters in height. 6. Man does not acquire his complete growth till after he has completed his 5th year; he attains his maximum weight at 40, and begins to waste sensibly after his 60th year. 7. Woman attains her maximum weight at the age of 30. During her reproductive period, the increase of her weight is very slight. 8. The weight of man and woman has been investigated, and who were fully developed and well formed, varies within extremes which are nearly as 1 to 2; while the height varies within limits which at most are as 1 to 1½, as may be seen from the following observed values:

Quetelet instituted a series of experiments on the strength of persons of both sexes at various ages. He determined both the lumbar power (the weight that could be carried on the back) and the power of the hands by means of Regnier's dynamometer. From these results, it appears that the lumbar power of females differs less from that of males during childhood than subsequently. During childhood, the lumbar power of boys is about one-third more than that of girls; towards the age of puberty, one-half; while in adult life it is more than twice as great. The average strength of a well-developed man is 89 kilograms, or nearly 19 kilograms more than his weight in his dress, so that such a man might hold on for a short time by a rope with a weight of 19 kilograms attached to his body. From experiments on the power of the hands, it appears that the manual power of the male sex is greater than that of the female at all ages. Before puberty, the ratio is 3 to 2, and it afterwards becomes 9 to 5. It also appears that the hands acting together produce a greater effect than the sum of the effects they produce when acting singly; and that the right hand is about one-sixth stronger than the left.

Principal Forbes made a series of experiments on English, Scotch, and Irish students, which, in most respects, are strongly corroborative of Quetelet's results, but which evince the superior development of the natives of this country, especially in strength. The following numbers are selected from Forbes's tables:
If we proceed to compare the human figure with that of the animals which in their form approximate most closely to man (viz., the anthropoid apes), the chief point that strikes us is the great relative size of the human brain-case and brain, and the comparatively small size and vertical direction of the face; the great length and muscularity of the lower extremities, and their adaptation to the erect position; the adaptation of the hand to the great variety of actions of which it is capable, due mainly to the fact, that the thumb can be opposed to the extremities of all the fingers, whether singly or in combination; the greater breadth of the pelvis, etc.

Those, however, who are inclined to support Mr. Darwin's hypothesis, maintain, that whatever system of organs be studied, the comparison of their modifications in the ape series leads to one and the same result—that the structural differences which separate man from the gorilla and the chimpanzee are not so great as those which separate the gorilla from the lower apes. This by no means implies that the structural differences between man and the highest apes are small and insignificant; it is admitted, on the contrary, 'that they are great and significant; that every bone of the gorilla bears marks by which it might be distinguished from the corresponding bone of a man; and that, in the present creation, at any rate, no intermediate link bridges over the gap between homo and troglodytes.—Huxley.

The last point we shall notice is: When did man first appear upon the surface of the globe? All that can be definitely stated upon this subject is, that the geological researches of Boucher de Perthes, Falconer, Prestwich, sir Charles Lyell, and many others, show that while it is impossible to fix the date of man's appearance, or even to approximate to it, there is apparent evidence of his existence far beyond that which is assigned by our popular chronology. The flint implements which have been discovered in the lower gravels of Abbeville and elsewhere, have been already noticed in a special article, and their occurrence in association with the fossil bones of extinct mammals, and the other evidence of their antiquity deduced from their geological position, have been there described.

The Brixham caverns afford similar and corroborative evidence of the antiquity of man. They were discovered accidentally in 1858 by the roof of one of them falling in. Below a thick stalagmite crust, which formed their floor, and which contained some of the bones of the cave-bear, was a mass of loam of an ochreous red color, in some parts 15 ft. in thickness, in which were found remains of the mammoth, an extinct rhinoceros, the cave-bear, etc., and from various parts of these deposits flint-knives were obtained. Under the bone-deposit was a bed of gravel, which in some parts was more than 20 ft. thick. It contained no fossils, but even in its lowest parts were found specimens of flint knives. The fabricators of these knives must have lived long antecedently to the time when the work of their hands was covered with stalagmite; and contemporaneous with the stalagmite must have been the cave-bear, whose bones were imbedded in it. The ossiferous caves of South Wales (Gower, Sicily, etc., yield similar results. (See Kent's Cavern.)

There is reason to believe that in the island of Sardinia the land has risen 100 ft. since man inhabited its shores, possessing at that time the art of fishing by nets and of making a coarse pottery. The western extremity of the island of Crete has been raised about 25 ft. since the construction of its ancient ports, which are now high and dry above the sea. Supposing the movement to have been uniform and equal in the two islands, the mussel-beds of Cagliari (in Sardinia) must have emerged from the sea more than 20,000 years ago; but before that time, man fished the waters over them, if count de la Marmora is right in conjecturing that a flat ball of baked earthen-ware, with a hole through its axis (which was found imbedded among them), was used for weighting a fishing net.

Our last illustration shall be taken from the New World. Agassiz estimates that the southern half of the peninsula of Florida, which is built up of coral reefs, took 135,000 years to form; and hence he would estimate the age of the human jaws and teeth and bones of the feet found in one of the coral banks to be 10,000 years old.

For further information on this interesting and difficult subject, we must refer the
reader to sir Charles Lyell's work *On the Antiquity of Man*. It is right to add that many still dispute the conclusions drawn from these facts; see *The Human Species*, by Quatrefages (1879).

**MAN (ante). See Biology; Species.**

**MANAAR**, Gulf of, lies between the w. side of the island of Ceylon and Hindustan, and is divided from Falk's passage on the n. by the islands of Ramisseram and Manaar, and by a low reef called Adam's bridge. At its n.e. extremity it is 80 m. in width, while at its south-western limit it reaches a width of nearly 200 miles.

**MANAGA, Francisca undiflora or *Hopeana*, a plant of the natural order *seraphiluraceae*, a native of Brazil.** The whole plant, and especially the root, is found to be of great value in exciting the lymphatic system. It is nauseously bitter, purgative, emetic, emmenagogue, and alexipharmic; in overdoses, an acrid poison. It is much used in Brazil as a remedy for syphilis.

**MANACOR**, a t. in the island of Majorca (q.v.), in a fertile plain, 30 m. e. of Palma. It manufactures brandy, wine, and oil. Pop. 10,000.

**MANAGUA, a t. of Central America, the capital of Nicaragua, in a healthy and fertile district on the south shore of lake Managua or Leon.** It owes its position chiefly to the rivalries of the cities of Granada and Leon, but partly also to its central situation.

**MANAKIN, one of the names of a bird belonging to the order insessores, called also chatterer (q.v.).**

**MANASSAS, BATTLES OF.** See BULL RUN.

**MANASSEH, (from Heb. Nasha, to forget, signifies, "one who causes to forget"), the name of the eldest son of Joseph.** At the Exodus, the tribe of Manasseh is said to have counted 39,200 warriors, and on entering Canaan, 52,700. It received land on both sides of the Jordan. The eastern half embraced the rich pasture-lands of Argob and Bashan, as far as the slopes of Hermon; the western extended from the Jordan to the Mediterranean, and lay between Ephraim and Issachar. Manasseh was also the name of one of the kings of Judah (the fourteenth), who succeeded his father Hezekiah, 699 n.c. at the age of 12, and reigned, according to the narrative, for 55 years. He rushed headlong into all manner of idolatry, and seduced the people to follow his example. The sacred writers cannot otherwise express their sense of the enormity of his guilt than by saying that the very heathen never went so far in their practice of abominations as Judah did in those days. His subsequent history is differently related in Chronicles and in the Book of Kings. The apocryphal composition called the *Prayer of Manasses* is received as canonical by the Greek church.

**MANASSEH BEN-JOSEPH BEN-ISRAEL, 1604–57, b. Lisbon; educated at Amsterdam, where his father had removed to escape persecution.** At the age of 18 he took the place of his former instructor, rabbi Isaac Uzziel, in the Amsterdam synagogue. In 1632 he set up a Hebrew printing-press at Amsterdam, and in 1632 published the first volume of his *Conciliator*, the Latin edition of which bears the title of *Conciliator, sive de Conveniencia doorum S. Scripturae, etc.* It is a learned harmony of the Pentateuch. Its author was at once recognized as the first Hebrew scholar in England, and among his correspondents were Vossius, H. Grotius, and Huet. In 1639, deprived of his property by the Spanish inquisition, he migrated to Batavie and began business as a merchant. He came to England in the time of the protectorate with the view of securing from Cromwell the concession of additional rights to the Jews. He met with a favorable reception, and succeeded in accomplishing some of the objects of his mission, after which he returned to Amsterdam. He was a friend of Grotius, and other famous scholars, and his own literary activity was great. Besides the *Conciliator*, he published editions of the Talmud, and the Hebrew Bible; *A Defense of the Jews in England*, which appeared at London, during his English visit, a work on the resurrection of the dead; and various other treatises. There is an English translation of the *Conciliator*, by E. H. Lindo; and an English life of Manasseh, by Dr. Thomas Pococke.

**MANATEE, or LAMANTIN, Manatus, a genus of herbivorous cetacea or *manatides* (q.v.), readily distinguished by the rounded tail-fin, and further characterized by the presence of small flat nails at the edge of the swimming paws, and by the structure of the grinders, which have square crowns with two transverse ridges. The species, which are all inhabitants of tropical coasts, feed not only on algae, but on the plants which grow along the shore, and are rendered accessible to them by the tide, which, after it has retired, often exhibit plain proofs of their browsing. They live chiefly in shallow bays and creeks, and in the estuaries of rivers, and often ascend rivers to a great distance from the sea. The best known species (*M. americanus*) is found in the West Indies and on the western coasts of tropical America. It sometimes attains a length of 20 ft., and a weight of 3 or 4 tons. The skin is very thick and strong, and is almost destitute of hair. The fingers can be readily felt in the swimming paws, and, connected together as they are, possess considerable power of motion, whence the name manatee (from Lat. *mannus*, a hand). The manatee is usually found in herds, which combine for mutual protection when attacked, placing the young in the center. When one is struck with a harpoon, the others try to tear out the weapon. The females show great affection for
their young. No animal is more gentle and inoffensive than the manatee. It has been tamed and rendered familiar enough to come for food when called. Vast numbers were formerly found in places where it is now comparatively rare, as its capture is easy, and its flesh—which has been variously likened to beef and pork—is held in considerable esteem. A common name for the manatee is sea-cow.—Another species is found on the coast of Florida, and a third on the W. coast of Africa.

MANATEE, a co. of s.w. Florida on the gulf of Mexico, having the Caloosahatchee river on the s., and lake Okeechobee on the s.e.; watered by the Manatee river and small streams; 4,070 sq. m.; pop. 67,365. The surface is generally level, and the soil not very productive; it grows, however, Indian corn, sweet potatoes, rice, and a little sugar and cotton. Co. seat, Manatee.

MANATIDE, a family of cetacea, including all the herbivorous section of the order. Besides the distinguishing characteristics mentioned in the article CETACEA, they differ from the ordinary cetacea in having swimming paws rather than pectoral fins. It has been supposed that some of the stories of mermaids may have originated in the females of some of the manitide being seen with the head and breasts raised out of the water. There are three genera of manitide, described in the articles DUGONG, MANATEE, and STELLERINE.

MANAYUNK', a part of the city of Philadelphia, on the e. bank of the Schuylkill river, and on the Reading railroad; connected with the heart of the city by steam and horse cars, hay on the Schuylkill, and a well-made highway. The canal of the Schuylkill navigation extends 2 m. along the river at first, and was afterward extended about a mile, which is employed in the manufacture of cotton and woolen goods and paper. There are 30 manufacturing establishments, with a capital of $6,000,000, employing nearly 5,000 persons, and producing goods annually valued at $10,000,000. The place has 8 churches, 2 weekly newspapers, 1 bank, 5 insurance companies, excellent schools, water and gas works, and a good market-house.

MANBY, GEORGE WILLIAM, favorably known for his exertions in saving the lives of persons in danger of shipwreck, was b. in 1765 at Hilgay, near Downham market in Suffolk. After studying for the army, he served seven years in the militia. Receiving the appointment of barrack-master at Yarmouth in 1808, he had frequent opportunities of witnessing the ravages produced by storms on the coast of Norfolk and Suffolk. A dreadful series of shipwrecks on a particular day in 1807, when H. M. gun-boat Supe was wrecked within 60 yards of the shore, and 67 lives lost, and when 147 dead bodies were found on about 30 m. of coast, drew his attention forcibly to the subject, and led him to experiments which resulted in the invention of the apparatus known by his name (see LIFE MORTARS AND ROCKETS). On Feb. 12, 1808, he succeeded in saving the lives of the crew of the brig Elizabeth, which was stranded at 150 yards from the shore; he sent a rope over to them by means of a shot, and this rope was the means of pulling a boat from the shore to the brig. A career of usefulness was thus commenced, which he followed for the remaining 46 years of his life. In 1810 a committee of the house of commons voted £2,000 to Manby, as a token of recognition of his services. Being appointed to report on the dangers of the Norfolk and Suffolk coasts, he recommended the establishment of mortar-stations at certain intervals. This recommendation was adopted by the house of commons and the government; and by the year 1815 there were nearly 60 such stations. Capt. Manby received a further grant from parliament in 1823 of £5,000; to which were added honorary distinctions from many foreign governments. It was estimated that, by the time of his death, nearly 1,000 persons had been rescued from stranded ships by means of his apparatus. He wrote two works on his favorite subject: An Essay on the Preservation of Shipwrecked Persons, with a descriptive account of the Apparatus, etc. (1813); and Practical Observations on the Preservation of Mariners from Stranded Vessels, and the Prevention of Shipwreck (1827). In what manner his system has since been supersedes by one of a more effective kind, is described under LIFE MORTARS AND ROCKETS. Capt. Manby died Nov. 18, 1854.

MANCH, or MAUNCH (Fr. maanche), a frequent charge in English heraldry, meant to represent a sleeve with long pendant ends, of the form worn by ladies in the reign of Henry I. Or, a manch gules, has been for a long time the arms of the Hastings family, one of whom was steward of the household to Henry I.

MANCHA, or LA MANCHA, a district of Spain, in the province of Ciudad Real, and the southernmost part of the kingdom of New Castile. See CASTILE.

MANCHE, a maritime department in the n.w. of France, formed from the most western district of the old province of Normandy, deriving its name from La Manche (the English channel), which washes its coasts. Greatest length, 96 m.; average breadth, 27 m.; area, 1,428,249 acres. Pop. 76,539,910. Of the entire area, 940,047 acres are cultivated, and about 2,250,000 acres are in meadow. The surface of the department is irregular; hills of no great elevation traverse it from n. to s. The Vire, the Douve, and the Selune are the chief rivers. The climate is mild and temperate, but somewhat humid. Flax, hemp, and fruit are extensively cultivated. Immense quantities of apples are grown, from which 44,000,000 gallons of cider are made annually. Horses of the true Norman breed are reared in the pastures, and excellent cattle of large size
are bred in the valleys. The department is divided into the six arrondissements of St. Lö, Coutances, Valognes, Cherbourg, Avranches, and Mortain. Capital, St. Lö.

MANCHESTER, a t. in Hartford co., Conn.; 8 m. e. of Hartford, on the Hartford, Providence and Fishkill railroad; pop. 4,233. The place is extensively engaged in manufacturing, there being over a dozen paper mills, and others of woolen, cotton, needle, and so on. The largest of all is the silk factory of Cheney Bros., which covers 7 or 8 acres and employs more than 1,000 operatives. There is a newspaper, library, town-hall, and many schools, churches, and stores.

MANCHESTER, a t. in Essex co., Mass., on the n. shore of Massachusetts bay, and on the Gloucester line of the Eastern railroad, 8 m. n.e. of Salem. Pop. 1865. It has 2 churches, a public library, and manufactures of leather and furniture. The purity of the air and the fine ocean views make it an attractive summer resort for many residents of Boston, New York, and other cities.

MANCHESTER, a city of New Hampshire, on the e. bank of the Merrimac river, at the falls of Amoskeag, 18 m. s. of Concord, 59 m. n.w. of Boston. The town is laid out in broad streets, shaded with elms, with 5 public squares. The falls of 54 ft. in a mile afford water-power to 5 manufacturing companies, with factories of cotton, paper, locomotives, hardware, etc. There are also extensive print-works and starch-mills. There are 16 churches, 45 public schools, 9 banks, and 2 daily and 3 weekly newspapers. Pop. '38, 50; '69, 20,107; '70, 23,536.

MANCHESTER (ante), a city in Hillsborough co., N. H., is reached by 4 railroads, the Concord, the Concord and Portsmouth, Manchester and Lawrence, and Manchester and North Weare. Its original name was Derryfield, under which it was incorporated in 1751. Its present name was taken in 1810, and the city charter dates from 1846. Cotton and woolen manufactories produce an enormous quantity of goods annually; water-power being furnished by the Merrimac river through canals leading from the Amoskeag falls to the mills, 4 of which have more than 300,000 spindles. There are also extensive locomotive, leather, boot and shoe, and tool shops. Among the principal public buildings are the court-house, state reform school, library, Roman Catholic convent, and others. There are 7 newspapers, of which 2 are dailies; 9 banks, and a very large number of schools and churches. The town was originally settled in 1722 by Scotch-Irish Presbyterians. The amount of capital invested in manufactures cannot be less than $10,000,000, and in this respect it is surpassed by only 3 or 4 cities in the United States. There is a great variety of manufactures besides those of cotton and woolen goods, such as boots and shoes, stockings, paper, cutlery, locomotives, steam-fire-engines. The 4 great corporations are the Amoskeag manufacturing co., the Manchester mills, the Stark mills, and the Langdon mills. The city has an excellent supply of water from Massabesic lake, near by.

MANCHESTER, the capital of Bennington co., Vt., on the Harlem Extension railroad, 30 m. s. of Rutland, and 60 m. n. of Troy, N. Y.; pop. 1897. Its fine mountain scenery, the purity of its atmosphere, and its picturesque walks and drives, make it attractive as a resort during the summer. It has 2 churches, a classical school for both sexes, a newspaper, and is the seat of the Burr and Barton seminary.

MANCHESTER, a village of Chesterfield co., Va., on the s. bank of the James river, opposite Richmond, and the seat of important manufactures; pop. 2,599.

MANCHESTER (Sax. Manchester), a city, municipal and parliamentary borough of Lancashire, and the great center of the cotton manufacture of the n.w. of England, stands on the Irwell, 32 m. n.e. of Liverpool, and 188 m. n.w. of London by railway. On the w. side of the Irwell is the borough of Salford, communicating with that of Manchester by means of 10 bridges, and considered as virtually a portion of the city.

By the census of 1871 the inhabitants of the parliamentary borough of Manchester were 383,843, and the increase from 1851 was 67,355. In the adjoining borough of Salford the pop. in 1871 was 134,803, the increase from 1851 having been 38,662. The area of the borough of Manchester is 9.9 sq. m., of Salford, 7.9 sq. miles. Both boroughs were enfranchised by the reform bill of 1832. Manchester having 2 members, and Salford one member, to parliament. The reform bill of 1867 gave Manchester 3, and Salford 2 members. Manchester was incorporated in 1838, and Salford in 1844. Manchester was made a bishopric in 1847, and received the title of city in 1853. Water for the supply of Manchester is collected on the Lancashire side of Blackstone Edge, at Woodhead, and conducted from a series of reservoirs through iron pipes, nearly 20 m., to the borough. The water-works, in which are invested about £3,750,000, and the gas-works, involving about £450,000, belong to the corporation. The manorial and market rights were also acquired by the corporation in 1845 for the sum of £200,000. There are 4 public markets in Manchester, and 2 in Salford, besides the cattle market. Smithfield market in Manchester is more than 4 acres in extent, and is entirely covered in. The market-tolls and rents of Manchester alone amount to £55,000 per annum. The sale of gas makes a profit of some £44,000 per annum, which is devoted to improvements in the borough. In 1845-46 a public subscription founded 3 parks of about 30 acres each, and the corporation has since acquired a fourth park of about 60 acres. Manchester was also the first borough to take advantage of the free libraries' act, which allows an appr-
p ration of a penny in the pound on the local assessment for parks, libraries, and museums; and here also was established the first free lending library in England. Five branch lending libraries and a museum have since been established in Manchester, and one reference library, one branch lending library, and an excellent museum in Salford. The Free Library, erected in 1873, is the old college library formerly belonging to the University of Manchester; 1662, the people of Manchester and Salford have the free use of upwards of 150,000 volumes of ancient and modern literature, besides newspapers and periodicals.

The two boroughs have about 100 churches belonging to the establishment. The cathedral, commonly called the old church, built 1422, is a very fine Gothic structure, and has latterly undergone a very extensive process of restoration in its original style. There are 17 Roman Catholic and 180 dissenting chapels, some of which, especially St. John's Catholic cathedral, the church of the Holy Name, and Cavendish independent chapel, are very beautiful specimens of modern Gothic architecture. There are 3 Jewish synagogues, 4 German churches, and 1 Greek church. The principal public buildings for secular purposes are the town-hall, built at the cost of three-fourths of a million sterling, in Gothic; the royal infirmary, the royal exchange, the royal institution, all in the Grecian style; the free-trade hall, in composite; and the assize courts, in decorated Gothic. There is a home for 150 convalescents in the suburbs, founded by Robert Barnes, a former mayor of Manchester. Many of the warehouses of the merchants are palatial in appearance, and the business transacted is quite in accordance with the magnitude of the buildings. The floor of the royal exchange contains about 5,170 square yards, and is yet thronged on market-day. Manchester has four private and five joint-stock banks, besides branches of the bank of England and the national provincial bank. The celebrated Bridgewater canal connects Manchester with Liverpool, and access is also obtained for heavy barges by the rivers Irwell and Mersey. There is communication by railway in every direction. When the widening of Deansgate, Victoria street, and St. Mary's Gate took place, it caused the demolition of considerable property, and the site was sold by the corporation for £288,960, or £56 per square yard. In Albert square a prince Albert memorial has been erected. A bronze statue of Richard Cobden stands in St. Ann's square; and there is one of Cromwell (unveiled in 1873) at the foot of Victoria street. Manchester publishes 15 journals and newspapers, 5 of which are issued daily.

The chief trade is cotton spinning and manufacturing, including calico-printing and bleaching and dyeing; but there are also considerable manufactures of silk and mixed goods, of small-wares, of machinery and tools, of paper and chemicals; and Manchester is also a depot for all kinds of textile fabrics, and does a very large export trade. There are ordinarily employed in the cotton-mills about 60,000 persons, who earn about £30,000 per week in wages. There are at least 7,000 skilled mechanics constantly engaged in the production of steam-engines, spinning-mules, looms, and other machinery, chiefly for the production of the various textile fabrics, whose wages average about 32s. each per week, and who need some 1500 laborers to assist them.

The educational endowments of Manchester are small compared with its population. There is a hospital school for 100 boys, founded by Sir Humphrey Cheetham, and incorporated by Charles II.; there is also a grammar-school, with about 230 free, and 350 paying pupils, founded 1519, by Hugh Oldham, bishop of Exeter. According to a school-board return in 1873, the number of day-schoolers in Manchester was 38,500 in actual attendance; and in evening schools and literary institutions there were 19,000 males, 5,000 females. In 1846 John Owens, a Manchester merchant, left £100,000 to found a college for secular instruction; and in connection with that institution, there are now more than 800 day and evening students. The college is well conducted, and is steadily rising in popularity. In 1873 a new building was erected at a cost of about £90,000, and the royal school of medicine was incorporated with it, whilst the natural history society and the geological societies handed over their collections into its keeping. A mechanics' institution was commenced in 1824, and is still carried on successfully. It has day and evening classes, a good library and reading-room, and all the necessary appliances for secondary education. Similar institutions on a smaller scale exist in Salford, and in the out-townships of Longsight, Rusholme, Harpurhey, Cheetham Hill, and Pendleton. In Manchester originated the agitation for free trade (see Anti-corn-law League). Manchester was also the first place to secure the privilege of inland bonding for articles chargeable with customs duties, and now produces a large revenue from that source.

Camden, who died in 1623, says: "Where the Irk runs into the Irwell, on the left-hand bank, and scarce three miles from the Mersey, stands that ancient town called in Antiquus (according to different copies), Manesium and Manetium. Perhaps, as an inland town, it has the best trade of any in these northern parts. The fustian manufacture, called Manchester cotonis, still continues there; this, with a great variety of other manufactures, called Manchester scarres, renders not only the town itself, but the parish about it rich, populous, and industrious." The parish of Manchester covers a large area, reaching to Stockport, Oldham, and Ashton-under-Lyne, and in the early part of the 16th c. was reckoned to have 20,000 communicants.

**Manchineel**, *Hippomane mancinella*, a tropical American tree of the natural order *euphorbiaceae*, celebrated for the poisonous properties of the acrid milky juice with which every part of it abounds. A drop of this juice, which is of a pure white color,
burns like fire if it falls upon the skin, and the sore which it produces is very difficult to heal. The Indians of tropical America use it for poisoning their arrows. The fruit is in form, color, and scent not unlike a small apple; the name is from the Spanish *mancinilla*, a small apple—and contains a nut about the size of a chestnut. The fluid which the fruit contains is milder than that of other parts of the tree, but its acridity is so great as immediately to repel any who, tempted by its appearance and citron-like fragrance, may ignorantly attempt to eat it. The leaves are alternate, ovate, serrate, and shining. It is said that, owing to the volatile nature of the poisonous juice, persons have even died from sleeping under the shade of the manchineel tree. Much seems to depend on the state of the atmosphere, and there is good evidence that rain or dew falling from the branches of the manchineel does produce injurious effects. The fruit of manchineel dried and pulverized, is diuretic; the seeds are excessively so. The wood is of fine quality, and well suited for cabinet-making. Whole forests of manchineel at one time existed in Martinique, which have been burned down. It grows chiefly in the vicinity of the sea. *Camararia latifolia*, another West Indian tree, of the natural order *apocynaceae*, is called *bastard manchineel*, from its resemblance to manchineel in its poisonous properties.

**MANCEHORIA.** See **MANTURIA, ante.**

MANCEI, a Roman family, beginning historically in the 14th c. with the name of Pietro Omni-Santi, surmounted Mancini dei Luci. Cardinal Francesco Maria Mancini, who married a sister of cardinal Mazarin in 1634, is the next distinguished member. His daughters, noted for their beauty and their intrigues, are spoken of by Michelet as "a battalion of Mazarin's nieces."—LAURE, 1635-57, was a favorite of Louis XIV, when prince.—OLYMP, 1639-1708, of the "black soul and black face," a mischievous beauty, was his mistress, who was married to an Italian and bore 8 children, was charged with poisoning her husband, and became a wanderer out of France, and when in Spain was suspected of poisoning Louise, the wife of king Charles II. Prince Eugene of Savoy was one of her five sons.—MARIE, 1640-715, another mistress of Louis XIV, who came near marrying her. She married prince Colonna in 1651, bore several children, quarreled with her husband, returned to Paris, was widowed, and then married by Louis XIV, and subsequently led an adventurous life.—HORTESE, 1646-99, a beauty, courted by Charles II. of England, by marshal Turenne, and Charles de Lorraine, was married to Armand de la Porte, marquis de la Meilleraye, who soon after assumed the title of duke of Mazarin on the death of the cardinal. She, too, was supposed to have been too free not only with Louis XIV., but with her former lovers; left her husband, entered the court of Charles Emanuel of Savoy; and on his death was expelled by his widow. She then visited Germany, and then Charles II. of England, who was soon again one of her suitors, fixed an annuity upon her, and allowed her a home in the palace of St. James.—MARIE ANNE, 1649-714, went to Paris in 1655, was married to Maurice Godefroi de la Tour, duc de Bouillon, in 1662; soon left and afterwards rejoined her husband; became the patroness of La Fontaine, and made her home a literary center, where Molière, Corneille, and other celebrities met. She, too, became suspected of the usage of poisons, and fled Paris in 1689, lived 8 years in England, 2 in Venice and Rome, and then returned to Paris. Her beauty and her society was courted to the last. She seems to have been the least disreputable, or vile, of a beautiful family which, if living in the present day, would be dozens of other places than the palaces of the rulers of great nations.

MANCEI, PASQUALE STANISLAUS, b. Naples about 1815. He became a professor of law, quite young at the university of Naples; deputy to the Neapolitan parliament in 1848, and editor of a famous protest of the liberal party against the acts of Ferdinand II. Self-exiled to escape the hospitalable dungeons of Ferdinand he fled to Turin, where he achieved a brilliant success at the bar, and was made law professor of the university of that city. He made a specialty of teaching the principle of nationalities as distinguished from dynasties. He was member of the Piedmontese chamber of deputies when Garibaldi's movements cut the knot of Neapolitan slavery; and he became minister of justice and ecclesiastical affairs in the provisional government. He promulgated an order to break up the mendicant and "contemplative" orders; but public opinion was not ripe for it, and it was not executed. He was deputy to the first Italian parliament in 1861, and became one of the leaders of the center, *consorteria*; one of the most brilliant orators of the parliament, and an active promoter of Italian unity and progress.

MANCO CAPAC I., by Peruvian tradition, was the first of the Incas, and founded the royal race several centuries before the invasion of the Spaniards. He is represented in legends as a child of the sun, with his wife, Mama Oello, instructed the natives of Peru in science, art, and architecture, and predicted the overthrow of the twelfth of his dynasty by a white race from distant lands.

MANCO CAPAC II., the last Peruvian Inca who made any serious opposition to the Spanish power. He was the son of Huayna Capac by the daughter of a conquered chieftain of Quito. His half-brothers Huascar and Atahualpa engaged in civil war upon their father's death, and the latter defeated and executed his rival. Atahualpa, trusting the faith of the Spaniards, was himself falsely accused and executed in 1533.
After the death of Toparca, whose claims to the throne were supported by Pizarro, Manco claimed the title, and for a time allowed himself to be used as Pizarro's tool. But his character was naturally bold and independent; he soon escaped from his degradation, and in 1536 laid siege to Cuzco, a great part of which he burned. This was the last triumph of the Peruvian race. Manco took refuge in the Cordilleras, and for years carried on an irregular warfare to the great annoyance of his enemies. Pizarro's cruelty in scourging publicly to death a favorite wife of the Inca in retaliation for the slaying of a Spanish messenger, rendered all thought of reconciliation impossible. In 1544 Manco was killed by a party of Almagros soldiers who had taken refuge in his camp.

MANDALAY. See ELEUSINE.

MANDALAY, Mandalay, or Pattawapura, the present capital of the kingdom of Burmah, lies 3 m. from the Irrawaddy river, a little n. of the former capital Amarapura (q.v.), and 330 m. n. of Rangoon. In 1856 its site was occupied by cultivated fields; but having been chosen by the king as the position for a new capital, was in the following year ready to receive the court. The city is laid out in three parallelograms, of which the inner two are walled. Within the inmost are the palace, and offices of government; in the second inclosure are the houses of the civil and military officers, and the quarter of the soldiers; while the outer city is inhabited by merchants, mechanics, etc. Pop. about 90,000.

MANDALAY (ante), situated on a bend of the Irrawaddy river, about 17 m. above the ancient capital of Amarapooa, became the capital of Burmah by command of the king in 1539. It is 400 m. n. of Rangoon, the great sea-port of all Burmah, and is reached by way of the river on steamboats. The climate is pestilential, and but for the swine, which act as scavengers, the filth to be found in all directions would render the city uninhabitable. Pigs crowd the highways, feeding from the refuse that is scattered everywhere, and these animals are under protection, and have even been the subject of provision on the part of benevolent individuals, who remembered them in their wills for the good of the city. The place is further infested with pariah dogs, vicious and noisy. The dwellings in Mandalay are constructed of bamboo, and of a dark red wood found throughout Burmah, the latter being usually ornamented with beautiful carvings. Such houses have three or four roofs, which give them an extremely picturesque appearance. A monastery near the city contains in its court-yard a number of statues representing the Buddhist Gautama, the founder of that religion, in various attitudes. A sluggish stream, the Schwaya-Ta-Chuong, with several carved wooden bridges, is near by, on the left bank of which stands the building of the former British residency, now abandoned. The citadel is built in a perfect square, of which each front is a mile in length. It is protected by a high crenelated wall, adorned at intervals by pretty seven-roofed kiosks; and by a broad moat filled with clear water, on whose surface float masses of blooming lotus-flowers, with here and there a carved war-boat, whose prow presents the figure of a dragon. A heavy gate and drawbridge at each side of the wall give access to the citadel, and are guarded by Burmese soldiers. Within are the hall of justice, the royal palace, and the abode of the sacred white elephant. The present king of Burmah, Theebaw, resides in the palace. He is the son of the late king Mindoon Men, and the youngest of three brothers. Great efforts were made towards the education of this prince, and he was trained in a Burmese convent. But on the death of his father, he seized the government, causing all the friends and near relatives of the other princes to be murdered, while they only escaped by seeking the protection of the British residency in disguise. They were afterwards smuggled to the British frontier, and were shipped to Calcutta, whence they have twice returned to Burmah, and raised rebellions, which, however, proved ineffectual. Since his accession to the throne, king Theebaw has become notorious for his bloodthirsty cruelties, until it has become a common incident to see Burmese publicly crucified in the streets of Mandalay under his orders. His reign has been one of the most vicious and despicable known to recent oriental history.

MANDAMUS is a prerogative writ which issues from the court of queen's bench, and in some cases a similar writ issues also from the other superior courts of law, whereby the court commands some public body, or inferior court, or justices of the peace, to do something which it is their legal duty to do, and the neglect of which there is no other way of redressing.

MANDAMUS (ante) is issued in this country by the highest court which has jurisdiction at law. The writ enjoins upon a court of inferior jurisdiction, a person or a corporation, the performance of a particular act as their duty. This is the usual remedy to enforce obedience by a corporation of acts within the legitimate sphere of its duties, though it will not be granted to enforce ordinary rights of contract, for which there is already a sufficient remedy in the law courts. It lies to compel the production by a corporation of its records and papers, when their evidence is material to a suit brought by a corporator; and to reinstall an ejected officer of a corporation in his office after his title thereto has been maintained at quo warranto. It is not granted as of right, but is issuable at the discretion of the court, and ought to be used, according to lord Mansfield, "upon all occasions where the law has established no specific remedy, and
Mandans. Mandrake.

where in justice and good government there ought to be one; in other words, a court will not take jurisdiction by this writ unless there be no definite remedy at law.

MANDANS, the name of a tribe of Indians who have always inhabited the lands along the upper Missouri, having been forced by the exigencies of Indian warfare from a point about 1500 m. from the mouth of that river to their present habitat, near fort Berthold, Dakota territory. They are of the Dakota family, and have always been in enmity with the Sioux, who still pursue them with persistent ferocity. In 1870 a reservation of about 9,000,000 acres, partly in Dakota and partly in Montana, was set apart by the government for the Rickarees, Minnetarees, and Dakotas, and on this the remnant of the tribe continues to reside, numbering in 1875 about 500 souls. The Mandans are generally peaceful, live by agriculture and hunting, and are notable for the interesting and peculiar character of their rites and ceremonies, the burial of their dead, and their mode of initiating warriors. No missionary work of any importance has been performed among them, and but slight attempts have been made for their education.

MANDAR, or WANDAL, a kingdom in w. central Africa, s. of Bornou (or Bornoo), to which it is now tributary, situated in a fertile valley abounding in fig and other fruit and flowering trees, well watered by many springs, and protected from assault by a range of the mountains of the Moon. It is inhabited by a race of negroes much further advanced in civilization than any of the neighboring tribes, who engage quite extensively in iron and cloth manufacture and possess bodies of drilled and uniformed cavalry. The country was formerly included in Karowa, s.w. of Mandara, but became independent mainly through the adoption of the Mohammedan faith. In 1863 a war was waged with Bornou and the country was entirely subjugated, Mora, its former capital, being razed to the ground. Doloo, pop. 30,000, is now its chief city.

MANDARIN, a general term applied to Chinese officers of every grade by foreigners. It is derived from the Portuguese mandar, to command; the Chinese equivalent is kuan. There are nine ranks, each distinguished by a different-colored ball or button placed on the apex of the cap, by a peculiar emblazonry on the breast, and a different clasp of the girdle. The balls are ruby, coral, sapphire, a blue opaque stone, crystal, opaque white shell, worked gold, plain gold, and silver. Theoretically, these grades are indicative of relative merit, but as office and titles are sold to a great extent, the competitive examinations, which are the only legitimate road to distinction, have lost much of their value. A mandarin is not allowed to hold office in his native province, the intention being to prevent intrigue, and to draw to Pekin the ambition and talent of the country, where temporary employment is given in subordinate offices, prior to appointments to the provinces. He is not allowed to marry in the jurisdiction under his control, nor own land in it, nor have a near relative holding office under him; and he is seldom continued in office in the station or province for more than three years—a system of espionage which serves further to strengthen the imperial government. It is incumbent on every provincial officer to report on the character and qualifications of all under him, which he periodically transmits to the board of civil office; the points of character are arranged under six different heads, viz., those who are not diligent, the inefficient, the superficial, the untalented, superannuated, and diseased. According to the opinions given in this report, officers are elevated or degraded so many steps in the scale of merit, like boys in a class. They are required also to accuse themselves when remiss or guilty of crime, and to request punishment.

MANDARIN, a village of Duval co., Fla., on the c. bank of the St. John's river, 15 m. above Jacksonville. It is a place of winter resort, and celebrated for its fine orange crops.

MANDARIN DUCK, a species of domestic duck brought from China and Japan. It has a brilliant plumage, a beautiful green crest, and a tuft of feathers on the back in the shape of a fan. These ducks have the reputation of conjugal fidelity and of never mating but once.

MANDATE is a contract by which one employs another to manage something gratuitously for him. The one is called a mandant, and the other a mandatory; the term being derived from the Roman law of mandatum. In England, in consequence of the doctrine that a simple contract cannot be enforced unless there is some consideration for it, or a quia pro scientia est, it is held that if the mandatory undertakes to do the work, but omits to do so, no action will lie against him, though it is otherwise if he once enter upon the work, in which case he is bound for the consequences of anything injurious or negligent. If the duty or work is undertaken, the mandatory is bound to use reasonable skill and diligence. In Scotland, where a consideration is not necessary to make a valid contract by word of mouth or writing, the mandatory is liable to an action if he has contracted or agreed to act. In Scotland, the word mandatory is used to denote a person who, in a litigation by a foreigner or person residing out of Scotland, undertakes to give security for costs, in the event of the mandant losing the suit, otherwise the suit is not allowed to go on in Scotland.

MANDAVI, the chief seaport of the principality of Cutch, Hindustan, on the n. shore of the gulf of Cutch, in lat. 23° 51' n., long. 69° 26' east. Though there is no regular landing-place, boats of any size can land at the sandy beach, and large vessels
find secure anchorage in the offing at a distance of about three miles from shore. Its wells are numerous, and full of water. Pop. officially estimated in 1872 at 35,988.

Mandeville, Sir John, an old English traveler, b. at St. Albans about the year 1300. Prompted by curiosity or love of adventure, he left his native country about 1327, visited the Holy Land, served under the sultan of Egypt and the great khan of Cathay (China); and after 33 years’ wandering through Europe, Asia, and Africa, returned to England, where he wrote an account of his travels in Latin, French, and English. He died at Liége, Nov. 17, 1372. Mandeville’s work is not of great value for historic geography, as he not merely states what came under his own observation, but what he heard; and he was credulous enough to admit what are now regarded as the most absurd and monstrous fables; but to do him justice, he (like Herodotus) customarily prefaced these by the phrases, “thee seyne, or men seyn, but I have not sene it.” Besides, several of his statements, once regarded as improbable, have since been verified. The common notion of his being pre-eminently a “lying” traveler, is therefore in all likelihood not well founded. Leland the antiquary even says, that he had the reputation of being a very conscientious man. His book is written in a very interesting manner, was long exceedingly popular, and was translated into many languages. A MS. of Mandeville’s travels, as old as the time of the author, exists in the Cottonian library. The first edition printed in England is that by Wynkin de Worde (Westminster, 1499) the last, with introduction, etc., by J. O. Halliwell, was published in London in 1839 (reprinted 1866).

Mandibula ta, Mandibulated or Masticating Insects, a great group or division of insects (q.v.), having the mouth of the structure described in the article coleoptera, and containing the orders coleoptera, orthoptera, neuroptera, and hymenoptera. The housefly mouth—formed for suction—is regarded as a modification, in all its separate parts, of the mandibulate mouth.

Mandin Goes are, strictly speaking, the inhabitants of the most south-westerly territories belonging to the great W. African race of the Wangarawa (sing. Wangara), and inhabiting a district extending in lat. from 8° to 12° n., and between the west coasts and the head waters of the Senegal and Niger. The name, however, as generally used, is applied to the whole nation of the Wangarawa, comprising a pop. estimated by Dr. Barth at from 6,000,000 to 8,000,000. The original seat of the Mandingo is said to be Manding, a small mountain country on the eastern sources of the Senegal, whence, partly by conquest and partly by emigration, they have spread themselves over a most extensive tract of country, and now consist of a variety of tribes. The Mandingo are black in color, tall and well-shaped, with regular features, and are, generally speaking, a fine race, capable of a high degree of civilization and organization, great travelers, fond of trading, and remarkable for their industry and energy. Of the neighboring nations, they were the first who embraced Islamism. The greater portion of them are now Moslems, and are zealous propagators of their religion.

Mandoline, a musical instrument of the lute species. The body of the mandoline is shaped like a shell, formed of a number of narrow pieces of different kinds of wood, bent into the shape, and glued together. On the open portion of the body is fixed the sounding-board, with a finger-board and neck like a guitar. The Neapolitan mandoline, which is the most perfect, has four double strings, which are turned, beginning with the lowest, G, D, A, E. The Milanese mandoline has five double strings, tuned G, C, A, D, E. The sound of the mandoline is produced by a plectrum in the right hand, while the left hand produces the notes on the finger-board. The mandoline is chiefly used for accompaniment; in the beauty and quality of its sound it is different from all other stringed instruments.

Mandrake, Mandragora, a genus of plants of the natural order solanaceae, nearly allied to belladonna (q.v.). Two species are described by some botanists, the Autunm Mandrake (M. autumnalis), which flowers in autumn, and has lanceolate leaves and ovate berries; and the Vernal Mandrake (M. vernalis), which flowers in spring and has oblong ovate leaves and globose berries. Both are natives of the south of Europe and of the east, and are united by many into one species (M. officinarum). The root is large and carrot-like, and from it the leaves spring with no apparent stem, and among them the stalked whitish-flowers. The calyx and corolla are 5-cleft, there are 5 stamens, and the fruit is a one-celled berry, about the size of a sparrow’s egg. The whole plant has a very fetid narcotic smell; but the fresh berries, when cut or bruised, have a pleasant odor like that of wine or apples, and two or three may be eaten without inconvenience. All parts of the plant, however, have poisonous properties like those of belladonna, but more narcotic, for which reason a dose of the root was formerly sometimes given to patients about to endure surgical operations. The ancients were well acquainted with the narcotic and stupefying properties of mandrake, and it was a common saying, of a sleepy or indolent man, that he had eaten mandrake. The root often divides into two, and presents a rude resemblance to the human figure; and human figures were formerly often cut out of it, to which many magical virtues were ascribed. Sometimes the roots of the bryony were employed instead of those of the mandrake, and sold under the name of mandrake root. From the most ancient times, aphrodisiac virtues have been ascribed to the mandrake, which was therefore supposed to cure barrenness. See Gen. xxx. 14–16. The same reputation has been attached in America to the berries of the
Manetho, a celebrated Egyptian historian, native of Sebennytus, and of the sacerdotal order, flourished in the reign of Ptolemy. According to some, he was priest of Diospolis or Heliopolis; others contend that he was high-priest of Alexandria. His name has been interpreted as "beloved of Thoth;" in the song of Lagos and Ptolemy Philadelphus, Mai en let, or Ma net, "beloved of Neith;" but both interpretations are doubtful. Scarcely anything is known of the history of Manetho himself, and he is more renowned for his Egyptian history than for any other portion of the annals of Ptolemy I. dreaming of the god Serapis at Sinope, Manetho was consulted by the monarch, and in conjunction with Timotheus of Athens, the interpreter of the Eleusinian mysteries, declared the statue of Serapis, brought by orders of the king from Sinope, to be that of the god Serapis or Pluto, and the god had a temple and his worship inaugurated at Alexandria. The fame of Manetho was much increased by his writing in the Greek language, and so being enabled to communicate from Egyptian sources a more correct knowledge of the history of his native country than his Greek predecessors. Of this history, only extracts given by Josephus in his work against Apion, and an epitome by Eusebius and other ecclesiastical writers, remain. It appears to have been drawn up in a compendious annalistic style of narrative, resembling the accounts given by Herodotus. The work of Manetho was divided into three books, the first beginning with the mythic reigns of gods and kings, and ending with the 11th dynasty of mortals; the second book continued the history from the 12th to the 19th dynasty; and the third from the 20th to the 30th dynasty, when Egypt fell under the dominion of Alexander the great. The reigns of the gods are given as amounting to 24,900 years, and the epoch of Menes, the founder of the monarchy, commenced 5,555 years before Alexander (332 B.C.). The difficulties attending the reconciliation of this chronology with the synchronistic history of the Hebrews, Greeks, and other nations, have given rise to numerous speculations and chronological systems since the revival of learning, by Scaliger, Freret, Marsham, Usher, Bunsen, Böckh, Lepsius, Poole, and others. The confusion in which the lists of kings have been transmitted, the ciphers of the lengths of each reign not agreeing with the summations of the durations of the dynasties, and these, again, differing from the total period assigned to the existence of the Egyptian monarchy, has given rise to two or three schools of chronology. The so-called long chronology, which supposes, with Scaliger and Böckh, that the 30 dynasties followed consecutively one after the other, has elevated the epoch of Menes to 5,702 B.C. The short chronology, or that which endeavors to square the dates of Manetho with the Hebrew chronology, or 4004 B.C. for the year of the world, on the contrary, assumes that several of the dynasties were contemporary, and that some intervals, such as that of the rule of the shepherd-kings, have been either exaggerated or misunderstood. The accession of newer and better information from the original sources of Egyptian monuments, papyri, and other documents, has considerably enhanced the general value of the history of Manetho, which, prior to their discovery, had fallen into discredit. But the restoration of the history of Manetho, notwithstanding all these resources, and the positive epoch of the monarchy, are still to be sought, although certain dynasties, in the 2d and 3d books of his work, can be reconciled with monumental evidence. Besides the true work of Manetho above cited, which he appears to have written in the reign of Ptolemy I. or II., another work, called Sothis, or the Dogstar, in allusion to the cycle of the heliacal rising of that star of 1461 years, and dedicated to Sebastos or Augustus, the title of the Roman emperors, and not found in the work before that period, has been handed down. This work seems to have been added by the epitomizers; and another work called the Old Chronicle, in which the history was arranged according to cycles, was compiled by them. Besides the history, Manetho wrote Τὸν Φυσικὸν Ἐπίτομον (Epitome of Physics), treating on the origin of gods and the world, and the laws of morality; and another work on the preparation of the
sacred kyphi, a kind of frankincense or aromatic food. The astronomical work called *Apotelesmata* is a spurious production of the 5th c. A.D.

**MANEUVER**, a French word, signifying "handy-work," is somewhat vaguely used in English military and naval language to denote collateral movements, not openly apparent, of bodies of men or squadrons of ships, by which an enemy is coerced, or by which it is sought to compel him to take some course adverse to his interests.

**MANFRED**, king of Naples and Sicily, a rare example of heroic fortitude and disinterestedness, was a natural son of the emperor Frederick II. by Blanca, the daughter of count Bonifacius Lanzia, and was b. about 1231. On his father's death, in 1250, he received the principality of Tarentum, and in the absence of his half-brother, Konrad IV., acted as regent in Italy. Notwithstanding Konrad's dislike to him, Manfred, with unexampled fidelity, bravely defended his sovereign's interests against the machinations of pope Innocent IV.; and after Konrad's death, which the pope accused him of having caused, he was acknowledged as regent of Apulia, in name of his nephew Konradin (q.v.). The pope, however, renewed his pretensions to Apulia, and compelled Manfred to flee for shelter to the Saracens, by whose aid he defeated the papal troops at Foggia, on Dec. 2, 1254, and again obtained possession of Apulia, to which he soon afterwards added Calabria. The new pope, Alexander IV., caused a crusade to be preached against him, but Manfred, steadily pursuing his victorious career, became, in 1257, master of the whole kingdom of Naples and Sicily. On the rumor of Konradin's death he was crowned king at Palermo, Aug. 11, 1258, and immediately afterwards was excommunicated by the pope, along with his adherents, among whom were the first prelates of the kingdom; but Manfred invaded the papal dominions, levied heavy contributions from them, and made himself master of the whole of Tuscany. His power now seemed secure, and his government was at once mild and vigorous; he founded many schools, built towns and harbors, and labored in many ways for the improvement of his kingdom. But this tranquility was not of long duration. Pope Urban IV. renewed the excommunication against him and his friends, and bestowed his dominions as a papal fief on Charles of Anjou, the brother of Louis IX. of France. Manfred, though at first successful in the war which ensued, was at last treacherously defeated, and slain in a bloody battle at Benevento, Feb. 26, 1266. His widow and children were savagely treated by the French, the daughter being confined for 18 and the sons for 31 years. His body was found some days after and interred as that of an excommunicated person; but the people, and even the French soldiers, heaped up stones for a monument, which received the name of the Rock of Roses.

**MANFREDONIA**, a city of Italy, in the province of Foggia, 26 m. n.e. of the city of Foggia, founded by Manfred (q.v.), king of Naples and Sicily, from the ruins of ancient Spitomum; pop. '72, 7,574. It is strongly walled, and an imposing castle protects its port. In the vicinity of Manfredonia are remarkable salt lakes—the Fontana Salato and the Lago di Saline—the beds of which, during the summer heats, are thickly incrusted with salt.

**MANFREDONIA, Gulf of (Sinus Ursus), an inlet of the Adriatic, which washes the Neapolitan provinces of Bari and Capitanata, 15 m. in length and 30 in breadth.**

**MANGALORE, a sea-port in the district of Canara, in the presidency of Madras, lat. 12° 52' n. In former times the harbor was good and the town prosperous, but within the present century it has become, to a great extent, silted up. Pop. (including seven villages in the vicinity) '71, 29,712. The cantonment on the north side of the town is healthy, being elevated, well drained, and open to the breezes from the sea.**

**MANGANESE** (symb. Mn, equiv. 27.6; new system, 55—spec. grav. 8) is one of the heavy metals of which iron may be taken as the representative. It is of a grayish-white color, presents a metallic brilliancy, is capable of a high degree of polish, is so hard as to scratch glass and steel, is non-magnetic, and is only fused at a white heat. As it oxidizes rapidly on exposure to the atmosphere, it should be preserved under naphtha.

It occurs in small quantity, in association with iron, in meteoric stones; with this exception it is not found native. The metal may be obtained by the reduction of its sesquisulfide by carbon at an extreme heat.

Manganese forms no less than six different oxides—viz., protoxide (MnO), sesquisulfide (MnO₂), the red oxide (Mn₂O₃), the binoxide or peroxide (MnO₂), manganic acid (MnO₃), and permanganic acid (MnO₄). The protoxide occurs as an olive-green powder, and is obtained by igniting carbonate of manganese in a current of hydrogen. Its salts are colorless, or of a pale rose color, and have a strong tendency to form double salts with the salts of ammonia. The carbonate forms the mineral known as manganese spar. The sulphate is obtained by heating the peroxide with sulphuric acid till there is faint ignition, dissolving the residue in water, and crystallizing. It is employed largely in calico-printing. The silicate occurs in various minerals.

The sesquisulfide is found crystallized in an anhydrous form in *brunelite*, and hydrated in *manganite*. It is obtained artificially as a black powder by exposing the peroxide to U. K. IX.—38
a prolonged heat. When ignited it loses oxygen, and is converted into red oxide. Its salts are isomorphous with those of alumina and sesquioxide of iron. See ISOMORPHISM. It imparts a violet color to glass, and gives the amethyst its characteristic tint. Its sulphate is a powerful oxidizing agent.

The red oxide corresponds to the black oxide of iron. It occurs native in hausmannite, and may be obtained artificially by igniting the sesquioxide or peroxide in the open air. It is a compound of the two preceding oxides.

The binoxide, or peroxide, is the black manganese of commerce and the pyrolusite of mineralogists, and is by far the most abundant of the manganese ores. It occurs in a hydrated form in varzelite and sead. Its commercial value depends upon the proportion of chlorine which a given weight of it will liberate when it is heated with hydrochloric acid, the quantity of chlorine being proportional to the excess of oxygen which this oxide contains over that contained in the same weight of protoxide. The reaction is explained by the equation—

\[ \text{MgO}_2 + 2\text{HCl} \rightarrow \text{MgCl}_2 + \text{H}_2\text{O} + \text{Cl}_2 \]

When mixed with chloride of sodium and sulphuric acid it causes an evolution of chlorine, the other resulting products being sulphate of soda and sulphate of protoxide of manganese, as shown in the equation—

\[ \text{NaCl} + \text{MgO}_2 + 2\text{SO}_2 \rightarrow \text{NaO}_2 \text{SO}_3 + \text{MnO}_2 \text{SO}_4 + \text{Cl}_2 \]

When mixed with acids it is a valuable oxidizing agent. It is much used for the preparation of oxygen (q.v.), either by simply heating it, when it yields 12 per cent of gas, or by heating it with sulphuric acid, when it yields 18 per cent. Besides its many uses in the laboratory, it is employed in the manufacturing of glass, porcelain, etc.

Manganic acid is not known in a free state. Manganate of potash is formed by fusing together hydrated potash and binoxide of manganese. The black mass which results from this operation is soluble in water, to which it communicates a green color, due to the presence of the manganate. From this water the salt is obtained in vacuo in beautiful green crystals. On allowing the solution to stand exposed to the air it rapidly becomes blue, violet, purple, and finally red, by the gradual conversion of the manganate into the permanganate of potash; and on account of these changes of color the black mass has received the name of mineral chameleon.

Permanganic acid is only known in solution or in a state of combination. Its solution is of a splendid red color, but appears of a dark violet tint when seen by transmitted light. It is obtained by treating a solution of permanganate of baryta with sulphuric acid, when sulphate of baryta and the permanganic acid remains dissolved in the water. Permanganate of potash, which crystallizes in reddish purple prisms, is the most important of its salts. It is largely employed in analytical chemistry, and is the basis of Condy's disinfectant fluid.

Manganese is a constituent of many mineral waters, and is found in small quantity in the ash of most vegetable and animal substances. It is almost always associated with iron.

Various preparations of manganese have been employed in medicine. The sulphate of the protoxide, in doses of one or two drams, produces purgative effects, and is supposed to increase the excretion of bile; and, in small doses, both this salt and the carbonate have been given with the intention of improving the condition of the blood in cases of anaemia. Manganic acid and permanganate of potash are of great use when applied in lotions (as in Condy's fluid diluted) to foul and fret ulcers. In connection with the medicinal applications of manganese, it may be mentioned that manganese is the agent employed in Dr. Angus Smith's celebrated test for the impurity of the air.

MANGE, in horses, dogs, and cattle, and scab in sheep, are diseases very similar to itch in the human subject, resulting from the attacks of minute mites, or acari, which burrow in the skin, especially if it be dirty or scurfy, cause much irritation, heat, and itching, and the eruption of minute pimples, with dryness, scurfiness, baldness, and bleaching of the skin. The treatment consists in destroying the acari and insuring the cleanliness and health of the skin, both of which objects are effected by washing the parts thoroughly every second day with soft soap and water, and dressing daily with sulphur or mild mercurial ointments, or with a solution containing four grains either of corrosive sublimate or arsenic to the ounce of water. Castor-oil seeds, bruised and steeped for twelve hours in buttermilk, are very successfully used by the native Indian man, and are applied along with a little glycerine. Where the heat and itching are great, as is often the case in dogs, a few drops of tincture of belladonna may be used to the usual dressing, or applied along with a little glycerine. Where the general health is indifferent, as in chronic cases, the patient should be liberally fed, kept clean and comfortable, have an occasional alternative dose of any simple saline medicine, such as niter or common salt, and a course of such tonics as iron or arsenic. Cleanliness and occasional washing and brushing maintain the skin in a healthy state, and thus prevent its becoming a suitable nidus for the acari.

MANGEL WURZEL. See BEET; MANGOLD WURZEL, ante.
MANGE, a machine for smoothing linen and cotton goods, such as table-cloths, sheets, etc., after washing. It has been much improved since the first rude invention, but does not supersede the sad-iron for the finer kinds of work.

MANGLES, James. 1785-1861; b. England; entered the British navy in 1800, and was made a commander in 1815. The next year he went down the Nile, and made excavations at the temples in Ispambool. He returned to England in 1820, by way of Syria. A collection of letters, written by him and his traveling companion, Commander Charles Leonard Irby, was printed for private circulation in 1823, and given to the public in 1844, as Travels in Egypt and Nubia, Syria, and the Holy Land.

MANGO, Mangifera, a genus of trees of the natural order anacardiaceae, having flowers with four or five petals, five stamens, of which the greater part are generally sterile, one ovary seated on a fleshy disk, the fruit a fleshy drupe. The Common Mango (M. indica) is a native of India. It is a spreading tree of rapid growth; 30 to 40 ft. in height, the stem only rising 8 to 10 ft. before it divides into branches; the foliage so dense as to be impenetrable to the burning rays of the sun, affording a most grateful shade; the leaves lanceolate, entire, alternate, stalked, smooth, shining, leathery, and about 7 or 8 inches long, with a sweet resinous smell. The flowers are small, reddish-white or yellowish, in large erect terminal panicles; the fruit is kidney-shaped, smooth, varying considerably in size and color, and containing a large flattened stone, which is covered on the outside with fibrous filaments, longest and most abundant in the inferior varieties, some of which consist chiefly of fiber and juice, whilst the finer ones have a comparatively solid pulp. The fruit of some of the varieties in cultivation is as large as a man's fist. The mango much prized for the dessert; it is juicy and sweet, with slight acidity. It was introduced into Jamaica in 1782, and is now very generally cultivated in tropical and subtropical countries. The unripe fruit is made into tarts and pickles. Mango kernels are nutritious, and have been cooked for food in times of scarcity. The tree is raised from seeds; the finer varieties are propagated by layering and inarching, and trees obtained in this way often bear much fruit without attaining a large size. There are several other species of mango, natives of different parts of the east, but the fruits of all of them are very inferior.

MANGO FISH, Polyenmus paraleus, a fish which inhabits the bay of Bengal, and ascends the Ganges and other rivers to a considerable distance. It is accounted one of the most delicious fishes of India, but is particularly esteemed when salted and prepared in a peculiar manner, when it bears the name of burthah. The name mango fish is given to this fish from its beautiful yellow color, resembling that of a ripe mango. Another Indian name is taphee. It is of a perch-like form, and belongs to a genus formerly referred to the perch family (percidae), but now the type of a distinct family (polyenidae), having the ventral fins behind the pectorals, although partially attached to the bones of the shoulder, and the lower rays of the pectorals extended into threads, which in the mango fishes are twice the length of the body. Mango fish is seldom more than 8 or 9 inches in length. The genus Polyenmus contains a number of species of tropical fishes, the air-bladders of some of which are of importance as isinglass; those of P. indica, a fish sometimes 20 lbs. weight, and other species, forming a considerable article of export from Singapore, under the name of fish-maws.

MAN GOLD-WURZEL (Ger. beet-root), or MANGOLD (Ger. beet), a name in general use in Britain and America, to designate the varieties of the common beet (q.v.) cultivated in fields for the feeding of cattle. By mistake the name was at first written mangel-wurzel, and this erroneous form is still sometimes used. The field-beets differ from the garden-beets chiefly in being larger in all their parts, and coarser. They have large roots, which in some of the varieties are red, in some greenish or whitish, in some carrot-shaped, and in some nearly globular. The cultivation of mangold-wurzel as a field-crop was introduced into England in 1786, but it is only of late that it has much extended. At first, so little was its value known, that the leaves alone were used as food for cattle. Its importance, however, was soon appreciated, and it rapidly gained favor. It is much more patient of a high temperature than the turnip, liable to fewer diseases, and vastly more productive under liberal treatment. In the island of Jersey, and in highly manured grounds in the vicinity of London, as much as from 70 to 90 tons to the acre have been raised. Throughout the south of England it is generally admitted that it is easier to grow 90 tons of mangold-wurzel to the acre as 20 tons of Swedish turnips. The lower temperature of Scotland, however, does not admit of the crop being raised to the same advantage. The yield is much smaller than in the south, and the plants are more liable to run to flower. This seems to be owing to the cold contracting the vessels, and in some measure acting in the same manner as a diminished supply of food in favoring the formation of seed. The increased precociousness of the turnip-crop of late years, however, has induced many to make trial of the cultivation of mangold-wurzel, and with considerable success. The mode of culture does not vary materially from that followed in Scotland in raising turnips. The land in which the crop is to be planted receives a deep furrow in autumn; and if it is quite free from perennial weeds, it is often previously well manured. Drills or ridges, from 20 to 30 in. wide, are formed in spring by the doubled-molded plow; and if manure has not been applied in autumn, from 20 to 30 loads are spread along the furrows: In addition, from 3 to 4 cwt.s. of guano, and 4
Mangon.  
Manila.  
436  

cwts. of ammonia salt, are sown broadcast over the drills; indeed, this crop can rarely  
be over-manured. The manures are then covered by the plow, and the ridges are after-  
wards run over with a light roller, to smooth them down. Two or three seeds are then  
diddled in on the tops of the ridges, from 1 ft. to 1½ ft. apart. It requires about 7 lbs.  
of seed to the acre; and as the grains are inclosed in a hard and rough coat, they may be  
moistened in water for two days previous to their being planted, for the purpose of  
providing a quick and regular baird. The long red, the round red, and the round  
green-topped yellow are all favorite varieties in England. As soon as the plants are  
about 3 in. above ground, they are singled out by the hand, and their cultivation is  
thereafter the same in all respects as in the case of Swedish turnips. The crop is usually  
ready to be taken up by the end of October; indeed, it should not be delayed beyond  
this period, for, being a native of the warm coasts of the Mediterranean, it is injured by  
severe frost. The leaves are wrenched off by the hand, and the earth is merely roughly  
taken away from the roots, as they do not keep well through the winter if cut or bruised.  
The roots are stored in pits or clamps, covered with straw and a little earth, as a protec-  
tion in severe weather. It is some time after storing before the roots can be used with  
advantage; for in autumn and the early part of winter, its juices being unripened, have  
a laxative effect on animals. Swedish turnips are at this season preferred for feeding;  
but the harshness of the mangold-wurzel wears off by spring, and it then becomes  
an excellent food for stock of all kinds, and if well kept, retains its juiciness till the  
middle of summer.  

Mangon, or Mangonel. See Balista.  

Mangostan, Garcinia mangostana, one of the most delicious of all fruits, pro-  
duced by the tree of the natural order Rutifera or Elsiaceae, a native of the Molucca  
islands. The tree is in general only about 20 ft. high, but of beautiful appearance, hav-  
ing an erect tapering stem and a regular form, somewhat like that of a fir; the leaves  
7 or 8 in. long, oval, entire, leathery, and shining; the flowers are large, with corolla  
of 4 deep red petals. The fruit, in size and shape, resembles an orange; it is dark  
brown, spotted with yellow or grey, has a thick rind, and is divided internally by thin  
paritions into cells. The pulp is soft and juicy, of a rose color, refrangent and slightly  
laxative, with a mixture of sweetness and acidity, and having an extremely delicate  
favor. It may be eaten very freely with perfect safety, and is esteemed very beneficial  
in fevers. The mangostan is cultivated in Java and in the s.e. of Asia; it has recently  
become common in Ceylon, and has been successfully introduced into some other tropi-  
cal countries.  

Mangouste, or Mongous. See Ichneumon, ante.  

Mangrove, Rhizophora, a genus of plants of the natural order Rhizophoraceae. This  
order consists of trees and shrubs, all tropical and natives of coasts, particularly about  
the mouths of rivers, where they grow in the mud, and form a close thicket down to  
and within the marge of the sea, even to low-water mark. Most of the species send  
down roots from their branches, and thus rapidly extend over large spaces, forming  
secure retreats for multitudes of aquatic birds, whilst crabs are also to be found in them  
in vast numbers, and shell-fish are attached to the branches. The order is distin-  
guished by simple, opposite leaves, with convolute deciduous stipules between the leaf-  
stalks; the ovary 2 to 4 celled, each containing two or more ovules; the fruit not open-  
ing when ripe, crowned with the calyx, 1-celled, 1-seeded. The seeds have the pecu-  
liarity of germinating whilst still attached to the parent branch, a long thick radicle  
proceeding from the seed, piercing its covering, and extending rapidly downwards, till  
the fruit falls off, when it is soon imbedded in the mud, into which its form, club-like,  
the heavy end downwards, secures that it shall penetrate in a right position. The  
whole number of species known is only about 50; the wood of some is hard and dur-  
able. The fruit of the common mangrove (rhizophora mangle) is sweet, eatable; and its  
juice, when fermented, yields a light wine. The bark of the common mangrove is  
sometimes imported into Britain for the use of tanners, but it is only of second-rate  
quality.  

Mangum, Willie Person, 1792-1861; b. Orange co., N. C.; graduated at the North  
Carolina university in 1815; was a successful lawyer and whig politician; elected a judge  
of the superior court in 1819 and 1826; was a member of congress 1823-26, and U. S.  
senator 1831-37 and 1841-53. He was president of the senate during the administration  
of John Tyler. In 1837 he received 11 electoral votes for president of the United States.  

Manhattan Island. See New York.  

Manheim. See Mannheim, ante.  

Mani, Manes, Manichaeus (entitled Zendik), Sadducee, the founder of the heretical  
sect of the Manichaeans (q. v.), who lived in the 3d c., A.D. Little is known with regard  
to his early history, and the accounts transmitted through two distinct sources—the  
western or Greek, and the eastern—are legendary and contradictory on almost every  
important point. According to certain—very dubious—acts of a dispute held  
between Manes and Archelous, bishop of Cascar (?), he was first called Curbicius, and  
was bought as a slave, at the age of seven years, by the wife of one Ctesiphon, in Babylonia,  
who gave him a good education, and at her death made him sole heir. Among the books
she left him, he is said to have found the writings of Scythianus, which had been given to her by one of the latter's disciples named Terebinthus, or Buddha. Mani emigrated into Persia, where he remained up to his sixtieth year, and changed his former name, so as to obliterate all traces of his origin and former state. Here he also became acquainted with the New Testament and other Christian works; and gradually conceived the idea of amalgamating the Magian with the Christian religion, and of adding what he knew of Buddhism to the new faith. For the better carrying out of this plan, he announced that he was the paraclete promised by Christ, King Sapor I. of Persia, in whose days he first proclaimed his mission, at first looked not favorably upon his proceedings; but, when he had failed to heal the prince, his son, he was cast into prison, whence he managed to escape, but, pursued and captured, he was publicly executed. According to other accounts, however, Mani was the scion of a noble Magian family, and a man of extraordinary mental powers, and artistic and scientific abilities—an eminent painter, mathematician, etc.—embraced Christianity in early manhood, and became presbyter at a church in Elwaz or Ahvaj, in the Persian province of Hazitis, gave himself out to be the paraclete, and styled himself in ecclesiastical documents "Mani, called to be an apostle of Jesus Christ through the election of God the Father," Persecuted by king Sapor I., he sought refuge in foreign countries, went to India, China, and Turkistan, and there lived in a cave for 12 months, during which he is said to have been in heaven. He reappeared with a wonderful book of drawings and pictures, called Erlishenk or Ertenki-Mani. After the death of Sapor (272 A.D.), he returned to Persia, where Hormuz, the new king, who was well inclined towards him, received him with great honors, and in order to protect him more effectually against the persecutions of the Magi, gave him the stronghold of Desherch, in Susiana, as a residence. After the death of this king, however, Behram, his successor, entrapped Mani into a public disputation with the Magi, for which purpose he had to leave his castle; and he was seized upon, flayed alive, and hung before Djondishapur, 277 A.D. For his doctrine, etc., see Manichzeans.

**MANIA** is the form of mental derangement most familiar to ordinary observers. The excitement and violence by which it is sometimes characterized have become, erroneously and unfortunately, the type and standard by which the disease and those subject to it have been recognized and treated. These qualities occasionally involved danger to those around, and were always calculated to inspire fear; so that for centuries they were counteracted by repression, coercion, and harshness. It is worthy of remark that contemporaneously with the establishment of confidence, and with the introduction of a humane system, the patient was often received into the pugilistic institution to which he appeared. This effect, must, however, in part be referred to that change of type in the nature of the malady itself which is supposed to depend upon a modification in the human constitution, as well as upon external circumstances, and which has been observable in all affections of an inflammatory character since the beginning of the present century. The discontinuance of restraint, and the cessation of the necessity for such a measure in asylums, whether regarded as protective or remedial, may be accepted as a proof of the reality and extent of this change, upon whatever it may depend. It is, moreover, probable that, by the accuracy of modern diagnosis, cases of wild frenzy, depending upon fever or inflammation of the brain, have been distinguished from those of true mania, and its true features thus better determined. These are loss of appetite, general uneasiness and irritation, watchfulness, headache, restlessness, intense stimulation of the passions and propensities, rapid ideation, incoherence and brouquity; violence or unbridled agitation and extravagance; and, as the disease advances, emancipation, hollowness of the cheeks and eyes, discoloration of the skin, brilliancy and fixity of eyes. However similar these symptoms may be to what are seen in the fevered and the phrenetic, great caution must be exercised in concluding that the circulation is involved directly, or at all, for of 222 cases examined by Jacobi, 23 only presented any indications of fever, and in these this condition was attributable to hectic and other causes unconnected with mania. Esquirol rarely mentions the pulse as affording any guidance in this kind of alienation. The true interpretation of these symptoms appears to be that they are connected with debility and exhaustion; that although, remotely, they may originate in any organ or condition, they proximately depend upon impaired nutrition and irritation of the nervous system, calling for support, stimulation, calm, and repose, alike moral and physical. The classification of the various aspects under which mania occurs has been so far regulated by the bodily affection with which it is complicated or associated. Epileptic mania, the most furious and formidable, and puerperal mania, perhaps the most intractable species, consist in the superaddition of the indications formerly detailed to certain states of the system. The essential psychical characteristic of mania is that all mental powers are involved, and are thrown into a state of exaltation and perversion. When the intemperate extravagance and excitement have subsided, when the affection has become chronic, delusions, previously existing, become prominent, and impart a predominating complexion to the condition. It is probable that, wherever delusions or hallucinations are detected, although they may seem solitary deviations from health, there is a broader and deeper substratum of disease, of which they are trivial manifestations; and where mania has ushered in such affections, the original disease may be held to remain while it remains, and to be reacted upon, and,
under certain circumstances, roused into activity through their instrumentality. In these views may be found an explanation of those partial mental derangements which appear to co-exist with health.—Bucknill and Tuke, Psychological Medicine—Sketches in Bedlam.

MANIA. See INSANITY.

MANICA, a small state of s.e. Africa, in the territory of Monomotapa, but tributary to the Portuguese. It is a mountainous region, and produces gold and copper, which, with ivory, form the chief articles of export, and are exchanged with the Portuguese for silk, linen, and iron. Many parts are fertile, affording pasture for large herds of cattle.

MANICHÆANS, a religious sect, founded by Mani (q.v.), which, although it utterly disclaimed being denominated Christian, yet was reckoned among the heretical bodies of the church. It was intended to blend the chief dogmas of Parseism, or rather Magism, as reformed by Zoroaster, with a certain number of Buddhistic views, under the outward garb of biblical, more especially New Testament history, which, explained allegorically and symbolically, was made to represent an entire new religious system, and one entirely at variance with Christianity and its fundamental teachings. The Manichaens assumed, above all, two chief principles, whence had sprung all visible and invisible creation, and which—totally antagonistic in their natures—were respectively styled the Light, the Good, or God, and the Darkness, the Bad, Matter, or Archon. They each inhabited a region akin to their natures, and excluding each other to such a degree that the region of darkness and its leader never knew of the existence of that of the light. Twelve zones—corresponding to the twelve signs of the zodiac and the twelve stations of the world—had sprung (emanated) from the primeval light; while "darkness," filled with the eternal fire, which burned but shone not, was peopled by "demons," who were constantly fighting among themselves. In one of these contests, pressing towards the outer edge, as it were, of their region, they became aware of the neighboring region, and fortieth united, attacked it, and succeeded in carrying the ray of light which was sent against them at the head of the hosts of light, and which was the embodiment of the ideal or primeval man (Christ), captive. A stronger aeon, however (the Holy Ghost), hurried to the rescue, and redeemed the greater and better part of the captive light (Jesus imparibitis). The smaller and fainter portion, however (Jesus passibili), remained in the hands of the powers of darkness, and out of this they formed, after the ideal of The Man of Light, mortal man. But even the small fraction of light left in him (broken in two souls) would have prevailed against them, had they not found means to further divide and subdivide it by the propagation of this man (Eve-sin). Not yet satisfied, they still more dimmed it by burying it under dark forms of belief and faith, such as paganism and Judaism. Once more, however, the original lights came to save the light buried in man, in the person of Christ, descending from the sun, with which he is one. The demons succeeded, however, in cutting his career of salvation short by seducing man to crucify him. His sufferings and death were naturally only fictitious, since he could not in reality die; he only allowed himself to become an example of endurance and passive pain for his own, the souls of light. Since, however, even his immediate adherents, the apostles, were not strong enough to suffer as he had bid them, he promised them a paraclete, who should complete his own work. This paraclete was Mani, who surrounded himself, like Christ, with twelve apostles, and sent them into the world to teach and to preach his doctrine of salvation. The end of the "world" will be fire, in which the region of darkness will be consumed and utterly annihilated. To attain to the region of eternal light, it is necessary that passion, or rather the body, should be utterly subdued; hence rigorous abstinence from all sensual pleasures, asceticism, in fact, to the utmost degree, is to be exercised. The believers are divided into two classes, the elect and the auditors. The elect have to adhere to the Segnaculum, Oris, Manus, and Sine, that is, they have to take the oath of abstinence from evil and profane speech (including "religious terms such as Christians use respecting the Godhead and religion"), further, from flesh, eggs, milk, fish, wine, and all intoxicating drinks (cf. Manu, Inst., v, 51, 52, 58: "He who makes the flesh of an animal his food... not a mortal exists more sinful... he who... desires to enlarge his own flesh with the flesh of another creature," etc.); further, from the possession of riches, or, indeed, any property whatsoever; from hurting any being—animal or vegetable; from heedling their own family, or showing any pity to him who is not of the Manichean creed; and finally, from breaking their chastity by marriage or otherwise. The auditors were comparatively free to partake of the good things of this world, but they had to provide for the subsistence of the elect, and their highest aim also was the attainment of the state of their superior brethren. In this Manichean worship, the visible representatives of the light (and moon) were venerated, not only as symbols of the ideal, of the good or supreme God. Neither altar nor sacrifice was to be found in their places of religious assemblies, nor did they erect sumptuous temples. Fasts, prayers, occasional readings in the supposed writings of Mani, chiefly a certain Fundamentale Epistola, were all their outer worship. The Old Testament they rejected unconditionally: of the New Testament they retained certain portions, revised and redacted by the paraclete. (August. c. Faust., book xviii.; cf. book ix.). Sunday, as the day on which the visible universe was to be consumed, the day consecrated to the sun, was kept as a great festival; and the most solemn day in their year was the anniversary of the death of Mani.
Mania.

Baptism and the Lord's supper were celebrated as mysteries of the elect. Of this mode of celebration, however, we know next to nothing; even Augustine, who for about nine years belonged to the sect, and who is our chief authority on this subject, confesses his ignorance of it. As to the general morality of the Manicheans, we are equally left to conjecture; but their doctrine certainly appears to have had a tendency, chiefly in the case of the uneducated, to lead to a sensual fanaticism hurtful to a pure mode of life.

The outward history of the sect is one of almost constant persecution. Diocletian, as early as 296 A.D., issued rigorous laws against them, which were reiterated by Valentinian, Theodosius I., and successive monarchs. Notwithstanding this, they gained numerous adherents; and very many medieval sects, as the Priscillians, Katharenes, Josephinians, etc., were suspected to be secretly Manicheans. Italy, the south of France, Spain, and even Germany, were the successive seats of this sect, which did not disappear entirely until the time of the reformation.

MANIFESTO, a public declaration issued by a sovereign prince or by a government on some state emergency, expressive of intentions, opinions, or motives. Immediately before entering on a war, a manifesto is issued containing a statement of the reasons which have been held to justify the sovereign or government in taking up arms. In case of a revolt, a manifesto is sometimes issued to recall subjects to their allegiance.

MANIGAULT, Gabriel, 1704-81; b. S. C., of Huguenot parentage; became a merchant, acquired great wealth, and in the beginning of the war of independence loaned to the state of South Carolina the sum of $220,000. In 1779, when Prevost attacked Charleston, Manigault, at 75 years of age, with a grand son but 15 years old at his side, was among the volunteers who defended the city.

MANILA HEMP. See Abaca, ante.

MANILA, the capital of the Philippine islands (q.v.), and residence of the Spanish viceroy, or governor of the Philippine archipelago, is situated in the island of Luzon, on the banks of the river Pasig, and at the embouchure of that river in the bay of Manila. It is divided by its river into Manila proper and Binondo. Manila proper, or the city of Manila, consisting of 17 spacious streets, crossing at right angles, contains the cathedral; the palacio, built in 1690; the archiepiscopal palace, the hall of audience, 11 churches and 3 convents, besides public offices, barracks and other military establishments. Beyond the ramparts, on the east side, is the calzada, or public promenade, crowded in the evening by carriages and equestrians. Instead of glazed windows, the houses are furnished by grilles and fitted with plates of semi-transparent oyster-shells. Binondo is larger and more animated than Manila; but the streets are less regular, and many still unpaved. Numerous canals intersect this suburb, which is the residence of the wealthy merchants. The bay and harbor of Manila are magnificent, and the Pasig is navigable for 10 miles. The trade is chiefly with the United States, Great Britain, China, and Australia. Manila is by law the only emporium of foreign trade with the Spanish East Indies. Its principal exports are sugar, abaca (Manila hemp), cigars, leaf tobacco, coffee, rice, and fine woods. The imports consist chiefly of woven goods from Manchester and Glasgow, with lead, iron-ware and beer; silks, nankins, vermilion, and curiosities are imported from China. The cheeroots of Manila are famous; they are generally preferred to those of Havana everywhere east of the cape of Good Hope. Their manufacture is under the charge of an administration whose headquarters are at Manila; 20,000 persons are employed in this branch of manufacture. The climate of Manila is on the whole healthy, and the average temperature throughout the year is nearly 82°. Convulsions of the earth have frequently made frightful ravages in this city. In 1894, many churches, private houses, etc., were destroyed, and the ships in the harbor were wrecked, but the number of victims was never ascertained. In 1828 and 1857, severe shocks were felt; but on June 8, 1863, one of the most dreadful earthquakes almost ruined the city. The cathedral and all the churches, with one exception, were overthrown; the palace of the viceroy and the British consulate were destroyed; and a number of lives, of which 2,000 seems but a moderate estimate, were lost. On Oct. 30, 1875, a violent hurricane killed 250 persons, and destroyed 3,800 houses. Manila is one of the four ports of the Philippine archipelago which are open to foreign vessels. In 1874 the value of the exports from Manila was $13,889,817 (about $3,178,000); and that of imports from Great Britain was $573,453. Pop., including suburbs (1865), 200,443.

MANILUS, Marcus, lived, according to Bentley, who has edited his works, at about the time of Augustus; but both his name and identity are in great doubt, as well as his birthplace, which Bentley claims to have been in Asia; others in Rome. He is known only as the author of a poem called Astronomiae, of which five books are extant treating of the fixed stars. Probably others on the planetary system have been lost or never completed. As an astronomer Manilus seems to have been somewhat in advance of his age, but as poetry his book has small value.

MANIN, Daniel, an illustrious Italian patriot and political leader, elected, during the revolution of 1848, president of the Venetian republic. Born in 1804 at Venice, Manin graduated at the university of Padua, was admitted doctor of laws at 19, and subsequently practiced at the bar, of which his father, Pietro Manin, was an eminent mem-
ber. From 1831 he became a recognized leader of liberal opinion in Venice; in 1847 his reputation as a political economist was established during the sittings of the scientific congress at Venice; and shortly after he was thrown into prison for a spirited public address of which he was the author.

Previous to the outbreak of 1848, Manin was for the second time incarcerated; but on the proclamation of the news that Paris, Naples, and Tuscany were in revolution, he was released in triumph by the populace, and was at once invested with supreme power. The organization of a civic guard, and the expulsion of the Austrians from the arsenal, were Manin's first public measures; the mob that clamored for the lives of their former oppressors, and which was said to have been incited at his dictation, was put down.

From this time on, the period of his election to the presidency of the Venetian republic, Manin's energies were devoted to the organization of the inhabitants for self-defense.

During the annexation of Lombardy to Piedmont, Manin laid down his authority; but on the defeat of the Sardinian army at Novara, Mar. 23, 1849, he resumed it, and was the animating spirit of the entire population of Venice during the heroic defense of the city for four months against the besieging Austrian army. On Aug. 24, Venice capitulated; but Manin, with 40 of the principal citizens, being excluded from all stipulations, quitted the city. He retired to Paris, where he taught his native language, declining innumerable offers of aid. From thence he proclaimed his desire that the republican system should give place in Italy to the Sardinian monarchy, or any executive form tending to get rid of Austrian rule. He died of heart-disease in Paris in Sept., 1857.

This really great man appeared a rare union of qualities the most exalted, enthusiasm being guided by great practical sagacity; extreme personal humility coexisting with a lofty sense of authority, and great faculty for command; and the energy and fire of action being equaled by the calm and stoical endurance of defeat and mortal disease.

MANIOC, Mandioc, or Cassava, Manihot utilissima, formerly known as jatropha manihot, and as janipla manihot, a large, half-shrubby plant of the natural order euphorbiaceae, a native of tropical America, and much cultivated there. It is now also extensively cultivated in Africa, and has been introduced into other tropical countries. Manioc, or maniho, is the Brazilian name; cassava, the West Indian; and in Peru and some other parts of South America, the name is juen or yuca. The plant grows in a bushy form, with stems usually 6 to 8 ft. high, but sometimes much more. The stems are white, brittle, and have a very large pith; the branches are crooked. The leaves are near the extremities of the branches, large, deeply 7-parted. The roots are very large, turnip-like, sometimes weighing 30 lbs., from three to eight growing in a cluster, usually from a foot to two feet long. In common with other parts of the plant, they contain a milky juice, so poisonous as to cause death in a few minutes; but as this is owing to the acid presence of hydrocyanic acid, which is quickly dissipated by heat, the juice, insipid by boiling, forms the excellent sauce called Casareep (q.v.); and fermented with molasses, it yields an intoxicating beverage called ouyeou; whilst the root, grated, dried on hot metal plates, and roughly powdered, becomes an article of food, very largely used in South America, and there very generally known as farinhas (Portug. meal). It is made like bread, is dried, and used as a food for pigs. It is boiled and mixed with water, but by the action of heat softening and agglutinating the particles of starch. These cakes are sometimes called cassaara or cassada bread. It is also imported into Britain, to be used in manufactories as starch. The true starch of manioc, separated in the ordinary manner from the fiber, is also imported in considerable quantity into Britain, under the name of Brazilian arrow root; and from it tapioca is made, by heating it on hot plates, and stirring with an iron rod: the starch-grains burst, some of the starch is converted into dextrine, and the whole agglomerates into small irregular masses. Another species or variety of manioc is also cultivated, the roots of which contain a perfectly bland juice, and are eaten raw, roasted or boiled. This, the Sweet Cassava or Sweet Juca (M. aipi of some botanists, said to be a native of Africa as well as of America), is described as having the leaves 5-parted, and the root of longer shape than the common or bitter cassava, and much smaller, only about six ounces in weight; but other descriptions of the sweet cassava as having roots quite equal in size to the bitter. The manioc is easily propagated by cuttings of the stem, and is of rapid growth, attaining maturity in six months. The produce is at least six times that of wheat.

MANIS, a genus of mammalia, of the order edentata, containing several species, natives of Africa and the warm parts of Asia, and in their habits and many of their characters closely resembling the nut-eaters (q.v.) of South America; but having, among other differences, the body and the tail covered with an armor of large sharp-edged and pointed scales. The species are pretty numerous. One, remarkable for the length of its tail, the phattagen of the ancients (M. tetradactyla), inhabits western Africa. It is about 5 ft. long, of which the tail occupies 3 feet. Another, the Short-tailed Manis (M. pentadactyla), is common in many parts of the East Indies.

MAN, ISLE OF, is situated in the Irish sea, in n. lat. 54° 3' to 54° 25', and w. long. 4° 18' to 4° 47'; the shortest distance between the island and the adjacent countries being from point of Ayre to Burrow head in Scotland, 16 miles. The length of the island is 33 f., breadth 12 f., and area about 145,325 acres, of which more than 90,000 are cul-
tivated." At the south-western extremity is an islet called the Calf of Man, containing 800 acres, a large portion of which is under cultivation. A chain of mountains extends from n.e. to s.w., the highest of which is Snaefell, 2,024 ft. above the mean sea-level from its summit, the view is very imposing; the picturesque glens and undulating country in the foreground; the rich plains of the n. and s. of the Island in mid-distance; and beyond, the Irish sea, bounded by the high lands of the surrounding countries, on which even the corn-fields may be described. Several streams take their rise in these mountains, and flowing through in many the fish have been destroyed by the washings from the lead mines. The coast-scenery from Maughold head on the e. passing s. to Peel on the w., is bold and picturesque, especially in the neighborhood of the Calf, where Spanish head, the southern extremity of the island, presents a sea-front of extreme grandeur.

The greater part of the island consists of clay-slate under various modifications. Through the clay-schist, granite has burst in two localities, in the vicinity of which mineral veins have been discovered, and are extensively worked. Nearly 4,000 tons of lead are extracted annually, as well as considerable quantities of copper, zinc, and iron; the lead ore is very rich in quality, as much as 108 oz. of silver having been occasionally extracted from the ton.

The island is divided into 6 sheets; these into parishes, of which there are 17; these, again, into trees; and, lastly, into quarterlands. The towns are Castletown (q.v.), Douglas, the modern capital (q.v.), Peel (q.v.), and Ramsey (q.v.). Within the past few years great improvements have been made in the island. At Douglas, a beautiful promenade has been erected; also a handsome landing-pier, at a cost of £48,000. Very extensive breakwater and other harbor works have been erected at Douglas. The total expense has been over £200,000. An outer pier and breakwater, constructed of concrete cement blocks, at a cost of about £150,000, was opened in 1879. At Ramsey, a public promenade and inclosure on the foreshore have been carried out; and harbor works have been erected both here and at Port Erin, in the latter case at a cost of £77,000. Port Erin harbor is more especially designated for the herring fleet, and for the steamers from Ireland, which are expected yet to form a great trade for the island, as a port of call between England and Ireland. A sum of close on £100,000 has been expended in casing the existing breakwater at Peel. To cover the extensive outlay on harbor works the consent of the imperial treasury was asked and obtained in 1866 for the readjustment of duties on articles imported into the island, such as spirits, wines, tobacco, teas, sugar, etc.

The Isle of Man possesses much to interest the antiquary. Castle Rushen (see CASTLE-TOWN), probably the most perfect building of its date extant, was founded by Guthlief, son of King Orry, in 947. The ruins of Rushen abbey, dated from 1154, are picturesque, and the remains of Druidical remains and Druidic monuments throughout the island.

The population of the island, in 1871, was 55,763: in 1881, 52,469; the small rate of increase being attributable to emigration. The language of the natives is a dialect of the Celtic, and is closely allied to the Gaelic and the Erse or Irish. As a spoken language, it is almost entirely disused.

The climate is remarkable for the limited range of temperature, both annual and diurnal; westerly and south-westerly winds greatly predominate; easterly and north-easterly winds occurring chiefly in the autumn quarter. Myrtles, fuchsias, and other tender exotics flourish throughout the year.

The fisheries afford employment to nearly 4,000 men and boys. More than 700 boats of various tonnage are employed in the herring and cod fisheries, the average annual produce being above £80,000. In addition to these, a large number of English and Irish boats arrive at the island during the fishing season. Besides the herrings consumed fresh, there are about 40,000 barrels cured. The trade is chiefly coastwise; the exports are limited to the products of the island.

Agriculture has of late years made considerable progress. Large numbers of fat cattle are shipped to the English markets, as well as about 20,000 quarters of wheat annually. The manufactures are inconsiderable; but to make up for this, about 100,000 visitors come to the island each season.

The revenue derived from the island amounts to about £50,000 per annum; of which the greater part is received from customs duties, and the whole of which, except £10,000 a year payable to the imperial treasury, is used for insular purposes, such as public improvements, education, police, cost of government, etc.

The principal line of communication with the United Kingdom is between Douglas and Liverpool, by means of a fine fleet of swift steamers. There is a submarine telegraphic cable between Maughold head and St. Bees head. In July, 1873, a line of railway was opened between Douglas and Peel; in 1874 to Castletown and the south; and in 1879 to Ramsey—all on the narrow-gauge system.

Previous to the 6th c., the history of the Isle of Man is involved in obscurity; from that period, it was ruled by a line of Welsh kings, until near the end of the 9th c., when the Norwegian, Harold Haarfager, invaded and took possession of the island. According to tradition, in the beginning of the 10th c., Orry, a Dane, effected a landing, and was favorably received by the inhabitants, who adopted him as their king: he is said to
Manissa, Manitoba.

have been the founder of the present Manx constitution. A line of Scandinavian kings succeeded, until Magnus, king of Norway, ceded his right in the island and the Hebrides to Alexander III. of Scotland, 1266 A.D.; this transference of claim being the direct result of the disastrous failure of the expedition of Hacon of Norway against the Scots in 1263. On the death of Alexander, the Manx placed themselves under the protection of Edward I. of England by a formal instrument dated 1290 A.D.; on the strength of this document, the kings of England granted the royal favorites from time to time, until the year 1406, when it was granted to Sir John Stanley in perpetuity to be held of the crown of England, by rendering to the king, his heirs, and successors, a cast of falcons at their coronation. The Stanley family continued to rule the island under the title of kings of Man, until James, the 7th earl of Derby, adopted the humbler title of lord, on his accession to the government. In 1651 the island was surrendered to a parliamentary force by receiver-general Christian, who had raised an armed body against the government, which was then in the hands of the countess of Derby; the parliament having thus obtained possession of the island, granted it to Thomas lord Fairfax. On the restoration, the Derby family were again put in possession. On the death of James, 10th earl of Derby, without issue, in 1755, James, 2d duke of Athol, descended from Amelia Sophia, youngest daughter of James, the 7th earl of Derby, became lord of Man. The Isle of Man having been for a long period the seat of an extensive smuggling-trade, to the detriment of the imperial revenue, the sovereignty of it was purchased by the British government, in 1765, for £70,000 and an annuity of £2,000 a year, the duke still retaining certain manorial rights, church patronage, etc. After negotiation; and sales from time to time, the last remaining interest of the Athol family in the island was transferred to the British crown by John, the 4th duke, in Jan., 1829; the amount paid for the island having amounted in the aggregate to £493,000.

The Isle of Man forms a separate bishopric under the title of Sodor and Man. The bishopric of the Sudoreys, or Southern isles, was for a time annexed to Man, hence the title of Sodor, which is still retained, the name having been applied to the islet of Holm Peel, on which the cathedral church of the diocese stands. This bishopric is said to have been founded by St. Patrick in 447. The Manx church has its own canons, and an independent convocation. The see is, for certain purposes, attached to the province of York. There are in the island about 30 places of worship in connection with the established church of Man. The livings are, with few exceptions, in the gift of the crown. The principal denominations of dissenters are represented in the island.

The Isle of Man is a constitution and government of its own, to a certain extent independent of the imperial parliament. It has its own laws, law-officers, and courts of law. The legislative body is styled the court of Tynwald, consisting of the lieut. gov. and council—the latter being composed of the bishop, attorney-general, two deemsters (or judges), clerk of the rolls, water bailiff, archdeacon, and vicar-general—and the house of 24 keys, or representatives. A bill is separately considered by both branches, and on being passed by them, is transmitted for the royal assent; it does not, however, become law until it is promulgated in the English and Manx languages on the Tynwald Hill. The house of keys was formerly self-elected; but in 1866 an act was passed establishing an election by the people every seven years, the electoral qualification being, in the country, £13 yearly value occupation, or £8 proprietary; and £8 proprietary or tenancy in the towns.

The ancient arms of Man were a ship with her sails furled; in 1270 the present arms were substituted, viz., gules, three legs of men in armor, conjoined in fesse at the upper part of the thighs, flexed in triangle, garnished and spurred, or, with the motto on garter surrounding, Quocunque jeceris stabit.

MANISa (anc. Magnesia ad Sipyllum), a t. of Asia Minor, on the s. bank of the Sarabat (Horreae), 28 m. n.e. of Smyrna. It abounds in handsome public buildings. Silk and cotton manufactures are carried on. Population variously stated at 35,000 and 60,000. The ancient Lydian Magnesia is famous for the victory of the Romans under Scipio over Antiochus III. of Syria. There was another Magnesia in ancient times, not far from this one, generally called Magnesia ad Meandrum.

MANISI TEE, a co. of Michigan, having lake Michigan on the w., drained by the Maniste river; 550 sq. m.; pop. '80, 12,538. It is a level region, heavily timbered with pine, and with a fertile soil. The productions are wheat, hay, Indian corn, oats, potatoes, and butter. Co. seat, Manistee.

MANISI TEE, a city in w. Michigan, incorporated 1869; situated at the mouth of the Maniste river on the shore of lake Michigan; pop. '70, 4,904. It is 45 m. s.w. of Traverse City, 72 m. n. of Minskogen, and 135 m. n.w. of Lansing. It has a prosperous community engaged in farming, and also in the manufacture of lumber, which is exported at the rate of 200,000,000 ft. annually. On the e. is lake Manistee, through which the river finds its outlet, the length of the river from this lake to lake Michigan being 14 m., and navigable by vessels of light draught. It has about 20 steam saw-mills
Manistee manufacturing great quantities of shingles, laths, pickets, etc. It has machine-shops, grist-mills, and a tannery. It contains 6 churches, excellent public schools (one building for educational purposes costing $18,000), a court house, and a town-hall. Seat of justice, Manistee.

MANITOBA, RED RIVER, or SELKIRK, SETTLEMENT, was a colony in British North America (of which the chief part is now known as Manitoba), lying along the Red river of the north. In 1811 the earl of Selkirk, a member of the Hudson’s Bay company, attracted by the fertility of the soil on the banks of the Red river, obtained from the company a grant of a large tract of land on both banks of the river, extending some distance within the present frontier of the United States. In 1816 he attracted a number of settlers from the highlands of Scotland. The right of the Hudson’s Bay company to grant this land was, however, disputed by the Northwest company; and when the settlers commenced to build, they were driven off by the servants of the Northwest company. Hostilities continued between the servants of the two companies for several years, and in 1816 there was a pitched battle between them. The earl of Selkirk arriving soon after found his settlers scattered; but by his energetic measures, and by help of 100 disbanded soldiers from Europe whom he had brought with him, he secured for his old and new protegees a peaceful settlement. They established themselves near Fort Garry, and in 1817 the earl obtained from the Indians a transfer of their right to the land to two miles back from the Red river on both sides. Still the settlers had some difficulties to overcome, especially from visitations of grasshoppers. These were gradually surmounted; but the population, including now a large number of half-breeds, remained very isolated, having little communication with the outside world. The Hudson’s Bay company surrendered all their claims to the north-west territory to the British government, which in the following year transferred that territory to Canada. The Canadian government now organized that portion of the Red river district between 96° and 99° w. and lat. 49° and 50° 30’ n. as the Province of Manitoba. Its area is about 14,000 sq. miles. The Red river valley is a level plain or prairie, with a soil unsurpassed in fertility by any in the world. It consists of from two to four feet of rich black mold, resting on a marly clay which elsewhere would itself be reckoned good soil. In places the ground has been cropped for fifty years without any apparent diminution of its fertility. The surface was generally treeless and ready for the plow, though a few miles to the eastward the country was wooded. The rich natural grasses of Manitoba afford a very favorable pasture for cattle. At the time of the transfer, the population was about 12,000. Since then there has been a steady influx of immigrants from the eastern provinces, from Britain, from the United States, from Iceland, and elsewhere. In 1879 the population of the province was calculated at 75,000. Trade has increased: saw-mills and flour-mills have been established. Through the government is at Fort Garry, now called Winnipeg, a town of near 10,000 inhabitants in 1879. The university of Manitoba, at Winnipeg, embraced the college of St. Boniface (Roman Catholic), St. John (Episcopal), and Manitoba (Presbyterian). Provision has already been made for common schools throughout the province.

The province is represented in the senate of the dominion by two members, and in the house of commons by four. The government of Manitoba consists of a lieutenant-governor, appointed by the dominion government; an executive council of five members; and the legislative assembly of twenty-four members, the province being marked off into that number of divisions. While the proposed transfer to the British crown of the Hudson’s Bay company was pending, this portion of their dominions was the scene of considerable contention and violence. The French-speaking population, led by Louis Riel, organized a force, imprisoned their English and Scotch opponents, seized Fort Garry, established a provisional government, robbed the strong-box, and dictated terms to the governor of the Hudson’s Bay company, to which he had to submit. A military force arrived in the province July, 1870, and Riel, fearing capture, escaped, an event which put an end to the insurrection.

MANITOBA (ante). A considerable portion of this province is prairie-land, diversified by patches of elm, ash, oak, poplar, and maple. The soil is a rich black mold, producing from 20 to 25 bushels of wheat to the acre, the grain ripening in 110 days. It produces also oats, barley, corn, hops, flax, hemp, potatoes, and all kinds of garden vegetables. The savannas of the Red river afford excellent pasturage. The winter climate, though severe, is declared to be milder than that of the Red river valley, farther south. The short summers are very warm. The climate, on the whole, is healthful. The Red river is valuable for navigation, except when it overflows its banks and inundates the surrounding country. The Canadian Pacific railway has its course through the province. A large proportion of the inhabitants are Roman Catholics, that religion having been established at an early day by missionaries to the Indians. A Roman Catholic archbishop resides at St. Boniface, and the see-house of the Anglican lord-bishop of Rupert’s Land is at Fort Garry. The board of education is composed of equal numbers of Roman Catholics and Protestants. There is a considerable Scotch Presbyterian element in the population. St. John’s college (Anglican), and St. Boniface college (Roman Catholic), were founded in 1872. The executive government consists of a lieutenant-governor and a council of five. The legislature is composed of a legislative council of
seven members, appointed for life, and of a legislative assembly of 24 elective members. The public business is carried on in both the English and French languages. The common law of England is in force in the province.

MANITOBA, LAKE a body of water in the n.w. territories of Canada, intersected by the 51st parallel and 90th meridian. It is about 60 m. s.w. of lake Winnipeg, which receives its waters through the Saskatchewan or Dauphin river, which near the middle of its course, expands into St. Martin's lake. Manitoba lake is about 220 m. long, and about 80 m. wide; area, about 1900 sq. miles. It is 40 ft. higher than lake Winnipeg, and navigable for vessels drawing 10 ft. of water. It abounds in fish. At its northern end it receives the waters of several smaller lakes, and at the s. those of the White Mud river. The name, in the Indian dialect, signifies "supernatural Strait," the Indians attributing what they regarded as the peculiar agitation of the water in some places to the presence of a spirit.

MANitous, a name used among most Indian tribes to denote any object of supernatural fear or worship. It somewhat resembles in this the Greek δαινον, which meant either a good or evil spirit. The great spirit, or ἴγερας, does not correspond with our idea of a personal God. Any article, as a charm, connected with Indian superstitions is also designated by the same term, just as Africans use the word fetich for idols, amulets, or rites.

MANitous, a co. in Michigan, comprising islands in lake Michigan, 100 sq. m.; pop. '80, 1334. The islands included, and which lie off the coast of the lower peninsula, are the Big Beaver, Great and Little Manitou, Little Beaver, Garden, Hog, South and North Fox. These islands have a rugged surface, and are not very fertile. Co. seat, St. James.

MANitous—comprising Grand Manitoulin, or Sacred isle; Little Manitoulin, or Cockburn isle, belonging to Britian; and Drummond isle, belonging to the state of Michigan. The island is covered with forests, and is bounded on the e. by lake Huron, n. by lake Michigan, s. by lake Superior, and w. by the straits of Mackinac. Its surface is gently undulating, and its chief towns are Houghton, Calumet, and Ishpeming.

MANぐらい, a co. in e. Wisconsin, on lake Michigan, drained by the Sheboygan, Manitowoc, and East and West Twin rivers; 612 sq. m.; pop. '80, 37,506. The soil is productive, yielding largely of wheat, rye, oats, barley, potatoes, hay, peas, and beans. Other productions are wool, butter, and pine lumber, the latter being the most important article of export. There are a large number of flour, saw, and woolen mills, besides tanneries, breweries, and currying establishments. Co. seat, Manitowoc.

MANitary, chief city in Manitowoc co., in e. Wisconsin, at mouth of the river of the same name and on the Milwaukee, Lake Shore and Western railroad. Its pop. is 5,168, largely German; has a bank, 4 newspapers, tan-yards, factories, and some lake commerce.

MANKATO, chief city in Blue Earth co., Minnesota; is 86 m. from St. Paul, on the St. Paul and Sioux City railroad; pop. '70, 3,452. It is also the terminus of the Central road, and is on the Missouri river; has 3 banks, 4 newspapers, a library, state normal school, 8 or 10 manufactories, and a good general trade.

MANLEY, John, 1734-93; b. at Torbay, England; bred a sailor in the maritime service. He soon became a resident of Marblehead, Mass. At the opening of the revolution he was placed by Washington in command of the schooner Lee, in which he did good service, seizing several vessels, one of which was of great value. In 1776 he received a regular commission from congress. His first capture in the Hanock, his new command, was the man-of-war Fox. Owning to cowardly conduct by his consort, capt. McNeil of the Hector, capt. Manley was taken by the British man-of-war Rainbow, on July 8, 1777. He was tried for his conduct in this affair and honorably acquitted. The last naval combat of the war was between the Hogue, capt. Manley, and four British men-of-war, the former having been driven on a sand-bank at Guadeloupe. Here for three days Manley defended himself against the tremendous odds and finally effected his escape. After the war his home was at Boston, where he died.

MANlius. The Roman family whose members bore this name had many famous representatives, of whom may be noted. 1. Marcus Manlius Capitolinus, who was consul in 392 B.C., and two years later gained his surname by rescuing the capitol from the attacks of the Gauls. From this time forward he courted the favor of the lower classes, and in 381 was arraigned before the centuries and sentenced to be thrown from the Tarpeian rock. The name of Marcus was never after borne by any of the Manlian gens, who considered him a traitor to his family and class. 2. Lucius Manlius Impe- rator, 391 B.C.; this Manlius was a son of Lucius, military tribune B.C. 399, twice dictator and three times consul. His surname was derived from his having despoiled a gigantic Gaul of a golden chain (torques) after having slain him in single combat. In his last consulship he waged a successful war against the Latins and
caused to be put to death his own son, who had disobeyed his orders by engaging in single combat with the enemy. 4. Titus Manlius Torquatus was consul in 235 B.C., and in 224. In that year he defeated the Gauls and crossed the Po, and soon afterwards was victorious over the Carthaginians. He was again elected consul in 210 B.C., but declined the honor. 3. Cælius Manlius Vetus, consul B.C. 189, after having been praetor in 195 and curule aedile in 197 B.C. He was victorious over the Gauls of Galicia and in Asia, but, on account of a serious defeat when returning through Thrace, with difficulty obtained the honor of a triumph.

MANLY, Basil, D.D., 1798-1868; b. near Pittsborough, Chatham co., N. C.; graduated at the South Carolina college in 1821; preached in the Edgefield district for three years; pastor of the Baptist church in Charleston 1826-37; president of the university of Alabama 1837-55. Resigning on account of failing health, he took charge of another church in Charleston, which he subsequently left and became a traveling missionary in Alabama. He took an active part in the organization of the southern Baptist convention in 1845, and in the establishment of the theological seminary at Greenville, S. C., in 1858. He published a Treatise on Moral Science, which has been a text-book in southern colleges.

MANN, A. Dudley, b. Va., 1805; was a commissioner of the United States to negotiate commercial treaties with Hanover, Oldenburg, and Mecklenburg in 1845, and with all the minor German states in 1847; special commissioner to the insurgent government of Hungary in 1849; minister to Switzerland in 1850; private secretary to president Pierce in 1853, but resigned in a few months to devote himself to the development of the material resources of the southern states. In 1861 he was sent on a special mission to induce the European governments to recognize the confederacy, and was afterwards associated for the same purpose with Messrs. Mason and Slidell.

MANN, Horace, LL.D., American statesman and educationist, was b. at Franklin, Mass., May 4, 1796; graduated at Brown university, Providence, and commenced the study of law. Elected to the legislature of Massachusetts in 1827, his first speech was in favor of religious liberty, and his second a plea for railways. He was an advocate of temperance, and a founder of the state anti-tetanic asylum. Removing to Boston, he was elected, 1836, to the state senate, of which he became president. After editing the revised statutes of the state, he was for 11 years secretary of the board of education. He gave up business and politics and devoted his whole time to the cause of education, introduced normal schools and paid committees, and, in 1843, made a visit to educational establishments in Europe. His report was reprinted both in England and America. For 11 years he worked 15 hours a day, held teachers' conventions, gave lectures, and conducted a large correspondence. In 1848 he was elected to congress as the successor of ex-president John Quincy Adams, whose example he followed in energetic opposition to the extension of slavery. At the end of his term he accepted the presidency of Antioch college at Yellow Springs, Ohio, established for the education of both sexes, where he labored with zeal and success until his death, Aug. 2, 1859. His principal works are his educational reports, and Slavery, Letters, and Speeches.

Manna, a species of sugar which exudes from incisions made in the stems of the manna ash (see Ash), a native of the mountainous parts of southern Europe. Sicily is the chief locality of the manna, and there, in July or August, the collectors make a deep cut through the bark to the wood near the base of the tree with a curved-bladed knife, repeating such incisions daily in different places, always, however, on one side only, and gradually working until the branches are reached, and then some of the leaves are also cut. The following year the other side of the tree is operated upon, and this alternation gives the bark time to heal. If the weather is warm and favorable the manna begins to ooze out of the cuts slowly, and to harden in lumps or flakes, which are from time to time removed by the collectors. Manna is a light porous substance, of a yellowish color, not unlike hardened honey, but harder and drier. There are various qualities known in commerce, according to the time of collection, the goodness of the season, and other causes. It is chiefly used in medicine, having a gentle purgative effect, which renders it valuable for administration to very young children. It consists principally of a crystallizable sugar called mannite, and an uncrystallizable sugar, which possesses the sweet and purgative properties. There are several other manna-yielding plants besides the ash, especially the manna-bearing eucalyptus of Australia (eucalyptus mannifera), which is non-purgative, and is a favorite sweetmeat with the children of that country.

Small quantities are found on the common larch (lauræ Europææ), in some districts; this kind is known under the name of manna of Briançon. Manna is also obtained in manna and tamarix variegata from the fronds of some sea-weeds. The manna of the Israelites, which they ate during their wanderings in the wilderness, appears probably, as shown by Ehrenberg in his Symboule Physica (Fasc. i. 1823), to have been the saccharine substance called Mout Sintat manna, which is produced in that region by a shrub, tamarix mannifera, a species of tamarisk (q. v.), from the branches of which it falls to the ground. It does not, however, contain any mannite, but consists wholly of mucilaginous sugar. The exudation which concretes into this manna is caused by the punctures made in the bark by insects of the genus oculus (C. manniparus), which sometimes cover the branches. It is a kind of reddish syrup, and is eaten by the Arabs.
and by the monks of Mount Sinai like honey with their bread. It has been very
generally supposed that the manna of the Jews was produced by a species of camel's
thorn (q.v.).

MANNA CROUP, or MANNA GROATS, a kind of semolina, prepared in Russia, usually
from the hard wheats of Odessa and Taganrog. In the process of grinding for flour,
small rounded fragments of these hard grains are obtained from the grooves of the
grinding stones, and these constitute the ordinary manna groats, which forms one of the
most esteemed materials for puddings. It is indistinguishable from the semolina of
Italy. Another kind is made by husking the small grain of the aquatic grass, glyceria
fluitans, which is carefully collected for the purpose; it is expensive, and is only used as
a luxury. Small quantities of the commoner kind are occasionally imported for use in
this country, but it is by no means sufficiently well known.

MANNA GRASS, Glyceria fluitans, or Pou fluitans, a grass plentiful in marshes, ditches,
and by the sides of stagnant pools in Britain, and most parts of Europe; found also in
Asia, North America, and New Holland. It is also known as flote fcese, floating sweet
meadows grass, etc. It varies in height from one foot to three ft., and has a long, slender,
nearly erect panicle, the branches of which are at first erect and appressed to the rachis;
the spikelets awnless, slender, cylindrical, an inch long or nearly so, with 7 to 20 florets;
the glumes small, unequal, and obtuse; the outer palea with seven prominent ribs and a
membranous margin; a scale of one thick fleshy piece. The stems are decumbent at the
base, and rooting at the joints; the leaves long and rather broad, the lower ones often
flattened. This manna grass is perennial, and useful in irrigated meadows and in very wet
grounds, affording large quantities of food for cattle. In many parts of Germany and
Poland, the seeds—which fall very readily out of the spikelets—are collected by spreading
a cloth under the panicles and shaking them with a stick; they are used in soups and
gruels, are very palatable and nutritious, and are known in shops as Polish manna,
manna seeds, and manna groat (q.v.). They are a favorite food of geese, and are also
eagerly devoured by carp and other kinds of fish.—Akin to this grass is the reed meadow
grass, water meadow grass or reedy sweet water grass (glyceria or poa aquatica), a still
larger grass, with very abundant herbage, the most productive, indeed, of all British fod-
der grasses, growing in ponds, ditches, marshes, and the sides of rivers, often where they are
tidal. Hay made of it is greatly preferred to that of other bog grasses. Its rapid
growth often choked up water-channels, so that they must be cleared of it.

MANNERS, THE FAMILY OF. This noble family are of Northumbrian extraction,
their ancestor, sir Robert de Manners, having been lord of the manor of Ethale, or Etal,
in that county in the 13th century. His descendant, also sir Robert de Manners, temp.
Edward III., was governor of the important border fortress of Norham castle, which he
defended with ability against the Scots, and was subsequently commissioned to treat,
on part of the king, with David Bruce, concerning the ratification of peace. In the
reign of Henry VI., we find another sir Robert de Manners acting as sheriff of North-
umberland, and representing that county in parliament; a post at that time, as sir B.
Bruce was nominated chief of the great power and profit. His wife, a daughter of the noble house of
Roos, or De Roos, brought to him that ancient barony, and with it the castle of Belvoir,
Leicestershire; the grandson of this marriage was raised to the earldom of Rutland by
Henry VIII.; and the tenth earl was raised to the dukedom in 1603. The eldest son of
the third duke was the celebrated marquis of Granby (q.v.), who attained a very high
reputation as a field-officer whilst acting as commander-in-chief of the British forces
serving under prince Ferdinand in Germany, but who did not live to inherit the duke-
dom. The marquis's youngest brother having married the heiress of Sutton, lord Lexing-
ton, assumed the additional name of Sutton, and became the father, inter alios, of two
sons, one of whom was for many years archbishop of Canterbury, and the other held the
high post of lord chancellor of Ireland early in the present century, whilst the arch-
bishop's son presided as speaker over the councils of the house of commons. The
present heir-presumptive to the dukedom of Rutland is lord John James Robert Manners,
son of the late and brother of the present duke.

MANNERS, JOHN. See GRANBY, ante.

MANNHEIM, formerly the capital of the Rhinish palatinate, now the most important
trading town in Baden, and, after Cologne and Coblenz, the most important on the
Rhine, is situated in a fertile plain, on the right bank of the Rhine, at the junction of
the Neckar, about 18 m. below the city of Spire. The site of the town is low, and a
high dike protects it from inundations. A bridge of boats crosses the Rhine, which is
here 1200 ft. in breadth, and a chain bridge the Neckar. The town is remarkable for its
cleanliness and regularity, the whole of it being laid out in quadrangular blocks. Its
fortifications were destroyed after the peace of Lunéville, and gardens now occupy their
place. The palace, built 1720–29 by the elector painter Karl Philipp, is one of the
largest buildings of the kind in Germany. The city contains a lyceum with a library,
a botanical garden, an observatory, etc. Tobacco, shawls, linen, and playing-cards are
manufactured, and there are several tanneries and bleach-works. A thriving trade
is carried on chiefly by boats on the Neckar and Rhine. About 6,600 vessels, of
MANNING, Henry Edward, Cardinal, b. July 15, 1808, at Totteridge in Hertfordshire, England; was educated at Harrow school and Balliol college, Oxford, where he took orders in the church of England. In 1834 he was presented to the living of Laven
ton and Graffham in Sussex co., and in 1840 was appointed archdeacon at Chichester, the cathedral town. Up to this time he was a consistent high-church Anglican, though, like many Oxford divines, inclined to Puseyism; but in 1851 the decision of the courts in the noted Graham case, which seemed to Manning and others to claim for the crown authority over a purely doctrinal question on the subject of baptism, left him, he thought, no alternative but to abandon his preferment and become a member of the Roman Catholic church. It was thought by many that this would prove the beginning of a serious movement toward Rome on the part of a large section of the Anglican church. For three years he studied the dogmas and rites of his new faith at Rome, and in 1857 was ordained by cardinal Wiseman and became priest of the parish of St. Helen and St. Marys. In 1865 he was nominated archbishop of Westminster, and other ecclesiastical honors were conferred upon him. He has always been particularly energetic in the matter of public education; in 1874 was opened the Kensington university (Roman Catholic), in the founding of which he had been for several years concerned. Perhaps more than any other dignitary of his church, he has been active in providing primary education for the masses. The cardinal's hat was conferred upon archbishop Manning by Pius IX in Mar., 1875. In the Vatican council of 1869-70 he took a prominent part, sustaining the extreme advocates of infallibility; and his controversy on the subject with bishop Dupanloup was one of the prominent features of that time. *Petri Privilegium* (1871) is an exposition of the doctrine and an account of the proceedings. On the same subject he has also published answers (1875) to Mr. Gladstone's expostulation, giving his views of the bearing of the Vatican decrees on ecclesiastical subjects and on the condition of Ireland, in the government of which he has long advocated reform. Among these are: *Unity of the Church* (1842), *Temporal Mission of the Holy Ghost* (1863), *Temporal Power of the Pope* (1866), *England and Christendom* (1867). The cardinal is a man of great keenness of intellect, firmness of purpose, and fervor of spirit.

MANNING, Jacob Merrill, D.D., b. Greenwood, N. Y., 1824; graduated at Amherst college in 1850, and at Andover theological seminary in 1853. In 1854 he was settled as pastor of a Congregational church in Medford, Mass., but resigned in 1857 to become associate pastor of the Old South church in Boston, where he still (1881) remains, being now the sole pastor. He has been a contributor to the *Bibliotheca Sacra*; was the orator of Boston, July 4, 1865; and has published *Truths and the Truth* and *Helps to a Life of Prayer*. His discourses and writings show a strong and clear intellect, with a finished literary taste.

MANNING, James, D.D. 1738-91; b. Elizabethtown, N. J.; graduated at Princeton college in 1762; became pastor of a Baptist church in Morristown, N. J., in 1763, and soon afterwards in Warren, R. I. In 1763 he proposed to some prominent Baptist gentlemen of Newport the formation of a "seminary of polite literature, subject to the government of the Baptists," and prepared a plan for the institution. The necessary money was raised, and a charter obtained in 1764. In 1765 Mr. Manning, but 27 years of age, was appointed "president and professor of languages and other branches of learning, with full power to act in these capacities, at Warren or elsewhere." The college, first called Rhode Island college, was opened at Warren in 1768, and in 1770 removed to Providence. In connection with the presidency, he was pastor of the First Baptist church. During the revolution when the college was occupied as a military barrack and afterwards as a hospital, Manning continued his duties as pastor and used his influence in behalf of his country. In 1785 he resumed his duties as president, and in 1786 was elected to congress, still retaining his connection with the college. While in congress he took an active part in the adoption of the national constitution. He resigned the presidency in 1790. Dr. Manning may be regarded as the founder of the college, though the plan was suggested by an association of ministers in Philadelphia. He was distinguished as a pulpit orator, possessing, according to his biographer, "a most attractive and impressive exterior, a voice of extraordinary compass and harmony, and manners expressing remarkable dignity and grace." The name of the college was changed to Brown university, in 1804 in honor of Nicholas Brown its liberal benefactor.

MANNING, James, D.D. 1738-91; b. Elizabethtown, N. J.; graduated at Princeton college in 1762; became pastor of a Baptist church in Morristown, N. J., in 1763, and soon afterwards in Warren, R. I. In 1763 he proposed to some prominent Baptist gentlemen of Newport the formation of a "seminary of polite literature, subject to the government of the Baptists," and prepared a plan for the institution. The necessary money was raised, and a charter obtained in 1764. In 1765 Mr. Manning, but 27 years of age, was appointed "president and professor of languages and other branches of learning, with full power to act in these capacities, at Warren or elsewhere." The college, first called Rhode Island college, was opened at Warren in 1768, and in 1770 removed to Providence. In connection with the presidency, he was pastor of the First Baptist church. During the revolution when the college was occupied as a military barrack and afterwards as a hospital, Manning continued his duties as pastor and used his influence in behalf of his country. In 1785 he resumed his duties as president, and in 1786 was elected to congress, still retaining his connection with the college. While in congress he took an active part in the adoption of the national constitution. He resigned the presidency in 1790. Dr. Manning may be regarded as the founder of the college, though the plan was suggested by an association of ministers in Philadelphia. He was distinguished as a pulpit orator, possessing, according to his biographer, "a most attractive and impressive exterior, a voice of extraordinary compass and harmony, and manners expressing remarkable dignity and grace." The name of the college was changed to Brown university, in 1804 in honor of Nicholas Brown its liberal benefactor.

MANNING, the Navy. Until a recent date sailors only engaged themselves for the term a certain vessel should be in commission, which there was a tacit understanding would be about five years. When the captain hoisted his pendant, the men came down and volunteered, or the crimps in some manner made it their interest to produce them. When the captain was a popular officer or noted for his daring, his crew was soon com-
pleted; while, when his reputation was that of a martinet, or of a commander under whom prize-money would probably be scarce, a ship would often lie for weeks, or even months in harbor, while the authorities sought in vain to provide her complement of men. In the Napoleonic and former wars, when seamen were urgently needed and knew their value, the press-gang was resorted to, and vacancies filled by compulsion. See Impressment.

At present seamen are encouraged by contingent advantages to enlist for a specified number of years, at the end of which they become entitled to permanent pension. On the paying off of their ship, these men are granted liberal leave, after which they join a depot, and are thence drafted to some other vessel in which their services are required. As a reserve for times of emergency, there are the royal naval coast volunteers (see Coast Volunteers), and the royal naval reserve (q.v.), both very important, auxiliaries, of which the value became instantly apparent when hostilities with the United States were anticipated in 1861.

The Dutch, Danish, and Swedish navies are mainly manned by volunteers, as is that of the United States. The navies of France, Russia, and Italy are manned by conscripts levied in the maritime provinces of the respective countries. The German ships of war depend on the law of compulsory service for their complement.

**MANNING** the YARDS, in a practical sense, consists in sending sufficient men aloft and on to the yards to furl or unfurl the sails: in a complimentary sense, the yards are said to be manned when a row of sailors, with their hands touching, are ranged along them, standing on the yard itself, and holding to a rope which runs across about breast-high between the lifts. When the men are all in clean white uniforms the act of manning the yards has a singularly lively and picturesque effect. It is resorted to when any great personage passes by the ship or comes on board, or in commemoration of some great event; but as the operation is attended with considerable and unnecessary danger, it is, under present regulations, performed far more rarely than used to be the case.

**MAN NITE.** See MANNA.

**MANNITIE,** or **MUSHROOM SUGAR** \((\text{C}_2\text{H}_4\text{O}_1)\), is a peculiar saccharine matter which forms the principal constituent of manna (q.v.); it is also found in several kinds of fungi, in asparagus, celery, onions etc. It is most readily obtained by digesting manna in hot alcohol. On cooling the filtered solution, the mannite is deposited in crystals, which are very soluble in water, and possess a sweet taste. It is not susceptible of alcoholic fermentation, and may be readily distinguished from cane and grape sugar by simple tests. Heated with hydrate of potash, it gives a mixture of acetate, formate, and valerianate of potash, hydrogen being evolved.

**MANNUS,** according to Tacitus, the name given by the Germans to the son of the earth-born god **Taizoo.** From his three sons they derived their three great tribes, the **Ingarones,** the **Iskarones,** and the **Herminones.** Mannus belongs, not to the Teutonic people alone, but to the great mythus of the origin of the human race, common to the whole Aryan family, and, like the Hindu **Manu** or **Manus,** stands forth as the progenitor of the inhabitants of earth endowed with reason. The name is derived from the Aryan root **man,** to think. Compare Wackernagel in Haupt's *Zeitschrift für Deutsches Altertum* (Bd. 6).

**MANOEIL,** Don Francesco, the most eminent of modern Portuguese lyric poets, was born at Lisbon in 1734, and devoting himself to the pursuits of literature, acquired a high reputation. The hostility of the inquisition compelled him, however, to abandon his native country. He took up his residence at Paris, where he died, 25th Feb., 1819. There are more editions than one of his *Obras Completas.* His odes are highly esteemed.

**MAN OF SIN,** an expression used by the apostle Paul in 2. Thess. ii. 3, and which is variously interpreted. The Roman Catholics assert that the **Man of Sin** is Antichrist. The Puritans applied the term to the pope of Rome; the fifth-monarchy men to Cromwell, and some modern theologians consider it as identical with that "wicked one" referred to in v. 8 by the apostle, who is to appear immediately before the second advent of Christ, whom he will destroy with the "spirit of his mouth" and the "brightness of his coming."

**MAN-OF-WAR,** an expression, of unknown origin, for an armed vessel carrying cannon, and belonging to some constituted and acknowledged government. As such she possesses the privileges of war; her deck is, by a legal fiction, taken to be a portion of the soil of the nation whose flag she hoists; in time of war she is justified in attacking, sinking, burning, or destroying the ships and goods of the foe, and by the law of nations, she may stop and search the merchant-vessels of neutral powers which she suspects of carrying aid to her enemy. See CONTRABAND. In case of being overpowered, the crew of a man-of-war are entitled to the ordinary mercy granted to vanquished combatants, lawfully fighting. Any vessel making war, but not belonging to an acknowledged government, is either a privateer (see LETTER OF MARQUE) or a pirate (see PIRACY).

**MAN-OF-WAR BIRD.** See Frigate Bird.
MANOMETER (Gr. manos, thin, rare) is properly an instrument for measuring the rarity of the air or of other gases; but the name is most frequently applied to instruments for indicating the elastic force of gases, which is always inversely proportional to their rarity. The several kinds of barometers (q.v.) are really manometers, and so is the steam-gauge of a steam-engine (q.v.).

MANOMETER (ante). The various forms of manometer may be classified under three heads: 1. the open-air manometer, on the principle of the barometer; 2. the confined-air manometer, on the principle of Mariotte's instrument (q.v.); and 3. the metallic-spring manometer. A simple open-air manometer consists of a glass tube, open at both ends, placed upright in a strong bottle of glass or iron, the bottom of which contains mercury. The tube passes through a tight packing box in the neck. In the upper part of the bottle there is an orifice which admits compressed air, acted upon by steam or vapor, whose tension it is desired to measure. But this form cannot be used for high pressures. The multiple-branch manometer is a modification of the simple open instrument, and is constructed by bending a long tube, open at both ends, in a series of V-shaped flexures of from 20 to 40 in. in height, the number of flexures depending upon the pressure the instrument is liable to be subjected to. Columns of mercury, of equal height, being placed in the lower halves of the V-shaped legs, will indicate the pressure excited at one end of the tube, by the sum of the excess of height of the mercurial columns in alternate legs, or by multiplying the excess of height in one leg by the number of legs containing such excess. The system is fastened to a board or metallic plate, which at one side, near the last branch, is furnished with a graduated scale. The compressed-air manometer is simply a strong V-shaped tube closed at one end, while at the other is attached the pipe communicating with the gas or vapor whose tension it is desired to measure. A portion of the flexure of the V contains mercury, and the space between it and the closed end is filled with common air. Now, according to Boyle's or Mariotte's law, a pressure exerted on the column of mercury sufficient to force the air into half the space it occupies at the normal atmospheric pressure, must become doubled, or 15 lbs. to the square inch must be added. Again, to compress the air into half the remaining space, 30 lbs., or double the pressure required for the reduction to the first half, must be added, making in all a pressure of four atmospheres for the reduction to one-fourth the original volume. It is evident, therefore, that a graduated scale, to exhibit the degrees of pressure, must have its spaces decrease from below upwards. The graduation is accomplished by means of an open-air multiple manometer. The metallic-spring manometer consists of an index traversing a graduated arc, and having applied to a spring connected with it—which may be in the form of a spiral—a piston actuated by the force of the gas or vapor in the boiler or steam-chamber.

MANOR, in English law, is a freehold estate held by the lord of the manor, who is entitled by immemorial custom to maintain a tenure between himself and the copyhold tenants, whereby a kind of feudal relation is kept up between them. As, however, subinfeudation in England was prohibited by the statute of quia emptores, in the reign of Edward I., and no manor could be created since that date, it follows that all existing manors must trace their origin from before that time. Copyhold estates are thus a relic of ancient feudalism, and form an exception to the general rule in England, where freeholds form the highest kind of estate known to the law. See COPYHOLD. Manors closely resemble the feudal estate held in Scotland by all proprietors of land, who have to this day unlimited powers of subinfeudation, which they constantly act upon, and thus keep up a chain of vassals. See FEU.

MANRENT (more properly, MANKRED), BONDS OF, agreements which used to be entered into in the Highlands of Scotland between the greater and lesser magnates, where protection on the one hand was stipulated in return for allegiance on the other. Such bonds were common up to two or three centuries ago, the royal authority being comparatively powerless to repress internal warfare among the fastnesses of the n. and west.

MANRESA, a t. of Spain, in the province, and 30 m. n.w. of the city, of Barcelona. It is situated in a fertile and well-irrigated district, on the left bank of the Cardonet. Manresa has manufactures of cotton and silk fabrics, broadcloths, etc. In 1811 it was set on fire by marshal Macdonald, when more than 800 houses, with churches and manufactories, were burned down. Pop. 15,204.

MANS, Le, a city of France, formerly capital of the province of Maine, now of the department of Sarthe, on the right bank of the river of that name, 132 m. s.w. of Paris by railway. The chief edifice is the cathedral, containing the tomb of Berengaria of Sicily, the queen of Richard Coeur de Lion. There is a public library of 50,000 vols., and several artistic and scientific institutions. The place, manufactures wax candles, woolens, lace, and various kinds of food for its poultry, of which it sends a large supply to the metropolis. It gives its name to a battle in the Franco-Prussian war of 1870-71, in which the French were defeated with the loss of 30,000 prisoners. Pop. '76, 45,709. Le Mans (anc. Cenomani) was, in the age of Charlemagne, one of the chief cities of the Frankish empire.

MANSARD ROOF, a form of roof invented by Francis Mansart, a distinguished French architect of the 17th century. It is constructed with a break in the slope of the roof so as to be a true mansard roof.

U. K. IX.—29
that each side has two planes, the lower being steeper than the upper. The framework ought to be arranged so that its parts are in equilibrium. This kind of roof has the advantage over the common form of giving more space in the roof for living room.

MANSAROWAR, or MANSASHROR, LAKE, is situated on the n. side of the Himalaya mountains, which divide Hindustan from Thibet and Tartary, and is the source of the river Sutlej. It is 11 m. in breadth from n. to s., and 15 m. in length, and is supposed to have been formed in the crater of a volcano. It derives importance from the fact of its being an object of veneration on the part of both the Hindus and the Tartars. The former esteem it as the most sacred of all their various places of pilgrimage, and incur all kinds of hardships in the course of their endeavor to visit it from long distances. The Tartars regard it no less highly, and convey a portion of the ashes of their friends to its shores to be thrown into it. It is situated on an elevated plain covered with long grass, to the n. of which is a conical hill dedicated to Mahadeva.

MANSART', or MANSARD, FRANÇOIS, 1598–1662; b. France, of Italian origin. A thorough education, lively imagination, and horror of tinselery in architecture, led him, says his French biographer, from the over-decorated style of his time, to adopt a severity and heaviness of style that was even less pleasing. He was the artist of many creditable though not remarkable works, and is credited with the first adoption of the double-slope roof, in general use a hundred years ago, under the name of gambrel roof, and again came into fashion under the name of Mansard roofs since 1830; but with such bold and decorative modifications from the original form as hardly to be assigned to the original source.

MANSART', or MANSARD, JULES HARDOWN, 1645–1708; b. in Paris, son of an obscure painter, who had married a sister of François Mansart. The uncle perceiving the talent of the nephew and his great industry, did all in his power to advance him, and with such success that the nephew, having assumed his uncle's name, soon became the most famous of the two; and being also a skilful courtier secured Louis XIV. for patron, and entered upon the construction of some of his most splendid works. The château de Clagny was his first work. The next was a château for Mme de Montespan at Versailles. The extravagance and rage for palace building which possessed the king was turned to the greatest advantage by Mansart, both as an artist and a man of business. He accumulated an immense fortune, and was covered with dignities and honors. His pride, vanity, and envy soon made him the object of opposition and detraction, but he made good his place in the favor of the king. His enemies accused him of using the influence of the king's mistresses, and of making plain faults in his plans so that, the king seeing them instantly, he could turn the fact to compliment him on the remarkable quickness of his eye and justice of his taste with an air that made the king the dupe of his cunning. He was the architect of many noted châteaux before engaging in 1660 upon the palace of Versailles, which, monstrous as was its expense, has never been considered proportionately beautiful. The grand Trianon was his work; but his most perfect monument is the palace of the Invalides in Paris, which, though inferior to very many domes in size, surpasses all in the exquisite proportions of its exterior lines. The place Vendôme and the place des Victoires in Paris are also by Mansart.

MANSE, in Scotch law, is the designation of a dwelling-house of the minister of the established church, and in popular use the term is often applied generally to the dwelling-house of any minister of a dissenting congregation, though no legal right exists in the latter case. In the established church every minister of a rural parish is entitled to a manse, which the heritors or landed proprietors are bound to build and uphold; and he is also entitled, as part of the manse, to a stable, cow-house, and garden. The manse must, by statute, be near to the church. The usual sum allowed of late years to build a manse is £1000. It has often been made a question, how far the heritors can be compelled to rebuild a manse which, by time or other circumstances, has become inadequate. It is now held to be the law, that at least the presbytery has power to order sufficient alterations and additions, and they can order a visitation, and take estimates from skilful tradesmen, and decree what is necessary to be done. It is only the ministers of rural parishes that are entitled to a manse, and not ministers of a royal burgh where there is no landward district.

MANSEL, The Rev. HENRY LONGUEVILLE, B.D., Waynflete professor of moral and metaphysical philosophy in Oxford: was b. at Cosgrove, Northamptonshire, in 1820, his father being rector of the parish. He was educated at Merchant Taylors' school, and at St. John's College, Oxford, and graduated in 1848. In 1853 he was appointed reader in moral and metaphysical philosophy in Magdalen college, and in 1859 became Waynflete professor. In 1887 he received the appointments of regius professor of ecclesiastical history, and canon of Christ church. Oxford. His published works are: Aldrich's Logic, with notes (1849); Prolegomena Logica (1851); article Metaphysics in 8th edition of the Encyclopaedia Britannica (1857), afterwards published separately; Bampton Lectures—the Limits of Religious Thought (1858); The Philosophy of the Conditioned (1866), in reply to Mill's Review of Hamilton's Philosophy. He was co-editor, with prof. Veitch, of sir William Hamilton's lectures.—Mr. Mansel is considered as belonging to the school of sir W. Hamilton. He was well versed in the erudition of metaphysical philoso-
phy, and wrote in a clear and elegant style. His *Bampton Lectures* occasioned much controversy, both theological and philosophical. *See Conditioned.* He died July 30, 1871.

**MANSFIELD, Ernst, 1585-1626;** the illegitimate son of count Peter Ernst; educated by his god-father, archiduke Ernst of Austria. In return for valuable military services under Rudolph II. the stigma of his birth was removed by decree of the emperor. The title and estates of his father were, however, refused, and in revenge he joined the enemies of Austria in the thirty years' war, and became a stanch Protestant champion. Under the elector Frederick he fought defensively in Bohemia and on the Rhine. His efforts failed, but they brought him great renown; and in 1623, aided by English subsidies, he again attacked Austria. Wallenstein met and overcame his force at Dessau, April, 1626. It was on the retreat which ensued after this defeat that he died.

**MANSFIELD, Peter Ernst, Count,** 1517-1604; b. at the castle of Mansfield in Prussia. Saxony; for many years an officer of Charles V. and Philip II. of Spain. From 1532 to 1537 he was a French prisoner. After his release he was made governor of Luxemburg, and afterwards governor-general of the Netherlands. In 1544 he was given the title of prince and returned to Luxemburg, where he resided until his death.

**MANSFIELD, a market t. of England, in the co. of Nottingham, and 14 m. n. of the town of that name, is surrounded by the remains of the ancient forest of Sherwood. It stands in the center of a large manufacturing and mining district, and contains, among other institutions, a royal free grammar school, with an annual income from endowment of £350. Silk, cotton, and wool at West Point are in operation, and the corn and cattle markets are largely attended. Pop.'71, 11,824.**

**MANSFIELD, a city in Richland co., Ohio; pop. 8,025. It is the junction of four railroads, of which the Atlantic and Great Western and the Pittsburg, Fort Wayne and Chicago are the most important. It has 7 hotels, 4 banks, 4 newspapers, an opera-house, public library, water-works, and many churches and schools. The manufacture of agricultural tools is a specialty, and the trade of the place is very heavy with the surrounding country, which is a productive farming region.**

**MANSFIELD, Edward D., L.L.D., 1801-80; b. New Haven, Conn.; graduated at West Point in 1819, but declined to enter the army; and graduated at Princeton in 1822; studied law at the (then) Litchfield (Conn.) law school. After being admitted to the bar he removed to Cincinnati, and in 1826 became professor of constitutional law in the college there. Shortly afterwards, however, he abandoned the legal profession to engage in journalism, editing successively the Cincinnati *Chronicle, Atlas, Gazette,* and *Railroad Record.* He was commissioner of statistics for the state of Ohio from 1857 to 1867, and a member of the societé Française statistique universelle. He was for several years a writer for the *New York Times* under the signature of "Veteran Observer." He published *Utility of Mathematics; Political Grammar; Treatise on Constitutional Law; Legal Rights of Women; Life of Gen. Scott; History of the Mexican War; American Education;* etc. Died in Cincinnati.

**MANSFIELD, Jared, 1759-1830; b. New Haven, Conn.; graduated at Yale college in 1777; became distinguished as a teacher and for his scientific acquisitions; was appointed in 1802 to a captaincy in the engineer corps of the army and assigned to duty at West Point as acting professor of mathematics. In 1803 he was appointed surveyor-general of the north-west territory and removed to Ohio, where he was employed in making the meridian lines on which is based the system of the public land survey. To accomplish this work he imported astronomical instruments from London, and established in his own house near Cincinnati the first observatory in the United States. In 1813 he removed to New Haven, and before the end of the year was appointed professor of natural and experimental philosophy at West Point. In 1828, after serving a term of 16 years, he resigned and returned to New Haven, where he died.**

**MANSFIELD, Joseph K. F., 1803-82; b. New Haven, Conn.; graduated at West Point in 1822, and entered the army as second lieut. of engineers. He was engaged in engineering duties on the Atlantic and Gulf coasts until 1846; in the war with Mexico he was chief engineer of gen. Zachary Taylor's army, distinguishing himself in the defense of fort Brown and in the battles of Monterey and Buena Vista, and being raised to the rank of col. by brevet. After the war he was for five years a member of the board of engineers for fortifications on the Atlantic and Pacific coasts; in 1858 he was appointed inspector-gen. of the army with the rank of col., which post he held until the breaking out of the rebellion, when he was placed in command of the department of Washington, and at once commenced the work of fortifying the capital. In Oct., 1861, he was transferred to camp Hamilton, Va., and in the month following to Newport News. He took part in the capture of Norfolk May 10, 1862, and commanded at Suffolk from June to September of that year, when he was assigned to the command of a division in the army of the Potomac, at the head of which, in the battle of Antietam,
he was mortally wounded, dying Sept. 18, 1802. Before assuming his last command he was promoted to maj. gen. of volunteers.

MANSFIELD, Mount, in Cambridge, Vt., the highest elevation of the Green mountain range, being 4,048 ft. above the sea. It presents a grand appearance from all sides, and the view from the summit is one of the finest in New England. It commands a prospect of the Adirondacks on the w., the Green mountains on the s., parts of the White mountain range on the e., and the mountains surrounding Montreal on the north. In summer states of the atmosphere lake Champlain also is visible. A wagon road leads to the summit on the eastern side, and there are accommodations for visitors at the top.

MANSFIELD, William Murray, Earl of, lord-chieft-justice of the king's bench, was the fourth son of Andrew, viscount Stormont, and was born at Perth, Mar. 2, 1704. He studied at Christ-church, Oxford, took the degree of m.a. in 1730, and was called to the bar in 1731. He soon acquired an extensive practice—mainly, it would seem, on account of his facility and force as a speaker, for neither then nor at any subsequent period of his career was he reckoned a very erudite lawyer—and was often employed on appeal cases before the house of lords. In 1743 he was appointed by the ministry solicitor-general, entered the house of commons as member for Boroughbridge, and at once took a high position. In 1746 he acted, ex officio, as counsel against the rebel lords, Lovat, Balmerino, and Kilmarnock; was appointed king's attorney in 1754; and at this time stood so high that, had not the keenness of his ambition been mitigated by a well-founded distrust of his fitness for leading the house, he might have aspired to the highest political honors. He became chief-justice of the king's bench in 1756, and entered the House of Lords under the title of baron Mansfield of Mansfield in the county of Nottingham. Still, his political role has little interest for posterity. As his opinions were not those of the popular side, he was exposed to much abuse and party hatred. Junius, among others, bitterly attacked him; and during the Gordon riots of 1788, his house, with all his valuable books and manuscripts, was burned. He declined, with much dignity, indemnification by parliament. In 1776 Murray was made earl of Mansfield. He worked hard as a judge till 1788, when age and ill-health forced him to resign. He died Mar. 20, 1793, in the 89th year of his age.

MANSFIELD VALLEY, a village of Alleghany co., Penn., 5 m. from Pittsburg, on Chartiers creek, and the Panhandle and Chartiers Valley railroad; pop. about 3,000. It has 5 churches, an academy, a newspaper, 3 savings banks, a smelting furnace, a glass factory, and an abundant supply of coal.

MANSLAUGHTER is, in Scotland, the offense of causing the death of a person by some carelessness or neglect. In England the offense is usually called culpable homicide.

MANSLAUGHTER (ante), the unlawful killing of another without malice, express or implied. Manslaughter is either voluntary, i.e., where there was an intent to commit the injury; or involuntary, where there was no such intent. It differs from murder in its absence of malice, and, as it is supposed to be committed in hot blood, no person can be an accessory before the fact. Among cases of homicide which constitute a manslaughter may be mentioned killing a person by gross negligence, though in the discharge of a lawful act; killing a person who has given great provocation; and killing an officer acting without or beyond his authority, though this may also be excusable homicide. The killing of an officer acting within his legal authority is murder. The provocation above-mentioned must be immediate, not remote; and though proof of provocation sufficiently repels the presumption of malice which the law attaches to every case of homicide, it is not sufficient to lower an offense from murder to manslaughter, if express malice be made out. In most of the United States manslaughter is divided into different degrees, punished with longer or shorter terms of imprisonment.

MANSTEIN, Vox, a Prussian gen. who distinguished himself in the Franco-Prussian war of 1870. At the head of the 9th corps, in the army of prince Frederick Charles, he participated in the battle of Vionville. At Gravelotte, Aug. 18, 1870, he commanded the German center, and served throughout the campaign, retiring in 1873.

MANT, Richard, d.d., b. Southampton, Eng., 1776; educated at Winchester college, and Trinity college, Oxford, taking his bachelor's degree in 1797; was elected fellow of Oriel college in 1798; was curate and vicar of several parishes in and near London 1801-15; received degree of d.d. from the university of Oxford; was made bishop of Killaloe and Killfenora, Ireland, in 1820, and in 1823 transferred to the see of Down and Connor. He was the author of a valuable Commentary on the Bible in connection with Dr. O'Doyly. This had an immense sale in England, and was republished in New York, with additions by bishop Hobart. Besides many sermons and tracts, and several poetical pieces, he published Biographical Notices of the Apostles; Scriptural Narratives of Christ's Life; History of the Church of Ireland from the Reformation to the Union of the Churches of England and Ireland in 1801; Ancient Hymns from the Roman Breviary with original Hymns.

MANTCHU RIA, a territory in eastern Asia, under the dominion of the Chinese empire, extending between lat. 42° and 53° n., and bounded, according to its present limits, by the Amur on the n.; by the Usuri and the Sungacha on the e., separating it
from the Russian maritime territory of Orochi; by the Shan-Altin range on the s., separating it from Korea; and by a portion of the Khingan mountains, the river Siru-
Muren, and the district of the upper Sungari, which separate it on the w. from the
desert of Gobi. Previously to the incursions of the Russians on the n. the area of this
territory was about 682,000 sq.m.; it is now about 378,000 sq.m.; nearly one-half having
passed into the possession of the Russians, who concluded a treaty with the Chinese,
Nov. 14, 1800, finally making over to themselves all the territory e. of the Usuri and n.
and e. of the Amur. Pop., variously estimated at from 3,000,000 to 4,000,000.
Mantchuria is divided into three provinces, Shing-King—formerly Lenoting, which alone
contains upwards of 2,100,000 inhabitants, and the chief town of which, Mukden, is the
seat of government for the three provinces—Girin or Kirin, and Ts-tsi-har. The country
is mountainous, densely wooded in the s., but consisting chiefly of prairies and grass-
land in the north. It is well watered and fruitful in the valleys. The rivers are the
Amur (the northern boundary), the Usuri (the eastern boundary), and the Sungari, which
waters the two provinces of Girin and Ts-tsi-har. The Sungari is about 1,200 m. in
length; its banks, which form the most densely-peopled region of Mantchuria, are low
and fertile, and its general course is n.e. to its junction with the Amur. About 200 m.
from its source, it passes the flourishing trading city of Girin, in lat. 43° 40' n., with a
pop. variously estimated at from 150,000 to 160,000, and inhabited by Mantchus and
Chinese, but by the latter in far greater numbers. The city of Mukden, on the Siru-
Muren, is large and beautiful, surrounded by walls, and containing 200,000 inhabitants.
In 1631 it was the seat of the government of the empire of Mantchu. Millet, barley,
tobacco, and oats are largely produced, and herds of cattle are fed on the prairies.
Chinese form the great bulk of the population; the Mantchus are for the most part sol-
diers, and are drafted out of the country into China. For the history of Mantchuria,
see CHINESE EMPIRE.

The Mantchus are the present rulers of China, who gradually subjugated the country;
the first emperor of the new dynasty, Shunche, succeeding to the last of the Mings in
1844. They are not a nomadic race like the Mongols, but are given to agriculture or
hunting, according to the part of their country they inhabit. They are of a lighter
complexion and slightly heavier build than the Chinese, have the same conformation of
the eyelids, but rather more beard, and their countenances present greater intellectual
capacity. Literary pursuits are more esteemed by them than by Mongolians, and they
are less under the priesthood. The Mantchus, in short, may be regarded as the most
improvable race in Central Asia, if not on the continent.—Williams, Middle Kingdom.

MANTEGNA, ANDREA, 1431-1517; studied art under Francesco Squarcione, a
famous master of Padua. Here Mantegna produced his first work in the churches of
Santa Sofia and San Cristofano. Rapidly acquiring skill and fame, he removed to
Mantua, where his acknowledged masterpiece, "The Triumph of Caesar," was painted.
This is now at Hampton court, England. From Mantua he was called to Rome by
Innocent VIII., and received from him the kindest treatment and remunerative employ-
ment, but soon returned to Mantua. Here, by his proficiency and genius both in the
higher class of engraving and as a religious and historical painter, he obtained a high
rank in his profession as well as large estate.

MANTELL, GIDEON ALGERNON, an eminent British paleontologist and geologist,
was b. at Lewes, in Sussex, in 1790; studied medicine, and for some time practiced in
his native town. Subsequently he removed to Brighton, and thence to London, where
he died, Nov. 10, 1832. Mantell's principal works are: Fossils of the South Downs (1829);
The Fossils of Tilgate Forest; Wonders of Geology (1838), perhaps the most popular
geological work ever written by an Englishman; and Medals of Creation, or First Les-
sions in Geology (1844). He was a very voluminous writer, no less than 67 works and
memoirs of his being mentioned in Agassiz and Strickland's Bibliotheca Zoologica et Geo-
l ogiae. His claims to a permanent place in the history of science rest chiefly on his
laborious investigations into the fossils of the Wealden beds. To him we owe the dis-
covery and description of four out of five of the great dinosaurian reptiles—viz., the
tyranodon, the hypsilophodon, the pelorosaurus, and the regnosaurus.

MANTEL-PIECE, the lintel over the opening of a fire-place supporting the masonry
above. It was in ancient times frequently ornamented with moldings and carving.
The name is now applied to the marble or wooden jambs, lintel, and shelf so universally
used.

MANTES (anc. Medunta), a t. of France, in the department of Seine-et-Oise, beauti-
fully situated on the left bank of the Seine, 29 m. w.n.w. from Paris, on the railway
between Paris and Rouen. Mantes is a place of great antiquity, and of much historic
interest. It was a town of the Celts, from which the Druids were expelled by Julius
Cesar. William the conqueror took it by assault in 1087, put the inhabitants to the
sword, razed the fortifications, and burned three-fourths of the houses; but here he
received the injury, through the starting of his horse, which caused his death in a few
days. Mantes has has a considerable trade in wheat, large tanneries, and salt peter
manufactures. Pop. '76, 5,649. On the opposite side of the river, connected with
Mantes by bridges and an island, is the village of Linny, with a pop. of 1304.
MANTEUFFEL, Edwin Hans Karl, Baron von, b. Magdeburg, 1809; entered a military career by joining the dragoon guards, April 29, 1827; and became second lieut. the following year. He displayed a vivid imagination and with considerable capacity, and interested his superior officers to that degree that he was sent for two years (1834-36) to the general military academy. In two years following he acted as regimental adjutant, being named adjutant to the 3d brigade of cavalry guards, Oct. 18, 1839. From 1840-48 he was in the immediate service of Prince Albrecht, but in the latter year was transferred to that of the king, with the rank of adjutant of the wing, being made a major in 1852, and lieut. col. in 1853. He was now placed in command of the 5th uhlan regiment; and in 1854 of the 3d cavalry brigade. His advancement continued to be rapid, and in 1858 he was made maj. gen., in 1851 adjutant gen., and in the autumn of the latter year lieut. gen. In 1864 gen. Manteuffel was engaged in the Sleswick-Holstein war, was present at the battle of Missunde, and commanded in the engagements and movements which resulted in the occupation of Jutland. After the close of this war he was employed in effecting the solution of the difficulty between Austria and Prussia, and arranged for the council of Gastein, by which this was brought about. He was now made governor of the duchy of Sleswick, with command of the Prussian troops in Holstein and the marines stationed at Kiel. In 1866 the war between Prussia and Austria broke out, and Manteuffel was ordered into active service. At midsummer he was commanding in chief the army of the Main, and fought at Hennstadt, Vettingen, Rossbrunn, and Wurzburg; receiving from the king for his services the order of merit. At the close of the war he was sent to St. Petersburg on a diplomatic mission, and on his return was made general-in-command of the troops in Sleswick Holstein, being advanced to the rank of general of cavalry, and a month later made commandant of the 9th army corps. In 1868 he was placed in command of the 1st army corps, and was engaged in the Franco-German war. His corps was under fire at Courcelles and Noiseville, directed the evacuation of Metz and the disposal of the prisoners, and then re-entered active service in a campaign against gen. Bourbaki. Later he operated against the south and south-east armies of the French, and performed most brilliant and effective service. In 1872 gen. Manteuffel was invested with the insignia of the order of the Black Eagle, and was afterward made field-marshall gen., and aid-de-camp gen. to the emperor.

MANTEUFFEL, Otto Theodor, Baron von, b. Prussia, 1805; studied jurisprudence at Halle, and in 1827 became a minor magistrate at Berlin. When count Brandenburg undertook the suppression of the revolutionary movement of 1848, Manteuffel was made minister of the interior. In this office he displayed a high order of executive ability, and gained the confidence of the middle classes. In 1850 he took office as minister of foreign affairs. Two years later he was appointed president of the council of ministers, and in 1856 he was sent to Paris as one of the plenipotentiaries to negotiate a peace. He retired from the ministry in 1858.

MAN TIDE. See Mantis.

MAN TIGER, or Mantegore, a monster with the body of a tiger, the head of an old man, and long spiral horns. It is one of the imaginary creatures known in heraldic blazon, and is variously represented, sometimes with the horns of an ox and feet of a dragon. The supporters of the earl of Huntingdon are mantegres without horns.

MANTINEA, anciently a city of Arcadia, in the Peloponnesus, on the borders of Argolis. It was situated on the river Ophis, in the midst of a broad plain, and was famous as being the scene of several battles, of which the most important was that fought between the Spartans and the Thebans under Epaminondas (362 B.C.), in which the former were defeated. Its site is now called Paleopoli. Some ruins still remain, the principal of which are those of a theater whose diameter was 240 feet. See col. Leake's Travels in the Morea (Lond., 1809).

MANTIS, a Linnaean genus of orthopterous insects, which included not only those now constituting the family mantidae, but also the phasmidae (leaf-insects, specter-insects, walking-stick insects, etc.). All of them are of very remarkable forms. The mantidae have a narrow, compressed, and elongated abdomen, and a long thorax, which consists almost entirely of the first segment. The head is triangular, with large eyes, three small stridulating stridulent eyes, and rather long bristle-like antenna. The wings fold in a fan-like manner, and the wing-covers are narrow, long, and thin. The second and third pair of legs are long and slender, and are used only for locomotion; the first pair are chiefly used as weapons of combat and instruments of prehension, and have the coxa usually long and large; the femur also long and large, compressed, and capable of closing on the coxa, so that the sharp edges cut like a pair of scissors. The mantidae feed on other insects, and remain long fixed in one position, moving their fore-legs in the air to catch prey, which has led to a superstitious regard for them as praying insects, and to many foolish notions and legends concerning them. One species (M. religiosa) is plentiful in the south of France and in Italy, and others are frequent in warmer parts of the world. The mantidae not only lie in wait for prey, but move about in quest of it, moving slowly, and advancing stealthily on the victim. Many of them are large insects. Some of the South American ones are 4 in. in length. They are all of very pugnacious disposition, the combat generally terminating in the decapitation of one of the combatants, or the divid-
ing of its body in some part by the legs of the other; and the victor enjoys his triumph in eating the vanquished. In China and some other parts of the east, these insects are kept in cages, and set to fight with each other for the amusement of the beholders. Some of the mantideae (genus *Empusa*) have the forehead produced into a horn.

**MANTLE**, a long flowing robe, worn in the middle ages over the armor, and fastened by a fibula in front, or at the right shoulder. The mantle is an important part of the official insignia of the various orders of knighthood. The mantle of rank wore similar mantles, in many instances decorated with heraldic charges, in which case the mantle bore either the impaled arms of the lady and her husband, or her husband's arms only. A number of examples may be seen in monumental effigies.

**MANTLET**, a sort of temporary fortification intended to protect the men working guns in embrasures, casemate, or port-holes from the bullets of sharp-shooters. The mantlet is usually made to be hoisted up while the gunner takes aim, and then lowered to cover the whole opening except a circular aperture for the muzzle of the cannon. With every increase in the range and precision of small-arms, mantlets become more essential for the safety of gunners. Mantlets are made of thick flax, of solid oak planks, or of iron plates, the last being preferable, as the lightest. At Sebastopol, the Russians effectively blocked their embrasures by thick mantlets of plaited rope suspended freely. A mantlet of planks or iron plates, about 5 ft. high, and occasionally mounted on small wheels, is also used to protect suppurs working at the end of a sap, although a rolling gabion is preferred for this purpose by many engineers.

**MANTLING**, or *Lambrequin*, a heraldic ornament depicted as hanging down from the helmet, and behind the escutcheon. It is considered to represent either the cointoise, an ornamental scarf which passed round the body, and over the shoulder; or the military mantle, or robe of estate. When intended for the cointoise, it is cut into irregular strips and curls of the most capricious forms, whose contortions are supposed to indicate that it has been torn into that ragged condition in the field of battle. When the mantling is treated as a robe of estate, the bearings of the shield are sometimes embroidered on it. A mantling adjusted so as to form a background for the shield and its accessories constitutes an achievement of arms. It is not till the latter end of the 14th c. that the mantling appears as a heraldic ornament on seals. In British heraldry, the mantling of the sovereign is of gold lined with ermine; that of peers, of crimson velvet lined with ermine. Knights and gentlemen have generally crimson velvet lined with white satin; but sometimes the livery colors (see *Livery*) are adopted instead, as is generally the practice in continental heraldry.

**MANTUA** (Ital. Mantova), an ancient city of Lombardy, and formerly capital of a duchy of the same name, but now belonging to the kingdom of Italy, is situated in lat. 45° 9' 34" n., long. 10° 48' 1" e. Its pop. (1871) of 26,687 comprises a number of Jews, whose commercial influence and social privileges are more extensive in this city than in any other of Italy. Mantua occupies two islands formed by branches of the Mincio, the waters of which surround the city, with the additional defense of swamps or marshy lakes. It is the most strongly fortified town in Italy, but, owing to its situation, is extremely unhealthy—a fact evidenced by the pallid faces of the inhabitants. There are five gateways leading into the city, one of which, La Porta dei Malini, deserves examination. The fortifications of Mantua, including its vast citadel, present such a combination of defensive resources, that its regular investment could only be effected by a numerous army; and its reduction even then would be impracticable, except by famine. It forms one of the four fortresses of the Quadrilateral, which, by the treaty of Villafranca, remained in the hands of Austria. The streets of Mantua are spacious and regular, but indifferently paved; the squares are numerous and fine. Some of the public buildings are splendid, both from the massive grandeur of their proportions and the novel beauty of their architecture. The inadequate population of Mantua, added to the somber character of its feudal structures, imparts to the city an air of gloomy decadence, except in the central commercial quarters, and the populous animated Ghotto or Jewish quarter, still subject to inclosure. The ancient ducal palace, or Castello di Corte, a vast irregular pile of building, was the state residence and fortress of the Gonzagas, by whom it was erected, and now serves as a state prison and for public offices. The adjoining sumptuous edifice, which now comprises the Palazzo Imperiale, the Palazzo Vecchio, and the Corte Imperiale, or Provincial Tribunal, was originally planned and begun by Buonaccorsi, the feudal lord of Mantua, in 1502; it contains 500 rooms, including a magnificent suite of state apartments, whose choicest embellishment consists of the paintings and designs of the great Mantuan artist, Giulio Romano. The cathedral of San Pietro, also designed by G. Romano, contains some fine frescoes. The glorious Basilica di San Martino and San Santo Egidio are of great antiquity—the former dating from 325, and the latter from 568. The province of Mantua had a high reputation in the time of the Romans. After sharing the fate of the rest of northern Italy, it was seized by the Gonzagas about the commencement of the 14th century. The last duke of the house of Gonzaga died childless at Padua in 1708, when Mantua fell into the hands of Austria. Austria gave it up with her other Italian possessions in 1866. Mantua is capital of a province of the same name, with an area of 855 sq. m.; pop. 72, 889, 942.
MANU (from the Sanskrit man, to think; literally, the thinking being) is the reputed author of the most renowned law-book of the ancient Hindus; and likewise of an ancient Kalpa work on Vedic rites. It is matter, however, of considerable doubt whether both works belong to the same individual, and whether the name Manu, especially in the case of the author of the law-book, was intended to designate an historical personage; for, in several passages of the Vedas (q.v.), as well as the Mahabharata (q.v.), Manu is mentioned as the progenitor of the human race; and in the first chapter of the law-book ascribed to him, he declares himself to have been produced by Viraj, an offspring of the Supreme Being, and to have created all this universe. Hindu mythology knows, moreover, a succession of Manus, each of whom created, in his own period, the world anew after it had perished at the end of a mundane age. The word Manu—kindred with our "man"—belongs therefore, properly speaking, to ancient Hindu mythology, and it was connected with the renowned law-book in order to impart to the latter the sanctity on which its authority rests. This work is not merely a law-book in the European sense of the word: it is likewise a system of cosmogony; it propounds metaphysical doctrines, teaches the art of government, and, amongst other things, treats of the state of the soul after death. The chief topics of its twelve books are the following: 1. Creation; 2. Education and the duties of a pupil, or the first order; 3. Marriage and the duties of a householder, or the second order; 4. Means of subsistence, and private morals; 5. Diet, purification, and the duties of women; 6. The duties of an anchorite and an ascetic, or the duties of the third and fourth orders; 7. Government, and the duties of a king and the military caste; 8. Judicature and law, private and criminal; 9. Continuation of the former, and the duties of the commercial and servile castes; 10. Mixed castes and the duties of the castes in time of distress; 11. Penance and expiation; 12. Transmigration and final beatitude. The text of this work has been published in several editions both in India and Europe. An excellent English translation of it we owe to Sir W. Jones (2d ed., by Haughton, London, 1829), and a very good French translation to A. Lodsceur Deslongchamps (Paris, 1833).

MANUAL, in military language, is an exercise with the musket or rifle, through which recruits are drilled, to give them a free use of their limbs, and of the weapon regarded merely as a pike. It comprises the first course of instruction after the rifle has been placed in the learner's hands.

MANUEL I., COMMENUS, Emperor of Constantinople, and fourth son of the emperor Calo-Joannes, was born about 1129, and succeeded his father in 1143. He became at once involved in an uninterrupted series of wars both with the eastern and western nations, and greatly distinguished himself by his courage and heroism. In 1144 Raymound, prince of Antioch, who had thrown off the Byzantine yoke, was compelled to submit again to vassalage; and in the following year the Turks, who had invaded Isauria, were paralysed by repeated and decisive defeats. In 1147 the crusaders, under Louis VII. of France and Conrad III. of Germany, marched through Manuel's dominions without hindrance on his part, as he was at this time preparing for his notable contest with Roger, king of Sicily, for the possession of Greece. At first this contest was highly favorable to Manuel; but after the death of Roger the fortune of war changed, and peace was concluded in 1155. The rest of his life was spent in wars with the Hungarians and Turks. He died Sept. 24, 1180.

MANUEL II., PALEOLOGUS, Byzantine emperor, 1348-1455, succeeded his father, John VI. He had been an associate in the empire in 1372. At the death of his father in 1391, being held as a hostage by sultan Bajazet, he escaped from Nicera to Constantinople, his own capital, to secure the throne for himself, without informing the sultan. Bajazet, enraged at his breach of faith, marched against him, ravaged the country adjoining Constantinople, and invested the city by sea and land. Manuel applied to the western princes, who sent him an army of 100,000 men under Sigismund, king of Hungary, and John, count of Nevers. The allies, at first successful, were defeated with great slaughter by Bajazet at Nicopolis in 1396, with the loss of 10,000 men. Bajazet then returned to the siege with greater vigor than before. Seeing the determination of the citizens to hold out, he made a private agreement with John, Manuel's nephew, to place him on the throne of Constantinople, and John was to deliver up the city to the Turks, and remove the imperial seat to Peloponnæus. He sent also deputies to the inhabitants, proposing to withdraw his army provided they expelled Manuel and placed John upon the throne. Manuel voluntarily resigned, received John into the city, conducted him to the palace, and then set sail for Venice to ask aid from the western princes against the Turks. Large supplies were promised. The citizens of Constantinople refusing to comply with such a base treaty, the siege was renewed, and its fall imminent when Bajazet was called away to resist Tamerlane. He raised the siege and went against Tamerlane with a large army, but was defeated at Angora, 1401, and taken prisoner. After the defeat and death of Bajazet in 1403, Manuel reigned in peace. He was succeeded by his son John VII., Paleologus.

MANUFACTURES (from Latin manus, a hand, and facio, I make). Bearing the significance which it gained with its derivation, this word describes the first structures, processes, and compositions designed by the mind of man, and executed by his hand, with more accuracy than it does the accomplishment of the machinery of the
present day, to which it is more generally applied. The first articles of manufacture must have been such as could be successfully employed for procuring the necessities of life; hence the fact that implements that have been discovered, representing the earliest ages of man's existence upon earth of which any details remain, have been generally of the most simple kind, for grinding grain; knives and other offensive weapons for destroying game; fish-hooks; pointed implements, which evidently filled the place of needles; and stones, hammers, axes, chisels, and other tools, used for building purposes (see LAKE DWELLINGS; LABOR). The processes to enforce nature and render its powers applicable to the preservation of human life were therefore, and in this order, the acquisition of food; the clothing of the body to protect it from the elements; and the erection of dwellings, partly for the same purpose, and partly for safety against wild and dangerous animals, and human foes hardly less dangerous in their savage condition. And it is to be observed that the ingenuity and toil of man have ever since been devoted to these purposes; added to which have been the necessities arising from improved or extended mental conditions, and the spread of wants in a direction other than material. Manufacturers have therefore included food-processes, the manipulation of fabrics, and building-construction; to which have been added, in the course of time, the art of war, the arts of design, and applied science, as agencies to fulfill the duties imposed by an ever changing and ever-advancing civilization. It is one of the fortunate incidents of human history that with few exceptions the processes of labor applied to the manufactures may be traced even in our day as these existed at the very beginning. It is possible to follow any art to its inception, and to trace its history to the first rude efforts of primeval man, with a considerable degree of accuracy, affording, when the results of such an investigation are brought into juxtaposition, a comprehensive view of the entire field of human art. Such investigations have been made, and their collected results exist in the industrial museums of Europe and America. Remarkable also is the occurrence of the earliest methods in use in the arts, in actual practice among savage and semi-civilized races in different parts of the world in our own time. The natives of Central and South America, Africa, and certain parts of Asia still employ the same processes in agriculture that were in use thousands of years ago; mills of the same character as those used by the Egyptians many centuries before the Christian era are still in active employment in northern Africa; and pottery of the same design and fashioned after the same methods and with the same tools as among the earliest races, are still made by their descendants in different parts of the world. And while we may thus view at one glance, in operation, methods and tools divided in actual history by many centuries, we are also enabled to follow the progress of the arts and manufactures, their improvement or their decadence, through existing specimens of workmanship. From the beginning in the aggregate—whatever may have been the case with certain nations or races—man seems to have been impressed by a restless spirit, and to have been continually provoked to an active ingenuity in labor. The very first instances of handiwork that have come to our knowledge through the labors of explorers have illustrated the impulse towards improvement. From the stone age to the neolithic, and from that to the age of iron—as we generally record our evidences of these periods—the progress not only in excellence of workmanship, but in beauty, is remarkable. And while it is easy to understand the mental processes that have culminated in the after history of art, and the improvement represented a practical good to be achieved, it is necessary for us to reconcile our ideas of prehistoric man with the fact that he was influenced by a leaning towards the aesthetic, and that even so early he showed signs of struggling toward an improved art-style. The fact is important that in all the history of manufactures the beautiful has been allied with the practical, with a persistence which seems to have the character of a law. The next important tendency to be observed in viewing the history of manufactures is that of applying the forces of nature to the reduction of human labor. As it is to this tendency that we owe the inventions which so extended the scope of the arts, its importance will hardly be underrated. Yet it is to be observed that in the beginning the forces of nature, expressed and operative through such rude mechanical devices as were at first invented, were called into operation only when the power of man had proved unequal to the task in hand. Man labored to the extent of his capacity, and only then supplemented his own efforts by the employment of the mechanical power of nature. It is nothing therefore inexplicable in the same that while we have known the ancients possessed a knowledge of the more hidden forces, and the means to apply them, they did not make use of these in instances where they might, but seem to have preferred the exercise of human force and ingenuity. A noble ambition appears to have influenced man in whose early days; compelling him to push to the utmost his individual capacity; and to place upon record, by means of his work, the comprehensive nature of man's ability, his power to meet emergencies, his control, within himself, of a microcosm representing all the possible constructive capacity of the entire world of mechanism. The arts of Greece and Rome, of Babylon and Nineveh, Carthage and Phenicia, as these have been preserved to us, sufficiently illustrate this phase of our subject. But the concentration out of which grew marvelous excellence presently ceased to exist; the fall of Nineveh, Carthage, Greece, and Rome, the inroads of barbarians, and the distribution of power over the face of Europe, blotted out for the time all progress in the arts; and the "dark ages" settled down upon civilization through a gloomy period of centuries, to the utter
check of improvement, and to the destruction of the arts and manufactures, except so far as these contributed to positive necessities and to sensual desires. Out of this period of inaction and stagnation of creative ability, civilization burst forth in the 13th c., beginning the "middle ages" and the renaissance, a time when man reached the highest pitch of skill in hand-work, and when manufactures attained an excellence in beauty, capacity for service, and durability, which they have never since approached. The history of the arts and crafts of Europe in the middle ages shows a surprising advance in all directions. The progress in merit in the fine arts has been fully recognized, and this was reflected in the condition of the crafts and the improvement in manufactures. Directly we see it in the wood-carvings of Brabant, Flanders, and Italy; in the wonderful art displayed in the manufacture of fictile ware; in the form given to bronze, iron, and brass; and in the intricate and beautiful carving of ivory. The most magnificent armor, displaying workmanship of exquisite beauty, is of this period. And so the most commonplace objects—the ordinary utensils of the household, the very architecture of the houses themselves—reflected the splendour genius of the masters of art. And above all, we are bound to consider the honesty of the workmanship peculiar to those days. The linen and wool fabrics of Holland and Flanders have never since been improved upon. The heavy and costly damasks and satins and silks and velvets, which played so large a part in the costumes of the period, were honest stuffs, whose lasting as well as artistic qualities cannot be gainsaid. The furniture of the period was solid and firmly put together, besides being ornamented and decorated with correct taste and refined sentiment. In the reign of king John in England, the wealthier classes used iron chandeliers and candelabra, and each of these was finished and shaped by hand with the hammer and with the truest art-taste. The story of the Della Robbias, and their labors in search of a special glaze for china, is equalled only by the later story of Bernard Palissy, whose struggles after the same secret, lost again, have furnished the material for many a book. In those days the blacksmith, and the cobbler or shoemaker, was as proud of his skill, and as earnest in the fulfillment of what he deemed his obligation to his craft, as was the most esteemed artist of Florence or Venice under the patronage of the Medici. Faust, who became a printer, was a goldsmith in Mentz; Hans Sachs was a cobbler; Benvenuto Cellini was a gold and silver smith; Andrea del Sarto, the painter, was a goldsmith's apprentice; and Ghiberti, who executed the two gates of the baptistry in Florence, which Isaac Anguissola were "worthy of Paradise," was the son of a goldsmith. Thus, at that time, art and manufacture went hand in hand; the union of the beautiful and the useful being considered not only desirable, but incumbent on the artificer as a part of his trade.

The conditions of labor in Europe, and therefore those of the manufactures, changed materially during the period between the 16th and the 18th centuries. The combinations of workingmen into guilds, and the wealth and power to which these attained, brought about the introduction of the force of capital, by the concentration of great wealth in a few hands; and the application of this force to manufactures on an enormous scale was brought about by the application of power to machinery, and the establishment of the factory system. From this moment, not only the system of manufacturing, but the character of the workmanship, and of artisans, the nature and amount of the demand for manufactures, the methods of supply, and the modes of transportation, altered throughout the civilized world. The history of manufactures fell under the influence of the invention and application of machinery, to which the arts of design necessarily yielded secondary power. From 1771, when the Arkwright's machinery was set up in England, to 1833, the number of operatives employed in the factories of the United Kingdom had grown to 334,684, of which number 195,508 were females. In 1836 the number of operatives was 652,497, of whom 409,300 were females, 25,982 being under 13 years of age. The number of factories, between 1838 and 1856, increased 28 per cent; the amount of power increased 63 per cent; and the number of hands employed, 80 per cent. In 1786, in every $200,000,000 in value of the product of manufacture in France, 60 per cent of the cost was for labor, and 40 per cent for raw material. In 1876 this condition was exactly reversed, 40 per cent only of the cost being for labor, and 60 per cent for raw material. In 1876 the total industrial product of France was valued at $2,400,000,000. These few figures are offered merely for their suggestive value; the statistics of the different articles of manufacture, and in different countries, will be found under their proper titles; see COTTON, LINEN, HATS, etc.

Beverley, in his History of Virginia, writing in 1703, refers thus to the dependence of the American colonists upon other nations to supply their wants: "They have their clothing of all sorts from England, as linen, woolen, and silk, hats and leather; yet flax and hemp grow nowhere in the world better than here. Their sheep yield good increase and bear good fleeces, but they shear them only to cool them. The mulberry-tree, whose leaf is the proper food of the silk-worm, grows there like a weed, and silk-worms have been observed to thrive extremely, and without hazard. The very furs that their hats are made of, perhaps, go first from thence. The most of their hides lie and rot, or are made use of only for covering dry goods in a leaky house. Indeed, some few hides, with much ado, are tanned and made into servants' shoes; but at so careless a rate that the farmers do not care to buy them if they can get others; and sometimes, perhaps, a
better manager than ordinary will vouchsafe to make a pair of breeches of deerskin. They are such abominable ill-husbands, that though their country be overrun with wood, they have all their wooden-ware from England; their cabinets, chairs, tables, stools, chests, boxe-, cart-wheels, and all other things—even so much as their bowls and birchen brooms—to the eternal reproach of their laziness." From which emphatic narrative by an eye-witness it will be inferred that the standard of manufactures in the country under consideration, a century and three-quarters ago, did not offer promise of the results reached at the present time. The first attempt at ship-building in the colonies was in the construction of the Owlet in 1614 at Manhattan river. She was 16 tons burden, 38 ft. keel, 44½ tt. long, and 11½ ft. wide. In her, in 1616, capt. Wilkinson discovered the Schuylkill river, and explored nearly the entire coast from Nova Scotia to the capes of Virginia. The saw-mill is said to have been introduced into Massachusetts in 1633, some years before it was used in England. And as late as 1767 a saw-mill was destroyed in the latter country by a mob, because it was supposed to be destructive to the work of the sawyers. In 1641 the general court of Massachusetts passed an act to the effect that there "should be no monopolies but of such new inventions as were profitable to the country, and that for a short time only." Saw-mills were introduced by the Dutch in New York as early as 1633, and seem to have been used there also for grinding-mills. The erection of these mills brought about an improvement in house-building, which had previously amounted only to the construction of huts or wigwams. The first brick-kiln in New England was set up in Salem, Mass., in 1629. In New York bricks were imported from Holland, until governor Stuyvesant introduced the industry. There were certainly tanners, cart-makers, glovers, furriers, and shoemakers in the colonies about the middle of the 17th c., despite the assertion of Beverley, whose observation, however, was probably confined to Virginia.

In the manufacture of fabrics the early colonists used the distaff and spindle, soon supplied by the spinning-wheel. The British in those days, seeking to force the colonists to buy everything in the home market, threw every possible obstacle in the way of domestic manufactures. Early in the 18th c. spinning-schools were started in Boston, and special taxes were imposed for their support. During the revolu­tionary war the colonists depended on their own exertions for clothing and other necessities, and Hargreaves’s and Arkwright's inventions were not permitted to be introduced across the Atlantic, so jealous were the British of the trade in their manufactures. Despite all their efforts, however, a cotton-factory was established at Beverly, Mass., in 1787; of Arkwright's machines, the first used in the United States was in a mill at Pawtucket, R. I., in 1790. The first cotton-mill ever built in the world, which combined all the requisites for making finished cloth from raw cotton, is said to have been erected in Waltham, Mass., in 1813. Our colonial ancestors usually obtained their furniture from England, the most of it, of the best class, being made of mahogany and oak. At first the articles made in the colonies were of the rudest character, and constructed of native woods. Later on, a South American and West India island trade sprang up, and mahogany and rose-wood were imported, and worked up into bedsteads, sideboards, and cupboards. The first nails made in the colonies were manufactured by hand, and it was customary among the country people to erect forges in the chimney-corners, and in the long winter evenings to make quantities of nails—even the children taking a share in the labor of this industry. About 1790 a machine for cutting and heading nails was invented by Jacob Perkins of Newburyport, Mass., which is said to have had a capacity of 10,000 nails per day. Another machine, invented by a citizen of Bridgewater, Mass., made, in 1815, 150,000,900 tacks. The introduction of the manufacture of glass into the American colonies was contemporaneous with the settlement of the country; the first glass manufac­tory being set up in the woods about a mile from Jamestown, Va., in 1607. In 1621 a fund was subscribed to establish a factory of glass beads, to be used as currency in trading with the Indians for furs. The first glass manufactory in Massachusetts was established at Germantown, near Braintree, for glass bottles alone. In 1639 a glass-house was set up in Salem. In 1732 the general court of Massachusetts passed an act authorizing the manufacture of glass in the province to Isaac C. Wesley. A glass-house existed in Philadelphia in 1683. Pottery was brought out from England and Holland by the first settlers, but the early colonists used wooden dishes and pewter platters. Some pottery was made by the Plymouth, Jamestown, and Manhattan colonists. In 1819 the manufacture of fine porcelain was commenced in New York, and in 1827 it was made in Pennsylvania. The manufacture of hats was considered of importance by the colonists, and in 1662 the colonial government of Virginia offered a premium of 10 lbs. of tobacco for every hat made in the province. Protection was early applied to the raw material of this industry, and in 1675 its exportation was prohibited. Before 1800 this manufacture was conducted in nearly every state in the union, and by the census of 1810 returns were made of the manufacture of hats to the amount of $4,323,744.

Silk-worm culture was proposed by James I. on the settlement of Virginia, and that monarch sent supplies of silk-worms' eggs to the colonists in his private stores. In fact, much of the raw material of the colonies. In 1788 the president of Yale college wore at commencement a silk gown made from materials raised and woven in Connecticu­t. A piece manufactured from silk raised near Charleston, S. C., in 1755, was made into three dresses, one of which was presented to the princess dowager of Wales, another
to lord Chesterfield, and a third to Mrs. Harvey of South Carolina, in the possession of whose family it still remains. In 1837 the manufacture of silk in the United States received a powerful impulse from a report of the congressional committee on manufactures in favor of this industry. It was stated that one specimen of the morus multicaulis, or mulberry, would sustain a sufficient number of silk-worms to raise 120 lbs. of silk, worth $640. Attention was directed to this industry in nearly all the states, and a condition of excitement occurred which became intensified by the promise of large fortunes. In the following year this excitement culminated in a degree perhaps never equaled by any similar movement, except the great "tuber" or bulb excitement in Holland and England. Single mulberry-trees sold at $10, nurseries were established and did a thriving business, and thousands of persons invested in the new speculation. Two years later a revolution of interest occurred. Most of the nurseries were abandoned or destroyed, and morus multicaulis trees, healthy and well-branched, were offered at three cents each with no difficulty buying. See Silk.

The manufacture of ladies' shoes began early in colonial times, and the town of Lynn, Mass., has been distinguished for this branch of industry almost from the time of its settlement. The first shoemakers in Lynn were established in 1635, and the first shoes made by them were of woolen cloth or neat leather only. Until 1800 shoes were made with woolen heels, covered with leather, but after that time leather heels were substituted. The first invention of importance in this manufacture was the pegging machine; the next was the last-machine invented by Elias Howe. Another important invention was the McKay sewing machine, for stitching the uppers and soles together. In 1870 Lynn produced 187,530 cases of boots and shoes, of 60 pairs each, being 11,250,000 pairs, valued at $17,000,000. An important manufacture, and one which is now more than a century old in the United States, is that of combs. These were at first imported from England by the colonists, but in 1759 an iron comb manufactury was in existence at West Newbury, Mass., where the business is still extensively conducted. In the same year there were combs made in Pennsylvania, and in 1783 they were in Boston, and there or three in Leominster, Mass. The first machine for making combs was patented by Isaac Tryon in 1798. In 1800 three manufacturies were established in Connecticut. At first the teeth were cut singly by a fine steel saw; but in 1814 a patent was granted for a machine which cut all the teeth at one operation. The invention of vulcanized India-rubber effected a revolution in the comb manufacture. An important manufacture is that of the cards used in the manufacture of cotton and woolen cloths. During the colonial period these cards were manufactured by hand-labor; and in that form their making continued to be a valuable branch of industry until the latter part of the 18th century. In 1777 Oliver Evans invented a machine for making cards, which is said to have produced them at the rate of 300 a minute. In 1784 another machine was invented which cut and bent the teeth, and had a capacity of 86,000 an hour. Cannon and cannon-balls were cast in Massachusetts as early as 1664. In 1748 a foundry at Bridgewater, Mass., made from 3 to 45 pounder guns; and during the revolution, cannon, cannon-balls, and shells were made in Massachusetts, Rhode Island, Connecticut, New Jersey, Pennsylvania, Virginia, and Maryland. Up to 1857 about 300,000 cannon had been cast in the United States. The manufacture of wall-paper did not begin in the United States until 1765, and in 1789 a production of 16,000 pieces per month in Philadelphia was considered a fair quantity. The first patterns with glazed grounds were made in 1824, but soon after the best French designs began to be imitated. The manufacture of iron was naturally one of the earliest industries practiced in the colonies. In 1620 there were iron-works at Falling Creek, in the Jamestown, Va., settlement, but the following year the place was attacked by Indians, and the inhabitants massacred, which stopped the manufacture of iron in that locality, and it was not resumed there until 1712. The first iron manufactory in Massachusetts was set up in Lynn about 1663, the village about the works being named Hammersmith, after the place of the same name in England, whence many of the workmen employed there had emigrated. The first article of iron said to have been cast in the American colonies was made at these works, being a small iron pot cast by a crew of workmen in the evening in one of the officers' houses, and in a furnace. The description of a furnace erected in 1794 in the town of Carver, Mass., mentions that 10 forges were there employed in making bar iron from scraps to the amount of 200 tons annually. Another of the early colonial industries was the manufacture of cordage, and as early as 1631 it was made in Boston, and in Charleston, Mass., in 1662; in 1698 there were several rope-walks in Philadelphia; and in 1794 Virginia and Maryland had each more rope-walks than any two of the northern and eastern states. In 1804 a spinning and twisting mill for making cordage was patented in the United States. The first paper-mill in America of which we have any account was erected at Roxborough, near Germantown, in Pennsylvania, about 1683. This was 50 years after printing had been introduced into the colonies, but only 5 or 6 years after a proclamation had been issued by the English government for the establishment of the first manufactury of white paper in England. The paper-mill in question was built by an ancestor of David Hinton House—whose family in Holland had long been engaged in the manufacture of paper—and William Bradford, the first printer in Philadelphia. In 1738 Bradford, when government printer in New York, owned a paper-mill in Elizabeth-
town, N. J., which was probably the second one erected in the colonies. Benjamin Franklin was, at various times, interested in the erection of 18 paper-mills. In 1787 there were 63 mills in operation in all the states. It is said that the first manufacture known to American history was that of salt, which was undertaken by the colonists at Jamestown, Va., in 1620. The first mill set up in New England was a wind-mill, near Watertown, Mass., which was taken down in 1633 and erected on Copp's hill in Boston. In New York the first mill was a horse-mill, which was built in 1629 on the site now occupied by Trinity church in that city. Agricultural implements were not made in America until comparatively recent period. One of the first persons to make a plow was Thomas Jefferson, who attempted to solve the mathematical problem of the true surface of the mold-board, and in 1793 had several plows made after his patterns, which he used on his estates in Virginia. The first American, after Mr. Jefferson, who made plows for common use was a farmer living in New Jersey, by the name of Charles Newbold, who invented the first cast-iron plow made in America. The manufacture of beer was undertaken in the very earliest history of the colonies. One John Appleton set up the first malt-house in Massachusetts in 1640. In 1633 Wouter Van Twiller caused the erection of a brewery in New York city. The distillation of brandy commenced in the colonies in 1640. Wine was made in Virginia from the native grape by French colonists, who came over for the purpose, before 1622. In New England governor Winthrop planted a vineyard as early as 1630, and Governor's island, in Boston harbor, was granted for this purpose in 1634.

The first cloth ever made in the colonies were the result of a bounty offered by the general court of Massachusetts in 1640. In the following year this bounty was given to several persons who made attempts at this manufacture; probably, at first, a coarse description of linen. The first systematic effort at the manufacture of woolens was by a company of Yorkshire men in 1644 at Rowley, Mass. At this period cotton was obtained from Barbadoes, while hemp and flax were native. Cotton seeds were first planted in the colonies in 1621; the plant was introduced into the Carolinas in 1666. It was grown only as a garden-plant, however, until after the revolutionary war. The first exportation of raw cotton occurred in 1751. In 1775 a corporation was formed in Philadelphia called the "United company of Philadelphia for promoting manufactures," of which Dr. Rush was president. Its object was "to establish American manufactures of woolens, linens, and cottons, with a view to the exclusion and supersede of British goods." The company possessed a spinning-jenny, newly imported from England, and employed in their factory 400 women. Two years later this company contracted with congress to supply clothing for the army.—A report made to the British house of commons in 1781, by the board of trade, on colonial industries, stated that in the American colonies the settlers had "fallen into the manufacture of woolen cloths and linen cloths, but for the use of their own families only; that the very high price of labor rendered it impracticable for them to manufacture such articles at less than 20 per cent dearer than that exported from England; that the greater part of the clothing worn in the province of Massachusetts Bay was imported from Great Britain, and sometimes from Ireland; that there were a few hat-makers only in the maritime towns; that there were no manufactures in New York worth mentioning, or in New Jersey; that the chief trade of Pennsylvania lay in the importation of provisions, no manufactures being established, and their clothing and utensils for their houses all imported from England; that in Massachusetts Bay some manufactures were carried on, as brown holland for women's wear, which lessens the importation of cloaks and some other sorts of East India goods." This report, in view of what has been heretofore stated, will be seen to exhibit a desire to underrate the manufacturing industry of the colonies; which was, however, already encroaching seriously upon the demand on the home market.

This brief statement concerning the early history of American manufactures is chiefly of interest in displaying, by contrast, the vast movement which took place in the century following the revolutionary war. In the United States, as elsewhere throughout the world, the organization of local, national, and international exhibitions has forwarded this movement with a rapidity and a result of excellence otherwise unattainable.

The gross statistics of manufacturing in the United States were given in the U. S. census for 1870 as follows:

<table>

The approaching publication of the U. S. census returns for 1880 will afford material in tabulated form by which it will become practicable to deduce important conclusions, and possibly to establish the existence of positive laws controlling the movement of the manufacturing industry as a whole, and in its relation to the most vital economic interests—not of the laboring classes alone, but of the race.

MANUMISSION, the form by which, in ancient Rome, slaves or other persons not sui juris, were set free. There were three ways in which the release might be accomplished, viz., by vindicta, census, or will. The oldest of these forms was the vindicta, which was as follows: The owner of a slave brought him before a magistrate and made a statement of the grounds upon which he proposed to make him free. Then the locator laid a rod on the head of the slave and declared him free, the master pronouncing the words "I wish this man to be free," and at the same time turning him about and letting him go. Then the magistrate proclaimed his freedom. Freedom by census was effected by the slave giving in his name, by direction of his master, at the lustral census. By will a slave could be freed conditionally or unconditionally, or made free and an heir to the testator. The laws at different periods placed restrictions upon the right of the master to manumit his slaves, such as limiting the number he might set free, and preventing him from defrauding his creditors. The manumittor stood to the manumitted in the relation of a patron to a freedman, and if the former were a citizen the latter became a member of his gens, and assumed his family name as well as personal name, to which he added such surname as pleased him, but commonly that by which he had been known as a slave.

MANURE. This is a term applied to a great variety of substances, mineral as well as organic, which have been used for the purpose of increasing the produce of those plants that man selects for cultivation. Lime, and the ashes of vegetables, have been applied to the land to increase its fertility from time immemorial; and also have all kinds of organic substances, whether vegetable or animal. The rationale of such applications to growing plants was but little understood till chemistry revealed to us the nature of the materials which entered into the composition of all plants. At the present day, much definite knowledge has been acquired of the true nature and action of the various substances that are found to increase the growth of our cultivated crops. It was long supposed that the food of such a varied class of plants as the globe presents must necessarily be very different, almost as much so as the difference in their forms and properties of their products. Chemistry, however, has shown that the food of all plants is very much alike, though some classes must be supplied with certain substances in greater abundance than others. The great mass of all vegetables is resolved into carbonic acid, water, and ammonia, on being subjected to heat or burned in a fire. It is these same substances which constitute the chief food of all plants. The light of the sun enables plants to decompose and assimilate carbonic acid and ammonia, and to manufacture out of them the various products they contain. All organic substances yield these by slow decomposition, as well as by combustion. It is for this reason that such substances increase the fertility of land when added to it. Water is so common an article, that nature provides all that plants require. Carbonic acid, too, is contained in considerable proportion in the atmosphere, and is readily taken from it by the leaves; still, it is of great use when applied to the soil as vegetable matter, and the decomposition rendered accessible to the roots of plants. Ammonia exists in exceedingly space quantities in the air as in rain and river water, as in sewage and artificial applications to the soil are generally needed to produce full crops. The nitrogen which enters into the composition of plants is generally supposed to be capable of being only assimilated either in the form of ammonia or nitric acid; it is for this reason that the salts of ammonia and nitric acid are all very powerful fertilizers. They generally produce a dark-green color in the leaves, such as is associated with healthy growth and luxuriance.

But besides carbonic acid, water, and ammonia, plants feed upon certain mineral or earthly substances, which seem to impart the power of condensing and digesting the other organic elements. On plants being burned, they leave lime, potash, soda, magnesia, silica, sulphates, and phosphates, as ash. These substances are all found to exist in certain kinds of plants in proportions which are confined within rather narrow limits. The earthly substances, it must be remembered, enter into combinations in definite proportions with the other constituents, and are thus linked together in the vegetable organisms as part and parcel of their structure.

Lime acts as a manuring substance directly by supplying one of the constituents of plants; so also does magnesia. But lime is often added as an agent to assist in digest-
ing and preparing the organic materials existing in the soil. See Lime. Magnesia is seldom applied singly to the soil; it is usually associated with limestone, and is generally
combined in the form of quantities sufficient for the latter purposes.
Potash is a substance most essential for all our cultivated plants; its market-price, however, is so high, that farmers seldom apply it directly to the soil. They employ cer-
tain crops, such as clover and turnips, to gather it up for them in the soil. These are consumed on the farm by cattle and sheep, and as little potash enters into animal tissues
as a permanent constituent, it is mostly returned to the dung-heap in the excrements
matters. Farm-yard dung thus possesses a value of its own, by supplying this con-
stituent, which cannot be bought economically in the market. Soda can be easily
obtained in the form of common salt, but as this substance is usually associated with
potash, the one is found in the dung-heap as well as the other. Common salt is applied
to corn-crops that are growing too rapidly. The salt has the effect of stiffening the
straw, and rendering it less liable to lodge. Salt is also used with great success in growing
mangold-wurzel, as this is a plant which was originally taken from the sea-shore.

Sulphates.—Every plant contains a quantity of sulphur, which is derived from the
sulphates that are found in the soil. Sulphate of magnesia has often been applied
with marked effect for turnips and potatoes, but its use does not commonly pay the expense
of the application. A much cheaper source of sulphur is found in sulphate of lime or
gypsum (q.v.).

Phosphates.—These are largely used in agriculture. Phosphoric acid being very
sparingly diffused in most soils, many plants have apparently great difficulty in obtain-
ing as much of this material as is necessary to rapid growth, and hence the importance
of an artificial supply, which is administered in the form of phosphate of lime. The
chief sources of this important element are bones (q.v.), apatite (q.v.), and guano (q.v.).
The reason of its importance, and the principle which should guide its application, are
explained in the article Bones as Manure.

Nitrogenous Manures.—Plants are supplied with nitrogen in the form of nitrites, or
of salts of ammonia. Nitrites and the salts of ammonia promote growth in all culti-
vated plants when the earthly substances that enter into their composition are present.
Nitrogenous manures are often beneficially applied without other substances to grain,
because the grain-plants have greater facilities than the turnip for taking up phosphates
and other constituents from the soil. So also, to a still greater extent, do we see the
operation of this principle in the case of grass. Having a permanent staff of roots in the
soil, the plants are ready to gather up the necessary supply of mineral food when
abundant nitrogenous food is presented to them, and thus nitrogenous manures of all
kinds have very marked effects on grass. What determines the amount that can be
profitably applied to the different cultivated plants, is simply the capability that each
species possesses of expanding under such treatment.

Farm-yard Manure.—This is the most valuable manure that the farmer uses. It con-
tains all the elements of plants, and without its use in ordinary circumstances the fertility
of the land would rapidly deteriorate. The richer the food upon which stock is fed so
much the richer the manure produced. Stock fed upon straw and water leave a very
inferior manure, that requires to be largely supplemented by other materials to add largely to the value of manure, the dung of all kinds, from containing nitrogen
and the earthly matters of the seeds of oil-bearing plants, produce a rich manure. Farm-
yard manure, under ordinary circumstances, is much more valuable for some kinds of
crops than for others. The potato, for example, cannot be raised with much success
unless it be supplied with this or other bulky manure having the greater number of ingre-
dients present. This does not appear to arise from its absolutely requiring more of any
one substance than many other plants that can do far better without artificial supply. It
seems to be owing rather to a deficiency of power to gather its food when dispersed
through the soil. A large allowance of farm-yard manure is therefore applied to the
potato when it is grown in great quantities. The bean, also, is dependent on farm-yard
manure more than the pea. Large breadths of turnips are often raised without farm-yard
manure, as, when supplied with phosphate and nitrogen, they seem to have greater facili-
ties for taking up what is diffused through the soil. The weaker and poorer the land the
more important does farm-yard manure become for all plants. Farm-yard manure also
tends to render soils more adapted for carrying clovers, and many farmers always apply
this to lands which are to be sown out in grasses.

Liquid Manure.—This is a favorite manure in many districts. Scotch and English
farmers, in general, endeavor to have all the liquid excrements of the stock absorbed
by the straw, and carried out in the solid form. On many farms, however, far more is pro-
duced than can be absorbed by the straw. Various modes have been adopted to apply it
when this is the case. It is commonly done by a large barrel drawn by a horse; the
liquid is distributed by various methods as the horse walks over the ground. The liquid
manure is commonly applied to grasses, more especially to clovers or rye-grass, common
or Italian. As the liquid accumulates it may be applied to the young grasses as soon as
the corn crop is removed. The plants, being vigorous in autumn, absorb it, and form
roots and juices that are available as soon as the growing season arrives. It may be
applied during intervals of mild weather during the whole winter. It is, no doubt, most
economical to apply it at the season of growth, as the roots take it up then very readily,
and there is comparatively little waste from being washed out of the soil. In some large establishments the whole urine is collected during the winter in large tanks, and applied in spring. This has been done on a large scale by means of underground pipes laid over the fields, the liquid being distributed by means of a pump and hose. Steam or water power has been in some cases applied to this operation; in others it is effected by gravitation, when the situation of the outfall and reservoir suits. In wet weather the liquid manure can be conveyed away through the drains, and in dry weather large quantities of water may be added for the purpose of diluting it and not allowing it to injure the plants. Liquid manure is exceedingly rich in all the elements of plants, and is valuable for all crops; but there are often considerable practical difficulties connected with its use and distribution.

MANUSCRIPT, from the Latin manus scriptum, written by hand, the original writing of a book, tract, or pamphlet prepared for the press. The ancient manuscripts were inscribed on papyrus, or parchment, and were preserved in sheets or rolled. The Egyptians rolled their papyrus manuscripts with regard only to the length of the subject treated; brief monographs being preserved flat, while treatises of greater length were formed into rolls whose extent was only governed by the comprehensiveness of the subject and the lucency of the writer. Manuscripts on parchment or vellum were at first made in rolls, but about the 3d c. they began to take the form of flat pages, precisely as in our books, and usually quarto in size. Mexican manuscripts when not rolled were folded as we do a map, and had covers of wood for their protection.—The multiplication of manuscripts among the Greeks and Romans, in the absence of any art of mechanical reproduction, became of necessity a matter for system and regularity so far as this was possible. At first, the art of transcribing belonged almost wholly to such among the slaves as became adept in writing. As the system of slavery among those nations was one of minute subdivision into classes, to each of which was allotted a specific kind of duty, this became comparatively easy, certain slaves who displayed facility being specially educated to be copyists. Of course, the value of a slave was increased by his becoming efficient in the practice of this art, and this fact becoming obvious the art was adopted in Rome by persons who became professional transcribers, not being slaves. And as early as the 5th c. this had become a business in which, in some cases, a number of persons were associated together, and these were bound by agreement, and by rules and regulations, formally adopted. The Egyptian papyri were, as a rule, written in black and red, with occasional ornamental interlacing. Slaves commonly wrote in the case of one of the earlier periods, and even of some later manuscripts, with pictorial illustrations of remarkable taste and delicacy of execution. Fourth and 5th c. manuscripts have generally the body of the writing in black ink, the initial letters being in red, with some display of ornamentation in form; sometimes several of the beginning words, or even two or three lines, are in red ink. The Arabic, Persian, and Syriac manuscripts are often illuminated, frequently much gold is used, and arabesque designs are common among these: the Koran does not permit the drawing or other representation of the human figure, and this character of ornamentation does not therefore occur among oriental manuscripts. The fashion of introducing pictorial art into the making of manuscripts was one which began at a very early period. There is a manuscript extant in which figures of human beings are used for illustration, which dates back to the early part of the 4th century. Varro, who lived in Rome in the 1st c. B.C., was the friend of Caesar, and was directed by him to form a public library, is said by Pliny to have been written with a work of biography which he illustrated with many hundred portraits. A copy of Diadochus in the imperial library at Vienna is illustrated with pictures of men and a 4th c. Virgil in the library of the Vatican is filled with decorative miniatures. A manuscript, which has been partly destroyed by fire, exists in the British museum library, which is still more remarkable in the way of illustration. It contained originally portions of both the Old and New Testament, and was ornamented with 250 miniatures, each of them 4 in. square, some of which remain in the partly destroyed fragment, the date of which is supposed to be about the 6th century. A copy of Homer's Iliad in the Ambrosian library in Milan, very ancient, is adorned with miniatures. Among the colors employed in writing in those early times were purple, green, blue, and vermilion, with gold and silver. The university of Upsala in Sweden has a splendid specimen known as the Argentines Codex (see Ulplfa), which is written in letters of silver with initials of gold on violet-colored vellum. It was not until after the 4th c. that the initial letters were made larger than those in the body of the text; after that they were set off with small flowers and leaves, or large leaves, each covering several lines, which even occupied an entire page. The Irish manuscripts of the 7th to the 10th c. disclosed the most extraordinary forms of initials, being grotesque in character; objects from natural history were united by complicated patterns of interlaced work, the whole effect being unlike anything else in manuscript anywhere, and apparently original with the Irish illuminators, to whose work we shall return further on. The early Franklin manuscripts show the influence of oriental styles, the illuminated initials being adorned with arabesques, combined with foliage patterns. The earliest Greek and Latin manuscripts were written without points or divisions, in square capital letters. Uncial writing was in use at the same time, and superseded the other style in about the 6th c.; it differed from the latter in being a combination of capitals and small letters, and led up to the cursive or flowing writing, which became customary by the 10th century. Abbreviations
were employed very early in the history of manuscripts, and by the 12th c. had become so general that manuscripts of that period are exceedingly difficult to read. Among such abbreviations, and tending to complicate still more the task of reading, are the arbitrary signs invented by Tiro, Cicero's freedman, for his system of shorthand. Punctuation was not known until the 10th c., when the comma first came into use, to be followed by exclamation and interrogation points, and the parenthesis five centuries later: about the 12th c. we first meet with the Arabic numerals in manuscripts.—First among the ancient manuscripts still in existence are the rolls of papyrus found in the tombs of Egypt, and which are frequently exhumed in a perfectly preserved condition after having been buried for thousands of years—owing to the dry climate and the entire want of humidity in the sandy soil. Among these are both Egyptian and Greek manuscripts, the former being in hieroglyphic, hieratic, or demotic characters, and nearly always of a religious nature, and having special reference to the dead. One of these papyri, existing in the national library in Paris, is supposed to be of a period nearly four thousand years before Christ: it is a moral treatise, written by an Egyptian prince. There are also found many business documents, bills of sale, accounts, and letters, which are written in the demotic character. Of the Greek manuscripts on papyrus one of the oldest known to be in existence is of the 3rd c. B.C., a portion of one of the books of the Iliad; another, found at Herculaneum, is part of a musical work by a writer of the 1st c. B.C., and is of that period. A petition to one of the Ptolemies, of the 2d c. B.C., exists in Paris. In the British museum there are rolls of parchment more than 3,000 years old, though the date of the invention of this material has been ascribed to the 2d c. B.C. The oldest parchment manuscript of a date since the beginning of the Christian era, is supposed to be the Palimpsest (q.v.) of Cicero's De Republica, attributed to the 2d c., and now in the Vatican library at Rome. There are also in that library a copy of Terence of the 4th or 5th c., and a Sallust of about the same period. The celebrated Medicean Virgil, nearly perfect, is in Florence, in the Laurentian library; it is also of the 4th or 5th century.—The oldest manuscript of the Bible known to be in existence is the Codex Sinaiticus, found by Tischendorf in a convent on Mt. Sinai, and placed in the imperial library of St. Petersburg; it is believed to be of the 4th century. The Codex Vaticanus, a Greek manuscript of the Bible, is of about the same period with the last, though this is not so well authenticated. The Codex Alexandrinus, in the British museum, is of the middle of the 5th c.; and the Codex Bezae, in the library of the university of Cambridge, Eng., of the 6th century.—Returning to the subject of ornamentation in this connection, and reverting to the labors of the Irish illuminators, we may properly quote from an English authority in regard to the importance and value of this class of manuscripts: "To the remembrance of these nations the praise is due of having invented and developed an independent style of ornamentation, and one destined to become a formidable rival to the traditionary splendors of eastern art. In Ireland, as far back as the 5th c., a style of art had been practiced, which in the succeeding centuries attained a perfection almost incredible. In nearly complete isolation from the rest of the civilized world, having few opportunities of seeing and admiring the works of the great Greek artists, their method of ornamentation exhibits no artistic power in the higher sense of the word, but is remarkable for a fine harmony of color, and a precision of technical execution little short of miraculous. The principal features of the style are an intricate and tortuous interlacing of narrow threads or ribands, generally in symmetrical patterns, sometimes filling up a letter, sometimes extending over a whole page; now the introduction of a number of circular ornaments, now filled by marvelously delicate spiral lines proceeding from the center, now by bolder wheel-like patterns of endless variety of design; to these may be added the use of numbers of birds and animals coiled up in endless and seemingly inex- tricable confusion, sometimes varied by the introduction of the human figure, and pat- terns formed of diagonal and straight lines, generally in squares or compartments, the idea of which some writers assert to have sprung from the remembrance of tesselated pavements." A copy of the gospels, called the Book of Kells, of the 7th c., is a manu- script of this style in the library of Trinity college, Dublin. This peculiar method of design was early introduced into England by Irish missionaries, and a splendid specimen of its adaptation is preserved in the celebrated Durham Book, in the British museum, which was executed at Lindisfarne at the commencement of the 8th century. In this may be traced at once a stronger influence of the Byzantine types; and though it is a most superb specimen of writing and decoration it does not exhibit the same originality or fertility of imagination as the works of the Irish school. From England the new style passed quickly to the continent, and was soon adopted and largely used by the illuminators, and it is curious to notice in the manuscripts of the succeeding centuries, prolific in works of splendor and elegance, the admixture of the Celtic and of the remnant of classic design. A change of style was introduced by the illuminators of England of the 10th century. This consisted in the introduction of foliage. At first it was of an entirely rudimentary character, and exhibited none of the botanical skill or study of nature so closely observed in later times. It was, in fact, a reflection of the architectural styles then becoming dominant, the ornaments and moldings of the great architectural works of the time being now adapted to the processes of book ornamenta- tion. A magnificent specimen of this new style still exists in the Benedictical of St. Ethelwold, in the possession of the family of the duke of Devonshire. This manuscript
was executed at Winchester (the great school of the arts in England) at the close of the 10th century. In the succeeding century the style became more developed, the forms of the leaves more freely drawn and less archaic, but in the 12th c. conventionalism become the rule; ornamentation had grown to be luxurious and fantastic; and the work produced was perhaps the most magnificent of any age. By the next century the tendency was towards naturalism, and men's minds were turned to a study of living things. In the 13th c. the portrait is a prominent feature in the character of the work. The initial letters of manuscripts of this period became glorious in burnished gold, scarlet, and blue. The miniatures of manuscripts gold backgrounds were constantly employed, and especially in those of French artists. In the 14th c. the gold and plain backgrounds gave way to rich patterns of diaper and checker work, and the heavy mass of burnished gold was divided into minute patterns or was entirely superseded by variegated color. In the 15th c. floral decoration became common; and the introduction of a background of pure landscape in the miniatures is a feature of this period.—Throughout the whole of the dark and middle ages the value attached to the possession of manuscripts, and the activity shown in multiplying them, are very remarkable. Long previous to the 12th c. the most active seal was displayed in search after ancient texts, even of profane authors.

"In the middle of the 9th c. Lupus, abbot of Ferrières, earnestly requested from the pope and the bishops of England and Ireland the loan of manuscripts of ancient writers, that copies might be made of them; and in 1040 count Geoffroy of Anjou gave to the abbey of Notre Dame of Saintes the title of the books he had been compelled by his forefathers to furnish a fund to bind the books of the monastery." (Silvestre.) The same writer mentions also the veneration paid in the 15th c. to the Florentine Pandects of the Laurentian library, a magnificent volume written in the 7th c., and esteemed the most valuable of the manuscripts of the Roman law. This manuscript was taken from Pisa by the Florentines in 1406, and after its deposition at Florence "was regarded with almost religious veneration, being shown only to the highest personages, with great ceremony, in the presence of the chief magistrate, accompanied by monks, bareheaded, and bearing lighted tapers." The price of manuscripts in the middle ages offers some interesting points for reflection. There is one account of a contract made in 1346 for writing a volume containing psalter, hymnal, and collectary, ornamented with illuminated letters in gold, azure, and vermilion, for which the charge was 16 shillings. A 14th c. Bible captured at the battle of Poictiers, sold for 100 marks, at that time a sum representing about $500. The gold manuscript, the British abbots of the 12th and 13th centuries received on the average five successive times between 1458 and 1510, a fact showing how readily money could be raised at that period on this species of property: in 1488 it was pawned for 28 shillings, and in 1510 for 20 shillings. Sometimes sums of money were deposited by borrowers of manuscripts as security for their safe return.

MANUSCRIPTS, ILLUMINATION OF, the art of painting manuscripts with miniatures and ornaments, an art of the most remote antiquity. The Egyptian papyri of the ritualistic class, as old as the 18th dynasty, are ornamented with vignettes or miniatures, attached to the chapters, either designed in black outlines, or painted in primary colors in tempera. Except these papyri, no other manuscripts of antiquity were, strictly speaking, illuminated; such Greek and Roman ones of the 1st c. as have reached the present day being written only. Pliny, indeed, mentions from Varro that authors had their portraits painted on their works, and mentions a biographical work, with numerous portraits introduced into it; such have disappeared with the wreck of ends; the finest illuminated MSS. which have survived being the Dioscurides of Vienna, and the Virgil of the Vatican, both of the 4th c., and ornamented with vignettes or pictures in a Byzantine style of art. St. Jerome, indeed, in the same century, complains of the abuse of the practice, as shown by filling up books with capital letters of preposterous size; but the manuscripts of this and the subsequent century are ornamented with rubrics only, as evidenced by the Codex Alexandrinus and other manuscripts. Probably the art of illumination was derived from rubrics, as the emperors in the 5th c., commencing with Leo (470 A.D.), signed in this color, like the Ch'inese; and this "vermilion reply," adopted by Charlemagne in the 9th, continued down to the 13th century. The art of illuminating manuscripts with gold and silver letters is supposed to have been derived from Egypt, but it is remarkable that no papyrus has any gold or silver introduced into it. The artists who painted in gold, called chryographi, are mentioned as early as the 2d century. One of the oldest manuscripts of this style is the Codex Argenteus of Ulfilas (300 A.D.); and the Bayeux tapestry, in which the king Edgar (960 A.D.), six other kings, and a hundred nobles are represented in gold letters. Gold letters seem to have been used in the east during the 12th and 13th centuries. At an early period, the use of illuminated or decorated initial letters commenced, which is to be distinguished from the illuminated or painted pages placed at the head of Byzantine manuscripts. Originally, they were not larger than the text, or more colored; but the Syriac manuscripts of the 7th c. have them with a pattern or border; and they go on increasing in size and splendor from the 8th to the 11th c., when large initial letters, sometimes decorated with little pictures or miniatures, came into fashion in the Greek and Latin manuscripts. The subjects of the figures mixed up with the Arabesque ornaments often referred to the texts; warriors and warlike groups of figures being introduced when the text referred to war; symbolical representations of hell, where the
chapters following treated on that region. These initial letters soon increased to a great size, being from 2 to 24 in. long; they were most used in the 8th and 9th centuries, but continued till the 12th c., and degenerated in the 16th to the last decadence of art—the grotesque. The art, which flourished in the eastern and western empires, passed over to Ireland, and there gave rise to a separate school or kind of illumination. This style, which consists in a regular series of interlaced ribbon ornaments, often terminating in the heads of griffons and other animals, seems to have been derived from the later patterns of Byzantine art, seen on mosaics, mural paintings, and other objects. Some, indeed, have thought that they are of oriental origin. The so-called Durham book, in the British museum, of the 8th c., is a splendid example of the school which was established in Holy island by St. Aidan, and in Kent by St. Dunstan, before the end of the 6th century. A remarkable MS. of the 6th c. is the book of Kells (q.v.), at Dublin. The scriptorium of the monastery at Hyde, near Winchester, was celebrated at this period for its illuminations; and the celebrated St. Dunstan of Glastonbury applied in early youth his talents to this art. The minute size and number of interlacements of the Book of Kells, at Dublin, is quite wonderful; while the Benedictional of Chatsworth, executed by one Godemann of Hyde for Ethelwold, bishop of Winchester (1100 A.D.), exhibits a bold style of art and ornament. Separate schools prevailed in the 11th c., the Greek or Byzantine manuscripts of the period exhibiting a fine style of ornament derived from the Byzantine school; while the Latin manuscripts of the period are distinguished by the use of a light blue and green in titles and pictures. While, however, the ornaments of the Byzantine and Latin schools were of a more purely architectural character, and the Anglo-Hibernian, Saxon, and even Franco-Gallic manuscripts of Charlemagne and his successors exhibit a union of Roman and Gaulish treatment; a new kind of work arose in the 10th c. in England, called the Opus Anglicum, resembling more in character the ornaments of Gothic architecture, a remarkable specimen of which is seen in the gospels made for King Æthelstan. During the 12th c., there arose a new style, distinguished by the profusion of its ornamentation, intricate mode of illumination, and abundant use of gold and silver. The taste was false, but the art had become more special, blank spaces being left for the limners to fill in. In the 13th c., the art still more deteriorated in western Europe—long-tailed illuminated initial letters were introduced; the background was often of gold, on which the ornaments and subjects were colored in a style resembling oil-painting, from 1190 to 1290; manuals were then prepared to instruct the limner, and the art was formalized. The Gothic style of ornament of this age has superseded the Roman or Byzantine of previous centuries. In the 14th c., the art greatly improved; the border or ornament running all round the page was introduced, and the ornaments were interpolated and enriched with miniature pictures, even by celebrated artists, as Niccolo Pisano, Cimabue, Giotto, in Italy. Few volumes, however, were illuminated till after the reign of Edward I., when the art took a further development; grotesque figures were introduced, and are alluded to by writers of the period. In the 15th c., continuous borders and fine miniature pictures were in use, and toward the end of the century, celebrated works of this nature were produced by Giulio Clovio in Italy, and Lucas van Leyden in Flanders, the Van Eycks, and Memling or Hemlink; medallions of exquisite style and finish were inserted in the border. Of this age, the most beautiful known specimen is the Book of Hours of Anne of Brittany, wife of Louis XII., with borders of natural plants on a gold ground. The Italian art of the same age was symmetrical rather than picturesque and naturalistic, but on solid backgrounds; the ornaments, although resembling those of preceding centuries, are distinguished by the introduction of miniatures. In the 16th c., in the reign of Louis XIV., the art became extinct, ending with a style of painting called camaieu gris, a kind of monochrome, in which the lights are white or gold, and shaded so as to emulate bas-reliefs. Among oriental nations, the Persians, Hindus, and Chinese have illuminated manuscripts of great beauty, none of which, however, can compete with those of the western nations in antiquity. For beauty of design, some of the Arab manuscripts are charming, but their artificers do not reach beyond the 15th century. The Chinese Buddhists have also illuminated classics, or religious books of their sect, one of which, the Diamond Book, as it is called, in the British museum, has a text splendidly printed in silver and gold letters on a blue ground; and the vignettes charmingly painted in tempora, on macerated leaves of the fucus Indicus.

Humphrey, H. Noel, Art of Illumination (12mo, Lond. 1849); Shaw’s Illuminated Letters (fol. 1828); Bradley, J. W., Manual of Illumination (12mo, Lond. 1860).

MANUTIUS, ALDUS (Aldo, a diminutive of Theobaldo, his baptismal name), a great printer and improver of the art of printing. His name, in its Italian form, is spelled in three different ways by himself or his descendants, viz., Manuzio, Manuzzi, and Manuci; while from his patron, Alberto Pio, lord of Carpi, he took also the name of Pio, and after the year 1500, always designates himself Aldo Pio Manutio Romano. He is often called Aldus the Elder. He was born at Bassiano, near Velletri, in the states of the church, in 1493, and established a printing-press at Venice in 1490 (though the first book bearing a date has 1494), from which many works were issued (see Aldine Editions). He died 1515.
The text is too long to be transcribed directly. It appears to be a historical text discussing various individuals and their contributions to literature and science. The text includes references to manorial writers, their works, and historical events. The text is written in a formal, academic style typical of historical or literary analysis. The content is dense and requires careful reading to understand fully.
Manutius. Maoris.

Samoa or Navigators' islands, a group not half that distance away. * The tradition says nothing of any indigenous population found in New Zealand before the arrival of these immigrants. Many writers, however, incline to the belief that it was previously inhabited by a darker race, somewhat akin to the Papuans of New Guinea, sometimes called Negroes and Pelagian negroes. Supposing that the two races, in process of time, intermingled, this might account, in some measure, for the differences apparent between the Maoris and the Tahitians, Samoans, Sandwich islanders, and other natives of the Pacific. But whether of pure or mixed race, all testimony combines in representing the Maoris as a nation standing very high in the scale of humanity. The skin of the Maoris is in general of an olive-brown color, but there are some in whom the shade is much lighter, while in others it is darker. In stature they almost equal Englishmen, and have a powerful muscular development. They have well-shaped, intellectual heads, and their features, when not tattooed, might almost be taken for European. Few of them have beards or whiskers, it being an immoral custom among them to pluck out the hair on the face with pipi shells. On the head, the majority have long black hair, which when wet waves in it; but with some it is of a reddish tinge, and some Maoris again have the hair slightly frizzled. Their eyes are large, their lips thick, and their teeth, unlike those of most savage nations, are large and irregular. The women are of less stature than the men in proportion, and are in other respects inferior to them, perhaps from their marrying too young, and having to perform too much of the drudgery of life. Some of the women, however, are represented as being delicately molded, with long eye-lashes, pleasing features, and a plaintive, pathetic voice, which makes them highly interesting. Both sexes used to practice tattooing, a custom which has been almost abandoned since the conversion of the Maoris to Christianity. It was a painful operation, performed with a hammer and saw-like chisel. The punctures were stained with vegetable dyes, and the patterns, which extended over the face, hips, thighs, etc., represented ornamental scrolls and figures, supposed to denote the rank of the individual wearing them. The women who had slightly tattooed, with a variety lines on the lips, chin, and occasionally other parts of the body. The priests were the principal tattooers, and during this period, old ancient songs were sung, to encourage, divert the attention, and increase the patience of the sufferers. This tattooing was supposed to make the Maori youth more terrible in the eyes of his enemies, and more acceptable in those of his mistress. Another remarkable custom among the Maoris was that of the taboo, by which the priest could make certain persons and things sacred and inviolate. This was partly a religious and partly a political ordinance, and was so much respected that even in war-time hostile tribes left unharmed all persons and things thus protected by the taboo of the opposite side. Cannibalism, a much more heinous and abominable custom, practiced so lately as within the last 45 years, was universally prevalent among the Maoris before their conversion to Christianity. The last instance of it occurred in the year 1845. "Now, however," says Dr. Scherzer (Voyage of the Novara), "any allusion to this revolting practice is very painful to the New Zealander, as reminding him of his former low position in the scale of nations." Every time that we endeavored to make any inquiry of the natives, whatever we asked this custom with which the inquiry was made a hint to the manner, dogs' flesh has ceased to be an article of food, ever since the introduction of pork by captain Cook. Formerly, the native or Maori dog, which at present is very scarce, was eaten on certain occasions, while its blood played a somewhat conspicuous part in Maori pharmacy." Infanticide, which also prevailed largely among them in their days of heathenism, is now universally abolished, and the same is the case with slavery and polygamy. The Maoris generally marry very young, and instances are known of females among them becoming mothers even at the tender age of 11 years. Their marriages, however, are not very productive, 3 in a family being considered a good average, and many of these dying in their first year. It is difficult to account for this, seeing that the Maoris of the present day are not addicted to intemperance, like other half-civilized tribes. The wars of the Maoris were formerly carried on with spears and clubs of various kinds, manufactured from stone and wood. Their most remarkable weapon was a spear of nephrite, which descended among the principal chiefs from father to son. Some of these were so large as to require a kind of handle, and even a port-er, called merimere, "the fire of the gods," and was sometimes used for scalping prisoners. There are other weapons of nephrite in use among the Maoris; they are much sought after, and very costly. The use of fire-arms is now, however, very general among the Maoris, and that they are adroit marksmen has been made but too apparent in their contests with English troops. The language of the Maoris, like the Polynesian languages generally, belongs to the Malay family. Its alphabet comprises only 14 letters, viz., A, E, H, I, K, M, N, O, P, R, T, U, W, and Ng. Seven tolerably distinct dialects are spoken among them. The language is represented as rich and sonorous, well adapted for poetical expression, especially of the lyric kind. The Maoris have an abundance of metrical proverbs, legends, and traditions, of which a collection has been made by Sir George Grey. They are also passionately attached to music and song. More than five-sixths of the Maoris are now converted to Christianity. Of these, such as live within the English settlements are becoming gradually assimilated to our own colonists, for the most part wearing the European dress, etc., while those further removed are content with the blanket, which has come to supersede the native
cloth. They generally practice agriculture, but will not work very hard. They are good sailors and fishermen, and, indeed, more than a hundred coasting-vessels of a good size are now the property of natives. The Maoris, however, as a nation, although ready to imitate our manners and customs, are not quite content with our colonial rule, and have frequently raised the standard of revolt against Britain under their native chieftains. In 1861 hostilities commenced between the Maoris and the British, which terminated in favor of the latter the following year. In 1863 war broke out again, the Maoris having conspired to expel the British troops. In 1898 they massacred many of the settlers, and resisted, to desperation, the troops sent to quell them—a feat accomplished the following year. Pop. 68, only 38,640.

MAORMOR, the old equivalent of the earl in Scotland, an official similar to a maor (q.v.), but placed over a province instead of a thanage, an earldom or county instead of a barony, exercising the office of royal deputy or steward over the territory of which he had at a still earlier period been the independent lord, and probably retaining to himself the third part of the royal revenues and prerogatives. Prior to the introduction of feudalism, Scotland seems in theory to have been subdivided into maormordsom, each made up of the maormor's portion and the king's, in later language, the earldom and the regality, over both of which the maormor exercised his office, though the former was, in a special sense, his own. Practically, however, in certain of these districts the king retained both maormord and regality in his own hands, and the maors held their thanages directly of the sovereign, without the intervention of a maormor. As the feudal system extended, the maormors were converted into earls, who were confined within the limits of their own districts, the earl of Fife alone retaining the privilege of exacting his rights over the whole province.

MAP (Lat. mappa, a towel). A map is a delineation, on a plane, of some portion of the surface of a sphere, celestial or terrestrial, on which the objects intended to be shown are traced, whether stars or towns, mountains, etc. Terrestrial maps are termed geographical, when they refer to the land; and hydrographical maps, or charts, when they delineate the shores of the sea. A perfect representation of a country, with all its parts in true proportions and relative positions, may be made on a globe; but, since the surface of the earth is spherical, it is not possible so to delineate any large portion of it on a plane as to retain these properties. Hence geographers resort to different methods of representation called projections (q.v.), which are for the purpose—whether real or imagined—from different points of view, or approximative developments. The five principal projections are— the orthographic, the stereographic, the globular, the conical, and the cylindrical, or Mercator's.

In the first of these, the flat surface on which the map is drawn is supposed to pass through the center of the earth, and according to the distance of the eye, the projection is either of the first, second, or third kind. In the orthographic, the eye is assumed to be at an infinite distance from the center of the earth, so that all rays of light proceeding from every point in its surface are parallel and perpendicular.

From the nature of this projection, it is evident that while the central parts of the hemisphere are almost accurately represented, towards the circumference the countries are crowded together and diminished in size. On this account it is of little use for geographical, though of considerable value for astronomical purposes. In the stereographic, the eye or point of projection is assumed to be placed on the surface of the sphere opposite the one to be delineated. If the globe were transparent, the eye would then see the opposite concave surface. Contrary to the orthographic, this method contracts the center of the map, and enlarges it towards the circumference. Owing to the unequal area of the divisions, and the difficulty of finding the true latitude and longitude of places, this projection is not much employed. In order to rectify the opposite effects of the two preceding, the globular projection, a modification of the first of the two, is generally adopted. If we suppose the eye to be removed from the surface to a distance equal to the sine of 45° of the circumscribing circle, the projection is called globular. In other words, if the diameter of the sphere be 200 parts, it must be produced 70 of these parts in order to give the point of projection.

All meridians and parallels in this projection are in reality elliptical curves, but as they approach so nearly to being circular arcs, they are very rarely shown otherwise.

The construction of the globular or equidistant projection is as follows (fig. 1): Describe a circle N.E.S.W., to represent a meridian, and draw two diameters, N.CS and W.C.E,
perpendicular to each other, the one for a central meridian, the other for the equator. Then N and S will represent the north and south poles. Divide each of the quadrants into 9 equal parts, and each of the radii CN, CE, and C also into 9 equal parts. Produce NS both ways, and find on it the centers of circles which will pass through the three points 80 x 80, 70 y 70, etc., and these arcs described on both sides of the equator will be the parallels of latitude. In like manner, find on WE produced, the centers of circles which must pass through a, b, c, and the poles. Having selected the first meridian, number the others successively to the east and west of it. A map in this way may be constructed on the rational horizon of any place.

The impossibility of getting a perfect representation of special parts of the sphere by any of the previous methods, led to the desire for others less defective. Of all solid bodies whose surfaces can be accurately developed or rolled out upon a plane without alteration, the cone and cylinder approach nearest to the character of the sphere. A portion of the sphere between two parallels not far distant from each other, corresponds very exactly with a like conical zone; whence it is that conical developments make the best projections for special geographical maps, and even with some modifications for large portions of the globe.

A conical projection of Europe (fig. 2) is constructed thus: Draw a base line AB of indefinite length; bisect it in E, and at that point erect a perpendicular ED, to form the central meridian of the map. Take a space for 5° of latitude, and since Europe lies between the 35th and 75th parallels of latitude, mark off eight of these spaces along ED for the points through which the parallels must pass. The center from which to describe the parallels will be the point in ED where the top of a cone, cutting the globe at the 45th and 65th parallels, would meet the axis of the sphere. This point will be found to be beyond the north pole at C. Since on the parallels of 45° and 65°, where the cone

![Fig. 2.—Conical Projection of Europe.](image)

![Fig. 3.—Mercator's Projection.](image)
table of meridional parts (a table of the number of minutes of a degree of longitude at the equator comprised between that and every parallel of latitude up to 89°), take the distances of the parallels and of the tropics and arctic circles from the equator, and mark them off to the north and south of it. Join these points, and the projection is made.

This projection, of course, does not and is not intended to give a natural representation of the earth, its effect being to exaggerate the polar regions immensely. The distortion in the form of countries and relative direction of places, is rectified by the degrees of latitude being made to increase proportionally to those of longitude. This is the only map which gives an unbroken view of the whole surface of the earth.

The term map is specially applied to representations of land, or land and water together; while that of chart is limited to the coast and water surface only, showing currents, rocks, anchorage, light-houses, harbors, soundings, and other objects of importance to seamen.

A geographical map proper is a general map of the world, or of a large extent of country. A topographical map differs from it in being limited in area, and much more detailed. The ordinance survey of Britain is a good example of a topographical map. Besides purely geographical and topographical maps, others are constructed for special purposes, which may be physical, political, or civil, military, statistical, historical, etc.

In order to construct a map, and to determine accurately the positions of places on it, a knowledge of two elements is essential—viz., latitude or distance from the equator, and longitude or distance east or west of the meridian adopted.

Every map, whatever its dimensions, is in some definite relation to the actual size of the globe. This relation is indicated by a scale—a graduated line showing, by its divisions, the number of miles corresponding to any space measured on the map. The scales of geographical maps range from about 800 m. to an inch (for maps of quarters of the globe) to 10 m. to an inch; those of topographical maps range from 1 in. to 25 in. to a mile, the largest topographical maps we have, admitting of the most minute details.

The ordnance survey of Great Britain is on the scale of 1 inch to 2,***500*** of nature, or 1 in. of paper to 1 m. of surface.

A recent improvement introduced into our best maps is that of printing the water-courses in blue ink, making the orography and skeleton of every country stand out in clear relief, thus avoiding the confusion resulting from all the lines being black, as in older maps.

MAPES, JAMES J., L.L.D., 1806-66; b. New York, where he was for a time a merchant and sugar-refiner, then professor of chemistry and natural philosophy in the national academy of design. He was the inventor of various useful processes in industrial chemistry. In later years he entered into the business of a scientific agriculturist near Newark, N. J., and was very successful. His knowledge of chemistry made him an expert in fertilizers, in which he was an extensive dealer. He was for a time editor of the Working Farmer, and published many papers and addresses on chemistry and agriculture. He also published the American Repository of Arts, etc., in 4 vols., the Practical Farmer, and other works. He spent considerable time in investigating the phenomena of spiritualism, with what conclusion is unknown. Died at Newark.

MAPES, or MAP, WALTER, a famous medieval writer of Latin verse, called by lord Lyttleton "the Anacreon of the 12th c.," was b. somewhere on the frontiers of Wales (probably Herefordshire) before 1150. He studied at Paris, and on his return to England found entrance to the court, became a favorite with Henry II., and was made archdeacon of Oxford in 1190, after which he does not again appear in history. He is thought to have died about 1210. Mapes's best known piece is the drinking-song, beginning:

Neum est propositum in taberna mori,
which has been charmingly rendered into English by Leigh Hunt. It is part of a longer poem entitled Confessio Galiae. Considerable doubt, however, is now felt as to the proper authorship of the poems commonly attributed to Mapes; and Mr. Wright, who has edited them for the Camden society (1841), brings forward several reasons for concluding that the author must be a different person from Mapes. The most weighty of these reasons is, that Giraldus Cambrensis, the intimate friend of the archdeacon, severely censures the poems that went under the name of Galias, of which the famous drinking-song was one, while in the same breath he warmly praises Mapes. It is certain, however, explain it as we may, that soon after the time of the archdeacon they were regarded as his, and his name is inscribed on them in MSS. of the 14th and 15th centuries. Mapes also wrote several prose works in Latin and Anglo-Norman.

MAPIMI, a desert in n. Mexico, extending s. from the Río Grande 44° of latitude, and being about 24" in width, or about 525 sq. miles. The name is taken from a mining town of about 5,000 pop. on the border of the desert. There is very little vegetation, but the presence of gold, silver, iron, and coal is claimed. Parts of Chihuahua, Durango, and Coahuila are included in the tract.

MAPLE, Acer, a genus of exogenous trees of the natural order aceraceae. This order contains more than sixty species, natives of the temperate parts of the northern hemisphere, and particularly numerous in North America and the n. of India. They have
opposite leaves without stipules, usually lobed or palmate. The flowers are in axillary corymbs or racemes, small, but abounding in honey, and very attractive to bees. The calyx is generally divided into five segments; the petals, when present, equal in number to the segments of the calyx, grow from the margin of a fleshy, hypogynous disk. The fruit is formed of two small winged nuts, each with one or two seeds. With few exceptions, the genus *acer* includes the whole order. —The Common Maple (A. *campestre*), a small tree, is a native of Britain, and of many parts of Europe and Asia. The leaves are small, and usually five-lobed; the wood is compact, fine-grained, takes a high polish, and is much used by turners and for carved work. Several nearly allied species are found in the s. of Europe. —The Striped Bark Maple (A. *sambucinum*) of North America, where it often forms great part of the undergrowth in woods, is remarkable for longitudinal black and white stripes on its bark; and the wood, which is very fine-grained, is often used for inlaying in cabinet-work. —The Greater Maple or Sycamore (A. *pseudo-platanus*), commonly called *plane-tree* in Scotland, is a native of various parts of Europe, but a doubtful native of Britain, in which, however, it has long been common. It attains a height of 70 to 90 ft., has a spreading umbreageous head, and large, palmate, coarsely serrated leaves on long stalks. It is of quick growth, and succeeds well near the sea, and in other exposed situations. The wood is white, compact, and firm; not hard, but capable of a fine polish; and is used by wheelwrights, turners, etc. It is not apt to warp. Stair-rails are often made of it, and pattern-blocks for manufactories, as well as bowls, bread-plates, etc. Sugar is sometimes made from the sap of this tree, as from that of several other maples; but the species which yields it most abundantly is the Sugar Maple (A. *saccharinum*) of North America, a species which much resembles the sycamore, and abounds in the northern parts of the United States and in the British possessions, where large quantities of sugar are made from it, although only for domestic use. The trees of this species have generally slender trunks, which, in winter, are readily broken. To obtain sugar, holes are bored in the trunk when the sap is ascending, early in spring, before the winter frost has passed away, in an obliquely ascending direction, at no great distance from the ground, at first only to the depth of half an inch, but afterwards deepened to 2 in.; and the sap thus collected is evaporated in boilers over a brisk fire, to the consistency of syrup, strained and poured into molds, in which it crystallizes into a coarse gray or brown colored sugar. It is sometimes afterwards refined. Four gallons of sap yield about 1 lb. of sugar. A single tree yields from 2 to 6 lbs. in a season. During the sugar-making season, sheds are erected in the woods for the boiling and other processes of the manufacture. The sap cannot be kept long after being collected. Good vinegar is made from it, and a kind of molasses much superior to that from the sugar-cane, and much used in America with buckwheat cakes, etc. The wood of the sugar maple has a satiny appearance, and is used for cabinet-making; it is sometimes finely marked with undulations of fiber, and is then known as bird's-eye maple, and is used for veneers. The cultivation of the sugar maple in Europe, for the sake of its sugar, has of late been much advocated. It is not so hardy in the climate of Britain as the sycamore, and seems to require a dry and sheltered situation.—The Norway Maple (A. *platanoides*) is a native of the n. of Europe, although not of Britain, and is also found in North America. It much resembles the sycamore, and its wood is used for the same purposes. It is pretty common in plantations in Britain. —A Himalayan species (A. *villosum*), a noble tree, found with pines and birches of great elevations, has recently been introduced into Britain.

MAQUET, Auguste, b. in Paris, 1813; educated at the college Charlemagne, where he was for a time teacher. Having written the drama entitled *Bathilde*, he was introduced to Alexandre Dumas to have it examined. The latter was struck with his talent, and proposed their working together. It is said that a considerable part of the romances which Dumas published previous to 1845 were largely from Maquet's pen. In 1851 he began publishing romances under his own name, which are highly appreciated in France. He has been president of the commission of dramatic authors and composers. His work in aid of Dumas embraced fifteen of his most famous novels. Under his own name since, are the romances *Histoire de la Bastille; Prisons de l'Europe; Belle Gabrielle;* and many others. For the theater he has prepared *La Fronde*, an opera; *Le Château de Gaulter; Le Captot de Bayasrie; La Belle Gabrielle;* and many others, in addition to the joint works of himself and Dumas, most of which he dramatized.

MAQLI, Aristotelis *maqui*, the only known species of a genus of plants sometimes referred to the natural order *tilicosan*, and which has also been made the type of a proposed order. It is an evergreen or sub-evergreen shrub, of considerable size, a native of Chili. The flowers are small, green, and yellow, in axillary racemes of no great beauty. The fruit is a three-celled berry, about the size of a pea, black, acid, and eelatable; the Chilian make a wine from it. The wood is used for making musical instruments, and the tough bark for their strings. The maquila sometimes ripens fruit against a wall in England, and is frequently cultivated as an ornamental shrub.

* MARA'OOU FEATHERS. See ADJUTANT. *

MARABOU' STORK, the African name of the adjutant stork, pouched adjutant, or argila of India. The sausage-like pouch which hangs from its neck is capable of being inflated, giving the bird a strange appearance. It is gregarious in its wild state, fre-
quanting the mouths of rivers, and living upon animals too large for other storks to swallow. It is easily domesticated, but its exceeding voracity impels it on every occasion to purloin chickens, turkeys, legs of mutton, cats, puppies, etc., swallowing them whole. Land tortoises 10 in. long have been found in its maws. See Adjutant, ante.

MARABUTS, a name given to the descendants of the Moravides (Arab, frontier inhabitants), a certain Arabic tribe, which, in 1053, founded a dynasty in the north-western parts of Africa, and held Morocco and Spain for a considerable period. The Almohads having put an end to their temporal dominion, their descendants exercise to this day a kind of spiritual superiority over the Moslem negroes in Barbary, the coast of Guinea, etc. They form a kind of priestly order, officiating at mosques and chapels, explaining the Koran, providing the faithful with amulets, prophesying, and working miracles. They are looked up to with great awe and reverence by the common populace, who also allow them a certain vague license over their goods and chattels— their wives not excluded. The great marabout ranks next to the king, and the dignity of a marabout is generally hereditary. One of the most eminent marabouts of our day was the late Abd-el-Kader (q.v.).

MARACAYBO, a fortified city of the South American republic of Venezuela, is situated on a sandy plain on the w. shore of the strait which connects the lake of Maracaibo with the gulf of the same name. Lat. 10° 45' n., long. 71° 40' w. It is the chief town of the state of Zulia (formerly called Maracaybo), comprising the territory surrounding the lake of Maracaibo, and containing 33,075 sq. m., and a pop. of about 90,000. It is a handsome town, with a hot but healthy climate, and has a harbor deep enough to contain the largest vessels, but inaccessible to them, owing to the shifting bar at its mouth. The chief articles of export are cacao, coffee, hides and skins, pistache, dividivi, the balsam of copaiba, and cotton. In 1871-72, 23,000,000 lbs. of coffee were exported. Pop. '73, 21,951.

MARACAYBO, LAKE AND GULF. The lake of Maracaibo, in the n. of Venezuela, is about 100 m. in length and 70 m. in breadth. It is of considerable depth, but the bar at its mouth prohibits the entrance of large vessels. It is connected with the gulf of the same name by a strait upwards of 20 m. in length, and from 5 to 10 m. in breadth. The gulf is a wide inlet of the Caribbean sea, 150 m. from c. to w., and about 75 m. from n. to south.

MARAGA, an old t. of Persia, in the province of Azerbaijan, 50 m. s. of Tabriz, on a tributary of lake Urumiah. It is surrounded by walls, and was long the capital of the province. It contains two bridges of the 11th c., and the remains of the observatory of the celebrated medieval astronomer, Nasir Edin. Pop. '15,000.

MARAOI, an island on the n.e. coast of Brazil, belonging to the province of Para, and situated between the estuaries of the rivers Amazon and Para, is 180 m. in length by 125 m. in breadth. In the n.e. it is somewhat elevated, without trees, and covered by herds of cattle. The western portion is low, and watered by numerous streams. Pop. estimated at 20,000.

MARANHAM, or Maranho, a rich and important maritime province of the empire of Brazil, is bounded on the n. by the Atlantic ocean. Area, 141,939 sq. m.; pop. '73, 380,000. The surface is uneven, but there is no range of mountains. It is quadrilateral in shape, and is watered by numerous rivers, which, falling into the Atlantic, traverse its whole length in a direction parallel with its sides. Its climate is fine, and its soil produces vast quantities of rice, for the production of which it is peculiarly fitted. Cotton, sugar-cane, and fruits are also extensively grown. Its surface is still to a great extent covered with forests; iron and lead ores and antimony have been discovered; and sheep, cattle, and horses are extensively reared.—The chief city is Maranham, or São Luiz de Maranham, the fourth in rank and importance, and the best-built city in the Brazilian empire. It is situated on an island of the same name, in lat. 2° 30' s., long. 44° 18' w., is remarkably clean, gay, hospitable, and prosperous, and has a pop. of 36,000. Maranham is the seat of a bishop, contains a cathedral, 10 churches, several monasteries and convents, a lyceum, and other educational institutions.

MARANO, a t. of the province of Naples, situated on a gentle slope 4 m. from Naples. Pop. '73, 30,000.

MARANÓN. See Amazon, ante.

MARANS, a t. of France, department of Charente-Infrérieure, near the union of the Sèvre-Niortaise and the Vendée, 13 m. n.e. of La Rochelle; pop. 3,217. It is well built, has a good bridge over the Sèvre, which is navigable here for vessels of 100 tons. By a canal recently constructed, ships of 300 tons can come to the town. The trade is principally in corn, wine, brandy, hemp, flax, timber, and salt. The surrounding country having been recovered from the sea, abounds in salt marshes, and is intersected by canals.

MARANTA, or Cannaceae, a natural order of endogenous plants, very nearly allied to selaminaceae (q.v.), and differing chiefly in having all the stamens petal-like, and the one fertile stamen lateral. They are destitute of the aromatic property so general in the selaminaceae. There are about 160 known species, all tropical or sub-tropical. They
are all herbaceous perennials. Not many of them are large or notable for the beauty of their flowers. The tuberous root-stocks of many abound in starch.

**MARATHON.** See Liqueur.

**MARATHUS,** a pashalic of Asiatic Turkey, is bounded n. by that of Sivas, e. by Dianbekis, s. by Aleppo, w. by Karamania. The greatest length is 130 m. and breadth 105 m.; pop. 248,000. It belongs to the basin of the Euphrates and the Jyhoon. The former river is the e. boundary, while the latter rises near its center and flows through it s.w. The district is mountainous and wooded except in the valleys of these rivers. It is crossed from w. to e. by the Taurus ridge and by the Anti-taurus and the Durdun Tagh. The climate is mild, and the country is well adapted to pasturage. The capital is Marash on the Jyhoon, 60 m. n.e. from the sea.

**MARATOS** is a term which was somewhat vaguely used by the older medical writers to designate those of general emaciation or atrophy for which they did not see any special cause. The word is now seldom used except occasionally as a synonym for *tabes mesenterica,* or tubercular disease of the mesenteric glands. See *Mesentery, Mesenteric Disease.*

**MARAT, JEAN PAUL,** one of the most infamous characters of the French revolution, b. 1744, of Protestant parents, at Baudry, in Neufchâtel. He spent some of his early years in Britain; published several treatises in London; acted as a teacher of languages in Edinburgh; and underwent punishment for stealing some valuable medals from the museum in Oxford. Afterwards returning to Paris, he practiced an inferior branch of the medical profession until the revolution brought him into prominence as a demagogue. His features and appearance were grotesque, his look wild, and his speeches extravagant, the ludicrous mingling with the terrible. His influence over the lowest classes, however, soon became great. He issued a journal, which he at first called the *Publiciste Parisien,* but afterwards the *Ami du Peuple,* which is historically connected with some of the most fearful events of that period. No falsehood was too monstrous to be published in it, no atrocity too great to be recommended. It was in a great measure the influence of Marat which led to the cruelties and massacres of Sept., 1792, in the midst of which he was elected a member of the convention, but on his appearance there he was received with almost universal expressions of abhorrence. No one would sit beside him, and when he attempted to speak a tumult always arose. His journal, now the *Journal de la République,* became more furious and sanguinary than ever. He demanded the sacrifice of 270,000 heads, and defended this in the convention, saying that if these were not granted, he would demand more. During the king's trial, he was urgent for his immediate execution, and in his journal called upon the people to slay 300,000 of the adherents of the old régime, and to reduce the convention to one-fourth. In April, 1793, Marat obtained the enactment of the fearful law against suspected persons, in virtue of which 400,000 were imprisoned. Robespierre, Danton, and Marat were now the triumvirate which ruled France. But on July 13, 1793, Marat was stabbed in his own house by Charlotte Corday (q.v.). This event was followed by some of the worst atrocities of the reign of terror: streams of blood flowed, as was said, to the manes of Marat, whose likeness, with gaping wounds, painted by David, was exhibited on an altar in the court of the Louvre, and then hung up in the convention; whilst it was decreed that his housekeeper, whom he had married "one fine day, in the presence of the sun," should be maintained at the expense of the state. A decree of Nov. 4, 1793, gave to Marat's remains the honors of the Pantheon; but they were cast out of it again on Nov. 8, 1795, and his picture was removed from its place in the convention.

**MARATEA,** an Italian town of the province of Basilicata, situated on the slope of a mountain, in the midst of a lovely and salubrious country. P. 6,480.

**MARATHON,** anciently, a village on the e. coast of Attica, about 20 m. n.e. of Athens, now called Marathon, or, according to Leake, the present Vrama. It was situated in a plain of the same name, about 6 m. in length and 3 in breadth, with a background of mountains in the w., and a marsh both on the n. and s.; eastward, it reaches the sea. Byron's lines in the *Isles of Greece* correctly describe it:

- The mountains look on Marathon—
- And Marathon looks on the sea.

It is gloriously memorable as the scene of the grand defeat of the Persian hordes of Darius by the Greeks under Miltiades (490 B.C.).

**MARATHON (ante),** was named from the hero Marathos, and known in Homer's time. Here legend relates that Eurystheus was overcome by the Heraclidæ and Iolaus, and here took place the contest of Theseus and the bull. When Pisistratus was driven from Athens to Euboea, Marathon was the first place occupied by him on his return. On the day of the great battle the Persian forces were under the command of Datis and Artaphernes, while Miltiades had eleven generals under his orders. Ancient writers differ widely in their estimate of the numbers of the invading forces. Plato declares that there were 300,000 in all; Trogus Pompeius, 600,000, but Cornelius Nepos says that of the effective force, there were 100,000 foot soldiers, and 10,000 cavalry. This last estimate is probably near the truth, as it agrees closely with the statement of Herodotus.
that the whole force was transported in 600 triremes, each carrying 200 men. All writers agree that the Greeks numbered about 10,000; so it is safe to say that they were outnumbered at least ten to one. They were materially assisted, however, by their slaves, who are not included in the 10,000. The result of the battle was due to the rigid discipline of the Greeks, in comparison with whom the Persians were but an unruly mob, and to the military genius of Miltiades. Of the 10 generals, 5 were opposed to giving battle, and the deciding vote of the polemarch was given at Miltiades's urgent persuasion. Each general in succession held the chief command for one day, and it was so arranged that the battle should take place on the day when Miltiades was in command. The Persians lost about 6,400 men; while of the Athenians only 192 fell.

Among them, however, was the polemarch Callimachus, Stresbius, one of the generals, and several men of high rank. Remains of the weapons used in the contest are still to be found on the field. Two mounds or tumuli were erected in the center of the plain, one commemorating the valor of the Athenians who perished, and setting forth their names and rank on carved pillars, and the other raised for the Plataeans and slaves. The remains of these tombs, and of the marble trophies erected, may still be seen.

MARATHON, a co. in n. Wisconsin, area, 5,520 sq.m.; pop. '80, 17,121; foreign, 6,451. It is drained by the Wisconsin river, and its tributaries, the Big Eau Claire, Big Eau Pleine, Little Eau Pleine, Clover, and others. The surface is level, and much of it is covered with a heavy growth of timber—ash, beech, birch, elm, maple, and pine. The principal crops are wheat and oats. The manufacture of pine lumber is extensively carried on. The Wisconsin Central, and Wisconsin Valley railroads pass through it. Co. seat, Wausau.

MARATTA, or MARATTI, CARLO, 1625-1713, a Roman from the Marches of Ancona: an enthusiastic disciple of the Raphael school; an admirable copyist, and one of the most conscientious and skilful of painters in restorations. It is to his unwarried industry that modern times are indebted for the degree of preservation that the grand frescos of the Vatican and the masterpieces of Raphael in the Farnese palace and elsewhere have exhibited. They had already, in his time, so altered as to threaten soon to be ruined. Maratta opposed the tendency to immense frescos, and dissuaded his pupils from works of unusual size. His forte lay in paintings where the Virgin Mary was the principal subject, and of this class nearly every gallery in Europe has his works. But he was author also of other pieces of great merit. His daughter Maria, married to Zappa, was both poet and painter.

MARAUDING (a word common, under orthographic variations, to most of the European languages, and, probably, of identical root with the verb "to mar") is irregular plunder or violence offered to the inhabitants of a country by the individuals of an army. In all armies where discipline is maintained, marauding is, at least professedly, punished by death; the provost-marshal having power to inflict that penalty summarily on all offenders taken in the act.

MARAVE Di, an old Spanish coin, either of vellon, worth about two-sevenths of a farthing; or of silver, worth five-sevenths of a farthing.

MARBEAU, JEAN BAPTISTE FRANCOIS; b. at Brives, in Corrèze, France 1708. After practicing and writing upon law for some years, he became interested in the unfortunate condition of certain classes around him; and in 1844, while engaged in making a report on the asylums in his neighborhood, he became greatly interested in the uncared-for children of mothers who are obliged to go out to work as soon as their children cease to nurse. He felt that there was a gap in benevolent asylums for children, and could not rest till he had done something to fill it. He opened the first crèche, or infant asylum, in France, and wrote a work entitled Des Crèches, which has been translated into several languages. The profits of its publication he gave to the infant asylums of his own neighborhood. From the beginning made by him the system has extended through France, the civilized countries of Europe, and to the United States. In 1871 there were 81 asylums for infant children in France alone. Marbeau's philanthropic works, besides Des Crèches, are: Politiques des Intérêts, ou Essai sur des Moyens d'améliorer le Sort des Travailleurs (Paris, 1834); Etude sur l'Economie social (1844); Du Passerimen en France et des Moyens d'y porter Remède, ou Principes d'Economie charitable (1847); De l'Indi- gence et des Secours (1850).

MARBECK, JöNH, d. about 1585, was organist of Windsor in the reign of Henry VIII. and his successor. An association having been formed in 1544 in support of the Lutheran doctrines, Marbeck joined it. Among the members were a priest, a singing man of St. George's chapel, and a tradesman. They were arrested on a charge of heresy. Their papers were seized, and in Marbeck's handwriting were found notes on the Bible and a concordance in English. The special charge against him, it is said, was that he had copied an epistle of Calvin against the mass. They were all condemned to the stake, but Marbeck, on account of his musical talents, and through the interposition of Gardiner, bishop of Winchester, was pardoned, and restored to his place as organist. He lived to see the triumph of his principles, and to publish his work, The Boke of Common Prater, noted. A new edition was published by Robert Jones, of Ely cathedral, entitled Marbeck's Book of Common Prayer, for voices in unison, arranged for modern use, with an ad
Marathon.

Marble.

Cibolium organ bass accompaniment. He finished also his Concordance. A Te Deum of his, and a mass for five voices, are found in Smith's Musica Antiqua, now in the British museum. In 1574 was published The Lyes of Holy Satyres, Prophets, Patriarches, and others; and afterwards, The Holie Historic of King David, drawn into English metre; A Rippling Up of the Pope's Fardel.

MARBLE, in its strict and proper sense, is a rock crystallized in a saccharoidal manner, having the fracture of loaf-sugar, and composed of carbonate of lime, either almost pure when the color is white or combined with oxide of iron or other impurities which give various colors to it. But many other kinds of stone are popularly included under this title. Indeed, any limestone rock sufficiently compact to admit of a polish is called marble. It is only in this vague sense that the indurated amorphous rocks used in this country can receive this name. Such are the black, red, gray, and variegated limestones of the old red sandstone period, found in Devonshire, which are very beautiful from the numbers of exquisitely preserved corals which abound in them; the marbles of the carboniferous series from Flintshire, Derbyshire, and Yorkshire, so full of encrinutes; the shell marbles from the oolite rocks at Rance, Stamford, and Yovil; and the dark Purbeck and Petworth marbles, beautifully "figured" with shells, from the wealden strata, which were so much used by the architects of the middle ages.

Sacrecharine or statuary marble is a white, fine-grained rock, resembling loaf-sugar in color and texture, working freely in every direction, not liable to splinter, and taking a fine polish. Of the marbles used by the ancients the most famous are: Parian marble, a finely granular and very durable stone, with a waxy appearance when polished. Some of the finest Grecian sculptures were formed of this marble, among others the famous Venus de Medicis. The marble of Pentelicus was at one time preferred by the Greeks to Parian, because it was whiter and fluer grained. The Parthenon was entirely built of it, and many famous statues still remain which were executed in this marble, but they are always more or less weathered, never retaining the beautiful finish of the Parian statues. The quarries at Carrara were known to the ancients, but they have been more extensively wrought for modern sculptors, who use this marble chiefly. It is a fine-grained, pure white marble, but is so often traversed by gray veins that it is difficult to get large blocks free from them. Of colored marbles, the best known are the rossio antico, a deep blood-red, sprinkled with minute white dots; verde antico, a clouded green produced by a mixture of white marble and green serpentine; giallo antico, a deep yellow, with black or yellow rings; and nero antico, a deep black marble.

The crystalline structure of marbles may be the original condition in which the rock was formed as a chemical deposition, in the same manner as some stalactites are crystalline, but there can be no doubt that they principally owe their structure to metamorphic action which has taken place subsequent to their deposition. This action having, at the same time, destroyed all trace of fossils, marbles were considered formerly as belonging to the primitive or metamorphic series of rocks; but, while they generally are members of one of the pelitic formations, it is now known that some of the statuary marbles of Greece and Italy are secondary, and others even tertiary limestones.

MARBLE (ante). Unstratified statuary marble is white in consequence of the action to which it has been subjected during some stage of its metamorphism. It is well known that blue limestone when burned becomes white, and this discharge of color will take place even before the carbonic acid gas is expelled. Marbles may be nearly pure carbonate of lime, or they may contain a large proportion of marine matter, magnesia, in fact, may be metamorphic dolomites (q.v.). The finest statuary marble is worth from $15 to $20 per cubic foot. The Grecian and Italian marbles have been described in the preceding article. In the United States, good statuary marble has for several years been quarried at West Rutland, VT., where a layer from 3 to 4 ft. thick is interstratified with 40 or 50 ft. of clouded marble. The finest of statuary marble is found at Pittsford, VT., where there is a bed 20 ft. thick, from which blocks have been taken capable of taking a very fine finish, in some respects perhaps superior to Carrara, although not working with quite equal facility. Some specimens have a faintish flesh tint, scarcely perceptible, which gives a very fine effect to busts, which, as is well known, are always improved by age, when made of marble too glaringly white. The greater portion of the marble in all quarries is more or less clouded, and most of the ancient temples are built of this kind. The Vermont marbles are of the age of the Trenton limestone, forming a part of the eolian limestone of prof. Hitchcock, which in that locality is about 2,000 ft. thick. At West Rutland the quarry is from 70 to 80 ft. thick, and at Pittsford 400 ft. thick. This marble belt extends n. and s. of Rutland co., through Vermont and Massachusetts, but it loses in quality in both directions. Towards the n. it is finer and harder, but less sound, and towards the s. it becomes coarser. Another belt of white marble extends along the flanks of the Alleghanies, through a part of Massachusetts, through New York and Maryland, and into Virginia beyond the Potomac river. This marble is a dolomite, and coarsely crystalline. It is quarried at various places in Westchester co., N. Y., and at Baltimore. At Canaan, Conn., and at Lee, Mass., and other places in New England, good building marble is quarried. Marble from Lee was used for the extension of the capitol at Washington. There are many varieties of colored marbles, and these are plain or
variegated. There are plain black, red, blue, gray, and yellow marbles. A jet black marble was used by the ancients. A kind found in Italian ruins is called Nero antico, and is now used for a ground-work for mosaics. Black marbles occur at Derbyshire, England, Kilkenny, Ireland, and at Shoreham, Vt. At Glenn's Falls, N. Y., there is a black limestone, which is used alternately with white marble for tiles, which goes under the name of black marble. The colored marbles were largely used by the Romans and Egyptians. After the advent of the Romans, the Architect had a great hand in the general architecture was called cipollino, and had much the appearance of gray granite. The columns of the temple of Jupiter Serapis were constructed of this stone. There are many localities of variegated marbles in the United States. A mottled lilac, chocolate, and white, known as Tennessee marble, is regarded with favor for mantels, tables, etc. Another of red, brown, and white is quarried at Burlington, Vt., but it is rather difficult to work on account of the silica it contains.

The opening of a marble quarry is usually expensive and attended with risk, as it is impossible to determine the quality of the stone before many feet thickness of rock is removed. From 10 to 30 ft. usually has to be taken off before perfectly sound disintegrated marble is reached. After a sufficient area of surface has been prepared by the removal of the imperfect stone, channeling machines, which may be either percussion or diamond drills, are set to work, and rectangularly crossed channels are cut to a desired depth, say from 5 to 7 feet. One of the blocks, called the key block, is then broken off at the base by wedging and lifted out with a crane. This gives the access to the others, which are then drilled as circumstances may require, broken off by wedging, and removed to a saw-mill, where they are squared or sawed into slabs.

MARBLE, MANTON, b. Worcester, Mass., 1835; graduated at the Rochester university in 1855, and made his entrance into journalism in Boston, where he was connected with the Journal and Praces. He removed to New York in 1858, and was employed during the next two years on the literary and editorial staff of the Evening Post. In 1861 he united with others in founding the World, of which he eventually became sole proprietor. Under his management this paper gained great influence as an organ of the democratic party, and a vigorous exponent of the principles of free trade. Early in 1876 he retired from the World, and was closely connected with the political movements consequent to the presidential election of that year, which was in dispute between Samuel J. Tilden and Rutherford B. Hayes.

MARBLEHEAD, a sea-port t. of Massachusetts, on Massachusetts bay, 16 m. n.e. of Boston. Its population was formerly devoted to the fisheries, but is now also largely engaged in manufacturing, chiefly boots and shoes. The town was settled by emigrants from the Channel islands. At the close of the revolutionary war there were 600 widows; and at the end of the war of 1812, 500 citizens of Marblehead were prisoners of war in England. Pop. 1870, 7,708.

MARBLEHEAD (ante) is built upon an elevated and rocky peninsula, 4 m. in length, and 2 m. in width, projecting into Massachusetts bay. It was once a part of Salem, which it joins on the west. It is connected with Boston, Portland, etc., by a branch of the Eastern railroad. It has a deep and very convenient harbor, but the shipping interest, formerly large, has declined of late. It has two national banks, a savings bank, excellent schools, a newspaper, and well established and prosperous churches. Many of the quaint peculiarities of the first settlers from the Channel islands may still be observed in their descendants. The place presents many features of interest. It has always been distinguished for patriotism, furnishing 1000 men to the revolutionary army. In the war for the suppression of the rebellion it furnished 1440 men. A wide-spread fire destroyed a large part of its business section in 1877.

MARBLES, PLAYING, are little balls of marble or some other hard substance, used as playthings by children. They are manufactured in great quantities in Saxon for export to India, China, and the United States. A hard calcareous stone is used in Saxony, square blocks, about 150 of those blocks are thrown together into a mill. This mill is generally constructed of a stationary flat slab of stone, which has numerous concentric furrows upon its face. A block of oak of the same diameter, part of which rests upon the small stones, is made to revolve over this, while water flows upon the stone slab. The whole process requires but a quarter of an hour, and a single mill can manufacture 20,000 marbles a week. The mills at Oberstein, on the Nahe, in Germany, manufacture marbles and agate especially for the American market.

MARBOIS, BARBE. See Barbe-Marbois, ante.

MARBURG, an interesting old German t., in the Prussian province of Hesse-Nassau, on both banks of the river Lahn 50 m. n. of Frankfort-on-the-Main, and 49 m. s.w. of Cassel. Its situation is strikingly beautiful. It is placed chiefly on a hill, round which are built quaint old-fashioned houses, interspersed with buildings of a later date, and separated by terrace-gardens. The hill is crowned by the stately burg or castle, while at its base extends the lovely valley of the Lahn. Of the ecclesiastical edifices, the principal is the fine Gothic church of St. Elizabeth, begun 1255, completed 1283, having two towers 303 ft. in height. It was erected in honor of St. Elizabeth (q.v.), daughter of
Andreas II. of Hungary, and wife of Ludwig, landgraf of Hesse and Thuringia. From her, the ancestress of the Cassel and Darmstadt branches of the house of Hesse, is descended the present princess (Alexandra) of Wales. The castle of Marburg was built in 1065. In one of its halls, the conferences between the Wittemberg and Swiss reformers regarding the Lord’s supper took place. The university of Marburg was founded in 1537 by Philip the magnanimous, landgraf of Hesse, and soon became one of the most flourishing in Protestant Europe. Among its earliest students were the celebrated Patrick Hamilton, and William Tyndale, the translator of the English Bible. The university has four faculties—theology, jurisprudence, medicine, and arts; and comprises about forty professors, twenty lecturers, and from 300 to 400 students. It contains a library of 130,000 volumes. Extensive potteries and tanneries are in operation. Pop. ’75, 9,658.

MARC ANTONIO. See RAIMONDI, ante.

MARCEA'TO, in music, means in a strongly accented or marked manner.

MARCEAU, FRANÇOIS SÉVERIN DES GRAVERS, 1769-96; a soldier and officer of the first French revolution, who joined the army as a private at the age of 16. In 1789 he participated actively in the capture of the Bastille; in 1792 was in the army of the Ardennes commanded by Lafayete. When the latter was forced to fly to avoid the guillotine of the Jacobins, Marceau persuaded the subordinate officers to remain, in a barracks, closing with these words—"Our country, and not our generals, is to be defended." He continued to act faithfully in accordance with this sentiment. In 1793, at the age of 24, he was made gen. of division; and in all the campaigns—under Württemberg in the Vendées, under Kleber and Jourdan—he maintained a character for chivalric courage and devotion to the republic that made his early death a grief to all France.

MARCELLINUS, SAINT, b. Rome, 3d c. d. 304; elected pope, 295. But little is known of his life or administration. There is an account, said to be fabulous, of a synod held at Sinuessa, in 303 or 304, during the DIOCLETIAN persecution; and Marcellinus is said to have confessed before this synod that, at the instance of DIOCLETIAN, he had offered incense to Vesta and Isis. The synod is said to have deposed Marcellinus, who, with many members of the synod, was put to death by DIOCLETIAN. The story is denied by Augustine and THEODOR, and is now not credited by either the Roman Catholics or the Protestant controversialists. Dr. DÖLLINGER, in his work Fables Respecting Popes in the Middle Ages, attempts to show that the story of the deposition of Marcellinus is a fabrication of later times. The Roman church commemorates Marcellinus April 24.

MARCELLO, BENEDETTO, 1668-1739; b. Italy; son of Agostino Marcello, a Venetian senator. He studied music under Gasparini and Lotti, and produced his first valuable composition in 1716, a serenata in honor of the birth of the eldest son of the emperor CHARLES VI. The work to which he owes his fame appeared in 8 vols., 1724-28, under the name of Rete Nuova. Macello Primo fu sopra i 50 primi Stvni, Poesie di G. A. Graugani, musiche de B. Marcello, Patrizio Venezia. The characteristics of his musical style are melody and simplicity, and a sound good taste.

MARCELUS, the name of two popes, of whom the latter deserves special notice, as having, when cardinal Marcello Cervini, taken a very prominent part in the discussions of the council of Trent, over which he was appointed to preside as legate of JULIUS III. He is also remarkable from the minor but curious circumstance of his not complying with the ancient custom by which the pope, on his election, lays aside his baptismal name, and assumes a new one. Marcello Cervini retained on his elevation the name which he had previously borne. He was elected Mar. 9, 1555, and survived his elevation but 22 days.

MARCELLUS, M. CLAUDIUS, a famous Roman gen., of one of the most eminent plebeian families. He was consul for the first time in 222 B.C., and obtained a decisive victory over the Insubrians in Cisalpine Gaul, slaying with his own hand their king, Birothomatas or Viridomarbus, whose spoils he dedicated to Jupiter, and was honored with a triumph. This was the third and last occasion in Roman history on which spolia opima were offered to the gods. In the second Punic war, Marcellus fought as praeto, in 216 B.C., against Hannibal at Nola, in Campania; and the victory which he gained was the more important, as it showed that Hannibal was not invincible, and that the Romans had not been irreparably overthrown at Cannae. In the course of two years he thrice repulsed the Carthaginian gen. at this place. Being consul again in 214 B.C., he was intrusted with the command of the war in Sicily. He took Segesta, and reduced to 2,000 Roman deserters whom he found there and then advanced against Syracuse, which he tried to storm. All his efforts were rendered unavailing by the skill of Archimedes (q.v.), and he was compelled to regularly blockade the city. Famine, pestilence, and ultimately treachery on the part of the Spanish auxiliaries of the Syracusans, enabled Marcellus to make himself master of the place (212 B.C.), after which the remainder of Sicily was soon brought under the dominion of the Romans. He was the first Roman gen. who adopted the practice (afterwards so common) of despoiling conquered cities of their works of art. In 210 B.C. he was again consul, and was again opposed to Hannibal, with whom he fought an indecisive battle at Numistro, in Lucania, and by whom he was defeated at Canusium, in Apulia, in 209 B.C., but on the day following retrieved the defeat. In 208 B.C. he was for the fifth time elected to the consulate, and assumed once
more the command of the Roman army against Hannibal. When out reconnoitering one day he fell into an ambuscade, and was slain. The Carthaginian gen., treated his remains with honor. It ought to be noticed that the accounts of Marcellus's life given by Livy, Plutarch, and others, are believed to be very much colored and distorted—as Polybius, one of the best and most trustworthy authorities on the Punic war, denies that he ever defeated Hannibal at all!

MARCH, the first month of the Roman year, and the third according to our present calendar, consists of 31 days. It was considered as the first month of the year in England until the change of style in 1752, and the legal year was reckoned from Mar. 25. The Anglo-Saxons called it *Ilied mnouth*, stormy month, and *Hraed mnouth*, rugged month. There is an old proverb, still used by the English and Scotch rustics, which represents March as borrowing three days from April; and in *The Complaynt of Scotland* they are thus described:

The first it shall be wind and weet;
The next it shall be snow and sleet;
The third it shall be sic a freeze
Shall gar the birds stick to the trees.

But it is disputed whether these "borrowed days" are the last three of March or the first three of April.

MARCH, a musical composition, chiefly for military bands, with wind instruments, intended to accompany the marching of troops. There are slow and quick marches, also marches peculiar to different countries.

MARCH, a market t. of Cambridgeshire, England, 29 m. n. from Cambridge, on both sides of the Old Nen, which is here navigable for boats, and on the East Anglian railway. There is a junction of five railways at March. There is a large square market-place in the center of the town, and a splendid court-house, in which the meetings of the Middle level drainage commissioners are held. Pop. 717, 584. In the neighborhood is *March red fen*, a drained fen with an area of 8,600 acres, from which the water is pumped off by steam-engines.

MARCH, or Mora'wa, a river in Austria, rising in Moravia, flowing s.e., and then s.w., separating Hungary from Moravia, during a part of its course, and entering the Danube 8 m. w. of Presburg. It is navigable for 50 m. from the Danube.

MARCH, Alden, LL.D., 1735-1809; b. Mass.; studied medicine at Boston and at Brown university, where he received a degree in 1820. He practiced surgery for many years at Albany, N. Y. He was one of the founders of the city hospital and the medical college at Albany, professor of surgery in the latter, and president of the American medical association.

MARCH, A-axis, d. about 1462; a Valencian poet, the date of whose birth is unknown; a disciple but not an imitator of Petrarch, and among the first poets of the 15th century. His productions are remarkable for force and delicacy, as well as for loftiness of poetic conception. The early editions of his works, published in the 16th c., are now very rare; but a more complete edition, based upon them, was published at Barcelona in 1854.

MARCH, Charles W., 1815-44; b. Portsmouth, N. H.; graduated at Harvard college in 1837; practiced law in Portsmouth, and was a member of the legislature. Subsequently he removed to New York, and became a writer for the *Tribune* and the *Times*, and a correspondent of the *Boston Courier*. He was also for a time vice-consul at Cairo. He published *Daniel Webster and his Contemporaries, or Reminiscences of Congress; Sketches and Adventures in Madeira, Portugal, and the Andalucias of Spain.*

MARCH, Francis Andrew, LL.D., b. Mass., 1835; graduated at Amherst college in 1854, where he was tutor 1847-49; was admitted to the bar in New York in 1856; taught school at Fredericksburg, Va., 1852-55; appointed tutor in Lafayette college 1855; adjunct professor 1856, and in 1858 professor of the English language and comparative philology; received the degree of LL.D. from the college of New Jersey in 1870, and from Amherst in 1871; elected in 1873 president of the American philological association. His contributions to the transactions of that society and of the national educational association on philological subjects have been numerous. He has written also for the *Jahrbuch für Romanische und Englische Literatur* in Berlin. To the *Princeton Review* he has contributed articles on jurisprudence and psychology. He has published *A Method of Philological Study of the English Language; Parler and Analyser for Beginners; Anglo-Saxon Grammar; An Introduction to Anglo-Saxon; Grammar, Reader, etc.* He has also edited a series of text-books of the Greek and Latin Christian writers, of which *Latin Hymns and Eusebius* have been issued. His rank among American philologists is very high.

MARCHAND, John B., b. Penn., 1808; entered the U. S. navy in 1828; was made lieu., in 1840, commander in 1855, capt. in 1862, and commodore in 1866. He took part in the Seminole and Mexican wars, and in the war for the union, distinguishing himself in the latter at the battle of Mobile bay, Aug. 5, 1864, where he commanded the *Laokawanna*. He retired in 1870.

March. Marcion. 480
MARCHAN TIA, a genus of *hepatice* (q.v.), the type of a sub-order distinguished by the spore-cases bursting irregularly, and the spores being mixed with elaters, by some botanists elevated into a distinct order. Several species are natives of Britain, some of which are very common in moist shady situations, covering rocks, earth, etc., with their spreading green lichen-like fronds.

MARCHENA, a t. of Spain, in the province of Seville, and 33 m. e.s.e. of the city of that name, in a district rich in corn and olives. In the vicinity are sulphur baths, to which many invalids resort. Pop. 11,000.

MARCHES, the boundaries between England and Scotland, also between England and Wales. See Mark.

MARCHES, in Scotch law, mean the boundaries of property. By an ancient Scotch statute, one proprietor can compel an adjoining proprietor to join him in erecting a mutual fence, or to bear half the expense thereof. No such power exists in England or in Ireland.

MARCHES, THE, a central division of the Italian kingdom, comprising the provinces of Ancona, Ascoli-Piceno, Macerata, Pesaro, and Urbino; 3,751 sq. m.; pop. 915,419. The district is bounded on the e. by the Adriatic sea, and on the w. and n.w. by the Apennines. It is traversed by the rivers Potenza, Foglia, and one or two smaller streams. The name is derived from the Italian mare. The most important city is Ancona, a sea-port on the Adriatic, 132 m. n.e. of Rome and of very ancient origin; pop. 45,741. Great part of the country is mountainous, but not unfertile. The chief articles of export are fruit, oil, nuts, grain, and wool. Pesaro, the capital of Pesaro and Urbino, n. of Ancona, pop. 20,000, is supposed to be of Pelasgian origin, and had a bishop as early as 251 A.D. It is a sea-port town, and has a very considerable commercial trade. The cathedrals of both Pesaro and Macerata are of great interest, and the whole district is noted for its public buildings, mosaics, and works of art. An account of the separate provinces will be found under the appropriate heads.

MARCHESI, POMPEO, 1790-1858; b. Italy; a sculptor, the pupil of Canova, and afterwards professor in the academy of fine arts. His masterpiece is "The Celebration of Good Friday," a marble group in the church of S. Carlo in Milan, and his other most noteworthy works are statues of the emperor Francis of Beccaria, and Bellini, and the Goethe statue in the public library of Frankfort.

MARCHING, one of the first necessities to distinguish a body of disciplined troops from a mere crowd of men, is a regular cadenced step, taken by every individual at the same time and with the same foot. The necessity of this for harmonious action is obvious. The ancient Roman legions had military music to beat time for their march. In the feudal ages, when infantry fell into disrepute, cadenced marching was unattended to, and seems only to have been thoroughly revived by marshal Saxe. The best music for a march is found to be some simple tune, such as can readily be performed by drums and fifes. The march, besides preserving the time, acts as a preventative of fatigue.

In the British service there are the slow march of 75 paces, each of 30 in., in a minute—only used on parade; the quick march, of 110 paces, in which all evolutions are performed; and the double-quick, of 150 running paces, with the knees raised high. This last cannot be sustained for any great distance, and is employed in a charge, or in suddenly occupying a hill or some commanding position, and in a few short internal movements of regiments.

Countermarching is an evolution by which a body of men change front, and at the same time retain the same men in the front rank. The movement being represented by "right face, quick march, left wheel, forward, halt, front, dress." On the same principle, a whole army will sometimes change front. If after the countermarch the order "rear-face" be given, the same front will be preserved, with the rear-rank in front, and what was previously the right now serving as the left. A rear-rank may also become a front-rank by merely countermarching round the end of the latter, which remains stationary.

MARCIANI SI, a t. of the Italian province of Caserta (Terra di Lavoro), situated 13 m. n. of Naples, in a low unhealthy plain, in the midst of several lakes. Pop. '72, 9,499.

MARCION, the founder of the Marcionites, an extremely ascetic Gnostic sect, was the son of a bishop of Sinope in Pontus. In his earlier years he was a sailor or ship-master. Being excommunicated by his father, on account of his heretical opinions, he went to Rome about 140 A.D. He made several anxious efforts to obtain a reconciliation with the Catholic church, for he does not appear to have loved schism; but his restless, prying, theorizing intellect constantly led him into opinions and practices too hostile to those of his fellow-Christians to permit of their being passed over in silence. After his final excommunication, he associated himself with the Syrian Gnostic Cledon, and founded a system, in some respects, quite antagonistic to Christianity. The gospel of Christ, according to him, consisted in free love of the good; the Mosaic system, with its motives of rewards and punishments, was mere legality; and there is as irreconcilable an opposition between the respective authors of the "Law" and the "Gospel," i.e., the Creator, on the one hand, and the God of the Christians, on the other, as there is between these two works. His system is but imperfectly known; and it is supposed to have assumed U. K. IX.—31
either three or four aboriginal beings—Good, Evil, Creator, and Matter. See Gnostics. Respecting the outward form of worship practiced among his followers, little is known save that it had great similarity—as had their whole religious system—to that of the Manichaens (q.v.). Marcion entirely rejected the Old Testament; and of the New Testament all but a few epistles and the gospel of St. Luke, which had also to undergo certain changes from his hand. The first four chapters were omitted, and the fifth he began with the words: "In the 96th year of the reign of Tiberius Caesar, God came to Capernaum, a city of Galilee, and spoke on the Sabbath." The Marcionites subsisted as a distinct party till the 6th c., and were diffused through Syria, Egypt, Palestine, etc. Tertullian and others wrote against them.

MARCION, an ancient German people who, in the time of Caesar, lived along the banks of the Rhine, but afterwards, as appears from Tacitus and Strabo, settled in Bohemia, from which they expelled the Boii. Their king Maroboduus, entered into an alliance with the tribes living around them to defend Germany against the Romans. The combined forces of the alliance numbered 70,000 men, and the emperor Tiberius signed a treaty with them in 6 A.D.; but the Marcomannic alliance was beaten 11 years later by the Cherusci and their allies, and in 19 the Gothic Cattaulda drove Maroboduus from the throne, and himself usurped the sovereignty. But he was soon overthrown, and the native dynasty established, under whose rule the Marcomanni extended their territory up to the Danube, till their encroachments alarmed the Romans, who attacked them in the time of Domitian. This war, which subsided for a time in the reigns of Trajan and Hadrian, broke out again under Marcus Aurelius, and was carried on with bitterness from 166 to 198, when it was ended by the peace of Commodus. The Marcomanni continued to make raids into the provinces of Noricum and Rhaetia, and in 270 invaded Italy as far as Ancona. From this time they are little heard of; and their Identity finally disappears among the followers of Attilla.

MARCO POLO. See Polo, ante.

MARCOUT, Jules, b. in Salins, France, 1824; educated in Paris. He was companion and pupil of Germaine Thurnier, and Agassiz in their studies in the Alps in 1844-46, and in the latter year published his Recherches Géologique sur le Jura Salinois. In 1847 he had charge of the classification paleontological of the museum. In 1849 he visited the United States and made geological explorations with Agassiz and others. In 1853-54 he was employed by the United States government in geological surveys in the Rocky mountains and California. In 1855 he became professor of geology at Zurich. In 1860 he returned to the United States to study fossiliferous formations. His works are numerous. Those on the geology of the Jura mountains were his first and last; while of treatises on the geology of the United States and Canada, and especially of the geologic peculiarities of the Rocky mountains and California, his are among the highest French authorities.

MARCUS THE HERESIArch, a Gnostic philosopher of the 2d century. Neander thinks he was born in Palestine; Jerome, that he was an Egyptian. Ireneaus and others of the fathers say that he was very licentious. Neander in his Church history has the following account of him: "Marcus set forth his system in a poem, in which he introduced the divine 6Eons discoursing in liturgical forms, and with gorgeous symbols of worship. After the fashion of the Jewish cabala, he discovered special mysteries in the numbers and positions of letters. The idea of a logos tou 6ontos, of a 'word' manifesting the hidden divine essence in the creation, was spread out by him into the most subtle details; the entire creation being in his view a continuous utterance of the ineffable."

MARCUS AURELIUS. See Antoninus, ante.

MARCY, Mount, one of the Adirondack mountains, in Keene, Essex co., N. Y., 5,467 ft. high. It was known to the Indians as Tukawac, the "cloud-divider."

MARCY, Erastus E., b. at Greenwich, Mass., Dec. 9, 1815; graduated at Amherst in 1837, and at the Jefferson medical college in Philadelphia in 1840. He began the practice of medicine as an allopathist, but after a few years adopted the homeopathic doctrines, and settled in New York, where he met with great success. He wrote extensively on medical and chemical subjects, edited for many years the Homeopathic Journal; published The Theory and Practice of Medicine, and Homeopathy vs. Allopathy, which were translated into foreign languages and republished in Europe. He also edited Hahnemann's Lesser Writings.

MARCY, Randolph B., b. Mass., about 1811; graduated at West Point in 1833, and was appointed lieut. 2d infantry in 1837; served in the war with Mexico, and was promoted to a captnacy; upon the conclusion of that war, was successively engaged in explorations in the Red river country, in operations against the Seminoles, and in the Utah expedition of 1857-58; was appointed paymaster, with the rank of major, in 1859, and inspector-gen., with the rank of col., in 1861; was chief of staff to gen. McClellan (his son-in-law) in West Virginia, on the peninsula, and in Maryland; and was made brig-gen. of volunteers Sept. 22, 1861. He has published Exploration of the Red River; The Prairie Traveler; and Personal Recollections. His residence is on Orange moun-
tain, N. J.
MARCY, WILLIAM LEARNED, 1786-1857; b. Southbridge, Mass. In 1808, after graduating from Brown university, he taught school for a short time, but soon entered upon the practice of law at Troy, N. Y. At the opening of the war of 1812 he entered the volunteer service as a lieu., and Oct. 22, 1812, led the attack upon St. Regis, a Canadian post, stormed the block-house, and captured the first flag and prisoners taken on land in the war. At the close of the war he returned to Troy, where he was for some time editor of the Budget, an anti-federalist daily paper. After filling several minor offices, he was made an associate-justice of the New York supreme court in 1829; in 1831 he was elected senator of the United States by the democratic party, but resigned the office upon being chosen governor of New York in 1832. This position he held for three terms, but in 1838 was defeated by William H. Seward. He was appointed a commiss- 

MARDI GRAS (literally fat Tuesday), the French designation for what is known as Shrove Tuesday in the calendar of the English church, the festival held upon the Tuesday preceding Ash Wednesday, the first day of Lent; with the exception of Mi-Carême or mid-Lent Thursday, the last of the prolonged festivities known as the carnival. It is most extensively celebrated in Rome and Paris. In the latter it has been the custom for many centuries to lead in procession a fat or prize ox (beuf gras, whence Mardi gras), followed in a triumphal car by a child called the butchers' king. The entire day and night is spent in the wildest revelry, sometimes degenerating into unrestrained license. In the United States the only celebration of Mardi gras worthy of note is that of New Orleans, where the first display was given in 1857, and since the end of the war the observance has been carried out with great pomp and splendor. For the preceding week the gayety has been universal, and on Mardi gras the whole city is turned over to the rule of king Rex, who enters the gates on the previous day. On Tuesday the mimic monarch passes through the streets, escorted by his body-guard, the "mystic krewe of Comus," knights of Mommus, and various military and visiting organizations. To him are confided the gates of the city; minor police regulations are suspended, and until the dawn of Ash Wednesday the air is filled with music; in every street are dense throngs of merry-makers, and the glare of illuminations. In the evening occurs the great street pageant, the, "mystic krewe of Comus," which are displayed on platforms, and brilliantly illuminated. These repre-

MARDIN', a considerable t. of Asiatic Turkey, is strikingly situated, at an elevation of 2,300 ft., on the southern slopes of the Mardin hills (anciently Mt. Masius), 57 m. s.e. of Diarbekir. It contains numerous mosques, bazars, and baths, and the ruins of an old castle. The ornaments in arabesque on the gates of the citadel are said to be finer than those of the Alhambra. Pop. about 15,000, of whom the half are Moslem Kurds, and the other half Chaldeans, Maronites, and Jacobites (q.v.), and who carry on manufactures of linen and cotton fabrics, and of leather. During the decline of the caliphate of Bagdad, Mardin rose to considerable importance, and was for a long time the capital of a principality under a branch of the Ayubites (descendants of Salah-ud-din), but its short-lived glory was soon after quenched by the advancing tide of the Mongols. It was subsequently taken by Timur.

MAR EE, LOCH, in the w. of Ross-shire, Scotland, is 18 m. in length, with a breadth varying from 1 to 3 m., and a depth, in some places, of 60 fathoms. Owing to its great depth, it never freezes over its whole extent. It is surrounded by mountain-scenery which, for wildness and grandeur, is not excelled in Scotland. The waters are carried off to the north by the River Findhorn. The loch contains numerous islands, one of which contains the remains of an ancient chapel, with a grave-yard.

MARE ISLAND, in Solano co., Cal., off the bay of S. Pablo. It has a U.S. navy-

Mareemann, 

Mare.
Maremman.
Margaret.

MAREMA (corrupted from Marittima, situated on the sea), a vast marshy region of w. Italy, extending along the sea-coast of Tuscany, from the mouth of the Cecina to Orbetello, and embracing an area of 997 sq. miles. The Pontine marshes and the Campagna of Rome are similar districts. Formerly, these maremma were fruitful and populous plains; but neglect of the water-courses of the district allowed the formation of marshes; and now they have become generators of tertian fevers, and present an aspect of dreary desolation in the summer months, when the inhabitants flee from their misfortunes, prejudicial alike to man and beast. Leopold II., the late grand duke of Tuscany, directed especial attention to the drainage and amelioration of the Tuscan maremma, and considerable success attended their being largely planted, trees being a corrective of their maladies. From 1828 to 1848 the cost of the drainage of the maremma was £331,000. The arable land in the vicinity of the maremma is exuberantly fertile; but the harvests are gathered by hired laborers in the most infected districts, and in their emaciated and livid features may be seen the fatal action of malaria. During winter the maremma is inhabitable, and yields good pasture.

MARENGO, Carlo, 1800-48; b. Piedmont; studied law at Turin, where he graduated in 1818. He soon turned his attention to literature, and won a considerable reputation in 1828 by a drama called Bondelmonte. His posthumous works were published at Florence in 1856, as Tragedie Inedite. His most popular work, perhaps, is La Famiglia Foscari.

MARENGO, a co. of w. Alabama, traversed by the Arkansas Midland railroad, and drained by the Tombigbee and Black Warrior rivers, the first forming the w. boundary; 975 sq. m.; pop. '70, 28,151-20,058 colored. The soil is extremely fertile, the staples being, Indian corn, and sweet-potatoes; of cotton, 23,614 bales were raised in 1870; and of Indian corn, nearly 600,000 bushels. Butter is also a staple, and the county is well stocked with horses, cattle, and swine. Chief town, Linden.

MARENGO, a village of northern Italy, in the province of Alessandria, situated near the Bormida, in the midst of extensive forests. Marengo was the scene of a memorable battle, in which a French army, commanded by Bonaparte, and numbering somewhat more than 20,000, defeated and routed 32,000 Austrians, under gen. Melas, on June 14, 1800.

MARENHOZ-BULOW (BERTHA VON BULOW), Baroness, for many years an advocate and expounder of the principles of the kindergartner system of education for young children. She was intimately acquainted with Frederick Froebel, the founder of the system, obtained a thorough knowledge of it from him, and introduced the schools in nearly all the countries of Europe, and in England. In Berlin she sustained a normal school for three years, where teachers of kindergartens were educated, and has since been lecturer in the Dresden college of the same kind. She has printed several pamphlets and lectures on the subject, such as The Kindergarten and The Child and its Being.

MARETIS, or MAREIA, Lake, the modern Birket-el-Muridit, a salt lake or marsh in the n. of Egypt, extends southward from the city of Alexandria, and is separated from the Mediterranean, on its n. w. side, by a narrow isthmus of sand. In ancient times its length was about 42 m., its breadth about 22. Its shores were planted with olives and vines, and the papyrus, which grew upon its banks and on its eight islets, was famous for its fine quality. In more recent times, the canals which fed lake Maretis were neglected, and its depth and area were much reduced. In the 18th c. the bed had become, in great part, a sandy waste; but in 1801, during the war between the English and French, the sea was let in by the former, and it is now again a marshy lake. The passage by which the sea found entrance was subsequently closed up by Mehemed Ali. The present dimensions of the lake are about 27 m. long by 25 m. broad.

MARESCH, J. A., 1700-94; a Bohemian by birth; but the greater part of his life was spent in the Russian service. He was a musician and made great improvements in the construction of the Russian horn, an unblet brass tube of conical shape. In 1755 he gave an exhibition before the imperial court, when a band of 37 men, furnished with horns varying from 7 feet to 1 foot in length, produced concerted pieces, each being carefully drilled to sound his own instrument at precisely the proper instant. For the skill and dexterity displayed in this rather ludicrous performance Maresch was richly rewarded by the empress Elizabeth.

MARET, HENRI LOUIS CHARLES, b. France, 1804. As a priest of the seminary of Stelpice, Paris, he distinguished himself in 1809 by joining a group of French bishops and theologians who pronounced squarely against the dogma of the infallibility of the pope, then just proclaimed officially from Rome. He wrote Du Concile general, a book which showed the absurdity of the claim from a standpoint within the church. This brought down upon him the anathemas of the pope's party and its organs, though the archbishops of Paris, Orleans, and Besançon were quite of the same opinion as Maret. But in 1871 Maret made a complete surrender, and declared to the pope that he "regretted everything which he had said in that work." He has been a large contributor to Roman Catholic reviews since 1896. His works on the relations of religion and philosophy are numerous.
MARET, Hugues Bernard. See Bassano, ante.

MAREY, Étienne Jules, b. at Beaune, France, 1830; educated as a physician. In 1850 he went to Paris; in 1860 opened a school of experimental physiology and gave a free course of instruction the following year on the circulation of the blood and the diagnosis of the diseases of the heart and its vessels. In 1864 he founded a laboratory of physiology in the rue de l'Ancienne Comédie in Paris; in 1867 succeeded Flourens as assistant professor of natural history in the college of France; and subsequently has filled many positions of honor in Paris and elsewhere. The study of animal heat, of muscular and nervous action in connection with the movements of the heart, electrical phenomena, and the study of the effects of various poisons have been his specialties. His works are mostly contributions to medical magazines and reviews, and he has published Théorie de l'Homme dans les Maladies, 1859, 4to; Physiologie Medicale de la Circulation du Sang, 1868, 3vo; Études Physiologiques sur les Caractères graphiques des Battements du Cœur, et des Mouvements Respiratoires, 1865, 3vo; Du Mouvement dans les Fonctions de la Vie, 1867, 3vo; etc.

MARFORI, Carlo, b. Italy, 1820; entered the Spanish civil service, and became a favorite of queen Isabella. He was an intimate friend of Narvaez, who originally introduced him to favor, and when Narvaez took office in 1866, Marfori became governor of Madrid and chief of the royal household. He was an object of hatred to the people, but remained in high favor with the queen, who refused to dismiss him, and, since the revolution by which she lost the crown, he has continued to be the chief of her household.

MARGARET, sometimes called the "Northern Semiramis," queen of the triple Scandinavian kingdom of Denmark, Norway, and Sweden, was the second daughter of Valdemar III., king of Denmark, and wife of Hakon VIII., king of Norway. Margaret was born in 1333; and on the death of her father, without direct male heirs, in 1375, the Danish nobles, passing over the son of Valdemar's eldest daughter, Ingeborg of Mecklenburg, offered the crown to Margaret and her husband in trust for their infant son Olaf. By the death of Hakon in 1389, Margaret became sole guardian of the young prince, who died at the age of 17 in 1387; and such was the discretion with which she had conducted the government during her sole regency, that the estates of both kingdoms concurred in electing her as their joint sovereign ruler. Having received the crown at their hands, she convoked a landthing, in which she announced that, with the concurrence of her subjects, she would nominate her grand-nephew, Eric of Pomerania, as her successor; and although, owing to Eric's infancy at the time, and his subsequent incapacity, the real power rested in the hands of Margaret, she contented herself from that time with the title of "Margaret, by the grace of God, daughter of Valdemar, king of Denmark." At the moment that Margaret was cementing the union of Norway and Denmark, the condition of affairs in Sweden opened the way for a further extension of her power; for the Swedish king, Albert of Mecklenburg, had so thoroughly alienated the affections of his subjects, that the nobles, declaring the throne vacant, offered to acknowledge Margaret as their ruler. The queen lost no time in sending an army into Sweden to support her pretensions, and defeated the king's German troops at Leaby, where Albert and his son Eric fell into her hands. Albert remained in prison seven years, during which time Margaret succeeded in wholly subjugating Sweden; and in 1397 she made her triumphal entry into Stockholm, with her nephew Eric, who shortly afterwards was, in his 16th year, crowned king of the three Scandinavian kingdoms. On this occasion, Margaret brought forward the memorable act of union, which she had drawn up with her own hand, and to which were appended the signatures of seventeen of the principal men in the three kingdoms. By this remarkable act, known as the union of Calmar, from the place at which it was signed and first promulgated, it was stipulated that the three kingdoms should remain forever at peace under one king, retaining their own laws and customs; and that, at the death of the sovereign, if he left several sons, one of their number should be chosen by the combined estates of the three realms, who were also to elect a new king in the event of the deceased monarch having died childless. This utopian scheme utterly broke down at the death of Margaret, which took place in 1412.

MARGARET (Marie Marguerite Thérèse Jeanne de Savoie), queen of Italy, b. 1851; daughter of Ferdinand, prince of Savoy; was married April 22, 1868, to Humbert, hereditary prince of Savoy, prince royal, and prince of Piedmont. The latter succeeded his father, Victor Emmanuel I., as king of Italy, Jan. 9, 1878, and Margaret ascended the throne with him as queen of Italy. She is amiable, cultivated, and the idol of her people. With a cultured taste and exquisite tact, she has a rare sweetness of disposition, and is almost idolized by the Italian people.

MARGARET of ANGOULEME. See Marguerite de Valois, ante.

MARGARET of ANJOU, wife of Henry VI. of England, and daughter of René of Anjou, the titular king of Sicily, and of Isabella of Loraine, was b. at Pont-à-Mousson, in Lorraine, Mar., 1425. She was married to Henry VI. of England in 1445; and her husband being a person of very weak character, she exercised an almost unlimited authority over him, and was the virtual sovereign of the realm; but a secret contract at her marriage, by which Maine and Anjou were ceded to the French, excited
great dissatisfaction in England. The strife between the English and French, which lost to the former the whole of their possessions in France except Calais, was charged upon Margaret. In 1450 occurred the insurrection of Jack Cade, and soon after the country was plunged in the horrors of that bloody civil war known as the Wars of the Roses (q.v.). After a struggle of nearly 20 years, Margaret was defeated and taken prisoner at Tewkesbury, and imprisoned in the Tower, where she remained five years, till Louis XI. redeemed her for 50,000 crowns. She then retired to France, and died at the château of Dampierre, near Saumur, in Anjou, Aug. 25, 1482.

MARGARET of AUSTRIA, 1440-1530; b. in Brussels; daughter of Maximilian I., emperor of Austria, and of Mary of Burgundy; remarkable for her domestic misfortunes, and her wisdom as ruler and in diplomacy. While an infant she was by the treaty of Arras affianced to the dauphin of France, afterwards Charles VIII., but the contract was not filled. In 1495, by a treaty with Ferdinand and Isabella of Spain, she was again engaged to prince John of the Asturias, heir to the Spanish throne. On her way to Spain to marry him, in the midst of a storm at sea, supposing that they would be wrecked, she had the amiable pleasure to write her own epitaph in these words:

C'est Margot, la gentle demoiselle,
Qu'eut deux maris, et s'isol morut puellule.

But she married prince John nevertheless in 1497. He died the same year and she returned in 1499 to the Netherlands. In 1501 she married Philibert, duke of Savoy, who died without issue in 1504, after a happy married life with her. On the death of her brother Philip in 1506 her father the emperor made her regent of the Netherlands, and gave her charge of the education of her nephew, the future Charles V. of Germany, and his sister Mary. She assumed the government, exhibited administrative talent of a high order; assisted as plenipotentiary in the conference of Cambrai in 1508, and concluded the treaty with cardinal Anboisse; brought the king of England to league against France in 1515; and negotiated with Louise of Savoy the peace of 1529, called the Paix des Dames. These were but the more showy events of her government. Her real title to most honorable mention in history is derived from the wisdom of the peaceful measures of her government, which brought the agriculture, the commerce, and the arts of the Netherlands to a high degree of prosperity. Margaret was the author of numerous unpublished poetical effusions. Her Correspondence avec son Pere was published in Paris in 1839 in two svo volumes.

MARGARET of AUSTRIA, Duchess of Parma, Regent of the Netherlands; 1523-86; b. in Brussels; daughter of Charles V. without marriage by Marguerite van Gest of the Netherlands. In 1535 she married Alexander, duke of Florence, who died in 1537; and in 1538 married Octave Farnese, who became duke of Parma and of Piacenza. She was appointed by Philip II. in 1539 to govern the Netherlands, and followed the system of her great predecessor of the same name in softening the asperities of conflicting parties in the government, and moderating the execution of the terrible religious edicts of Philip II. The letter refusing to modify his persecutions under the inquisition, an insurrection broke out in 1566. While she manifested great energy in repressing it, she did all in her power to prevent the cruelties of Spanish religious intolerance towards those who took part in it. But no sooner was order re-established than Philip II. sent the duke of Alva with full power to complete the work in the spirit of the inquisition, and placed in his hands the powers with which she had been invested. She left the country to become the butchering-ground of religious persecution, and rejoined her husband in Italy, where she passed the remainder of her life. She was of masculine temperament, loved the chase, was a natural politician, gifted with a supple sagacity that suited itself to the occasion, and with views of statesmanship several centuries in advance of those of Spanish rulers.

MARGARET, SAINT, Queen of Malcolm Canmore (q.v.).

MARGARIC ACID (C₄H₄O₄). 110 is one of the solid fatty acids. At an ordinary temperature it is solid, white, and crystalline; it is perfectly insoluble in water, dissolves in boiling alcohol, from which it separates in glistening groups of very delicate needles, and is readily soluble in ether. It unites with bases, forming margarates, and in combination with glycerine (q.v.) forms the glyceride or fat known as margarine.

This acid occurs either in a free state or in combination with alkalis in most of the animal fluids, with the exception of the urine, and as a glyceride it is widely diffused in the animal and vegetable fats. Heintz maintains that this acid is merely a mixture of about ten parts of palmitic acid (q.v.) with one part of stearic acid (q.v.). Margarine constitutes the solid ingredient in human fat, butter, goose grease, olive oil, etc.

MARGARITA, or NUEVA SPARTA, an island in the Caribbean sea, belonging to Venezuela. Area, 440 sq.m.; pop. 21,000. Discovered by Columbus in 1498, Margarita was long famous for its pearl fisheries.

MARGARITE, or PEARL MICA, called also corundellite, clingmanite, and pearl-glimmer, one of the hydrous silicates, belonging to the chloride series. It crystallizes in the triclinic system, usually in intersecting or aggregated laminae; sometimes massive with scaly fracture. Analysis by J. Lawrence Smith of a specimen from the island of Naxos gave: silica, 30.02; alumina, 49.52; peroxide of iron, 1.65; lime, 10.82; magnesia,
0.48; potash and soda, 1.25; water, 5.55 per cent. The mineral occurs in chloride rocks at Sterzing in the Tyrol; associated with emery in Asia Minor and in the Grecian archipelago, as discovered by Dr. Smith; with corundum at Village Green, Delaware co., Penn.; at Unionville, Chester co., Penn.; with corundum in Buncombe co., N. C.; and at Katterhenburg in the Isal mountains. A variety called *diphane* contains protode oxide of manganese, associated with iron.

MARGARITONE D'AREZZO, 1212-89; b. Arezzo, Italy. He executed many pictures both in fresco and distemper. Of the former, on wood and on copper, the most celebrated specimens were in the church of San Clemente, and a work executed for the nuns of Santa Margarita. But that which Vasari calls one of his masterpieces, "on which he placed his name," was a "San Francesco," painted for the convent of the friars de Zoccoli at Fiesole, with his own inscription, *Margrît. de Arelio pingebat.* He is said to have excelled more as a sculptor than as a painter. His masterpiece of art was a reclinling statue in marble of pope Gregory X. in the cathedral of Arezzo, which is still in good preservation.

MARGATE, a municipal borough, seaport, and famous watering-place of England, in the isle of Thanet, Kent, about 70 m. e.s.e of London. All the usual resources of a watering-place—theater, baths, libraries, assembly room, etc.—are found here. The town is very picturesque, which is the principal promenade. The shore, covered with a fine and firm sand, is well adapted for sea-bathing. Fishing is carried on to a considerable extent. A deaf and dumb asylum was opened in 1873. A fluctuating population of between 50,000 and 100,000 is poured into the town during the season. 

MARGAY, Felis tigrina, a species of cat or tiger-cat; a native of the forests of Brazil and Guiana; about the same size with the wildcat of Europe; of a pale fawn color, with black bands on the fore-parts, and leopard-like spots on the hind-parts, and on the rather long thick bushy tail. It has been erroneously represented as untamable, being, in fact, capable of a complete domestication, and of being made very useful in rat-killing.

MARGINAL CREDITS, the name given to business operations, in which bankers lend the credit of their names, as it were, to their customers, and thus enable them to carry out important commercial transactions which otherwise could not be gone into, or only at excessive cost. A merchant in this country, for instance, desires to import tea or silk, but his name is not so well known on the Chinese exchanges, that bills drawn upon him by a merchant in China can be sold there at a reasonable rate of exchange. The tea or silk cannot be bought without the money being on the spot to buy it with, and if he sends out specie for that purpose he involves himself in heavy charges for freight and insurance, and loses the interest of his money while on the voyage. Before it arrives, the prices of tea and silk may have been so altered in the market that he would not be inclined to buy, and his money would thus be placed where it is not wanted. And a fine drafts by the merchant in China on the merchant in this country would not sell, or only at a heavy sacrifice, the drafts by the merchant in China on a banker in this country will sell at the best price. The merchant in this country therefore deposits with his banker, cash or securities equal to the amount to which he desires to use the banker's name, and receives from him marginal credits for the amount. These are bill-forms drawn upon the banker, but neither dated nor signed, with a margin containing an obligation by him to accept the bills when presented. The bills are dated, drawn, and indorsed by the merchant in China before being sold, so that the obligation runs from the date on which the money was actually paid, and the tea or silk is most likely in the merchant's warehouse before the bill is payable. For the transaction, the banker charges the merchant a commission to remunerate himself for the risk involved.

Many other transactions between merchants abroad and in this country can only be carried through by the acceptances of a London banker being tendered in payment, but the transactions are intrinsically the same as when marginal credits are used. The banker in the country can arrange with his customer to obtain the London banker's credit for him. Bankers—usually in London—also accept bills to a great amount for the exchange operations of foreign banks. A banker in, say Canton, buys from his customers bills drawn upon merchants in this country for a given amount, and sends them to his correspondent in London, who holds them for him and grants a credit in his favor on the security of them. The Canton banker operates upon this credit by drawing upon the London banker, and sells his drafts at the most favorable exchange. With the money received he purchases other bills, and remits them also, to be again drawn against. When these operations are made with caution and sound judgment, they are beneficial to all concerned; but when engaged in without sufficient knowledge or recklessly, they involve most disastrous consequences.

MARGRAVE. See Marquis, ante.

MARGUERITE DE VALois, in her youth known as Marguerite d'Angoulême sister of Francis I. of France, and daughter of Charles of Orleans, comte d'Angoulême, was b. at Angoulême, April 11, 1492. She received a brilliant, and even a profound education, but was characterized by the most charming vivacity. In 1509 she was married to Charles duke of Alençon, who died in 1525. In 1537 she was married to Henry d'Albret king of Navarre, to whom she bore a daughter, Jeanne d'Albret, mother of
the great French monarch, Henri IV. She encouraged agriculture, the arts, and learning, and to a certain extent embraced the cause of the reformation. Later, she found it monotonous. On the other hand, she was prudent, and even to return to the practices of the Roman Catholic church. She never ceased to act with a courageous generosity towards the reformers, who always found an asylum and welcome in Navarre. She wrote a little religious work *Miroir de l'âme pècheresse*, which was condemned by the Sorbonne, as favoring Protestant doctrines. She also wrote poems and tales, and a *Heptaméron des Nouvelles* (Par. 1559), modeled on the *Decameron* of Boccaccio. Marguerite died Dec. 21, 1549.

MARHEINKE, PHILIPP KONRAD, 1780-1846, b. Germany educated at Göttingen, and in 1806 appointed professor extraordinary of theology at Göttingen. In 1809 he was made ordinary professor of theology at Heidelberg; and in 1811 called to the same position at Berlin, and chosen pastor of the church of the Trinity there, where he became a colleague of Schleiermacher. His studies lay principally in the direction of Christian symbolism and dogmatics. To the former he devoted his *Christliche Symbolik* (1810-14), and his *Institutiones Symbolicae* (1830); to the latter, his *Grundlehrer der Christlichen Dogmatik* (1819). The first edition of the latter work is based upon Schelling's philosophy; the second was revised in accordance with the philosophy of Hegel, of whom Marheineke was a follower, though he belonged to that small school of Hegelians who maintained that Hegel's philosophy was in accord with Christianity. His method of treatment is historical rather than dogmatic. His position was entirely independent, and he cannot be fairly classed as a Lutheran, a supernaturalist, or a rationalist. To the mystics he was strongly opposed. The positive form of his theology may be found in his *Entsury der Praktischen Theologie* (1837). He wrote many books besides those named, and was one of the editors of Hegel's collected works.

MARIA CHRISTINA, queen of Spain, b. April 27, 1806, was a daughter of Francis I., king of the two Sicilies. In 1829 she became the fourth wife of Ferdinand VII. of Spain; who in 1830 restored the law by which, in default of male issue, the right of inheritance was given to females, and in October of that year the queen gave birth to a daughter, Isabella II., ex-queen of Spain. The Spanish liberals gladly embraced the cause of the queen, rejoicing to see the dreaded Don Carlos, Ferdinand's brother, further removed from probable succession to the throne. Ferdinand died Sept. 29, 1833, and by his testament his widow was appointed guardian of her children—the young queen Isabella and the infant Maria Louisa, now duchess de Montpensier—and also regent, till the young queen should attain the age of 18 years. A civil war broke out, the adherents of the young queen vying to place him on the throne. The event of this war, which continued till 1840, was long doubtful, and Spain was fearfully dotted by contending armies; but the queen-mother seemed indifferent to everything except the company of her ex-husband, Don Fernando Muñoz, one of the royal body-guard, whom she made her chamberlain, and with whom she was united, in December, 1833, in a morganatic marriage, which, however, was kept secret, whilst her connection with him was no secret. She had 10 children by him. A conspiracy, which broke out on the night of Aug. 13, 1836, exposed Muñoz to great danger, and led the queen-mother to concede a constitution to Spain. Her practice as regent was to adopt the course agreeable to the minister of the day, and thus her government was despotic under one ministry and liberal under another. She contrived, however, upon many occasions to embarrass the proceedings of her more liberal or constitutional ministers; but when she sanctioned by her signature the law respecting the Ayuntamientos (q.v.), a popular commotion ensued, and she gave to the new prime minister Esparrtero (q.v.), Oct. 10, 1840, a renunciation of the regency, and retired to France, but continued to interfere from her retirement in the affairs of Spain.

After the fall of Esparrtero she returned to Madrid in 1843, and in October, 1844, her marriage with Muñoz, who was now made duke of Rianzares, was solemnized. Her participation in the schemes of Louis Philippe as to the marriage of her daughters, in 1846, and the continual exercise of all her influence in a manner unfavorable to constitutional liberty, made her the object of great dislike to the whole liberal party in Spain. At length, in July, 1854, a revolution expelled her from the country, and she again took refuge in France, but returned to Spain in 1864, only to retire again in 1868. She died Aug. 18, 1878.

MARIA LOUISA, the second wife of the emperor Napoleon I., b. March 12, 1791, was the daughter of the emperor Francis I. of Austria. She was married to Napoleon, after his divorce of Josephine, April 2, 1810. The marriage seemed to give stability to the Bonaparte dynasty, and in some measure to afford a prospect of peace to Europe. On Mar. 29, 1811, she bore a son, who was called king of Rome. At the beginning of the campaign of 1813 Napoleon appointed her regent in his absence, but under many limitations. On the abdication of Napoleon, she went to Orleans, and thence, in company with prince Esterhazy, to Rambouillet. Her son was not permitted to follow his mother, but went with her son to Schönbrunn, where she remained till, in 1816, she received the dukies of Parma, Placentia, and Guastalla, on the government of which she then entered. She contracted a morganatic marriage with count von Neipperg. She died at Vienna, Dec. 18, 1847.

MARIANA, JEAN, a distinguished Spanish historian and scholar, was b. at Talavera in 1537, and in 1544 entered the then rising order of the Jesuits. His early studies, both
in languages and theology, were so brilliant that he was appointed to teach in the schools of his order, first at Rome (where the celebrated Bellarmine was one of his scholars in 1561, afterwards in Sicily in 1565, and finally in Paris in 1569). After a residence of three years his health became so much impaired that he was compelled to return to his native country, and settled at Toledo, where he resided till his death, at an extreme old age, in 1624. His retirement, however, was not inconsistent with the most energetic and sustained literary activity. From an early period he devoted himself to a history of Spain, of which he published 20 books in 1592, and 10 additional books, carrying the narrative down to 1616, in 1605. The original of this history was Latin, the elegance and purity of which have secured for Mariana a place among the most distinguished of modern Latinists. Its great historical merit is also admitted, although with some drawbacks, even by Bayle. Mariana himself published a Spanish translation, which still remains one of the classics of the language. Among his other productions are a volume published at Cologne in 1609, consisting of seven treatises on various subjects; scholia on the Bible, which, although written at the age of 88, display a degree of vigor as of learning which might provoke the admiration of modern biblical students; an edition of the works of Isidore of Seville, with notes and dissertations; and several similar works. But the most celebrated of the works of Mariana is his well-known treatise, De Rege et Regis Institutione, which appeared in 1599, and in which is raised the important question whether it be lawful to overthrow a tyrant. Mariana decides that it is—even where the tyrant is not a usurper but a lawful king. See Jesus. The principles of the book, in other particulars, are in the main the same as those of all modern constitutional writers. The tyrannicide doctrines of this writer drew much odium upon the entire order of Jesuits; but it is only just to observe that while, upon the one hand, precisely the same doctrines were taught in almost the same words by several of the Protestant contemporaries of Mariana (see Hallam's Literary History, iii. 130-140); on the other, Mariana's book itself was formally condemned by the general Aquaviva, and the doctrine forbidden to be taught by members of the order.

MARIANNA, or MARIANA, an episcopal city of Brazil, in the province of Minas-Geraes, about 12 m. e. of Ouro Preto. In the neighborhood are gold, silver, and lead mines. Pop. 8,000.

MARIANNE ISLES. See LABRONES, ante.

MARÍAS, Las Três, three islands in the n. Pacific ocean, on the w. coast of Mexico, belonging to the state of Jalisco. They extend from n.w. to s.e. The largest is 15 m. in length and 8 in breadth; the next is 24 m. and the smallest 8 m. in circuit. They are all barren and uninhabited, but abound in wood, water, salt, and game, and were formerly visited by English and American whalers. Diego de Mendoza, who visited them in 1592, named them Isles de la Magdalena.

MARÍA THERESA, Empress of Germany, the daughter of the emperor Karl VI., was b. at Vienna, May 18, 1717. By the pragmatic sanction (q.v.) her father appointed her heir to his hereditary thrones. In 1730 she married Francis Stephen, grand duke of Tuscany, to whom she gave an equal share in the government when she became queen of Bohemia and Hungary and archduchess of Austria, on the death of her father, Oct. 21, 1740. She found the monarchy exhausted, the finances embarrassed, the people discontented, and the army weak; whilst Prussia, Bavaria, Saxony, Naples, and Sardinia, stirred up by France, put forward claims to portions of her dominions, chiefly founded on the extinction of the male line of the house of Hapsburg. Frederick II. of Prussia soon made himself master of Silesia; Spain and Naples laid hands on the Austrian dominions in Italy; and the French, Bavarians, and Saxons conquered some of the hereditary Austrian territories. The young queen was in the utmost danger of losing all her possessions, but was saved by the chivalrous fidelity of the Hungarians, the assistance of Britain, and most of all by her own resolute spirit. Her enemies also quarreled amongst themselves; and the war of the Austrian succession, after lasting more than seven years, terminated in her favor by the peace of Aix-la-Chapelle in 1748. She lost only Silesia and Glatz, and the duchies of Parma, Piacenza, and Guastalla, whilst, on the other hand, her husband was elected emperor. During the time of peace she made great financial reforms; agriculture, manufactures, and commerce flourished, the national revenues greatly increased, and the burdens were diminished. The empress availed herself of the increase of the revenue for the increase of her military power. She held the reins of government herself, but was much guided by her husband and her ministers. She found at last in Kaunitz (q.v.) a minister possessed of the wisdom and energy requisite for the conduct of affairs, and in him she placed almost unlimited confidence. The seven years' war (q.v.) between Austria and Prussia again reduced Austria to a state of great exhaustion; but when it was concluded, the empress renewed her efforts to promote the national prosperity, and made many important reforms, ameliorating the condition of the peasantry, and mitigating the penal code. Her son Joseph was elected king of the Romans in 1764; and on the death of her husband, in 1780, she associated him with herself in the government of her hereditary states, but in reality committed to him the charge only of military affairs. She joined with Russia and Prussia in the partition of a third part of Poland (1772), after the death of Augustus III., although she at first objected to the proposed spoliation, and thought it necessary
to satisfy her conscience by obtaining the approval of the pope, Galicia and Lodzi-
meria were added to her dominions at this time. She also compelled the pope to give
up Bukowina to her (1777). The brief Bavarian war of succession ended in her acqui-
sition of the Inththal, but led to the formation of the färistenland or league of German
princes, which set bounds to the Austrian power in Germany. Maria Theresa died Nov.
29, 1780. Throughout her reign she displayed a resolute and masculine character, and
raised Austria from deep depression to a height of power such as it had never
previously attained. Although a zealous Roman Catholic, she maintained the rights of
her own crown against the court of Rome, and endeavored to correct some of the worst
abuses in the church. She prohibited the presence of priests at the making of wills,
abolished the right of asylum in churches and convents, suppressed the inquisition in
Milan, and in 1758 the order of Jesuits. She also forbade that any person, male or
female, should take monastic vows before the age of 25 years. She did nothing, how-
ever, to ameliorate the condition of the Protestants in her dominions. She had three
sons and six daughters. Her eldest son, Joseph II., succeeded her.

MARIAZELL, the most famous place of pilgrimage in Austria, on the n. border of
the crownland of Styria, 24 m. n. of Bruck. It consists of a number of inns, or lodging-
houses, and contains 1200 inhabitants. It is visited by 250,000 pilgrims annually. Here
there is an image of the Virgin believed to possess the power of working miracles.
During the great annual procession from Vienna, the greater number of the pilgrims of
both sexes spend the night in the woods in drinking, singing, and general riot. Formerly the procession from Graz and Vienca took place at the same time, but owing to
the fighting as well as debauchery, that characterized the occasion, the processions
were ordained to take place at different times.

MARICO PA, a co. in e. central Arizona, bounded by New Mexico on the e.; trav-
ersed by Salt river and bounded s. by the Gila: 14,500 sq. m.; pop. in '76 estimated at
3,500. In the valleys, wheat, barley, and Indian corn are raised; the e. portion is rugged and mountainous, and here are found considerable gold, silver, copper, and lead.
Apache Indians roam over the country. Chief town, Phoenix.

MARICO PAS. See Coto-Maricopas.

MARIE AMÉLIE DE BOURBON, Queen of the French, wife of king Louis Philippe,
1782-1866; b. in Sicily; daughter of Frederick IV., king of the Two Sicilies; reared and
educated in Sicily, Naples, and Venice. Louis Philippe, duke of Orleans, while ban-
ished from France, met her, and they were married Nov. 25, 1809. She bore him a
large family of children, most of whom have been eminent for talents and high charac-
ter. On the accession of Louis XVIII., they returned to Paris, and resided in France
or in England until the French revolution of 1830, when Lafayette and Lafayette selected
her husband as the best available leader of the liberal monarchic party, and made
him king. She exhibited a repugnance to the elevation, fearing to have her husband
considered a trespasser on the rights, which she seemed to respect, of the elder branch of
the Bourbons. As queen she was a model of abstention from political intrigues, of every
domestic virtue, and of the highest influence over her husband to good ends. Her home
vices, sympathetic nature, and public charities, made her dear to the French people,
and prolonged the duration of a reign the duplicity and selfishness of which was in
marked contrast to the disinterested beneficence of her own life and influence. When
Louis Philippe was deposed 1848, she bore the fall with dignity and calmness quite
in contrast with the hurried fear of her royal consort. She joined him at Claremont,
England, where, under the name of the comtesse de Neufly, she passed the remainder
of her life, and closed the eyes of her husband in 1850, after 40 years of noble compan-
ionship and mutual fidelity. In her last years she sought to bring about a reconciliation
with the elder branch of the Bourbon family. Five sons and three daughters were the
fruit of her marriage. The eldest son, the duke of Orleans, died in 1849; the eldest
daughter, the princess of Arenberg, died 1889; their successor on the thrones of duke de
Nemours, prince de Joinville, duke d'Aumale, duke de Montpensier. The princess
Louise became queen of Belgium, and the princess Clémentine married the prince of
Saxe-Cobourg. M. Trognon has published *Vie de Marie Amélie, Reine des Français,* 1871.

MARIE ANTOINETTE DE LORRAINE, Josephine Jeanne, wife of Louis XVI., of
France, was the youngest daughter of Francis I., emperor of Germany. Her mother
was the famous Maria Theresa (q.v.). Marie Antoinette was born at Vienna, Nov. 2,
1755; at the age of 14 was betrothed to the dauphin; and in the following year was
married at Versailles. Her reception by her husband and the king, Louis XV., was
flattering enough; but her Austrian frankness and simplicity, her naivety, unceremonious
pleasantry, and detestation of rigid etiquette, scandalized Versailles. Soon after the
accession of Louis XVI. (May, 1774), libels were circulated by her enemies, accusing her
of constant intrigues, not one of which has ever been proved. Her faults as a queen
(and, in that age, rapidly growing earnest, angry, and imbittered, they were fatal ones)
were a certain levity of disposition, a girlish love of pleasure, banquets, fine dress, an
aristocratic indifference to general opinion, and a lamentable incapacity to see the actual
misery of France. The affair of the diamond necklace (q.v.) in 1785 hopelessly com-
promised her good name in the eye of the public, although in point of fact Marie
Mariazell. Marienberg.

Antoinette was quite innocent of any grave offense. Her political rôle was not more fortunate. Loménie de Brienne and Calonne were ministers of her choice, and she shared the opprobrium called down upon them for their reckless squandering of the national finances. She strongly opposed the assembly of the notables, and in the following year, of the states-general; and, indeed, she had good reason to dread their convocation, for one of the very first things the notables did was to declare the queen the cause of the derangement of the finances. From the first hour of the revolution she was an object of fanatical hatred to the mob of Paris. Her life was attempted at Versailles by a band of assassins on the morning of Oct. 6, 1789, and she narrowly escaped. After this she made some spasmodic efforts to gain the good-will of the populace by visiting the great manufactories of the capital, such as the Gobelins, and by seeming to take an interest in the labors of the workmen, but the time was gone by for such transparent shamming to succeed. The relentless populace only hated her the more. At last she resolved on flight. Her husband long refused to abandon his country, and she would not go without him. A dire sense of kingly duty and hope failed: not wanting to Lotti, but after the mob stopped his coach (April 18, 1791), and would not let him go to St. Cloud, he consented. The flight took place on the night of the 20th June. Unfortunately, the royal fugitives were recognized, and captured at Varennes. From this time her attitude became heroic; but the French people could not rid themselves of the suspicion that she was secretly plotting with the allies for the invasion of the country. After the useless effort to defend the Tuileries (Aug. 10, 1792), she was confined in the Temple, separated from her family and friends, and subjected to most sickening humiliations. On Aug. 1, 1793, she was removed to the Conciergerie, by order of the convention, condemned by the revolutionary tribunal (Oct. 15), and guillotined next day.

MARI DE' MEDICI, wife of Henri IV. of France, was the daughter of Francis I., grand-duc of Tuscany, and was born at Florence, April 26, 1573. She was married to Henri, Dec. 16, 1600, and in the following September gave birth to a son, afterwards Louis XIII. The union, however, did not prove happy. Marie was an obstinate, passionate, waspish, and withal dull-headed female, and her quarrels with Henri soon became the talk of Paris. She was—as such women are apt to be—wholly under the influence of favorites. A certain couple, who professed to be man and wife, Leonora Galgaï and Concini, exercised a most disastrous influence over her mind, and, of course, encouraged her dislike to her husband. The assassination of Henri (May 14, 1610) did not much grieve her, and she was even suspected of complicity in the act, but nothing was ever ascertained that could incriminate her. For the next seven years she governed as regent, but proved as worthless a ruler as she had been a wife. After the death of Concini a sort of revolution took place. Louis XIII. assumed royal power. Marie was confined to her own house, and her son refused to see her. Her partisans tried to bring about a civil war, but their attempts proved futile; and by the advice of Richelieu, then bishop of Luçon, she made her submission to her son in 1619, and took her place at court. Marie hoped to win over Richelieu to her party, but she did not in the least comprehend that mighty genius; however, she soon enough found out that he had no mind to be led by her, whereupon she resolved, if possible, to undermine his influence with the king. France had been unsuccessful in its attempts to invade Flanders, whence she escaped, and fled to Brussels in 1621. Her last years were spent in utter destitution, and she is said to have died in a hayloft at Cologne, July 3, 1642.

MARIE GALANTE, an island in the West Indies, one of the Lesser Antilles, belongs to France, and lies 17 m. s.e. of Guadeloupe. Area, about 60 sq.m., covered for the most part with wood, and surrounded by steep rocky shores. The cultivated soil produces sugar, coffee, and cotton. Cattle and horses are abundant, the latter of a highly esteemed breed. Its chief town, Grandbourg, or Marigot, on the s.e. coast, has a population of 2,000. The population of the island is 13,000. Marie Galante is so-called from the name of the ship commanded by Columbus when he discovered the island in 1493.

MARIENBAD, one of the most frequented of the Bohemian spas, 33 m. n.w. of Pilsen, at an elevation of almost 2,000 ft. above the level of the sea. The springs of Marienbad have long been used by the people of the vicinity, but it is only since the commencement of the present century that it has become a place of resort for persons from distant parts of the world. The springs are numerous, varying in temperature from 48° to 54° Fahr. They are saline, containing sulphate of soda and various alkaline ingredients, but differing considerably in their composition and qualities. They are used both internally and in the form of baths. Great quantities of the waters of some of the springs are exported to distant places. Marienbad is surrounded by wooded heights, has a population of 1600, and is visited every season by upwards of 8,000 patients.

MARIENBERG, a t. of Saxony, in the circle of Zwickau, 38 m. s.w. of Dresden. It has manufactures of linen, lace, and steam-engines, and the neighboring mines give employment to a great number of the inhabitants. Marienberg has mineral baths, and an establishment for the cold-water cure. Pop. '73, 5,756.
MARIENBURG, an old t. of Prussia, in the province of Prussia, on the Nogat, 28 m. s.e. of Danzig. It was long the seat of the grand masters of the Teutonic order (q.v.) of knights, who removed from Venice thither in the year 1300. The first fortress of the knights, however, was founded here in 1274. Marienburg remained in the hands of the knights till 1457, when it was taken by the Poles. The castle, or palace, in which 17 grand masters had resided, a noble edifice in a species of Gothic peculiar to the vicinity of the Baltic, was restored in 1820. Pop. '75, 8,538.

MARIENWERDER, one of the most prosperous and beautiful towns of the province of Prussia, in the kingdom of Prussia, is picturesquely situated on an elevation, about 2 m. e. of the Vistula, and 47 m. s.s.e. of Danzig. It was founded in 1233 by the Teutonic order of knights, and its old castle was the residence of a commander of that order. The town derives its prosperity chiefly from being a residence of numerous government officials. Manufactures of various kinds are carried on, and fruit is extensively cultivated. Pop. '75, 7,627.

MARIES, a co. in s. central Missouri; drained by the Gasconade river and its affluents; 550 sq. m.; pop. 80, 7,323. The surface is broken and hilly, and only in the valleys is there much fertility. Indian corn is the chief product, 165,479 bushels being raised; 79,245 of wheat. The baser metals are found, but not in great abundance. Chief town, Vienna.

MARIETTA, the chief t. in Washington co., Ohio, on the e. bank of the Muskingum, at its union with the Ohio river; and the terminus of the Marietta and Cincinnati, and Marietta, Pittsburg, and Cleveland railroads; 150 m. from Columbus, 175 m. from Cleveland, and 300 m. from Cincinnati by way of the rivers; pop. 70, 5,218. The town was settled by New England emigrants in 1788, and is the oldest town in Ohio. The town is on a high, plat, on a level with the Scioto, and is the seat of Marietta college, which was chartered in 1835 and graduated its first class in 1838. Marietta is the center of an extensive business in petroleum, and is not distant from large deposits of coal and iron. There are 3 newspapers, 4 banks, a library, city hall, art gallery, and a very large number of refineries, factories, foundries, shops, and stores. The schools have long been noted for their superior qualities. A description of ancient mounds and works on the site of the city will be found in Ancient Monuments of the Mississippi Valley, by Squier and Davis. These have been in great measure destroyed by the building of the city, but traces of them still remain. The name Marietta was bestowed in honor of the French queen, Marie Antoinette.

MARIETTA COLLEGE, at Marietta, Washington co., O., was founded in 1835. The grounds occupy a pleasant square, and the college has four buildings. In 1878 it had 11 instructors and 80 students, G. W. Andrews, D.D., L.L.D., president.

MARIETTE, Auguste Édouard, b. at Boulogne-sur-Mer, 1821; became professor of grammar and design, and while engaged in these duties was drawn to the study of archeology. Attracting attention by an article published in 1847 on the history of his native town, he was made assistant in the Egyptian museum of the Louvre, where he became so intelligent a disciple of the lore of Champollion in Egyptian hieroglyphics that he was sent to Egypt to gather Coptic manuscripts. While there he searched for the true site of Memphis, and by his familiarity with ancient authors, not only found the remains, but identified the temples, monuments, and tombs, by their descriptions. His discoveries were gratefully acknowledged by the French government, and increased means for investigation were placed in his hands by the duke of Luynes. His principal excavations for Memphis were made 4 m. from the spot where the archaeologists had previously searched, and resulted in uncovering an avenue of sphinxes, the temple of Sérapis mentioned by Strabo, one of the most splendid structures of granite and alabaster of the ancient time, in which were found the sarcophagi of the bulls of Apis from the 19th dynasty to the time of the Romans. The labors of 1500 men under his hand brought to light 2,000 sphinxes and between 4,000 and 5,000 statues, and inscriptions and curiosities without number. Some of the statues were evidently of Grecian art. The explorations have served to confirm the fact of the greatness of the city of Memphis, its wealth and luxury. His excavations around the great sphinx of Gizeh brought to light many new facts and curiosities, which have been added to the collections of Egyptian curiosities in the Louvre. On his return to Paris in 1854 he was made conservator of the Egyptian museum. In 1858 he was again in Egypt following up his former searches with a small army, and upon discovering the temples that adorned the islands of Elsou, Karnak, Médinet-Abou, etc. The vicerey of Egypt then made him conservator of the monuments of Egypt, with title of bey, and charged him with the formation of a collection of his precious discoveries at Boulak. In 1873 the institute of France rewarded him the biennial prize of 20,000 francs. He is considered the most eminent of French Egyptologues. The following are some of his works: Mère d'Apis, 1856, 8vo, a light on the religion of the Egyptians; Choix de Monuments et de dessins, découvertes ou exécuté pendant le déblayement du Sérapéum de Memphis, 1856, 4to; the Sérapéum de Memphis, in folio, with plates, 1857-64; Aperçu de l'histoire d'Egypt, 1864, 8vo; Nouvelle table d'Abou, with plates, 1865, 8vo; Foulées exécutée en Egypt, en Nubie, et au Soudan, d'après les ordres du vicerei, folio, with maps and plates, 1867; Notice des principaux.
monuments du musée de Boulogne, 1870, 8vo; Les Papyrus égyptiens du musée de Boulogne, folio, 1871; and Album du musée de Boulogne, folio, illustrated by 40 superb photographic plates, representing 600 objects of Egyptian art, published in 1873. Upon his death the khedive took charge of the embalming of his body, and its deposit in an ancient sarcophagus.

MARIGLIANO, a t. of s. Italy, province of Caserta, not far from Nola. It has a castle and several churches, one of which has a good collection of pictures. Pop. '70, 5,182.

MARI GOLDA, a name given to certain plants of the natural order composite, sub-order corymbifera, chiefly of the genera calendula and tagetes. The genus calendula has the achenia remarkably curved, variously toothed, and very rough on the back. The species are annual and perennial herbaceous plants and shrubs, of which some of the former are found in the countries bordering on the Mediterranean, the latter chiefly in s. Africa. Pot Marigold (C. officinalis) is an annual, a native of France and the more southern parts of Europe, with an erect stem, 1 to 2 ft. high, the lower leaves obovate on long stalks, and large, deep yellow flowers. It has long been very common in British gardens, and there are varieties with double flowers. The whole plant has a slight aromatic odor, and a bitter taste. It was formerly in great repute as a carminative, and was regarded also as an aperient and sudorific. The florets were the parts used, and they were dried in autumn, to be preserved for use. They are often employed to adulterate saffron, and sometimes for coloring cheese. They were formerly a frequent ingredient in soups, and are still so used in some parts of England. The genus tagetes consists of annual and perennial herbaceous plants, natives of the warmer parts of America, although T. erecta, one of those most frequently cultivated in Britain, bears the name of African Marigold; and tagetes patula, another annual well known in our flower-borders, is called French Marigold. Both species are Mexican. They have been long in cultivation, and with a little assistance of a hot-bod in spring, succeed well even in Scotland, and are much admired for the brilliancy of their flowers. —CORN MARIGOLD is a chrysanthemum (q.v.). —Marsh Marigold (q.v.) has no botanical affinity with the true marigolds.

MARIN', a co. in w. California, bounded w. by the Pacific, s. and e. by San Pablo bay, San Francisco bay, and the Golden Gate, the last separating it from the city of San Francisco; 500 sq. m.; pop. '80, 11,325. It is traversed by the North Pacific Coast railroad. The surface is marked by many hills, the highest of which, Table mountain, is 2,600 ft. high. It is the largest butter-producing county in the state, the amount in 1870 being over 2,000,000 pounds. Chief city, San Rafael.

MARI'NA, MALINTzin, or MALINCHE, b. Mexico, probably in the last years of the 15th century. She was of a noble family in the province of Guazacaleos, but when a child was sold in slavery to the Maya Indians. Soon after Cortez invaded Mexico she became his interpreter and his mistress. Their son, don Martino Cortez, attained to considerable importance in Mexico. She was afterwards married to Juan de Jaramillo, and was living as late as 1590.

MARINED, a term applied in heraldry to an animal whose lower part is terminated like the tail of a fish.

MARINE ENGINE. See Steam Engine.

MARINE FORTIFICATION differs from land fortification in that the approaches of the enemy which are to be resisted take place on the level of the sea, so that he can come near without having to overcome the dangerous slope of the glaciers. The combat is simply one between two powerful batteries, and the question to be decided is whether the ship or the fort will first be placed hors de combat; the ship having ordinarily the largest number of guns, while the fort has more solid battle-ments, and its fewer guns of great caliber can be fired with a steadiness unattainable on so shifting a base as the ocean. Under these circumstances, the less relief a sea-fortress has the better, as by so much the enemy may be hit from the shipping. Its walls are usually built perpendicular, or nearly so. The magazines and quarters for the men are bomb-proof, as also are the casemates, from which the guns are usually fired, although sometimes, as in the martello-tower, the gun is worked on the top of the structure.

Sea-fortifications may be of various importance, the simplest being the battery consisting of a mere parapet formed in a cliff or on a hill, and mounted with guns to command the sea; these are generally built in such concealed situations that it is hoped the hostile ships will not perceive them until they actually open fire. They are numerous all around the British coast. Next greater in importance is the martello-tower (q.v.). More powerful still are the beach-forts, such as those which on either shore defend the entrance to Portsmouth harbor: these are constructed of the most solid masonry, faced with massive iron plates, and armed with guns of the heaviest caliber, sweeping the very surface of the sea, so as to strike an approaching ship between wind and water. The guns are usually in bomb-proof casemates, and the fort is often defended on the land side if the coast be level; if, however, higher ground be behind, this would be useless, and then the sea-front alone is defensible. Most terrible of all sea-forts, how-
ever, are the completely isolated forts, with perpendicular faces and two or three tiers of heavy guns. Such are the tremendous batteries which render Cronstadt almost inapproachable, and by which Spetses and Plymouth sound are now fortified. These forts are generally large, with all the requisites for a garrison to maintain itself; against them wooden ships stand no chance, and in the American civil war fort Sumter, at Charleston, showed itself no mean antagonist for iron sides. In such forts iron is employed as the facing, in plates of such vast thickness and weight that it is supposed no ship can ever possess any comparable resisting power; and, as they are armed with guns the smallest of which will probably be 300-pounders, it is expected that they will be able to destroy any fleet that could be sent against them.

At the present day the value of sea-fortifications is disputed, as iron-plated vessels may pass them with impunity unless the artillery in the fort be so heavy as to destroy the armor of the ships. In the long run, however, it is apparent that the fort can command the greater power, for its armor may be of any thickness, while that of the ship must be limited by her floating powers, and, on the other hand, the limit to the size of artillery must be sooner reached in a ship than in a solid and stationary fortress.

**MARINEO**, a t. of Sicily, in the province of Palermo, and 11 m. s. of the town of Palermo, near a small river which flows into the gulf of Palermo. Pop. 8,360.

**MARINE'S COMPASS.** See Compass, ante.

**MARINES** are soldiers that serve on board ships of war. The men are drilled in all respects as soldiers (light infantry), and therefore on shore are simply ordinary land-forces. On board ship they are trained to seamen's duties, but still preserving their military organization. Their ordinary functions are as sharpshooters in time of action, and at other times to furnish sentries for guarding the stores, gangways, etc. They are useful as exercising a good control over the less rigidly disciplined sailors, and, having always firearms and bayonets ready, they have often been instrumental in suppressing the first outbreaks of mutiny. The royal marines are divided into three divisions of light infantry and one of artillery. Promotion goes by seniority throughout the artillery and infantry respectively. In rank marine officers correspond with army officers of similar grades according to seniority; as a corps the marines take place between the 49th and 50th regiments of infantry of the line. Every ship, on being commissioned, has her complement of marines drafted into her. The uniform is red, with blue facings and white belts. On their coats proudly bears the word "Gibraltar," in the famous defense of which fortress they bore an heroic part.

Marines were first established, as a nursery from whence to obtain seamen to man the fleet, by order in council of Oct. 16, 1664. Their utility becoming conspicuous, other regiments of marine forces were raised, so that by 1741 there were 10,000 men, and in 1759 as many as 18,000. During the great French war the number rose above 30,000, but a great reduction took place after peace was concluded. By the navy estimates of 1875-76, 14,000 marines were provided, including 3,000 artillery, at a cost for the year of £940,417. Their government rests solely with the admiralty.

**MARINES (ante).** The introduction of marines into the American army took place by act of congress passed Nov. 10, 1775, by which two battalions of this arm were directed to be organized. Again, by act of July 11, 1789, "establishing and organizing a marine corps," this body became an established element in the naval force of the United States, liable to do duty either on board vessels of war at sea, or in forts or otherwise upon shore, as might be directed by the president. The commandant of the corps has the rank and pay of col. It has no regimental organization, however, but "may be formed into as many companies or detachments as the president may direct." When employed on naval service the marines are subject to the laws and regulations which govern the navy; but if engaged on shore duty they are amenable to the authority of the articles of war. The number of marines was fixed by the act of July 1861, at 3,074 enlisted men, but this is practically lessened by the amount of the annual appropriations for the naval department. The United States marine corps consisted in 1890 of 86 officers and 1500 enlisted men.

**MARINE-STORE DEALERS,** in point of law, are subjected to certain restrictions as regards the business they carry on, in order to keep some check on their relations with thieves and other vendors of stolen property. They are bound, under a penalty of £20, to have their name and the words "dealer in marine stores" distinctly painted, in letters not less than 6 in. in length, over their warehouse or shop; to keep books stating the name of the person from whom they bought or received the respective articles in their possession; not to purchase marine stores from any person apparently under 16 years of age: not to cut up any cable or article exceeding five fathoms in length without a permit from justices of the peace. By the act 24 and 25 Vict. c. 101, dealers in old metals have also been subjected to similar restrictions. Whenever a dealer in old metal has been convicted of being in possession of stolen property, justices of the peace may order him to be registered at the chief police-office of his district, and he shall keep a book containing entries of the goods he has and of the person from whom obtained, etc.

**MARINI, GIOVANNI BATISTA,** an Italian poet, b. at Naples in 1569. After a period of fruitless study, Marini abandoned jurisprudence for the more congenial pursuit of
poetry, a decision which so incensed his father as to lead to his expulsion from home. All through life, Marini seems to have courted trouble by his unbridled licentiousness, and many of his best compositions are polluted with a shameless obscenity, unavailing only deplored by the poet at the approach of death, when he expressed the desire that they should be suppressed and destroyed. Marini quitted Naples for Rome, and finally followed in the suite of cardinal Aldobrandini to Turin, where he was at first received with flattering notice from the reigning prince, Charles Emmanuel; but on the publication of some bitting satirical verses, he was thrown into prison. On his release, he repaired to France, where Marie de' Medici received him with marked favor, and conferred on him a liberal pension. In his poem Il Tempio he celebrates this queen's noble qualities. His best work, the Adone, was written during his residence in France, and on its publication, he revisited his native country (1622), and died at Naples, aged 56, in 1625, in the midst of high public festivities in his honor. He is the founder of the Marinist school of poetry, of which the essential features are florid hyperbole and false overstrained imagery.

MARINO. See SAN MARINO, ante.

MARINO (anc. Boville), a market-t. of central Italy, province of Rome, and 12 m. s.e. of the city of Rome, near lake Albano. Marino is situated on a high hill above a plain, and is surrounded by strong walls and towers, which were erected by the Colonna in 1480, and add much to its picturesque beauty. According to the writer of Murray's Handbook, the long street called the Corso, the piazza of the Duomo, and the fountain would do credit to many town of more importance. At the foot of the hill of Marino, lying between Lake and the ridge of Alba Longa, is a deep glen beautifully wooded, called the Parco di Colonna. This valley is highly interesting as the site of the Aqua Ferentina, memorable as the spot on which the Latin tribes held their general assemblies, from the destruction of Alba to the consulship of P. Decius Mus, 338 B.C. Marino is also interesting in the history of the middle ages as the stronghold of the Orsini family, who first appear in the 13th c. in connection with their castle of Marino. In the 15th c. it became the property of the Colonna family, who have retained it almost without interruption to the present time. Pop. 6,500.

MARIO, GIUSEPPE, Marquis de Candia, was b. at Turin in 1810, of an aristocratic family, and evinced from his boyhood high musical abilities. In 1830 he received his commission as officer in the chasseurs Sardes; but having involved himself in some youthful escapade, was ordered from Genoa to a temporary retreat at Cagliari. From thence he threw up his commission, and finally escaped to Paris, on his resignation not being accepted. The young Sardinian deserter speedily won his way into the most exclusive circles of fashionable Paris, both by the genuine, manly stamp of his nature, and the charm of his exquisite voice. Having contracted debts, however, he accepted the appointment of first tenor of the opera, with a salary of 1500 francs per month; at the same time he changed his name from marquis of Candia to Mario. After a term of two years' study at the conservatoire, Mario made his début, on Dec. 2, 1838, in Rossini's Re di Dide, and achieved the first of a long series of operatic triumphs. At the théâtre Italien, he took rank with Rubini, Lablache, Malibran, Sontag, and Grisi; and by none of these great artists was he excelled in purity, sweetness, method, and taste. From 1845 to 1850 he fulfilled an engagement in Russia, and on his return appeared in London, where his success was immense. Mario's operatic career was a succession of brilliant and remunerative engagements. In his private capacity, he was esteemed for his large-handed liberality, and for his noble assistance to struggling artists. His répertoire embraced all the great works of Rossini, Bellini, Donizetti, and Verdi. Mario took farewell of the London stage in 1871.

MARIOLATRY (Gr. Maria, and latreia, adoration), a name given by polemical writers to the worship paid by Roman Catholics to the Virgin Mary. This name is intended to imply that the Catholic worship of the Virgin is the supreme worship of latreia or adoration, which Catholics earnestly disclaim, although, from her relation to our Lord, they hold her worship, which they style hyperdulia, to be higher than that of all other saints. See INVOCATION OF SAINTS. Many examples of prayers addressed to Mary, of acts of worship done in her honor, and of expressions employed regarding her are alleged by controversialists, for the purpose of showing that the worship of Mary in the Roman church is in effect "adoration." Such are (see Farrar's Ecclesiastical Dictionary, p. 352) the "Litany of the Sacred Heart of Mary"; the adaptation of the Athanasian creed as a profession of faith regarding her; addresses to her as the "hope of the desponding, and refuge of the destitute:" professions that "her son has given her such power that whatever she wills is immediately done;" kneelings and prostrations before her image; pilgrimages in her honor. To many and similar allegations, Roman Catholics reply that many of the objected prayers and devotional practices are entirely unauthorized by the church, and that some of them are undoubtedly liable to misinterpretation; but they further insist that all such prayers, however worded, are to be understood, and are, in fact, understood by all Roman Catholics, even ordinarily acquainted with the principles of their faith, solely as petitions for the intercession of Mary, and as expressions of reliance, not on her own power, but on the efficacy of her prayers to her son. It would be out of place in this work to enter into such controversies, and we shall content ourselves with a brief account of the origin and nature of the worship of the Virgin Mary in the
church, and of its present condition, as it is professed by those religious bodies among which the practice now prevails.

Although no trace is found in the New Testament of any actual worship of the Virgin Mary, yet Roman Catholic interpreters regard the language of the angel Gabriel, who saluted her as "full of grace," or highly "favored," and as blessed "among women," and her own prediction in the canticle of the magnificat, that "all nations should call her blessed" (Luke i. 48), as a foreshadowing of the practice of their church; and they rely equally on the language employed by the early fathers, as, for instance, Irenæus, regarding the Virgin, although Protestants consider it as having reference to the incarnation. But it seems quite certain that, during the first ages, the invocation of the Virgin and the other saints must have held a subordinate place in Christian worship; the reason for which, according to Roman Catholics, was probably the fear which was entertained of reintroducing among the recent converts from paganism the polytheistical notions of their own creed. But from the time of the triumph of the truth in the 4th c., the traces of it become more apparent. St. Gregory Nazianzen, in his panegyric of the virgin martyr Justina, tells, that in her of peril she "implied Mary the Virgin to come to the aid of a virgin in her danger" (Opp. tome i. pp. 278, 379). St. Ephraim, the Syrian, in the same age, uses language which is held by Roman Catholics to be equally favorable to their view; and the fact that about this time there arose a sect, the Collyridians, who were condemned for the actual adoration of the Virgin, seems to them to prove that some worship of her must have existed in the church, out of which this excessive worship of the Collyridians grew. But it was only after the heresy of Nestorian that the worship of Mary seems to have obtained its full development. His denial to her of the character of mother of God, and the solemn affirmation of that character by the ecumenical council of Ephesus (430 A.D.), had the effect at once of quickening the devotion of the people, and drawing forth a more marked manifestation on the part of the church of the belief which had been called into question. The 5th and 6th centuries, both in the east and west, have been an epoch in which the evidence of the practice and the writers of each succeeding age till the reformation speak with gradually increasing enthusiasm of the privileges of the Virgin Mary, and of the efficacy of her functions as a mediator with her son. St. Bernard, and, still more, St. Bonaventura, carried this devotional enthusiasm to its greatest height; and the popular feeling found a stronger and still more strong manifestation in the public worship of the church. From a very early period, we find several festivals of the "blessed Virgin," but in the centuries to which we refer, the number received large additions. The institution of the "Rosary of the Virgin Mary," the appointment of a special office in her honor, and more than all, the fame of many of the sanctuaries which were held to be especially sacred to her worship, gave a prominence to the devotion which Protestants find it difficult to reconcile with the honor which they hold due to God alone.

The chief festivals of the Virgin, common to the western and eastern churches, are the conception, the nativity, the purification, the annunciation, the visitation, and the assumption. All these festivals are retained in the English calendar. The Roman church has several special festivals, with appropriate offices—all, however, of minor solemnity.

MARION, a co. in n.w. Alabama, having the state line of Mississippi for its n.w. boundary; bounded on the n.e. by the Big Bear river; 900 sq.m.; pop. '80, 9,564—9,382 of American birth, 523 colored. It is drained by the Buttahatchie and Sipsey creeks, branches of the Tennessee and Tombigbee rivers. Its surface is undulating, rising into hills in some sections containing beds of bituminous coal, a large proportion being covered with forests. Its agricultural products are tobacco, cotton, wool, sweet-potatoes, butter, honey in large quantities, sorghum, oats, corn, rye, and wheat. Cattle, sheep, and swine are raised. Seat of justice, Pikeville.

MARION, a co. in n. Arkansas, having the state line of Missouri for its n. boundary, the White river for its s.e., and the Buffalo Fork, one of the chief affluents of the White river, for a part of its s. border; 600 sq.m.; pop. '80, 7,907—7,895 American birth, 43 colored. It is drained by the Crooked creek, flowing centrally through it into White river, and has a surface formed of the ridges of the Ozark mountains, partially covered with groves of chestnut, ash, hickory, etc. Its soil is adapted to the raising of fruit, live stock, every kind of grain, tobacco, cotton, sweet-potatoes, and sorghum. Honey is produced in large quantities, and the products of the dairy. Its mineral products are lead ore, variegated marble, and silurian limestone. Seat of justice, Yellville.

MARION, a co. in n. Florida, intersected by the Ocklawaha river, flowing into lake Griffin in the next county; has for its n.e. boundary lake George and the St. John's river, and has Orange lake in the extreme n., and smaller lakes, including Bryant and Ware in the e. section; 2,000 sq.m.; pop. '80, 13,046—12,961 of American birth, 8,805 colored. The Withlacoochee river forms part of its s.w. boundary. Extensive forests of good building timber grow along the river banks and surround the lakes; in other sections the level surface spreads out into fertile plains. Its agricultural products are tropical fruits, rice, oats, cotton, and corn, and its soil is specially adapted to the cultivation of sugar-cane and oranges. Carriages are manufactured. Seat of justice, Ocala.
MARION, a co. in w. Georgia, drained by the head waters of the Flint river and Kinchafoonee creek; 450 sq.m.; pop. '80, 8,598—8,595 of American birth, 4,307 colored. The Southwestern railroad crosses the extreme n.w. corner. Its surface, generally level, is covered to a great extent with hardwood timber, and the growth of swampy districts. Its soil produces fruit, oats, corn, tobacco, cotton, rye, wool, sweet potatoes, butter, honey, and sugar-cane. Much attention is paid to the raising of live-stock. Seat of justice, Buena Vista.

MARION, a s. central co. of Illinois, intersected by the Illinois Central and Ohio and Mississippi railroads; 576 sq.m.; pop. '80, 23,691. It is a prairie country, the productions being grain, cattle, and wool. Co. seat, Salem.

MARION, a central co. of Indiana, the converging point of 12 completed railroad lines (see INDIANAPOLIS); 420 sq.m.; pop. '80, 102,780. It possesses a level surface, except in the northern part. The soil is fertile, producing grain and hay in large quantities. Other productions are cattle and wool. Co. seat, Indianapolis.

MARION, a s. central co. of Iowa, watered by the Des Moines river, and intersected by the Des Moines Valley railroad. It has a varied surface and fertile soil. The productions are coal, iron, cattle, grain, and wool. Co. seat, Kiooxville.

MARION, a co. in s.e. central Kansas; 950 sq.m.; pop. '80, 12,457—American, 8,603. The increase in population is most remarkable, the census of '70 giving but 788; the estimate of '75, 5,907; and of '78, 8,306. The county is drained by Cotonwood creek, which furnishes water-power. The surface is a rolling plain, and produces corn, wheat, and hay in great abundance. Stock raising is a leading industry. Traversed by Atchison, Topeka and Santa Fe railroad. Chief town, Marion Center.

MARION, a central co. of Kentucky, watered by branches of Salt river, and intersected by a branch of the Louisville and Nashville railroad; 285 sq.m.; pop. '80, 14,691. The surface is varied in character, the soil is fertile, and grain, tobacco, and wool are produced in large quantities, while live stock is largely raised. Co. seat, Lebanon.

MARION, a co. in s.w. Mississippi, having the state line of Louisiana for its s.w. border, is intersected by the Pearl river in the w. section; and by the Mississippi, 1300 sq.m.; pop. '80, 7,991—6,869 of American birth, 2,450 colored. It is drained by Black and Red creeks, affluents of Leaf river. Its surface is generally level, partially tillable, and largely covered with timber. Its soil is sandy, and not remarkably productive; but there is a fair farming district near the Pearl river, where the products are tobacco, cotton, wool, sweet potatoes, butter, honey, sugar-cane, rice, oats, corn, and live stock. Seat of justice, Columbia.

MARION, a co. in n.e. Missouri; 460 sq.m.; pop. '80, 24,837—22,828 of American birth. The Mississippi river bounds it on the e., and it is also drained by the North and South rivers, and the n. and s. forks of the Fabius. It is traversed by the Hannibal and St. Joseph railroad. The surface is in part prairie and in part forest. Principal products: wheat, oats, hay, and Indian corn. Chief town, Palmyra.

MARION, a n. central co. of Ohio, intersected by the Atlantic and Great Western and Bee-line railroads; 360 sq.m.; pop. '80, 20,564. It is a level and fertile region, producing, cattle, grain, and wool, and manufacturing large quantities of lumber. Co. seat, Marion.

MARION, a co. in w. Oregon, bounded e. by the Cascade range, and w. by the Willamette river, by which, with its tributaries, it is drained; pop. '80, 14,576. It is traversed by the Northern California railroad. The principal products are the cereals, and in 1870 there were raised 332,091 bushels of wheat, and 164,087 of oats. Sheep-breeding is carried on to some extent. The e. part of the county is hilly and mountainous, but contains considerable quantities of the precious metals, and of iron and coal. The chief town, Salem, is also the capital of the state.

MARION, a co. in e. South Carolina, having the Little Pedee river for its e. boundary, Lynch's river for its s. and s.w.; intersected in the w. section by the Great Pedee, and having the state line of North Carolina for its n.e. boundary; 1650 sq.m.; pop. '80, 34,107—34,043 of American birth, 18,298 colored. The Wilmington, Columbia and Augusta railroad crosses it centrally. Its surface is generally level and equally divided between forest and cultivated land. Its soil is a sandy loam, very fertile in some localities, producing fruit, tobacco, cotton, oats, corn, sweet potatoes, wool, wine, butter, sugar-cane, and large quantities of honey, rye, and wheat; other products are turpentine and tar. Cattle, sheep, and swine are raised. Seat of justice, Marion Court-House.

MARION, a co. in e. Tennessee, having the state line of Alabama for its s. boundary, is drained by the Tennessee river running at the foot of a range of the Cumberland mountains in the s.e. section, and the Sequatchie river emptying into it in the same region; 700 sq.m.; pop. '80, 10,911—10,712 of American birth, 1369 colored. It is traversed in the s. section by the Bridgeport, Alabama, to Victoria, Tennessee, division of the Nashville, Chattanooga and St. Louis railway; by the Sequatchie branch centrally to Victoria; and the Sewannee railroad crossing its w.n. corner. A large proportion of the surface, which along the rivers rises into steep high bluffs or buttes, is covered with forests or occasional groves, and the soil is productive. Corn, tobacco, cotton, fruit.

U. K. IX.—32
wool, sweet potatoes, wine, and great quantities of honey are produced; other products are sorghum, maple sugar, every kind of grain, and live stock in large numbers. Bituminous coal, iron ore, and fire-clay are mined, and its principal industries are connected with their mining and manufacture. In the n.w. are medicinal springs impregnated with iron. Seat of justice, Jasper.

MARION, a co. in n.e. Texas, having the state line of Louisiana for its e. boundary, is drained by the navigable Caddo lake 20 m., in length, comprising a third of the e. section, and Big Cypress bayou, flowing through it from n.w. to the e. section; about 300 sq. m.; pop. '80, 10,985—10,745 of American birth, 7,229 colored. It is traversed centrally by the Jefferson division of the Texas and Pacific railroad, forming a junction with the East Line and Red River railroad at Jefferson. Its surface is uneven and well wooded with every kind of timber. Iron ore is among its mineral products, and mineral springs appear in some localities. Its soil has every element of fertility, especially the bottom lands, producing sweet potatoes, corn, live stock in general; great numbers of beef cattle and large quantities of cotton are raised, which are among its exports. Its manufactories include iron foundries and tanneries. Seat of justice, Jefferson.

MARION, a co. in n. West Virginia, intersected from s.w. to n.e. by the Monongahela river, and from n.w. to s.e. by the Baltimore and Ohio railroad; 330 sq. m.; pop. '80, 17,198—17,052 of American birth, 155 colored. The Monongahela river is navigable to Fairmont, and the co. is also drained by Trygurt's Valley river. Its surface is uneven, and largely covered with forests. Its soil is very fertile, and its agricultural products are fruit, buckwheat, Indian corn, wool, flax, maple sugar, sorghum, oats, wheat, honey, live stock, and dairy products. Among its mineral products are bituminous coal, iron ore, and glass sand. Its manufactories are tanneries and lumber mills; also, thrashing-machines, flour, cigars, furniture, and machinery are manufactured, and coal is mined. Seat of justice, Fairmont.

MARION, the chief t. of Perry co., in w. central Alabama; pop. 2,646. It is 28 m. from Selma, on the Selma, Marion and Memphis railroad, and is the seat of the Howard Baptist college, founded in 1837; and also of the Marion and Judson seminaries for girls. There are two weekly papers, a bank, six churches, a few machine-shops; and the place has a good trade in cotton and corn with the surrounding country.

MARION, a t. in Ohio, near the center of Marion co., 85 m. n.e. of Dayton, 40 m. n. of Columbus. It is on the Atlantic and Great Western, Columbus and Toledo, and Cleveland, Columbus, Cincinnati and Indianapolis railroads. It has a court-house, 3 newspapers, banks, and 9 churches. There are grain-elevators, machine and carriage shops, and manufactories of chairs, sashes and blinds, chains, and rakes. Pop. of whole township, '70, 3,485.

MARION, Francis, 1732—95; b. near Georgetown, S. C. He received a scantly education, and after a trial of sea-faring life, in which he was wrecked and with difficulty rescued, engaged in farming. When the war with the Cherokee Indians arose, 1759, he immediately enlisted, and as a cavalry lieut., did good service in the campaigns of 1759—61. At the outbreak of the revolution, Marion was chosen a delegate to the South Carolina congress, but soon organized a company of volunteers in his neighborhood, and placed it under the command of col. William Moultrie. His first active service was in Charleston harbor, and later in the defense of fort Moultrie, June 28, 1776; and his gallant conduct there was rewarded by promotion to the rank of lieut.col. He was present at the siege of Charleston, 1780, having meanwhile been actively engaged in various parts of Georgia and South Carolina. He was not in the city at the time of its surrender to gen. Clinton, owing to a severe accident which kept him from duty. After that disaster, Marion, then a col., raised several companies of volunteers among the country lads, or "cowboys" as the Tories called them, and with this force marched to the relief of gen. Gates, at that time in North Carolina. Though poorly armed, wretchedly dressed, and at first exposed to much ridicule on that account, Marion's brigade proved of the greatest value, through their intimate knowledge of localities and the native shrewdness which earned for their leader the sobriquet of "Swamp Fox." From the Pedee to the Santee river, and from the sea-coast back to the central counties, the imperfectly drilled, but sturdy and enthusiastic brigade seemed to cover all points at once, and caused no little embarrassment to the British forces. Among the most noted of the engagements in which Marion took part, may be named fort Moste, fort Wilson, Granby, Parker's ferry, and Eutaw. At the close of the war gen. Marion resumed his former occupation, and remained on his plantation till his death.

MARIONETTES, little jointed puppets of wood or cardboard, representing men and women, and moved by means of cords or springs by a concealed agent. They are exhibited in what are called marionette theaters, the exhibitor varying his voice, so that a sort of dramatic performance is accomplished. This entertainment was known to the Greeks, and from them passed to the Romans. In modern times, it has chiefly prevailed in France and Italy, and has there reached a very respectable degree of artistic perfection.

MARION HARLAND (pseud.). See TERIUNE, MARY VIRGINIA.
MARIOTTE, Edme, a distinguished French natural philosopher, was b. in Bur- 
gundy during the first half of the 17th c., and was the prior of St. Martin-sous-Beaune, 
when the academy of sciences admitted him within its pale in 1666. His life is devoted 
of particular interest, having been almost wholly spent in his cabinet, among his books 
and instruments. He died in 1684. Mariotte’s forte consisted in an extraordinary power 
of drawing conclusions from experiment. He repeated Pascal’s experiments on gravita- 
tion, and detected some peculiarities which had escaped that ingenious philosopher; 
confirmed Galileo’s theory of motion; enriched hydraulics with a multitude of discov- 
eries; and finally made a thorough investigation into the subject of the conduction 
of water, and calculated the strength necessary for pipes under different circum- 
tances. His collected works were published at Leyden in 1717, and at the Hague (2 vols. 4to) in 
1740. His Traité du Mouvement des Éaux was published by La Hiore (Paris, 1786, 12mo), 
MARIOTTE, LAW OF, an empirical law deduced by Boyle (q.v.) and Mariotte (q.v.) 
from two independent series of experiments, though, strangely enough, reached by both 
at about the same time. It is generally expressed as follows: The temperature remaining 
the same, the volume of a given mass of gas is in inverse ratio to the pressure which it sustains. 
This law may be held to be substantially correct within a considerable range of pres- 
sure. But the labors of Regnault have made it evident that atmospheric air and most 
other gases, especially under very high pressures, are really more compressed than if 
they followed the law. This deviation is most marked in the ease of gases capable of 
being liquefied, as they approach the point of liquefaction. 
MARIOTTE’S INSTRUMENT, a J-shaped tube for demonstrating the law of Mari- 
otte or Boyle, that the volume of a gas is inversely as the pressure upon it. The closed 
end of the J is only a few inches in length, while the open end is over 30 inches. Mer- 
cury being poured in till it is 8 in. higher in the long than in the short leg, it will be 
found that the air in the latter will occupy one-half its former space. If the column 
of mercury is 15 in. higher in the long leg, or half an atmosphere, making the pressure 
altogether 6 of an atmosphere, the volume of air in the closed or short end will have 6 
of its former volume. See MARIOTTE, LAW OF, ante. 
MARIPÓSA, a ca. in e. central California; 1440 sq.m.; pop. ’80, 4,359—1859 being 
foreign. It is drained by the Merced and Mariposa branches of the San Joaquin river; 
on the n. and e. it is bounded by spurs of the Sierra Nevada. In the n.e. part are 
the far-famed Yosemite falls and some of the grandest and most picturesque scenery 
of the world. More to the s. are three collections of mammoth trees, containing more than 
425 specimens, of which 134 are over 15 ft. in diameter. Many of them are from 275 to 
375 ft. in height and from 25 to 34 ft. in diameter. It is supposed that the age of some of 
these trees is at least 2,500 years. The entire country is rich in gold mines and has been 
the scene of very extensive mining operations. The western part is level and fertile; in 
1870 there were produced over 12,000 bushels of wheat and barley; wool and hay are 
also staples, and sheep breeding is carried on with great success. Chief town, Mariposa. 
MARISCAL, Ignacio, b. Mexico, 1829; called to the bar in 1849, and the next year 
made solicitor-general of Oaxaca. He was appointed judge of the Oaxaca court in 1859, 
and of the circuit court in 1860. He was secretary of Legislation at Washington from 
1869 to 1866, and charged d’appareil from 1867 to 1868. In the latter year, Juarez 
made him minister of justice; in 1869 he came to the United States as envoy extra- 
ordinary; and in 1871-72 he was Mexican secretary of state. In 1872 he was once more 
appointed minister to this country, where he remained till the Diaz revolution in 1877. 
MARITZ (the anc. Hebres), a river of European Turkey, rises in the Balkans, and 
flows e.e. through the province of eastern Roumelia to Adrianople, where it bends s., 
and falls into the Egean by the gulf of Enos. It is upwards of 300 m. in length, and is 
navigable to Adrianople, about 100 m. from its mouth. 
MARIPOL, or Mariampot, a seaport in the government of Ekaternoslov, Russia, 
is situated near the place where the Kulunzis falls into the sea of Azov, 60 m. w. of 
Taganrog. It was founded in 1779 by Greek emigrants from the Crimea, and the port 
was opened to foreign vessels in 1836, when 20 ships entered it; but afterwards their 
number increased to more than 300. The articles of export are wheat, linceed, wool, 
and hides from the adjacent provinces, the value being about £500,000. The imports 
are insignificant, ships most commonly arriving in ballast. Pop. ’67, 7,760, who speak 
a corrupt jargon derived from the Turkish and Greek languages. 
MARIS, C., a Roman general, was born of an obscure family, at the village of 
Cereate, near Arpinum, 157 B.C. In the Numantine war (134 B.C.) he served with 
great distinction under the younger Scipio Africanus, who treated him with high con- 
sideration, and even indicated that he thought him a fit successor to himself. In 119 
B.C. he was elected tribune of the plebs, and signalized himself by his vigorous opposi- 
tion to the nobles, by whom he was intensely hated. In 114 B.C. he went to Spain as 
propror, and cleared the country of the robbers who infested it. He now married 
Julia, the aunt of Julius Caesar. He accompanied Q. Caecilius Metellus to Africa in 
100 B.C., was elected consul 2 years after, and intrusted with the conduct of the Jugur- 
than war, which he brought to a successful close in the beginning of 106 B.C. From
this period dates the jealousy between him and L. Sulla, then his quaestor, which was ultimately productive or so many horrors. Meanwhile, an immense horde of Cimbri, Teutones, and other northern barbarians, had burst into Gaul, and repeatedly defeated the Roman forces with great slaughter. Marius was again called to the consulate for the year 104 B.C., and for the third, fourth, and fifth time in the following years, 103–101 B.C., for it was felt that he alone could save the republic. The war against the Teutones in Transalpine Gaul occupied him for more than 2 years; but he finally annihilated them in a battle of 2 days' duration at Aquae Sextiae, now Aix, in Provence, where 200,000—according to others, 100,000—Teutones were slain. After this he assumed the chief command in the n. of Italy against the Cimbri (q.v.), whom he also overthrew, near Vercellae to the w. of Milan, with a like destruction (101 B.C.).

The people of Rome knew no bounds to their joy. Marius was declared the savior of the state, the third founder of Rome, and his name was mentioned along with those of the gods at banquets. He was made consul for the sixth time in 100 B.C. It has often been remarked that, had he died at this period, he would have left behind him one of the greatest reputations in Roman history. When Sulla, as consul, was intrusted with the conduct of the Mithridatic war, Marius, who had long manifested an insane jealousy of his patriotic rival, attempted to deprive him of the command, and a civil war began (88 B.C.). Marius was soon forced to flee, and after enduring the most frightful hardships, and making numerous hairbreadth escapes, he reached Africa, where he remained until a rising of his friends took place under Cinna. He then hurried back to Italy, and, along with Cinna, marched against Rome, which was obliged to yield. Marius was delirious in his revenge upon the army of Cinna; but in 40 days had raised 40,000 men, and won 3 great victories. Marius and Cinna were elected consuls together for the year 86 B.C., but the former died after he had held the office 17 days.

MARIVAUX, PIERRÉ CARLÉT DE CHAMBLYN DE, 1688–1763; b. Paris. He wrote many comedies, mostly for the Italian theater, but they are not now performed. The best are Le jeu de l'Amour et du Hasard, and Les Fauxsses Confidences. He wrote also the romances La vie de Mariane, and Le Pauvre Parvenu. He was elected a member of the French academy in 1749.

MARJORAM, Origanum, a genus of plants of the natural order labiate, having a 10-ribbed, 5-toothed calyx, loose spikes, and broad bracts. The species are annual, perennial, and shrubby plants, natives chiefly of the east, and of the countries bordering on the Mediterranean. They abound in a yellow essential oil—oil of marjoram or oil of origanum—which is obtained from some of the species by distillation. The common Marjoram (O. vulgare) is the only species found in Britain, and is not unfrequent in dry hilly and bushy places. It is a perennial plant, has a stem 1 foot high, ovate leaves, and roundish, panicked, crowded heads of purple flowers, with large bracts. It is used, as are also other species, as a seasoning in cookery, and an infusion of it is a stimulant, tonic, and remedy for nervousness. The powder is an errhine. The essential oil is used as a palliative of toothache, and is mixed with olive oil, to make a stimulating liniment, which is used as a remedy for baldness and in rheumatic complaints, and in cases of sprains and bruises.—The Sweet Marjoram of our gardens (O. majorana) is an annual plant, a native of Greece and the East, with ovate, grayish-green leaves, covered on both sides with a thin down, about 3 roundish heads of flowers growing close together, wrinkled bracts, and small white flowers. Its uses are similar to those of the common marjoram.

Mark, the standard weight of the money system of various countries of Europe. In Germany, during the Carolingian period, a pound-weight (the Roman pound of 12 oz., which had been adopted as the standard of weight by the Frankish kings) of pure silver was coined into 240 pennies (denarii), so that a pound of money, or 240 silver pennies, actually weighed a pound. But in the course of time the coin having become debased, a new standard was found necessary, and as 240 of the pennies then commonly contained about half a Cologne pound of pure silver, it was agreed to accept this as the standard. The Cologne pound was divided into 32 oz., and the half-pound of 16 oz. had been known by the name of a mark as early at least as 1042; and thus the mark of 16 Cologne oz. of pure silver, equivalent to 7 oz. 14 dwt. 14 gr. English, and now coined into 14 thalers, has come to be the fundamental standard of reference. In France the mark was divided into 8 ounces=64 drams=192 deniers or pennyweights=4608 grains. The mark of Holland is the same as that of France. The pound or livre poids de marc used in all retail dealings in France prior to the revolution, was equivalent to 2 marks or 16 oz., or rather more than half a kilogram of modern French weight. The name mark was also given to a coin once current in England, in value 13s. 4d. The value of the Scotch mark was 13¾d. sterling. The mark formerly in use in Hamburg was worth 1s. 2½d. sterling; the mark banco, in which accounts were kept, 1s. 5¾d. In the new uniform currency of the German empire, the unit of reckoning is the mark, approximately equal to 1s.

Mark, a German geographical term, signified primarily the mark of a country's limits (the marc); and hence was applied as a designation of the border countries or districts of the German empire, conquered from neighboring nations. Thus, we read of the marks of Austria, of Northern Saxony or Brandenburg, Laosatia, Moravia,
MARK the Evangelist is probably the same who, in the Acts of the Apostles, is called John Mark. He came originally from Jerusalem, was a nephew of Barnabas, and accompanied the apostle Paul and him to Antioch, Cyprus, and Perga in Pamphylia, returned to Jerusalem, and went afterwards to Cyprus, and thence to Rome (see Acts xiii.; Col. iv. 10; 2 Tim. iv. 11). Ecclesiastical tradition speaks of a missionary expedition of Mark to Egypt and the west of Africa, of his suffering martyrdom about the year 62 or 66 (the Coptic church still consider him their founder and first bishop), and of the transmission of his corpse to Venice, which city has chosen him for its patron saint. The festival (April 25) which the Roman Catholic church holds in his honor is no older than the close of the 7th century. The canonical gospel which passes under his name is believed by some scholars to have sprung from a primitive collection of notices of the life and acts of Christ, drawn up by Mark, and to have been worked up into its present form by a later writer, who had before him the gospels of Matthew and Luke. Others, on the contrary, are of opinion that in Mark's work we have the primitive gospel from which the rest have originated. Compare Wilke, Der Ueевangelist (Dresd. and Leip. 1839), and Baur, Das Marcusевangelium (Tibh. 1851). See Gospels.

MARK the Evangelist (ante), called "John whose surname was Mark," and simply "John " in the earlier parts of the Acts, but in a subsequent passage and in the epistles "Mark" only; was, perhaps, a native of Jerusalem, as his mother lived there in the first days of the church; probably became a disciple under Peter's ministry, as Peter calls him his "son:" was a companion of Paul and Barnabas as far as Perga in Pamphylia, where he left them and returned to Jerusalem. When they were about to start the second time Barnabas was resolute in his purpose to take Mark with them, but Paul thought that it was not proper to have with them one who had once before left them in the midst of the work. This difference of opinion on a matter so vital produced a sharp contention between the zealous co-laborers and friends which resulted in a division of their work, Barnabas taking Mark with him to Cyprus, and Paul, with Silas as his companion, going by land through Syria and Cilicia and thence to the west. Nearly all the information concerning Mark which the Scriptures after this supply is found in Paul's epistles in which the apostle's references to the evangelist are highly honorable to both. Paul may have thought, on subsequent reflection, that he had been hasty in his judgment, or, as more probable, Mark's steadfastness of character may have been increased by experience and especially by the remarkable dispute and separation to which his earlier conduct had given rise. One thing is certain, that Paul's notices of him are all nobly commendatory. To Philemon he ranks him with Luke among his fellow-laborers, words which from Paul mean much; to the Colossians he sends the salutation of Marcus's sister's son to Barnabas, adding the significant parenthesis—"touching whom ye received commandments, if he come unto you, receive him," and to Timothy among the last recorded words before his martyrdom, after telling him to use diligence in coming quickly unto him, he says, "Take Mark and bring him with yourself, for he is very profitable to me in the ministry." While the New Testament thus describes Mark as, during different portions of his life, a companion of Paul, Peter speaks of him as, probably at an intermediate time, present with him when he wrote his first epistle. By the earliest Christian writers after the apostolic age he is described as the companion of Peter rather than of Paul.

MARK, GOSPEL OF (ante), was received in the earliest times by the Christian churches as canonical, and as the work of Mark, under the guidance of the apostle Peter. The first written declaration to the effect, now extant, is recorded by Eusebius as quoted by Papias from John the presbyter, who probably was contemporary with John the apostle. "Mark having become Peter's interpreter wrote accurately all that he remembered, but did not record the words and deeds of Christ in order; for he was neither a hearer nor a follower of our Lord, but afterwards, as I said, became a follower of Peter, who used to adapt his instruction to the requirements of his hearers, but not as making a connected arrangement of our Lord's discourses; Mark, therefore, committed no error in writing down particulars as he remembered them, for he made one thing his object—to omit nothing of what he heard and to make no erroneous statement." Without committing ourselves to all the details of this statement, two facts we may consider as established by it: first, that Mark's gospel was in general use among the churches at the close of the 1st c.; and second, that in writing it he was in a greater or less degree under Peter's guidance, so that the second gospel may be regarded as having received his sanction to the same extent, at least, that the third was approved by Paul. While nearly all the facts which it records are given also in one or more of the other gospels, Mark's shorter gospel abounds in word-painting and precise descriptions which imply that at some stage of the narrative an eyewitness had furnished the writer with particulars which otherwise he could not have known. In one instance, while Matthew says Jesus "stretched forth his hand towards his disciples," Mark's description is, "Looking around on the circle of those who were seated about him." Where Matthew says, "He turned and said unto Peter," Mark's account is, "When he had turned about and looked on his
disciples, he rebuked Peter." In the account which three evangelists give of the rich young man who came to Jesus, only Mark adds, "Jesus looking earnestly on him loved him." In narrating the healing of the withered hand on the Sabbath day, while Luke says, "Looking around on them all," Mark says, "Looking around on them with anger, being grieved for the hardness of their hearts." Mark thus describes Galilee as "exceeding fierce, so that no man could pass by the way:" Luke says of one of them that "often times the spirit had caught him, and he was kept bound with chains and in fetters, and he brake the bands and was driven by the demon into the wilderness." Mark's account is the most picturesque of all, "No man could bind him, no, not with chains; because that he had been often bound with fetters and chains, and the chains had been plucked asunder by him, and the fetters broken in pieces; neither was any man strong enough to restrain him; and always, night and day, he was in the mountains, and in the tombs, crying and cutting himself with stones." Matthew and John were eye-witnesses, and had personal knowledge in other ways, of what they narrate; Luke's narrative in some parts gives information that he had probably obtained from Mary and from historical records; and when Mark relates so many particulars which imply the presence of an eye-witness from the beginning, the testimony of the early church is confirmed that that eye witness was Peter. In two instances, the probability rises almost to certainty: while Matthew gives Peter's confession in full, "Thou art the Christ, the son of the living God," followed by the benediction which it drew from Jesus, "Blessed art thou, Simon Barjona, for flesh and blood hath not revealed it unto thee, but my Father, who is in heaven," and by the remarkable promises as well as stern rebuke to which we can here only refer, Mark gives the confession only in the briefest form, "Thou art the Christ," and, omitting all intimation of benediction and promises, records the rebuke in its full force. Again, while the other gospels all speak in general terms of the cock-crowing in connection with Peter's denial, Mark specifies the crowing twice, both in the Savior's prediction and in the progress of the denial itself. In both these instances we seem warranted in saying that it was Peter, who dictated in the narrative these striking discriminations against himself.

Synopsis of Contents.—Omitting all notice of the birth and minority of Jesus and recording briefly the ministry of John the Baptist, Mark introduces Jesus at his baptism, followed by the descent of the Holy Spirit upon him, with the voice from heaven, and by the temptation in the wilderness. He then begins the account of his public ministry at the imprisonment of John; narrates the call of Simon and Andrew and of James and John; the mighty works wrought in Capernaum, followed by the circuit in Galilee; the forgiveness of the paralytic, attested by his restoration to health; the calling of Levi, followed by the entertainment at his house where many publicans and sinners were guests; the disciples in the corn-fields and the authority claimed by Jesus over the Sabbath day; the withered hand restored on the Sabbath; the multitudes drawn to Jesus from all parts of Palestine, Idumea, and Syria; the choice of the 12 apostles; the effort of the mother and brethren of Jesus to restrain him; the parable of the sower; the emblems of the lighted candle, of the seed sown, and of the grain of mustard seed; the stilling of the storm on the lake; the legion of demons that, cast out of the man, entered into the swine; the woman healed, and the daughter of Jairus raised up; the preaching at Nazareth, and unbelief of the people there; the twelve instructed, empowered, and sent forth, two by two; the perplexity of Herod, explained by a full narrative of his history; the healing of the daughter of Jairus, the return of the demoniac of the Gerasenes; the casting out of 5,000 men with five loaves, followed by the walking on the sea, and by the multitude of the sick brought together from all the region around and healed; the traditions of the elders condemned as making void the commandments of God, and counter-instructions concerning true religion given; the Syrophenician mother, at first apparently rejected in order to manifest her faith, rewarded by finding her daughter restored; the deaf stammerer cured; the 4,000 fed with seven loaves; warning against hypocrisy under the emblem of a leaven; a blind man led out of the town and healed; Peter's confession of faith, followed by his presumption and stern rebuke; the disciples warned concerning future trials; the transfiguration and instructions connected with it; the dumb, deaf, and desperate demon cast out; the death of the Son of man foretold; the ambition of the disciples reproved, and humility taught under the emblem of a child; John's narrow views corrected; offenses warned against under the emblems of a hand and foot to be cut off and of an eye to be plucked out; the unlawfulness of divorce declared; little chil-

tered blessed; the rich inquirer concerning eternal life; the disciples amazed and afraid; the ambitious request of James and John; Bartimaeus restored to sight; the entrance into Jerusalem; the fig-tree dried up, and instructions afterwards drawn from it; the temple cleansed, and the subsequent demand for authority silenced; the hypocritical question of the Pharisees and Herodians, the scoffing question of the Saduccees, the earnest question of the scribe, and the silencing question of Jesus; warning against the scribes; the offerings of rich men and of the poor widow compared; the destruction of the temple foretold, with the attending tribulations and the sudden coming of the Son of man; the conspiring of the chief priests and scribes; the broken box of ointment, and the prediction concerning it; the covenant of Judas with the chief priests; the passover kept, the supper instituted, the betrayal and Peter's denial foretold; the conflict in Gethsemane; the betrayal, apprehension, denial by Peter, condemnation by the council, and accusa-
tion before Pilate; Barabbas released, and Jesus scourged and crucified; scenes at the cross and at the tomb; resurrection, attested by appearances to the disciples; commission and promise to the apostles; the ascension of Jesus, followed by the successful preaching of the apostles everywhere in his name. The last 13 verses of the xvi. chapter are not found in two of the oldest and best manuscripts, and their genuineness has, therefore, been questioned; but their genuineness is claimed as fully proved by the quotations from them by Irenæus and other writers of the 2d c., whose testimony is much older than any manuscript extant.

MARK ANTONY. See Antontius, ante.

MARKET OVERT, a term in English law, used to denote an open market. If stolen goods are sold in open market without fraud on the part of the buyer, the real owner cannot reclaim them from such purchaser till he has prosecuted the thief.—In Scotland, the real owner can reclaim the goods at any time, whether in the meantime sold in open market or not.

MARKETS. See Fairs.

MARKHAM, CLEMENTS ROBERT, b. England, 1830; educated at Westminster, and appointed a naval cadet in 1844. He was made lieut. in 1850, but left the navy the next year. He had been attached to the expedition in search of sir John Franklin in 1850-51, and from 1852 to 1854 he traveled in Peru and among the Andes. He was appointed a clerk to the board of control in 1855; introduced the cinchona plant into India in 1860; went to Ceylon and India in 1865, and in 1867 took charge of the geographical department of the India office. He went with the English expedition against Abyssinia as geographer in 1867, and was present at the capture of Magdala. He has published Franklin's Footsteps, 1852; Cuzco and Lima, 1856; Travels in Peru and India, 1862; A Quichua Grammar and Dictionary, 1863; Spanish Irrigation; 1871; A History of the Egyptian Expedition, 1880; A Life of the Great Lord Fairfax, 1870; Oriental, a Quichua Drama, 1871; Memoir on the Indian Survey, 1871; general sketch of the History of Peru, 1873: The Threshold of the Unknown Region, 1874; A Memoir of the Countess Chinchor, 1875. He is secretary of the royal geographical society and editor of the Geographical Magazine.

MARKHAM, GERVASE, 1570-1635; b. Nottinghamshire, England; was a capt. in the army of Charles I, and an author of great versatility, having employed his pen upon poetry, the drama, military tactics, angling, archery, etc. The most important of his works are The Poem of Poems; Sir Richard de Grinville (a tragedy); The English Husbandman; and The Whole Art of Angling.

MARKHAM, WILLIAM, a relative of William Penn; deputy-governor of Pennsylvania and Delaware in 1681-82; secretary of the province in 1684; deputy-governor of Delaware, 1691-93; deputy-governor of Pennsylvania under gov. Fletcher, 1693-95; and under William Penn, 1695-99.

MARKING-NUT, the fruit of semecarpus anacardium, a tree of the natural order anacardiaceae, a native of the mountains of India. It is a large tree, with oblong leaves, and terminal panicles of flowers. The fruit is a heart-shaped nut, seated on a large swollen receptacle. The receptacle, when ripe, is rotted and eaten, and resembles a roasted apple; although, when raw, it is astringent and acid. The nut is black, and between the two coats of its shell there is a black acrid juice, much in use for marking cotton-cloths, a mixture of quick-lime and water being applied, to prevent it from running, and to brighten the color. It is also used as an external application in rheumatism.

MARL (Ger. Mergel), a mixture, naturally existing, of clay and carbonate of lime. Marl are found in very different geological formations, but everywhere seem to owe their origin to deposition by water. The name is sometimes applied to friable clays, or mixtures of clay and sand, in which there is almost no trace of lime; but the presence of a notable portion of carbonate of lime is essential to marl, properly so called. This proportion varies from 6 to 20 per cent. Marly soils are in general of great natural fertility. Marl is very advantageously used as a manure, acting both chemically and mechanically; but different kinds of marl are of very different value in this respect. The use of marl as a manure has been known from ancient times. An English statute of 1255 (10 Henry III.) gave every man a right to sink a marl-pit on his own ground, and there is other evidence that the application of marl to land was common in England in the 13th century. Old marl-pits are very common in some parts of England. The quicker action and greater efficiency of lime have led to its use in many cases instead of marl, although some kinds of marl are extremely useful in some soils. The bulkiness of marl confines its use to the neighborhood in which it is found.—Marl is sometimes indurated into a rock, and a slaty variety, containing much bitumen (bituminous marl-slate), is found in Germany and other countries.

MARLBOROUGH, a co. in n.e. South Carolina; 500 sq. m.; pop. ’80, 20,598. The surface is generally level, and there are extensive forests. The chief productions are wheat, corn, oats, rice, and cotton. Co. seat, Bennettsville.
MARLBOROUGH, a t. in Middlesex co., Mass., 32 m. w. of Boston; pop. '80, 10,126. The Boston, Clinton and Fitchburg and a branch of the Fitchburg railroads pass through it. The principal business is the manufacture of boots and shoes, which is extensive. There are 7 churches, 2 newspapers, a national and a savings bank, 3 hotels, a public library, a soldiers' monument, and a handsome town-hall.

MARLBOROUGH, an old and interesting t. of England, Wiltshire, is a municipal and parliamentary borough, pleasantly situated in the valley of the Kennet, 75 m. w.s.w. of London. It consists principally of one street of picturesque houses. The chief edifice is the "college," a handsome building occupying the site of the old castle. As early as the days of Ceur-de-Lion there was a castle at Marlborough; and a parliament, whose enactments were called the "statutes of Marlbridge," was held here in the reign of Henry III. The college was incorporated in 1485; the pupils are about 300 in number. Marlborough was formerly an important posting-station between London and Bath and Bristol. It still carries on a trade in coal, corn, and malt. Pop. '71, of parliamentary borough, which returns one member to parliament, 5,034.

MARLBOROUGH, JOHN CHURCHILL, Duke of, the greatest general and statesman of his time, was b. June 24, 1650, at Ashe, in Devonshire, of an old family impoverished by the civil wars. Without having received much education he became a page in the service of the duke of York, who gave him a commission as an ensign of guards in his 16th year. He was present at the relief of Tangiers, and a number of engagements with the Moors, and after his return to England rose to the rank of capt. in a regiment which was sent to the Netherlands to the support of the French. In the campaign from 1672 to 1677 his brilliant courage and ability gained him the praise of the celebrated Turenne. On the conclusion of the war by the peace of Nimegue, Churchill, now a col., returned to England. His advancement had been obtained not merely on account of his own merits, but through the influence of his sister Marie, mother of the duke of York. His prosperity was afterwards still further secured by his marriage with Sarah Jennings, a lady as remarkable for her talents and imperious disposition as for her beauty. When James II. ascended the throne, Churchill was made baron of Sundridge, and was raised to the military rank of general. He took an active part in suppressing Monmouth's rebellion, but on the landing of the prince of Orange he passed over to the side of the invader very unscrupulously. He was rewarded by being made earl of Marlborough. He aided in reducing Ireland to subjection, and, having received from William III. the command of the troops employed against France in the Netherlands, displayed great ability as a gen. In the campaigns of 1690, 1691, and 1693. But in 1692 he fell into disfavor with the king and was dismissed from all his offices, and shortly after he was even thrown into the Tower for a few days on the charge of maintaining treasonable correspondence with the exiled king. On the commencement of the war of the Spanish succession he was intrusted with the command of the British army in the Netherlands. The death of William, and the accession of Anne to the throne in March, 1702, made Marlborough virtually regent, although without the title. His wife entered the queen, and he himself directed the minister Godolphin, whose son had married his daughter. A constant succession of victories strengthened his political power. In the campaign of 1702 he drove the French out of Spanish Guelders, in reward for which service the queen raised him to the rank of duke; and in 1703 he campaigned again in the Low Countries. In 1704 he went to the support of the emperor in Germany, and joined prince Eugene of Savoy; in July, 1704, he stormed the French and Bavarian lines at Donauwörth; and on Aug. 13 overthrew a stronger French and Bavarian army in the memorable and decisive battle of Blenheim. The parliament bestowed on him the estate of Woodstock, and the queen caused Blenheim palace to be built for him, though it had to be finished at his own expense. In 1705 Marlborough was made a prince of the empire. During the year 1705 Marlborough was chiefly occupied with diplomatic negotiations, but in 1706 he resumed that career of victory by which Louis XIV. was so completely humbled. In March of that year the French Families was fought which compelled the Duke of Orleans to evacuate the whole of Spanish Flanders. In the summer of 1708 an attempt made by the French, under Vendome, to recover Flanders, brought on an engagement at Oudenarde, July 11, which resulted in the total defeat of the French. On Sept. 11, 1709, he fought the bloody and unsuccessful battle of Malplaquet; in 1710, his final campaign, he took town after town from the French. Meanwhile, however, important events took place at the British court: the queen shook off the tyranny of the duchess of Marlborough, which had become intolerable to her; Godolphin and Sunderland ceased to be ministers, and the earl of Oxford and the Tories came into power. Marlborough was accused of having embezzled the public money, and on Jan. 1, 1712, he was deprived of his offices, but the charge against him was not prosecuted. On the accession of George I. he was treated with distinction and made capt.gen., and master of the ordinance. But on May 28, 1716, he had a stroke of apoplexy. This, though it slightly impaired his speech, did not prevent him, from continuing to sit in parliament and attending to his other duties till six months before his death, which happened on June 16, 1722. He left an immense fortune. Marlborough was unquestionably guilty of political dissimulation, was inordinately fond of money, and may have been part-
monious. But his character had many elements of singular excellence. He was generous in action, gentle in temper, a devoted husband, and a pious Christian.

His wife, Sarah Jennings, was b. on May 29, 1660, and when about 12 years of age came into the service of the duchess of York, and became the chosen and most intimate friend of the princess Anne, over whom, after her accession to the throne, she exercised the influence due to a superior and extremely active mind. Her power was almost boundless; the whig ministry depended upon her support, and she disposed of places and offices at her pleasure, and is even said to have accumulated money by the sale of them. Her rule became, however, at last intolerable to the queen, in whose favor her own cousin, lady Masham, whom she herself had brought to court, supplanted her. She retired from the court in January, 1711. She long survived her husband, living in complete retirement, and died on Oct. 29, 1744, leaving a fortune of £3,600,000 sterling. The only son of the duke and duchess of Marlborough died young, and the title has been inherited by the descendants of one of their daughters.

**MARLINE-SPIKE**, a ponderous iron pin, with a large head and taper point, used on shipboard for separating the strands of rope preparatory to splicing or knotting; also employed as a lever in tightening rigging, etc.

**MARLOW, GREAT.** See Great Marlow.

**MARLOWE, CHRISTOPHER**, familiarly Kit, an English dramatic writer, was b., it is supposed, in 1565. But little is known of the events of his life. He studied at Corpus Christi college, Cambridge, and took the degree of master of arts in 1587. After leaving the university, he came up to London, and wrote for the stage. His chief works are *Dr. Faustus*, *Edmund II.*, *Tamburlaine the Great*, and two cantos of *Hero and Leander*, a narrative poem, which was afterwards completed by Chapman. He appears to have led a reckless life; and on June 1, 1593, he perished in a tavern brawl, it is supposed by the hand of a jealous rival.

Of all the dramatic writers before Shakespeare, he was the greatest genius; indeed, his *Edmund II.* may be considered a foreshadow of Shakespeare's historical dramas. His "mighty line" has been the subject of much critical laudation. His imaginative force and splendor are at their best in *Faustus*; his delicacy and sweetness in *Hero and Leander*. An edition of his works, with a life and a literary-historical introduction, was published by Dyce in 1850.

**MAR-MALADE** (Port. marmelada, from marmelo, a quince; which, again, is from Mid. Lat. *malomellum*, Gr. *mellinon*, honey-apple or sweet apple) is a semi-liquid preserve, made by boiling the pulp of thick-rinded fruits, such as oranges, pine-apples, quinces, etc., with portions of the rind. The most common kind of marmalade is made from the bitter or Seville oranges, the common or sweet sorts being considered inferior for this purpose, though also occasionally used. The mode of preparing it is generally as follows: the rind is boiled by itself, and the white woolly coating on the interior being then removed, the rind is cut up into thin strips, and boiled along with the expressed juice of the pulp and a quantity of sugar equal in weight to the other ingredients. After the mixture has attained the proper consistence, it is treated in a similar manner to jam, jelly, and other preserves. A species of marmalade is commonly made in France from apricots, peaches, plums, pears, etc.

**MAR-MARDE, an old t. of France, in the department of Lot-et-Garonne, on the right bank of the Garonne, 50 m. above Bordeaux. An important general trade is carried on with Bordeaux, with which Marmande is in daily communication by steamboat. Pop. 76, 6,037, who manufacture hats, woolen stuffs, brandy, etc.

**MAR-MAROS, the name of a co. in n.e. Hungary, bounded on the n. by Galicia, e. by Galicia and Bukowina, and s. by Transylvania. It is the third county in size in Hungary; 3,998 sq. m.; pop. 70, 220,506. The population is made up of Wallachs, Jews, Magyars, Germans, and Ruthenians, the latter being fully half the whole number. The prevailing church is the united Greek. It is a mountainous region, being crossed and intersected by the Carpathian chain, many of whose peaks reach a great height. It is a rich mineral country, containing iron, lead, coal, and gold; there are also great salt mines, asbestos, marble, crystals, and diamonds. Mineral springs are frequent, the land is heavily timbered, chiefly with oak; and there are vast numbers of horses and sheep. The river Theiss waters this county, and its valley is fertile, and produces grain, fruits, and wine; elsewhere maize is the only important food product.

**MARMIER, XAVIER, b. in Pontarlier, France, 1809.** After journeys through Europe he translated Krummacher's stories from the German; to French, and their success enabled him to make further travels and to become director of the *Revue Géomanique*. In 1835 he was attached to the scientific voyage of the *Recherche* to the Arctic sea. During the voyage he acquired a knowledge of the Danish, Swedish, and Finnish languages; and on his return in 1839 was made professor of foreign literature at Rennes, and two years later was given a sinecure under the minister of public instruction. In 1842 he visited Russia; traversed the Indies, passing from the Danube to the Nile; and Syria in 1846; Algeria in 1846; North America in 1848; South America, 1849, etc.; everywhere studying the languages, idioms, and literature of the country. His works are numerous.
and valued as a fund of information for students of the languages and manners of all the people among whom he has been—for he has written continuously as he traveled.

**Marmont.**

**Marmont. Auguste Frédéric Louis Vieusse de,** duke of Ragusa and marshal of France, was b. July 20, 1774, at Châtillon-sur-Seine, entered the army at an early age, served as a brig. gen. in Egypt, returned with Bonaparte to France, supported him in the revolution of the 18th Brumaire, and afterwards continued in active military service. Having defended the Revolution but its navigation is by no means Montgolfiers. In 1809, he joined the great army in 1809, the day before the battle of Wagram, was intrusted with the pursuit of the enemy, won the battle of Znaym, and was made a marshal. He was thereafter for eighteen months governor of the Illyrian provinces; and in 1811 succeeded Massena in the chief command in Portugal, where he assumed the offensive, caused the siege of Badajoz to be raised, and kept Wellington in check for fifteen months. A wound compelled him to retire to France. In 1813 he commanded a corps d'armée, and fought at Lützen, Bautzen, and Dresden. He maintained the contest with great spirit in France in the beginning of 1814; and it was not until further resistance was hopeless that he concluded a truce with Barcay de Tolly, on which Napoleon found himself compelled to abdicate. The Bourbons loaded Marmont with honors. On the return of Napoleon from Elba, he was obliged to flee. After the second restoration, he spent much of his time in agricultural pursuits, till the revolution of 1830, when, at the head of a body of troops, he endeavored to reduce Paris to submission, and finally retiring with 6,000 Swiss, and a few battalions that had continued faithful to Charles X., conducted him across the frontier. From that time he resided chiefly in Vienna. In 1852 he engaged in an effort for the fusion of the French legitimists and Orleanists, but died at Venice on Mar. 2 of that year. He was the last survivor of the marshals of the first French empire.

**Marmontel.** Jean François, an elegant French writer, b. of an obscure family at Bort, in the Limousin, July 11, 1723. He studied for the church, but turned aside to literature, and after obtaining some reputation in Toulouse as a poet, he went to Paris on an invitation from Voltaire in 1746. Here he wrote tragedies and operas without any great success, but was fortunate enough to get a secretarship at Versailles, through the influence of Mme. Pompadour, in 1753. Afterwards, he received a more lucrative appointment, the Mercure being intrusted to his charge. His Contes Moraux (3 vols. Par. 1761), part of which originally appeared in the Mercure, have been translated into many languages, but are in some measure liable to the charge of monotony. He wrote other works, the most celebrated of which is his Bélisaire, a political romance, containing a chapter on toleration, which excited the most furious hostility on the part of the doctors of the Sorbonne. The book was condemned as "heretical and blasphemous." The clergy declaimed against it from the pulpits; the city was in a ferment; even the wise Turgot was borne away by the current. Pamphlets, epigrams, caricatures appeared in great numbers. There was a dead set-to between the philosophers and wits on the one hand, and the theologians on the other; but the latter were defeated, and Marmontel was named historiographer of France. In 1787 appeared his Eléments de Littérature, consisting of his contributions to the Encyclopédia, in which he had charge of the departments of poetry and general literature. It is really his best book, and the one on which his reputation most securely rests. After the revolution, he retired to the village of Ablo- ville, near Evreux, where he died, Dec. 31, 1799. An edition of his Œuvres Complètes was published by himself in 17 vols.; another 18 vols. (Par. 1818); a third, 7 vols. (Par. 1819-20).

**Marchmor, The Sea of,** the Propontis of the ancients, a small sea between European and Asia Minor; a shallow sea, the strait of the Dardanelles (anciently Hellespont), and with the Black Sea by the strait of Constantinople (anciently Bosphorus). It is of an oval form, and about 153 m. in length by 45 in breadth, but has besides a large gulf, the gulf of Issikmid or Isid, which extends about 30 m. eastwards into Asia. The depth is great. There is a current from the Bosphorus through it and the Hellespont to the Archipelago; but its navigation is hazardous, as it contains many islands, of which the largest is Marmora or Marma, famous for its quaries of marble and alabaster. The scenery around the sea of Marmora is soft and beautiful.

**Maroset, A name often given to a number of small and beautiful species of American monkeys of the genera *harpale* and *jacchus,* also called Oustittt, and sometimes also to species of the genus *midas* of naturalists. They are all distinguished from the other American monkeys by the smaller number of their grinders, resembling in this the mon- keys of the old world, also by the sharpness and crookedness of their nails. They depart from the true quadrumanous character in having the thumb not opposable. The tail is very long, and thickly covered with hair, but not prehensile. They exhibit a very affectionate disposition; but unhappily all of them prove very delicate when removed from a warm climate. The name Marmoset is sometimes restricted to the species also called the Striated Monkey, or *Harpale Oustittt* (harpale jacchus, or *jacchus vulgaris*), a native of Guiana and Brazil, a species often brought to Europe, and a favorite pet whenever it can be obtained. It is about seven or eight inches long, exclusive of the tail, which measures a foot. Its fur is long and soft, of a fine dark gray or reddish-yellow color, banded with black; a long tuft of white hairs on the sides of the black head.
MARMOT, Arctomys, a genus of rodents, usually ranked among the muridae, but regarded as forming a connecting link between that family and sciuridae; resembling squirrels in their dentition, although in their form and habits they more resemble rats and mice. They have two incisors and two premolars in each jaw, four molars on each side above, and three below. The Common Marmot, or Alpine Marmot (A. alpinus), is a native of the Alps, the Pyrenees, and the more northern mountains of Europe, up to the limits of perpetual snow. It is not a native of Britain. It is about the size of a rabbit, grayish yellow, brown towards the head. It feeds on roots, leaves, insects, etc. It is gregarious, and often lives in large societies. It digs large burrows with several chambers and two entrances, generally on the slopes of the mountains, where the marmots may be seen sporting and basking in the sunshine during the fine weather of summer. They spend the winter in their burrows, in one chamber of which is a store of dried grass; but the greater part of the winter is passed in torpidity. The alpine marmot is easily tamed. The Quebec Marmot (A. empetre), found in Canada and the more northern parts of America, in woody districts, is a burrowing but not a gregarious animal.

MARNE, a river of France, the Matrona of the ancients, the most considerable tributary of the Seine, on the right. It rises in the plateau of Langres, flows through the departments of Haute-Marne, Marne, Aisne, and Seine-et-Marne, in a course at first to the n.w., and then to the w., with many windings; passes Chaumont, Joinville, St. Dizier, Vitry, Châlons, Epernay, Château-Thierry, and Meaux; and joins the Seine at Charenton, about four miles south of Paris. It is navigable for 114 miles, and it is navigable for 16 miles. It is rather a rapid stream, and in most places with a wide bed. The commerce carried on upon this river has been extended by means of canals, of which the most important is one completed in 1851, connecting it with the Rhine.

MARNE, an inland department in the n.e. of France, formed out of the old province of Champagne, is traversed by the river Marne, and extends southward from the frontier department of Ardennes. Area, 2,021,488 English acres, of which 1,519,320 acres are cultivable, and 45,704 are in vineyards. Pop. '76, 407,780. The soil is very fertile in the s., but chalky and arid in the north. It is in the dry and chalky soil of the n. of this department where the best varieties of the famous champagne wine (q.v.) are grown. In 1875, 15,318,345 bottles of champagne were exported. Of wines of all kinds, about 15,400,000 gallons are produced annually. The bearing of a Spanish breed of sheep is a chief industry, and woolen manufactures are largely carried on. The department is divided into the 5 arrondissements of Châlons-sur-Marne, Epernay, Reims, Sainte-Ménéhould, Vitry-le-François. Capital, Châlons-sur-Marne.

MARNE, Haute, an inland department in the n.e. of France, s.e. of the department of Marne. Area, 1,545,460 acres; pop. '76, 252,448. The surface is generally hilly, and is mountainous in the s. and east. More than one-half of it is cultivable, and about one-third is in forests. The principal rivers are the Marne, with its tributaries, and the Meuse. About 13,000,000 gallons of wine of an ordinary quality are produced. The department is rich in iron ore; there are numerous furnaces, and the production of iron is the principal branch of industry. There are three arrondissements, Chaumont, Langres, and Vassy; capital, Chaumont-on-Bassigny.

MARNIX, Philip van. See ALDEGONDE, SAINTE.

MAROCO. See Morocco.

MAROCETTI, Carlo, Baron, chevalier of the legion of honor, an Italian sculptor of merit, b. at Turin in 1805. Having completed his primary studies at the lyceum Napoléon, he entered Bosio's study. On the completion of a tour through Italy he took up his abode in France in 1827, and carried off a medal the same year for his beautiful statue of "A Young Girl sporting with a Dog." In 1831 he exhibited the "Fallen Angel." On the outbreak of the Paris revolution of 1848, Marochetti repaired to London, where he continued to reside, having met with splendid encouragement both from the public and a host of royal and noble patrons. Among his best works are an equestrian statue of Emmanuel Philibert, executed gratuitously for the city of Turin; the tomb of Bellini, in Père la Chaise; the grand altar in the Madeleine at Paris; statues of the emperor, the duke of Orleans, and queen Victoria; the colossal figure of Richard Cœur-de-lion, exhibited at the portal of the Crystal palace. One of his last works was a statue of lord Clyde in Waterloo place, London. He died in 1867.

MARONITES, a Christian tribe of Syria, of very ancient origin, regarding which considerable controversy has arisen. The most probable account represents them as descendants of a remnant of the Monothelite sect (see MONOTHELITISM) who, fleeing from the repressive measures of the emperor Anastasius II., in the early part of the 5th c., settled on the slopes of the Lebanon, their chief seats being around the monastery of Maron, a saint of the 5th c., whose life is found in Theodoret's Religions Histories (ii. p. 1292). The emigrants are said to have elected as their chief and patriarch a monk of the same name, with the title of patriarch of Antioch, and, throughout the political vicissitudes of the succeeding centuries, to have maintained themselves in a certain independence among the Moslem conquerors. In the 12th c., on the establishment of the Latin kingdom of Jerusalem, the Maronites abandoned their distinctive monothelite opinions.
and recognized the authority of the Roman church. Again, in the council of Florence, 1445, they entered into a formal act of union with Rome. In 1584 a college was founded in Rome for the education of the Maronite clergy; and in 1738 they formally subscribed the decrees of the council of Trent. Nevertheless, although united with Rome, they are permitted to retain their distinctive national rites and usages. They administer communion in both kinds; they use the ancient Syriac language in their liturgy; their clergy, if married before ordination, are permitted to retain their wives; and they have many festivals and saints not recognized in the Roman calendar. The Maronites at present are about 150,000 in number, distributed into 150 parishes. Their patriarch is still styled patriarch of Antioch, and resides in the convent of Canobin on the Lebanon. He acknowledges the supremacy of the pope, and is bound to lay before him every tenth year a report of the state of his patriarchate. Under him are 17 bishops, to whom are subject the officiating clergy of the 150 districts alluded to above. The revenues of all orders of ecclesiastics, however, are very narrow, and the inferior clergy live in great measure by the labor of their hands. Very many convents for both sexes are spread over the country, containing, in the whole, from 20,000 to 25,000 members, who all wear a distinctive costume, but follow the rule of St. Anthony. The chief seat of the Maronites is the district called Kesrawan, on the western declivity of Mount Lebanon; but they are to be found scattered over the whole territory of the Lebanon, and in all the towns and larger villages towards the n. in the direction of Aleppo, and southwards as far as Nazareth. Their political constitution is a kind of military republic, regulated for the most part by ancient well-recognized laws. Like the Arabs of Syria, they have a political hierarchy, partly hereditary, partly elective. The chief administration is vested in four superior sheikhs, who possess a sort of patriarchal authority, and under these are subordinate chiefs, with whom, as in the feudal system, the people hold a military tenure. They retain even still a custom similar to that of the Sardinian vendetta, by which the kindred of the slain are bound to avenge his death. The relations of the Maronites with the Druses have been already detailed. See Druses By an arrangement adopted since the recent sanguinary conflicts, both populations alike are subject to one governor, who is appointed by the porto as governor of the Lebanon.

MAROONS, a name given in Jamaica and Dutch Guiana to runaway negro slaves. The term was first applied to those slaves who were deserted by their masters, the Spaniards, when the British conquered Jamaica (1655), and who took refuge in the uplands, where for 140 years they maintained a constant warfare with the British colonists; but in 1795 they were subdued, and a portion of them removed to Nova Scotia, and afterwards to Sierra Leone. The remnant fraternized with their manumitted brethren in 1834-35. The Maroons of Dutch Guiana form a number of small independent communities.

MAROS' RIVER, in the Austro-Hungarian empire, takes its rise in the Carpathian mountains of Transylvania, near Mt. Magos; flowing s.w. through Transylvania it enters Hungary, where it forms the n. boundary of the Banat or military frontiers. It empties into the Theiss: length 530 miles. On the left side its principal branches are the Nyarad, Kokel, Sebes, and Strehl; on the right, the Aranyos. In its upper portion it flows through a country rich in almost all the metals and minerals; its lower course is through fertile lands. It is navigable as far as Karlsburg, which is the principal city upon its banks.

MAROS-VASARHELY, a market t. of Austria, in Transylvania, in a fruitful district, on the Maros, 55 m. n.n.e. of Hermanstadt. It contains a strong castle, a beautiful Gothic church (Reformed), and a public library of 60,000 vols. Tobacco, wine, and fruit are extensively grown. Pop. '09, 12,678.

MAROT, CLÉMENT, 1495-1544; b. in Cahors, France; studied law, found it repugnant, attracted the attention of Marguerite de Valois, and was made valet de chambre to Francis I. His father was court poet of Anne of Bretagne, and had also been valet de chambre of the same king. Marot's wit, poetic faculty and charming manners secured the favor of the monarch, to whom he had dedicated a poem, the Temple of Cupid. At the battle of Pavia, in Italy, he was taken prisoner with Francis I. Returning to France not long after, he was imprisoned for supposed sympathy with the reformers in religion, suggested by his poem, L'Enfer. Released by his friend, the bishop of Chartres, his pen became more lively and caustic than before, as will be seen by the following verse from L'Épitre aux Dames de Paris:

L'envi de mes mains et cagots,
Je la dirais, mais je ne dirai pas,
Et des abus dont l'église est fourrée,
J'eu parlerais, mais garde la bouche.

He was again imprisoned (1530), but obtained the favor of the king by a poem and was again released. Dreading further imprisonment, he sought refuge, in 1538, at the court of the queen of Navarre. In 1539 we find him at Ferrare, Italy, at the court of the duchesse Rénée, where he formed a friendship with Calvin. Pope Paul III. ordered the duchess not to harbor those pestilent men. They left together and went to Venice. But he was no suitable companion for Calvin; Marot was simply a free-thinker. Their bond of friendship was hatred of the corruptions of the church. Calvin was building a.
faith hedged round about with the same dogmatism that he was combating. Marot would soon have lampooned that as caustically as he had the Roman church had Calvin not been a fellow-sufferer from persecution. Marot reappeared at court between 1538 and 1545, but was considered a dangerous heretic; yet he obtained employment in translating the Psalms of David from the Hebrew into French rhythm. The church condemned it, the king interdicted its publication; but it circulated nevertheless, and became one of the favorite studies of the Jansenists and Calvinists. The psalms were set to music by Goudimel, and sung in the meetings of the Protestants. Marot fed himself in danger in Paris, and joined Calvin in Geneva. But he found the austerities of the latter and his followers as repugnant to him as the weaknesses of the monks. Accused of playing backgammon and other frivolities, he found it more pleasant to leave the city than to reside in it, and sought refuge in Turin, where he died poor at the age of 50. La Harpe says of him: "The name of Marot marks the first epoch really notable in the history of our poetry." Another critic considers him remarkable chiefly as being the first to mold French to a really polished and melodious verse. His works form a singular variety of tracts, songs, ballads, letters, cock-and-bull stories, madrigals, epigrams, epitaphs. He was the Tom Moore of his day—precise in the expression of his thought, and at once witty and graceful. The Roman de la Rose, Frère Ludin, Frère Thibaud, A Madame d'Alençon, and the translations of the Psalms, are a few of his numerous works. His letters, Épitres, are considered his finest work.

MAROZIA, a Roman lady of noble birth, but of infamous reputation in the scandalous chronicles of her age, daughter of the equally notorious Theodora, was b. in the close of the 9th century. On the dissolution of all the moral ties of public and private life which the war of factions occasioned in Rome in the 10th c., Maroza, by her beauty and her intrigues, contrived to exercise great influence. She was married three times, and if we may credit the narrative of Lupitrand, had skill and address enough to procure the deposition and death of the pope, John X., and the elevation of her son—the fruit, it is alleged, of adulterous intercourse—to the pontificate, under the name of John XI. This, however, rests on the testimony of Lupitrand, who wrote some time after the period, and whose authority is considered more than doubtful not merely by Muratori, but even by so critical and unbiased a writer as Dr. Pertz. Maroza's latter years brought on her the punishment of her crimes. She died in prison at Rome in 938.

MARQUE, LETTERS OF. See LETTERS OF MARQUE.

MARQUESAS ISLES are, properly speaking, the southern group of the Mendaña archipelago, in Polynesia, the northern group bearing the name of the Washington islands; but the name is also applied to the whole archipelago. The Marquesas islands, in lat. 7° 30' to 10° 30' s., long. 138° to 140° 20' w., were discovered by Mendaña de Neyra, a Spanish navigator, in 1568; the Washington islands were discovered in 1791, by Ingraham, an American. Area of the group as under the French protectorate, 500 English sq. m.; pop. 10,000. The Marquesas islands were named after the vicerey of Peru, Marquesas de Mendoza. In 1842 the Marquesas islands submitted to the French, and they are now governed by independent chiefs, under the protectorate of France.

MARQUETRY (Fr. marquerterie), the art of inlaying wood with wood of other colors, or with various other materials, as metal, ivory, shell, etc.

MARQUETRY (ante). See Buhl-work; Inlaying; Mosaic; ante.

MARQUETTE, a co. in n. Michigan, intersected in the e. and n.e. by the Marquette, Houghton and Ontonagon railroad, and the Chicago and Northwestern railway; about 3,425 sq. m.; pop. '80, 25,393—11,868 of American birth, 154 colored. In the n.e. it forms part of the shore of lake Superior, and it is drained by numerous rivers and creeks, the Escanaba and Michigamme being the most important, and has lake Michigamme in the north. Pine forests cover a large extent of the surface, which is generally level. Its agricultural products are potatoes, butter, maple-sugar, and oats. Live stock is raised to some extent. Its mineral products are granite, iron ore (red oxide), lead, and limestone. Iron is found in great abundance, especially in Iron mountain, a ridge rising in the n.e. section to the height of 900 ft. above the level of lake Superior. Under the most favorable circumstances the yield is about 200,000 tons from this mine annually. Mining is the chief industry. Its manufactories consist of furnaces for the manufacture of pig-iron, mining powder, charcoal, and nitro-glycerine. There are lumber and lath works and machine shops. Seat of justice, Marquette.

MARQUETTE, a co. of s. central Wisconsin; 490 sq. m.; pop. '80, 8,907. Surface level and traversed by Fox river; soil fertile; corn, wheat, and wool are the staple products. Capital, Montello.

MARQUETTE, a city in Michigan, a shipping point for the coal-mines of Marquette co. and depot of supplies, by the s. shore of lake Superior; on a bluff 35 ft. in height; pop. '70, 5,242. It has an excellent harbor with convenient piers reaching far into the lake. It is 500 m. from Detroit by water, and 400 m. by rail from Chicago. It is 95 m. s.e. of Houghton, and is the e. terminus of the Marquette, Houghton and Ontonagon railroad, besides having communication with the large cities by steamer. It is lighted with gas, has several machine-shops, foundries, rolling-mills, and blast furnaces. It has a fine opera-house; 3 banks, with an aggregate capital of $700,000, 2 of them national;
Marquette.
Marriage.

510

6 churches, 3 public halls, a park of forest trees, good schools with expensive edifices, a newspaper, a well-organized fire department, and a public library. Its water supply is brought from the lake by the Holly system. Roofing-slate and brown stone are quarried.

MARQUETTE, Jacques, 1637-75, b. France; came to Canada as a Jesuit missionary in 1666, and after spending a year and a half in the valley of the Three Rivers learning the Indian languages of several of the Algonquin tribes, was assigned to the Mohawk mission; but before going his direction was changed, and he was sent to lake Superior, where he founded the mission of the South Sainte Marie in 1668. In 1669 he was sent to La Pointe, among the Ottawas and Hurons. The Siouy broke up the mission and dispersed the Hurons, whom he followed to Mackinaw and the mission St. Ignatius, on the north shore, where he built a chapel in 1671. The following year, writing with great show of piety and holy zeal to father Dablon, the head of the order in Montreal, he congratulated himself with what he had accomplished, and expressed himself “ready to seek new nations toward the South sea who are still unknown to us, and to teach them of our great God,” etc. He had heard in many ways from the Indians of the existence of a great river to the westward, whose course was south, and which they called by its present name, Mississippi. It was imagined by the missionaries to empty into the South sea or Pacific. Marquette was something of a surveyor and ambitious of explorations. As early as 1669, while at La Pointe, he had this voyage of discovery in his mind. The sagacious governor Frontenac was made familiar with the rumors of the great river, and while the unfortunate La Salle had been turned from his projected expedition in the same direction, Louis Joliet was commissioned by the governor to undertake the tour of discovery, and Jacques Marquette was instructed by the Jesuits to accompany him. The shores of lakes Huron, Superior, and Michigan had already been explored and rudely mapped. May 17, 1673, they started from Mackinaw in two canoes, with five French voyageurs, and proceeded to Green bay of lake Michigan, where the mission of St. Francois Xavier had been established in 1629. They reached the mouth of Fox river, ascended it to the rapids, which they passed by portage, and went to its source, where they found a village of Miami Indians. There procuring two fresh Indian guides, they carried their canoes over to the waters of the Menomini or Wisconsin river. Down this they floated by day, till on June 17 they entered the Mississippi. They descended it for 300 m. without seeing a human being, when they perceived a trail on the e. side of the river, and discovered a village of Illinois Indians, by whom they were well treated. When they reached the junction of the Missouri, Marquette described it as a river whose rapids were violent, and in whose muddy stream the floating timber trunks and branches of trees swept by with a force that inspired fear. He proceeded down to the mouth of the Ohio. Still further down they discovered iron on the river bank, and were now greatly tormented by mosquitoes. They met Indians on this part of the river who had guns, hatchets, knives, hoes, and glass bottles for their gunpowder; and were informed that they were within ten days’ journey of the sea; that they purchased goods that came from people of the east; and that those people dressed the people who had been enemies of them as they proceeded, and when arrived at the mouth of the Arkansas, were received with much comfort and state in the Indian villages. Having arrived at lat. 34°, they feared to go further lest they should fall into the hands of the Spaniards, and on July 17 started to ascend the river. On reaching the Illinois they ascended it, instead of going further up to the mouth of the Wisconsin. From the head of this stream they are supposed to have made the portage to lake Michigan at or near Chicago; and were greatly impressed with the beauty and fertility of the country. After an absence of 4 months, and a voyage in canoes of 2,550 m., they were back at Green bay the latter part of September, where Marquette remained, and Joliet proceeded to report to the governor at Montreal. On Oct. 25, 1674, Marquette with a party, in ten canoes, set out to form a mission settlement in Illinois. From the head of Green bay, at Sturgeon cove, they carried their canoes through the forest to the shore of lake Michigan, thence skirted the western shore of the lake to the Chicago river, where, enfeebled by sickness, he stopped, but an Indian hut, and spent the winter. On Mar. 30, 1675, their hut was inundated by a freshet in the river, and they gathered their necessities to pursue the journey to the Illinois, which they made by the portage to the Des Plaines river, and finally arrived at the Indian town of Kaskaskia, where he says “he was received like an angel from heaven.” After Easter he returned to lake Michigan, on which he embarked with two companions and explored in their canoe the eastern shore of lake Michigan. They had proceeded as far as a small stream, south of the one which now bears his name, when his strength failed, and he died peacefully, and was buried. The party continued their journey to Michilimackinac, or Mackinaw. In 1676 his bones were dug up by a party of Ottawas, who washed, dried, and boxed them carefully in birch bark, and formed a procession of 30 canoes, bore them with funereal chants to the mission of St. Ignace, north of Mackinaw, where the relics were received with solemn ceremonies, and buried beneath the floor of the chapel of the mission.

MARQUEZ, LEONARDO, b. Mexico, 1818; prominent during the war between Mexico and the United States, 1845-48, and in 1847 was active in the defense of the valley of
Mexico. In 1849 the successful revolutionary movement of Santa Anna was supported by Marquez, who headed a rising in Guanajuato. In reward for this service, Santa Anna, on receiving the presidency, promoted him to high command. Alvarez and Comonfort found a bitter and persistent antagonist in Marquez, who conducted against them a fierce guerrilla warfare, during 1856–57, and who, during the next three years, sustained Miramón and Zuloaga in their conflict with Juárez. This conflict he continued to set a price upon the head of Miramón, who, indeed, retired from the field, and until the occurrence of the French intervention in 1861. He supported Maximilian in his progress through Mexico, and on the latter assuming the crown of the new empire, Marquez was appointed minister of the new government to Constantinople. From this mission he returned in 1866, and witnessed the downfall of the empire, partaking of the last struggles of Maximilian, and commanding the defense of the city of Mexico against the operations of Porfirio Díaz. On the surrender of the capital he fled to Havana, and has since made that city his residence. The career of Marquez, though brave and adventurous, was stained by unnecessary cruelty. In 1859 he gained the bloody victory of Tacubaya, and signalized his success by the execution, not only of prisoners of war, but of non-combatants, an act which gave him the significant name of "the tiger of Tacubaya." Other instances of a similar sanguinary temper occur in the execution, by his orders, of the prime minister Ocampo, and generals Valle and Degollado, who were his prisoners. In view of these facts, the established government of Mexico, after the downfall of Maximilian, set a price upon the head of Marquez; and on the occasion of the general amnesty granted in 1870, he was expressly excluded by name. It is due to him to state that he has made published statements denying the charges of cruelty which had been brought against him.

**Marquis**, or Marquess, the degree of nobility which in the pecking of England ranks next to duke. Marquises were originally commanders on the borders or frontiers of countries, or on the sea-coast, which they were bound to protect. In England the title of marquis was used in this sense as early as the reign of Henry III., when there were marquises or lords-marchers of the borders of Scotland and Wales; and the foreign equivalents, marquis ducal, for the continental, the first English marquises of the modern sense was Robert de Vere, earl of Oxford, who was created marquis of Dublin by Richard II., to the no small offense of the earls who had to yield him precedence. The oldest existing marquisate is that of Winchester, created by Edward VI. in 1551. The title was first introduced into Scotland in 1599, when the marquises of Huntly and Hamilton were created.

The coronet of a marquis, as worn in the United Kingdom, is a circle of gold, with four strawberry leaves (or oak leaves), and as many pearls alternating with them, and placed on pyramidal points of the same height with the leaves. The mantle is scarlet, with three and a half doublings of ermine. A marquis is styled "the most honorable," his wife is a marchioness; his eldest son takes by courtesy the next lower title in the pecking, except where that is identical with the title of the marquisate, in which case he must take the next lower still, as in the case of the marquis and earl of Salisbury, whose eldest son bears the courtesy-title of viscount Cranborne. The younger sons of a marquis are styled "lord," and daughters "lady," with the addition of Christian name and surname.

**Marriage**, the union of a man and woman in the legal relation of husband and wife. This in one form or another is the oldest institution of society and the source of its most ancient laws. Society, indeed, could not long exist without some rules being imposed by necessity for the appropriation of men and women to one another, securing them in the enjoyment of one another's society, and defining their obligations to the children. According to the law or practice of the greater part of the civilized world, one man marries one woman at a time. The Mormon heresy on this subject is now being suppressed by force. But this familiar system of monogamy is a comparatively recent development of marriage. A great diversity of opinion exists as to the particular form of primitive marriage. It is conceivable that there may have been many forms. Polygyny and polyandria—one man with many wives, one wife with many husbands; these have certainly existed. By the most recent writer on the subject (Morgan, Systems of Consanguinity and Affinity, 1871; and Ancient Society, 1877) it is asserted that intercourse was originally promiscuous. This negation of marriage is vehemently disputed. Morgan also affirms a primitive custom of intermarriage between brothers and sisters; the consanguine family of the Malay civilization; and a custom of intermarriage of several sisters with each other's husbands, and of several brothers with each other's wives. This custom is said to result in the formation of a gens, governed in its marital relations by the principle of exogamy—viz., selection of wives outside the gens. After this comes the marriage of single pairs with or without exclusive habitation. The patriarchal family was largely monogamous; and true monogamy does not appear before the rise of private property, lineal succession, and slavery. (See on this subject, McLennan, Primitive Marriage, 2d ed.; Tyler, Early History of Mankind; Lubbock's Origin of Civilization; Bachofen, Das Mutterrecht.) The primitive ceremonies of marriage are of immense number, and some of striking beauty. Those which have left the most distinct survivals in modern custom are sale and capture. As regards Christian Europe, in 1085 Hilde-
brand declared marriage to be a sacrament of the church; and at the reformation Calvin declared it to be an institution of God. The school of Grotius described it as a contract of partnership. Throughout Christendom marriage is generally accompanied by a marriage license, a written instrument established by law, or even judgment of a priest, on public grounds declared essential, marriage is a contract, but differs from other contracts because its incidents are fixed by public law, and because it affects the status of the contracting parties. The varieties of marriage as a modern legal institution are well summarized in Bergson's introduction to Concordance entre les Codes Civils (Paris, 1856). We can describe only the modes of constituting marriage in use in England, Scotland, and Ireland. For rights connected with the dissolution of marriage, see Divorce. For the effects of marriage on property, see *Husband and Wife*.

**England.**—To insure deliberation and to preserve indubitable evidence of so important a fact, the English law makes certain forms essential to marriage. A breach of the contract to marry gives rise to an action of damages (though this remedy is being gradually condemned by public opinion); but marriage itself will not be set aside and treated as null merely because either party procured it by fraudulent representations. Marriage cannot, therefore, be void, whether of either party or both at pleasure, though that effect is brought about in another way by certain kinds of misconduct, whether studied or not, of either party. See Divorce, Judicial Separation. Another circumstance in which marriage differs from other contracts is, that it cannot be entered into in a moment, but certain preliminary notices must be given, and forms gone through. From the year 1753 (the date of Lord Hardwicke's act, 26 Geo. II. c. 33) to 1836 (the date of Lord Russell's act, 6 and 7 Will. IV. c. 85, which first authorized marriages in registered buildings and before a registrar), the power of solemnizing lawful marriages, when the parties were neither Quakers nor Jews, was conferred by the legislature on the clergy of the established church only. Since the latter date notice or any of two forms of contracting marriage: it may be by the presence or without a religious ceremony; and if with a religious ceremony, it may be either in the established church or in a dissenting chapel. If the marriage is to take place in an established church, there must be publication of bans of marriage for three preceding successive Sundays, either after the second lesson or during the communion service; but a marriage license obtained from the ordinary of the district, or a special license from the archbishop, will dispense with bans; fifteen days' previous residence in the parish by one of the parties being necessary. A registrar's certificate, obtained on 7 days' residence and 21 days' notice, will also dispense with bans, but an established church clergyman is not bound to marry on this. The marriage must take place in the church, the marriage service of the church of England being read over, and this must be done in canonical hours—i.e., between 8 and 12 A.M., in presence of two witnesses. If the marriage is celebrated in a dissenting chapel (and for that purpose such chapel must be duly licensed and registered under lord Russell's act), a certificate or license must be got after notice from the registrar; and there must be present the registrar of the district as one of the witnesses, except in Quaker and Jewish marriages. If the marriage is not with any religious ceremony, it must take place in the office of the superintendent-registrar, and in presence of witnesses; both parties in the presence of witnesses took oath, that they take each other for man and wife. The canonical hours must be attended to in all cases. The omission of any of these requirements with the knowledge of the parties, makes a marriage void. It is felony to celebrate a marriage in a private house, unless by special license from the archbishop. And in all cases the fact of the marriage must be entered in a church, and also in a civil register; the latter being ultimately filed and kept in Somerset house, London, where a copy of the certificate of registration can be had for a small sum. The guilt of perjury is incurred by making or signing a false declaration on giving notice to the officer. When one of the parties to a marriage celebrated under the act 6 and 7 Will. IV. c. 85, resides in Scotland or Ireland, a certificate by the session-clerk in Scotland of due proclamation of bans there, or a certificate from an Irish registrar, is equivalent to a certificate by an English district registrar. In the case of the marriage of an infant—i.e., a person under 21 years of age—evidence of the consent of parents or guardians has to be produced to register the marriage. If one of the parties applying for license or bans fraudulently provides a false statement of age, he has been held liable to a penalty from the property of the infant; which will be ordered by the court of chancery to be settled on the innocent party, or, if both parties concurred in the fraud, on the children of the marriage. The absence of consent of parents or guardians, however, does not make a marriage null. It may sometimes happen that persons go through the form of marriage, and yet are not married; as where one of the parties is already married, the spouse being alive. In such case it is quite immaterial whether the party so remarrying is really ignorant that his or her spouse is alive, provided such is the fact; for though, after seven years, if nothing has been heard of one of two married parties, the other will escape the penalties of bigamy on marrying again, yet it depends entirely on whether the first spouse is really dead at the time, whether the second marriage is valid. Other instances where the marriage is void, though the ceremony is complete, are where the persons are related to each other within the forbidden degrees of consanguinity and affinity, where either of them is under age, or of unsound mind, or physically disqualified. In the last case the nullity must be declared in the divorce court. As regards
members of the royal family (except the issue of princesses married into foreign families), they must either get the sovereign’s consent, or give 12 months’ notice to the privy council, subject to objection from both houses of parliament, in terms of 12 Geo. III. c. 11. Marriage betwixt a divorced party and the adulterer is lawful in England. But no clergyman of the established church can be compelled to marry any person whose previous marriage has been dissolved on the ground of adultery.

The marriages of Quakers and Jews were excepted from the acts prior to 6 and 7 Will. IV. c. 85, and are now subject to a peculiar legislation. They need not be in a registered building, and the registering officer of the Quakers, or the secretary of the synagogue, is authorized to be present instead of the registrar. (For mixed Quaker marriages, see 23 and 24 Vict., 18 and 35 Vict. c. 10.)

The marriages of European British subjects in India are regulated by the imperial act 14 and 15 Vict. c. 40, and the Indian marriage act of 1865. As regards the colonies, the chief imperial statute is 25 and 29 Vict. c. 64, which, however, leaves the matter of registration to local acts. Generally, marriages celebrated in foreign countries according to the lex loci are recognized as valid if the parties are capable of marriage. Marriages abroad within the lines of the British army are sanctioned by 4 Geo. IV. c. 91; and marriages may take place before British consuls under 12 and 13 Vict. c. 68, and 31 and 32 Vict. c. 61.

Considerable changes have been made in the details of the marriage law of Ireland by the acts of 1870 and 1871, viz., 33 and 34 Vict. c. 110, and 34 and 35 Vict. c. 49. The first of these acts was required partly as a readjustment after the disestablishment of the Anglican church in Ireland; but it also provides a form of license to be issued by Episcopalian bishops or their nominees, and by the heads of the non-Episcopalian Protestant communions; and it contains important provisions relating to the legalization of marriages of different religious persuasions. Such marriages must be performed by a clergyman in a building set apart for the celebration of divine service, with open doors, between 8 A.M. and 2 P.M., and in the presence of two or more credible witnesses. A certificate from the local registrar is also required under pain of nullity. The act of 1871 gives the form of certificate required for a marriage by special license; it enables Roman Catholic bishops to issue licenses for mixed marriages, and it extends to such marriages the power of licensing previously given to other church officials.

Scotland.—In Scotland, the principle of the civil law, consensum non concubitus facit matrimonium, has been adopted; and this consent can be proved either by a regular ceremony in facio ecclesia publicly recorded, or in three other modes known to the law. The chief impediments to this consent are nonage, insanity, impotency, relationship within the prohibited degrees, subsisting marriage, adultery in the case of the adulterers, and, since lord Brougham’s act (19 and 20 Vict. c. 96), non-residence in Scotland. There are many notorious cases of sham marriages, where a form has been gone through to prevent scandal or by way of joke, but no serious intention to marry was present. Also, if force has been used; or where an error as to the woman’s chastity has been caused by her misrepresentation or concealment; or a mistake of personal identity occurs; or where a fraudulent conspiracy has been formed, the marriage is null. In Scotland, as elsewhere, down to the council of Trent, a sacerdotal benediction was essential to marriage; and the first marriage, or invalid marriage was one celebrated with an improper religious ceremony, and quite different from the irregular marriage (without religious ceremony) punishable under 19 and 20 Vict. c. 96. By 10 Anne, c. 7, Episcopalian ministers, and by 4 and 5 Will. IV. c. 28, all other priests or ministers not of the established church were permitted to celebrate marriage. This had previously been the privilege of the established church. Proclamation of bans takes place in the parish church, whether civil or quoad sacra, in which at least one of the parties has resided for six weeks. Irregular marriages are constituted by consent, and proved by a written or verbal declaration of interchanged consent per verba de presenti; or by a promise to marry, on the faith of which intercourse has followed (these facts, according to one opinion, requiring to be proved by a decree of declarator); or by cohabitation and habit and reuse. The consent which makes an irregular marriage may, of course, be given before the registrar, or may be proved by a conviction before the justices of the peace. under 17 and 18 Vict. c. 89, the registration act. An order appointing registration can be obtained on proof before the sheriff, under lord Brougham’s act, 19 and 20 Vict. c. 96.

Much discontent was felt in Scotland with the corrupt practices in proclaiming bans. The proclamation was generally not made on three successive Sundays, as required by law, but thrice on one Sunday; and for this illegality the session-clerks were in the habit of charging higher fees than would otherwise have been exigible according to custom. Indeed, the fees charged varied largely over the country, and in some places were so exorbitant that, in the opinion of many authorities, they were a direct occasion to con-cubinage and irregular marriage. The dissenter too, rightly or wrongly, felt aggrieved by the necessity of having recourse to the parish church. To remedy this state of things, the marriage notice (Scotland) act, 1878, was passed, “to encourage the celebration of regular marriages.” According to this act, where two persons residing in Scotland wish to marry regularly, but without bans, each of them gives notice, in a form provided by the act, to the registrar of the parish or district in which he or she has lived for fifteen days immediately before; and this notice is entered by the registrar in "the marriage

U. K. IX.—33
notice book," which anybody can inspect for one shilling; and for seven consecutive days after receiving the notice, the registrar is bound to keep posted up in a conspicuous and accessible place on the door or outer wall of his office, a public notice of the marriage, in another form provided by the act. Where both persons live in the same parish or district, one notice is enough. After the seven days, if no objection to the marriage appears on the face of the notice, and if no objection is stated by a third party in a writing subscribed by him and supported by a declaration taken before the registrar, the latter must grant to the person giving notice a certificate of due publication; and this certificate is sufficient authority for a minister, clergyman, or priest to celebrate a regular marriage, just as if it were a certificate of proclamation of bans. The certificate must be subscribed within three months of its date; and no minister of the church of Scotland is obliged to celebrate a marriage not preceded by proclamation of bans. One party to the marriage may produce a registrar's certificate, and the other a certificate of bans. The act imposes severe penalties on those who celebrate a marriage with a religious ceremony but without a certificate of the one kind or the other; on registrars granting certificates not authorized by the act; and on persons guilty of willful falsehood in a notice, a declaration, or an objection. The registrars keep a supply of forms for use under the act. As regards the treatment of objections made to the registrar; where these relate merely to some formality or statutory requirement, the registrar must make inquiry, and report to the sheriff, who may direct the notice to be either amended or canceled; but where the objection relates to a legal incapacity to marry or a legal impediment to marriage, the registrar is forbidden to issue a certificate until he sees the judgment of a court of law disposing of the objection.

Ireland.—As regards marriages celebrated in what was once the established church of Ireland, not much difference existed between England and Ireland, except that bans, being under the canons and rubrics of the church, were more easily proclaimed, and the use of licenses (which were much cheaper) was more common. Roman Catholic marriages were under the common law, and if celebrated by a priest were valid without bans, license, notice, residence, or consent. Mr. Monseil's act, 26 and 27 Vict. c. 90, directs them to be registered. Presbyterians were regulated by the Irish marriage act, 7 and 8 Vict. c. 51, passed in consequence of the famous case of Queen and Millis, invalidating all celebration of mixed marriages by Protestant non-conformists. This act and the act of 26 and 27 Vict. c. 27, relating to the registration of places of public worship for the solemnization of marriage, are extended by the act 36 Vict. c. 16 to meet the case of communities "who are not Roman Catholic, and who do not describe themselves as Protestant." Other non-conformist marriages were by registrar's certificate or license. For a long time, mixed marriages by the Catholic clergy were forbidden by 10 Geo. II. c. 13.

MARRIAGE (ante). The common statement that marriage is a contract open to many objections. It is argued that the stipulations are in futuro, and that there can be no conditions or limitations attached, and that, while the law of contract supposes all parties to stand on an equal footing, the law of marriage, like that of other status, presupposes that they are not equal, and has even been called the "law of unequals." Undoubtedly the best statement is that the term marriage is used in law, as, indeed, in common language, in two entirely distinct senses: first, to denote the contract itself; and, secondly, to designate the resulting condition or status. The relations of the parties to one another in this status, their mutual rights, duties, and restraints, and, more especially, the powers of the wife as to tenure and disposition of property, are treated under the heads of HUSBAND and WIFE; and DIVORCE, ante. The question now in hand is, What constitutes a legal marriage in the United States? In the first place, it may be stated, generally, that the law on this subject is, in this country, far more liberal in relation to ceremonies and formalities than in any other civilized land, with the single exception of Scotland. The statutes of the various states, it is true, differ greatly, and in some instances the discrepancies amount to positive contradiction; but the general tendency is in the direction indicated. In defense of this tendency it may be said that public policy favors marriage, that liberal construction often protects an innocent but ignorant party from the consequences of imposition, and that it tends to discourage vice. On the other hand, it might be urged that to accept very slight evidence as proof of a valid marriage is to encourage thoughtless and improvident union, to open a door for the legal sanction of vicious entanglements, and that the most sacred engagement of life cannot be surrounded by too many safeguards.

To constitute a valid marriage there must first be legal capacity; which, in most states, is held to exist in the case of males at the age of 14, and of females at 12. There must next be free consent and mutual agreement. But not even in Scotland does consent alone complete the contract. The wording of the law is: "consensus et communicatio," in other words, there must be cohabitation. Yet the essence of the contract is consent, and many rulings indicate that in the United States subsequent cohabitation is not a requisite. The consent must be in verba passi, in words of the present and not the future. Here arises a remarkable discrepancy in the method by which the courts in different states have arrived at the same result—the enforcement of loosely constructed marriages. Some few, following the law of Scotland, have declared that an agreement.
in futuro followed by cohabitation was sufficient, while most maintain the opposite doctrine. Thus, in a case where the parties agreed to live as if man and wife, and to allow their fellow-boarders to suppose them so, and that after the occurrence of certain events they should in fact be married, it has been held in one state that this was a good contract, while in another state the opposite was held in a very similar state of facts. But besides consent, there are various other regulations, such as to license, religious ceremony, consent of parents if under a certain age, and others, many and various. Are these requirements of such a nature as to render a contract entered into without compliance with their provisions void or voidable? In the earlier cases great reluctance was shown to admit that such a contract could stand. In Milford vs. Worcester, 7 Metcalf, 48, it was held by the courts of Massachusetts that a marriage without statutory compliance was absolutely void. So Parsons, in his work on contracts, says that he knows of no case in which a mere agreement to marry, with no formality and no compliance with any law or usage regulating marriage, is actually permitted to give both parties and their children all the rights, and lay them under all the obligations and liabilities, civil and criminal, of a legal marriage. But he reluctantly admits that recent decisions tend very strongly that way. And in not very recent cases it has been held, both in Pennsylvania and in New Hampshire, that a marriage contract in words of the present is valid without forms or witnesses; while the Illinois supreme court has gone so far as to say that, where there has been cohabitation, the presumption of marriage exists until overthrown by direct evidence—a very doubtful doctrine. See also Fenton vs. Reed, 4 Johnson, 54. In New York the rulings have been very strong in support of recognizing such marriages, and it may be regarded as now well-established law that the non-compliance with statutory provisions does not render a bona fide contract void, and can be dealt with only by conflicting the prescribed penalties of fine or imprisonment on the negligent parties; though in certain cases it may render the marriage voidable. It is not necessary that both parties should know that the agreement to be legal man and wife is good in law. The actual agreement—which of course must be to assume the legal relations of man and wife, not simply to live together—is enough; and if, while one of the parties is acting in good faith, the other believes that he can legally renounce the contract, he is not to benefit by his treacherous conduct. As to whether such a contract as has been described has actually been completed, the question is purely one of evidence; and it is admitted on all sides in the country that evidence as such, such as cohabitation, general repute, reception as man and wife by the family and by neighbors and friends, may be admitted, and their weight passed upon by the jury.

It is in general true that the lex loci applies to marriage contracts; that is, if a marriage is good where it is contracted, it is good anywhere; and it has even been held that where, in Massachusetts, a white man and negro woman went to Rhode Island for the ceremony, in order to avoid a prohibitory statute of the first state, their marriage could not be treated as void in Massachusetts. But suppose the laws of Utah allow polygamy, is it to be recognized as valid elsewhere? or, if the people of one state regard as incestuous what is allowed in another, are the people of the first to have no protection from the presence of what they consider a disgraceful example? Probably the courts in such cases would hold that lex loci may be overruled by public policy, but the decisions on the point are not yet clear. A peculiar class of cases of recent date, in this country, arises from the laws of Southern states in regard to the condition and marriage of colored persons, and especially negroes. It is the marriage with a white man. The State, 3 Texas Court of Appeals, 263, that such intermarriage is illegal: in North Carolina a marriage of the kind made in another state, but without intent to avoid the law, was ruled good; and by similar reasoning it has been decided that, in a case where the intent to avoid the law was obvious, the contract was void. But the main point of interest as to these cases is whether such laws are constitutional, or whether they conflict with the 15th amendment. On this point, we believe, there is as yet no decision by the supreme court.

Here, as in England, the common-law principles as to contracts in restraint of marriage and marriage-brokerage contracts are in full force. Thus, a bond by a widow not to marry again is absolutely void; and, in general, the law regards with extreme disfavor any undertakings or contracts as regards marriage which might have been the result of coercion or fraud.

MARRIED WOMAN. See HUSBAND AND WIFE.

MARROW is a substance of low specific gravity, filling the cells and cavities of the bones of mammals. There are two varieties, which are known as watery marrow and oily marrow. In some of the short bones, as the bodies of the vertebrae and the sternum, the marrow has a reddish color, and is found on analysis to contain 75 per cent of water, the remainder consisting of albuminous and fibrinous matter with salts and a trace of oil. In the long bones of a healthy adult mammal, the marrow occurs as a yellow, oily fluid, contained in vesicles like those of common fat, which are imbedded in the interspaces of the medullary membrane, which is a highly vascular membrane lining the interior of the bones. This marrow consists of 96 per cent of oil, and 4 of water, connective tissue, and vessels.

The oily matter of the marrow is composed of the same materials as common fat, with the oleine (or fluid portion) in greater abundance. Being of low specific gravity, it
is well suited to fill the cavities of the bones, and forms an advantageous substitute for the bony matter which preceded it in the young animal. Its special uses are not very clearly known, but the fact that it loses much of its oil, when the general nutritive powers fail, or when certain forms of disease attack the bone, shows that it plays some definite part in the economy.

**MARROW CONTROVERSY**, one of the most strenuous and memorable struggles in the religious history of Scotland, took its name from a book entitled the *Marrow of Modern Divinity*, written by a Puritan soldier in the time of the commonwealth. The highly "evangelical" character of this work, and especially its doctrine of the free grace of God in the redemption of sinners, had made it a great favorite with the few zealous and pious ministers then to be found in the church of Scotland, and in 1718 an edition was published by the rev. James Hog of Carnock, followed, in 1719, by an explanatory pamphlet. The general assembly of the same year appointed a commission to look after books and pamphlets promoting such opinions as are contained in the *Marrow*, and to summon before them the authors and recommenders of such publications. The committee, after an examination, drew up a report, which was presented to the next assembly, that of 1720, and the result was the formal condemnation of the doctrines of the *Marrow*, a prohibition to teach or preach them for the future, and an exhortation (strong, but vain) to the people of Scotland not to read them. This act of the assembly was immediately brought by the celebrated Thomas Boston (q.v.) before the presbytery of Selkirk, who laid it before the synod of Merse and Teviotdale. The "evangelical" ministers in the church, few in number, but supported by a very considerable amount of popular sympathy (for the *Marrow* by this time ranked next to the Bible in the regards of the religious portion of the Scottish peasantry), resolved to present a representation to the presbytery, complaining of the late act, and vindicating the "truths" which it condemned. Twelve ministers signed the representation—James Hog, Thomas Boston, John Bonnar, James Kid, Gabriel Wilson, Ebenezer Erskine, Ralph Erskine, James Wardlaw, James Bathgate, Henry Davidson, William Hunter, and John Williamson. These are the famous "Marrow-men"—also known as the "twelve brethren" and the "representers"—whose names were long held in great veneration by the lovers of "evangelical" religion. A commission of the assembly of 1721 was appointed to deal with the twelve, and a series of question was put to them, to which answers were drawn up by Ebenezer Erskine and Gabriel Wilson. These replies did not prove quite satisfactory, and the "Marrow-men" were called before the bar of the assembly (1722), and solemnly rebuked. Nevertheless, as the assembly was not supported in the position it had assumed by the religious sentiment of the nation, no further steps were taken in the matter, and thus the victory virtually lay with the evangelical recusants. It was, however, substantially the same controversy—though it did not go by the name—which, 11 years later, resulted in the deposition of Ebenezer Erskine, and the origin of the "secession" body. See Boston, Thomas, and Erskine, Ebenezer.

**MARRUCINI**, an ancient people in central Italy, on a narrow tract of land along the right bank of the river Aternus. Their territory extended from the Apennines to the Adriatic; between the Vestini on the n. and the Frentani on the s.; and between the Peligni and the Adriatic on the e. and west. They were an independent nation, said to have been the first to cultivate the bean, generally worshiped the earth goddess in the Marsi and Peligni. They entered into alliance with the Romans in 304 B.C., but rebelled at the beginning of the social war. Their only place of importance was Teste, now Cheitii, on the right bank of the Aternus, now the Pescara.

**MARRUM.** See Ammophila.

**MARRYAT, FREDERICK**, an English sailor and novelist, was the son of a West India merchant, and was b. in London, July 10, 1792. On leaving school he entered the navy as a midshipman under Lord Cochrane. In 1813 he attained his lieutenantcy, and was made commander in 1815. While afloat he saw much active service, established a high character for bravery, and was made a c.p. in June, 1825. About 1829 he wrote his first novel, entitled *Frank Midshipman*, and this was followed in rapid succession by those graphic and humorous pictures of sea-life which have taken a permanent place in every English circulating library. He died at Langham, in Norfolk, Aug. 2, 1848. He was married, and left six children. Marryat's works are too numerous to be enumerated here; the most popular are perhaps *Midshipman Easy*; *Peter Simple*; *Jacob Faithful*; and *Japhet in Search of a Father*. His fictions are full of adventure, and are characterized by a certain rude breadth of humor. Since Smollett's time, no novels have provoked so much laughter as his.

**MARS**, a contraction of Mavors or Mayors; in the Oscur or Sabine language, MAMERS, the name of an ancient Italian divinity, identified by the Grecizing Romans with the Thracian-Hellenic *Ares*. It will, however, be better to treat the two conceptions separately.

The Roman Mars, who as a war-god is surnamed *Gradivus* (= grandia divus, the great god), also bore the surname of *Silvanus*, and appears to have been originally an agricultural deity; and propitiatory offerings were presented to him as the guardian of fields and flocks; but as the fierce shepherds who founded the city of Rome were even more
addicted to martial than to pastoral pursuits, one can easily understand how Mars Silvanus should have, in the course of time, become the "god of war." Mars, who was a perfect personification of the stern, relentless, and even cruel valor of the old Romans, was held in the highest honor. He ranked next to Jupiter; like him he bore the venerable epitaph of Father (Mars-piter); he was one of the three tutelary deities of the city, to each of whom Numa appointed a flame; nay, he was said to be the father of Romulus himself (by Rhea Silvia, the priestess of Vesta), and was thus believed to be the real progenitor of the Roman people. He had a sanctuary on the Quirinal; and the hill received its name from his surname, Quirinus, the most probable meaning of which is the spear-armed. It was under this designation that he was invoked as the protector of the Quirites (citizens)—in other words, of the state. The principal animals sacred to him were the wolf and the horse. He had many temples at Rome, the most celebrated of which was the temple outside the Porta Capena, on the Appian road. The Campus Martius, where the Romans practiced athletic and military exercises, was named after him; so was the month of March (Martius), the first month of the Roman year. The Juili Martyres (games held in his honor) were celebrated every year in the circus Aug. 1.

Ares, the Greek god of war, was the son of Zeus and Hera, and the favorite of Aphrodite, who bore him several children. He is represented in Greek poetry as a most sanguinary divinity, delighting in war for its own sake, and in the destruction of men. Before him into battle goes his sister Erin (Strife); along with him are his sons and companions, Deinos (Horror) and Phobos (Fear). He does not always adhere to the same side, like the great Athena, but inspires now the one, now the other. He is not always victorious. Diomedes wounded him, and in his fall, says Homer, "he roared like nine or ten thousand warriors together." Such a representation would have been deemed blasphemous by the ancient Roman mind, imbued as it was with a solemn Hebrew-like reverence for its gods. The worship of Ares was never very prevalent in Greece; it is believed to have been imported from Thrace. There, and in Scythia, were its great seats, and there Ares was believed to have his chief home. He had, however, temples or shrines at Athens, Sparta, Olympia, and other places. On statues and reliefs, he is represented as a person of great muscular power, and either naked or clothed with the chlamys.

MARS, one of the planets. See Solar System.

MARS, ANNE FRANÇOISE HYPPOLYTE BOUTET, 1779-1847; b. France; called Made-moiseille; one of the most illustrious French actresses, daughter of an excellent actor named Monvel and an actress Mlle. Mars-Boutet, both of Paris. At the age of 14 she appeared at the comédie Française in personations of ingenuous childhood, under the care of Mlle. Contat, the prima donna of the theater. These simple parts continued for many years to be her rôle, and it was not till she had reached her 24th year that her first grand success was obtained in L'Abbé de l'Epee in the part of the deaf and dumb girl. From that time forward, through a period of nearly 40 years, she acted through the whole range of dramatic art with a fullness of talent that never failed to present with delicacy, power, and good taste each new character in which she appeared. Beginning her career as a child in the stormy days of the revolution, a mother at 16 achieving her first great triumphs in the early days of the first empire, rendering more admirably than her predecessors the heroines of the classic drama of the great poets of France before the revolution, and finally taking up one after another the works of succeeding generations of dramatists and poets, Victor Hugo, Alfred de Vigny, Scribe, Dumas, and breathing into their heroines the glow of her own talents. She prolonged her apparent youth, beauty, and power almost to her dying day. The habit of playing ingenuous characters in her youth, and many years of practice in simple roles before assuming leading parts, seem to have ripened those delicate and superb coquetties which beauty and genius combined find latitude to exhibit on the stage. Beautiful in face, imposing in form, suave in manner, tasteful in dress, with a voice melodiously modulated at will to suit every emotion, she was in appearance the ideal actress. Her liaison with the emperor Napoleon seems to have made a real impression on her heart, for on the accession of Louis XVIII, she refused to use the customary ejaculation of vive le roi, and had some trouble with the theatrical manager about it; but the king covered the misunderstanding by settling upon her 30,000 livres. She was not married, and her private life was that of the corrupt society of her time. Although a generous giver, she left at her death an estate of 800,000 francs.

MARSALA, a large fortified seaport on the w. coast of Sicily, 16 m. s.s.w. of Trapani. Pop. of commune 73, 24, 202. It stands in a fruitful and well-cultivated district, and is a regularly built and pleasant town, with a college, a cathedral, a gymnasmus, and several conventual establishments. It occupies the site of Lilybeum, the ancient capital of the Carthaginian settlements in Sicily, and was selected by Garibaldi as the landing-point of his volunteers in his famous Sicilian campaign, 1860. It obtained its present name from the Arabs, who, when they held Sicily, esteemed this part so highly that they called it Marsa Alla, "Port of God." Its harbor is encumbered with sand, but its celebrated wines form an export trade of great importance, chiefly since 1892, when they were adopted by lord Nelson for the use of the British fleet. Thirty thousand pipes of Marsala wine, which resembles sherry, are annually manufactured, two-thirds being exported. Marsala has also a large export trade in olive, oil, salt, and soda.
MARSH, William, b. Dublin. In 1771 he was appointed to the civil service of the East India company at Bencoolen, Sumatra; became secretary to the government, and acquired a thorough knowledge of the Malay language; returned to England in 1799 with a pension, and devoted himself to literature, and published a History of Sumatra. In 1795 he was made second secretary, and afterwards first secretary, to the admiralty. In 1801 resigning, he retired to private life and study. In 1812 he published his Grammar and Dictionary of the Malay Language, and in 1817 a translation of Marco Polo. In 1831 he voluntarily resigned his pension. In 1834 he presented to the British museum his rich collection of oriental coins, and his library of books and oriental MSS. to King’s college. He published also Numismata Orientalia (eastern coins); Catalogue of Dictionaries, Vocabularys, Grammars, and Alphabets; and some papers on the language, manners, and antiquities of the east in the Philosophical Transactions and the Archæologia.

MARSEILLAISE, the name by which the grand song of the first French revolution is known. The circumstances which led to its composition are as follows. In the beginning of 1792, when a column of volunteers was about to leave Strasbourg, the mayor of the city, who gave a banquet on the occasion, asked an officer of artillery named Rouget de Lisle, to compose a song in their honor. His request was complied with, and the result was the Marseillaise—both verse and music being the work of a single night! De Lisle entitled the piece Chant de Guerre de l’Armée du Rhin. Later on it was sung with that rapturous enthusiasm that only Frenchmen can exhibit, and instead of 600 volunteers, 1000 marched out of Strasbourg. Soon from the whole army of the north resounded the thrilling and fiery words aux armes, aux armes; nevertheless the song was still unknown at Paris, and was first introduced there by Barbaroux when he summoned the youth of Marseilles to the capital in July, 1792. It was received with transports by the Parisians, who—ignorant of its real authorship—named it Hymne des Marseillais, which name it has ever since borne.

MARSEILLES, the first seaport of France and of the Mediterranean, in the department of Bouches-du-Rhône, is situated on the gulf of Lyons, 410 m. in a direct line s.s.e. of Paris, and in lat. 43° 17’ n., long. 5° 22’ east. Marseilles is a military place of the fourth class, and is defended by a citadel and other works; the roads are protected by the fortified isles of If (crowned by a castle, once a state-prison), Pompege, and Ratonneau.
Its harbor is formed by an inlet of the sea running eastward into the heart of the city, and from its extent (nearly 70 acres), and its great natural and artificial advantages, it is capable of accommodating 12,000 vessels. The new harbor consists of a series of docks or bassins (de la Joliette, de l'Entrepôt, Napoleon, Impérial), upwards of a mile long, with an area of about 100 acres. Alongside the bassins de l'Entrepôt and Napoleon are the bowered warehouses, erected at an outlay of a million sterling, and the finest of the kind in Europe. From the margin of the old harbor the ground rises on all sides, forming a kind of amphitheater; and beyond the city proper the encircling hills, covered with vineyards and olive-gardens, are dotted with white country-houses. Immediately north of the harbor is the old town, with its narrow streets lined with high closely piled houses; but through it a wide avenue, with branches, has recently been driven. South of the old harbor is the church of St. Victor, the most ancient of Marseilles; and farther to the south rises the rocky hill of Notre Dame de la Garde, with its church, held in the highest veneration by the sailors of the Mediterranean. At the foot of the hill is the wide promenade, Cours Bonaparte. Other fine promenades are Le Cours and Le Prado.

The principal public buildings are the hôtel de ville, the museum, the public library with its 78,000 vols., and the exchange. The cafés and shops of Marseilles rival those of Paris in splendor. Marseilles is the first commercial emporium of France. It has many soapworks, iron manufactories, sugar refineries, etc. The large vessels and steamers annually entering its harbor number upwards of 8,600, and measure above 2,600,000 tons. Marseilles is directly connected by rail with Lyons, Toulouse, and Nice; and is the packet station for Italy and the east. It is in point of population the third town of France, having had, in 1876, 324,690 inhabitants. (Total pop. of commune, including military, 318,868.) The formerly barren country round Marseilles has been of late greatly fertilized by means of the canal which supplies Marseilles with water from the Durance. During a portion of the year the climate of Marseilles is delightful, but in summer and autumn the heat is often intense. Cold, dry, and cutting winds from the n.e. render the climate at times exceedingly trying. In the environs of the town are about 6,000 bastides, or country villas.

Marseilles was founded by a Greek colony from Phocaea, in Asia Minor, about 600 years B.C. Its ancient name was Massalia, written by the Romans Massilia. It was an importation of the ancient Greek community, planted numerous colonies along the north Mediterranean shore, and introduced the germs of Greek civilization into Gaul. The Massaliots were long in intimate alliance with the Romans; but the city was at last taken by Julius Caesar. In the 8th c. it was destroyed by the Arabs, and the maritime republics of Italy inherited the commerce of the Mediterranean which formerly had been centered in Marseilles. It was united, with the whole of Provence, to France in the reign of Charles VIII. In 1720, when it had again risen to great importance, it was ravaged by a fearful epidemic, and 40,000 of its inhabitants swept away. Since 1830 the commerce and industry of the city have increased vastly. The conquest of Algeria has brought increasing prosperity to Marseilles, and its North African trade is now an important part of its commerce.

MARSH, ANNE CALDWELL, 1798-1874; b. at Lindley Wood, Staffordshire, England. She was the author of more than 20 novels and tales, of which Emilia Wyndham, Mt. Sorel, and Mordant House are usually thought the best. Most of her works were written anonymously, and it is not certain how many are rightly attributed to her. Her best work is free from sensationalism, and of delicate conception, but lacks power; several of the stories have been republished in this country. During the latter part of her life she assumed the name of Marsh-Caldwell, and succeeded to the estate of Lindley Wood.

MARSH, GEORGE PERKINS, LL.D., an American philologist, was born at Woodstock, Vt., Mar. 17, 1801; graduated at Dartmouth college, New Hampshire, 1820; studied law at Burlington, Vt.; was elected to the supreme executive council of the state in 1835, and to congress in 1842 and 1849. He was for several years United States minister resident at Constantinople, and in 1852 was charged with a special mission to Greece. He traveled in the north of Europe, and became an adept in the Scandinavian languages. Between 1857 and 1859 he served as railroad commissioner for Vermont. In 1861 he was appointed U. S. minister in Italy. His most important works are a Grammar of the Icelandic Language; The Camel, his Organization and Uses; Lectures on the English Language; The Origin and History of the English Language; Man and Nature.

MARSH, DEXTER, 1806-58; b. Mass.; although possessed of little education, and occupying the humble position of a day-laborer, was a keen observer, and interested in natural history. While engaged in his work he often came across many fossil footprints on the large stone slabs which he quarried for paving-stones. Of these he made an extensive collection from many parts of the Connecticut valley, New Hampshire, and New Jersey. Many of his specimens were sold during his life, and are now distributed among various colleges and museums; but among those retained by him, and sold for over $2,500 after his death, were more than 500 slabs covered with footprints and marks of rain, and about 200 fossil fishes.

MARSH, HERBERT, D.D., 1757-1839; b. London. Having received his education and a fellowship at St. John's college, Cambridge, graduating with great distinction, he
removed to Germany in 1788, and resided several years at Göttingen and Leipsic, where he published, in German, several articles in defense of the policy of England in the continental wars. For this service he was rewarded with a pension on the recommendation of Mr. Pitt. In 1806 he received the title of F.R.S. by royal mandate. On the French invasion of Germany he returned to England, and in 1807 was appointed lady Margaret's professor of divinity at Cambridge. He abandoned the custom of lecturing in Latin, and lectured only in English. In 1816 he was made bishop of Landaff, and in 1819 of Peterborough. Bishop Marsh was learned in theology, politics, Greek, Latin, German, and oriental literature. He was the first who brought into England the bibli- cal criticism of Germany. His principal works are a translation of the first part of Michaelis's Introduction to the New Testament; Authenticity of the Fire Books of Moses considered; The National Religion the Foundation of National Education; Lectures on the Criticism and Interpretation of the Bible; Lectures on the Authenticity and Credibility of the New Testament and on the Authority of the Old Testament. Bishop Marsh was a strong opponent of both Calvinists and Roman Catholics.

MARSH, James, D.D., 1794-1844; b. Hartford, Vt.; graduated at Dartmouth in 1817, and entered the Andover theological seminary, but suspended his studies there after the first year to return to Dartmouth as tutor. Returning to the seminary in 1820, he graduated in 1822. His studies at Andover extended beyond the ordinary limits, and included not only the modern languages, but the then new field of German criticism, and the works of Plato. He was also an appreciative reader of Wordsworth and Coleridge, and an article contributed by him in his senior year to the North American Review on ancient and modern poetry attracted wide attention. He also began at the same time a translation from the German of Bellerman's work on the geography of the Scriptures. His intense application to study injured his health, on which account, before his graduation, he visited the southern states. Though strongly disinclined to become a preacher, he was ordained as a Congregational minister in 1824. From 1824 to 1826 he was professor of languages in Hampden Sidney college, Va., giving a portion of his time, however, to the adjacent theological school. Here he began his translation of Herder's Spirit of Hebrew Poetry, the first part of which appeared in 1826. In 1826 he was appointed president of the university of Vermont, and it was at his suggestion that some important changes were made in the courses of study in that institution. Finding the duties of president irksome, he resigned the post, and accepted instead the professorship of moral and intellectual philosophy, which he held to the close of his life. In 1829 he contributed to the Christian Spectator a review of Stuart's Commentary on Hebrews, which contained the germ of his most characteristic writings. At this period he became acquainted with the writings of Coleridge, in which he found much to confirm and strengthen his own convictions. His introduction to the first American edition of the Aids to Reflection won him a high reputation at home and abroad. It was reproduced in London, and in 1833 prefixed to a complete American edition of Coleridge's works. In 1830 he published a volume of selections from the old English divines, including Howe's Blessness of the Righteous, and Bates's Four Last Things. In 1833 he completed his translation of Herder's Spirit of Hebrew Poetry. He also published several pieces of modern logic, including a treatise on psychology, which he did not live to complete. His Remains, with a Memoir by prof. Joseph Torrey, appeared in 1843. He died in Colchester, Vt.

MARSH, Othniel Charles, b. Lockport, N. Y., 1831; educated at Phillips academy, Andover, Mass., and at Yale college, where he graduated in 1850; and then took a two years' course of study in the Sheffield scientific school. He was then engaged in the same line of study at the German universities of Heidelberg, Breslau, and Berlin. On his return to this country he was, in 1860, appointed professor of paleontology at Yale, and still holds this position as well as the curatorship of the geological and kindred scientific collections. He is also one of the trustees of the fund of $150,000 given by the late George Peabody to the college "to found and maintain a museum of natural history, and especially in the departments of zoology, geology, and mineralogy," and was most actively concerned in the planning and erection of the massive and fire-proof Peabody museum, which is to form but one wing of the completed building when the funds for building and maintenance have sufficiently accumulated. From 1868 to the present time he has been constantly engaged in the discovery and classification of fossils of extinct animals of the Rocky mountain region, leading many expeditions in person, and directing the operations of others. In these explorations his parties have penetrated into the wildest solitudes under considerable personal hardships and dangers, and have obtained extensive collections of immense scientific value, including fossil animals hitherto unknown to science. The number of several hundred new species discovered are the dinoceratids, a six-horned animal of the eocene period; the pterodactyls, or flying lizards; the ichthyornithes, a cretaceous bird furnished with teeth; and a great variety of bats, monkeys, and marsupials. In many papers published at intervals up to the present time (1881) he has described these and many other species, and is constantly adding to the collection by discovery and purchase. Within a few years the description by prof. Marsh of certain fossil bones found by him and, though belonging to the equine race, differing from the modern horse in several particulars, and markedly in the construction of the foot and
number of toes, has added to the evidences of the doctrine of natural selection and of the evolution of species, exhibiting, as is claimed, the gradual divergence by a species from the primary form, and the result therefrom of what have hitherto been regarded as orders of entirely distinct creation. Prof. Huxley has repeatedly claimed that these discoveries of Marsh completely supply the proof alleged to be wanting by the opponents of the doctrine of the "survival of the fittest."

Prof. Marsh has written many articles on scientific subjects which have appeared in almost all the scientific journals. He is a fellow of the royal geographical society and a member of many other associations at home and abroad.

**MARSHAL** (Fr. maréchal, Teut. marke, horse, and ecke or schalk, servant), a term, in its origin, meaning a groom or manager of the horses; though eventually the king's marshal became one of the principal officers of state in England. The royal herald rose in dignity with the increasing importance of the chivalrie, till he became, conjointly with the constable (q.v.), the judge in the curia maritales, or courts of chivalry. An earldom is attached to the dignity, and the office of earl-marshall is now hereditary in the family of the duke of Norfolk. When the king headed his army in feudal times, the assembled troops were inspected by the constable and marshal, who fixed the spot for the encampment of each noble, and examined the number, arms, and condition of his retainers. With these duties was naturally combined the regulation of all matters connected with armorial bearings, standards, and ensigns. The constable's functions were virtually abolished in the time of Henry VIII., and the marshal became thenceforth the sole judge in questions of honor and arms. The earl-marshall is president of the English college of arms, and appoints the kings-at-arms, heralds, and pursuivants. The marshal's functions were formerly exercised in time of peace in the aula regis or king's great court, and on the division of the aula regis, he appointed deputies in the new courts; hence arose the office of deputy to the earl-marshall. The marshal's chief and of exchequer is to take charge of persons committed to their custody by the court. Besides the earl-marshall there is a knight-marshall, or marshal of the king's (queen's) household. The marshal of the king's bench held two different courts, which have been altogether discontinued since 1849. The marshal or provost-marshall of the admiralty is an officer whose duty it is to act ministerially under the orders of the court of admiralty in securing prizes, executing warrants, arresting criminals, and attending their execution.

The dignity of marshal existed formerly in Scotland, where a different orthography was adopted, and the office of marischal was hereditary in the family of Keith. Sir Robert Keith, the marischal, was one of the most distinguished warriors in the army of Robert the Bruce; and his descendant, the marischal, in 1456, had the dignity of earl conferred on him with no other title but that of earl-marischal. There is little doubt that the Lyon king-at-arms was, like the English kings-at-arms, originally subject to the marischal, but his independence ceased at a very early period, and the heraldic functions were discharged by the earl-marshall in England. Devolved in Scotland on the lord lyon, who held office directly from the crown. Scotland had no knight-marischal till 1652, when Charles I., at his coronation, created the office. In 1716 George, tenth earl-marischal, was attainted in consequence of his share in the rebellion of the previous year, and the office has since been in abeyance. In France the highest military officer is called a marshal, a dignity which originated early in the 13th century. There was at first only one maréchal de France, and there were but two till the time of Francis I. Their number afterwards became unlimited. Originally the marshal was the esquire of the king, and commanded the vanguard in war; in later times the command became supreme, and the rank of the highest military importance. From the title of this class of general officers the Germans have borrowed their field-marshall, and we our field-marshall, a dignity bestowed on commanders distinguished either by elevated rank or superior talents.

**MARSHAL (ante), in the United States, is used in three significations: 1. To denote the ministerial officer of the United States courts, there being one appointed to each judicial district. The duties of this officer resemble those of a sheriff in the state courts: he opens and closes the sessions of the district and circuit courts, serves warrants, and with his deputies enforces the execution of the internal revenue and other U. S. statutes. 2. To denote a leader or director of ceremonies, festivities, or processions. 3. In many states of the Union, west of the marsh is the head of the municipal police force, and is to be distinguished from the officers of the county called sheriffs, and from the officers of the justice courts called constables. In a few northern cities, formerly, the name was applied with doubtful propriety to special police officers.

**MARSHALING** or **ARMS** is the combining of different coats-of-arms in one escutcheon, for the purpose of indicating family alliance or office. In the earlier heraldry, it was not the practice to exhibit more than one coat in a shield, but the arms of husband and wife were sometimes placed accolée, or side by side, in separate escutcheons; or the principal shield was surrounded by smaller ones, containing the arms of maternal ancestors; and we not infrequently find maternal descent or marriage indicated by the addition of some bearing from the wife's or mother's shield. Then followed diminution, where the shield was parted per pale, and the two coats placed side by side, half of each being shown. By the more modern custom of impaling, the whole of each coat is exhibited, a reminiscence of the older practice being retained in the omission of bordures,
orles, and pressures on the side bounded by the line of impalement. The most common case of impalement is where the coats of husband and wife are conjoined, the husband's arms occupying the dexter side of the shield, or place of honor, and the wife's, the sinister side. Bishops, deans, heads of colleges, and kings-of-arms, impale their arms of office with their family coat, giving the dexter side to the former.

A man who marries an heiress (in heraldic sense) is entitled to place her arms on a small shield called an escutcheon of pretence, in the center of his achievement, instead of impaling. Quartering, or the exhibiting different coats on a shield divided at once perpendicularly and horizontally, is the most common mode of marshaling arms, a practice which, however, was unknown till the middle of the 14th century. The divisions of the shield are called quarters, and are numbered horizontally, beginning at the dexter chief. The most common object of quartering is to indicate descent. The coats quartered in an escutcheon must all have been brought in by successive heiresses, who have intermarried into the family. In the case of a single quartering, the paternal arms are placed in the first and fourth quarters, and the maternal in the second and third. The third and fourth quarters may, in after-generations, be occupied by the arms of a second and third heiress. Sometimes an already quartered coat is placed in one of the four quarters of the escutcheon, then termed a grand quarter. We occasionally find a shield divided by perpendicular and horizontal lines into six, nine, or even more parts, each occupied by a coat brought in by an heiress; and in case of an odd number of coats, the last division is filled by a repetition of the first. In the course of generations, a shield may thus be inconveniently crowded by the accumulation of coats, including the several coats to which each heiress may, in a similar way, have become entitled, and in Germany, sometimes twenty or thirty coats are found impaled in one escutcheon; but in British heraldry, families entitled to a number of quarterings, generally select some of the most important. Quarterings, at least in Scotland, are not allowed to be added to the paternal coat without the sanction of the heraldic authorities.

Sovereigns quarter the ensigns of their several states, giving precedence to the most ancient, unless it be inferior to the others in importance. In the royal escutcheon of the United Kingdom, England is placed in the first and fourth quarters, Scotland in the second, and Ireland in the third; the relative positions of Scotland and England, being, however, reversed on the official seals of Scotland. Spain bears the arms of Leon in the first and fourth quarters, and Castile in the second and third. An elected king generally places his arms surmount on an escutcheon of pretence.

MARSHALL, a co. in n.e. Alabama, watered by branches of the Tennessee river and by the Black Warrior; 450 sq. m.; pop. '80, 14,585. It has a rugged surface, broken by mountain ridges, a part of the Appalachian chain. The soil is generally fertile, productions being wheat, Indian corn, sweet potatoes, tobacco, butter, and cotton. Co. seat, Warrenton.

MARSHALL, a co. in n. Illinois, intersected centrally by the Illinois river, navigable to Lacon, and entering lake Pecora in the extreme s.w.; also, by the Pecora and Bureau Valley division of the Chicago, Rock Island and Pacific railroad; the Chicago to Illinois river branch of the Chicago and Alton, forming a junction with the Dwight to Washington and Lacon branch. The Illinois Central forms its e. border, with a junction at Wenona; 360 sq. m.; pop. '80, 15,036—12,610 of American birth, 37 colored. It is drained by Sandy creek, along whose banks and those of the Illinois river the soil is very fertile, and the surface is for the most part level prairie. Its products are: grain, tobacco, wool, sweet potatoes, wine, dairy products, sorghum, honey, and corn. At Henry, in the n. section, is a combination bridge, lock, and dam of the Illinois Improvement. It has manufactories of carriage, wooden goods, pumps, agricultural implements, cooperage, tin, copper, and sheet-iron ware; among its manufactories are foundries, machine shops, and distilleries. Bituminous coal is found and easily mined. Seat of justice, Lacon.

MARSHALL, a co. in n. Indiana, intersected by the Pittsburg, Fort Wayne and Chicago, and the Indianapolis, Peru and Chicago railroads, forming a junction at Plymouth; also by the Baltimore and Ohio railroad; 450 sq. m.; pop. '80, 23,416—22,111 of American birth, 9 colored. It is drained in the s.e. by the head waters of the Tippecanoe river, the Yellow river, and other branches of the Kankakee. Its surface is generally level, and diversified by groves of sugar maple and openings of hard-wood trees. Its soil is fertile and adapted to the raising of live stock, and the cultivation of fruit and vegetables, every kind of grain, wool, dairy products, honey, maple sugar, sorghum, and hops. It has manufactories of furniture, flour, lumber, hubs, wagons, carriages, and wooden goods; also breweries. Iron ore is found. Seat of justice, Plymouth.

MARSHALL, a co. in n. Iowa, intersected by the Central railway, and the Cedar, Mississippi, and Missouri river division of the Chicago and Northwestern railroad, forming a junction at Marshalltown; 576 sq. m.; pop. '80, 28,793—20,680 of American birth, 128 colored. It is drained by the head waters of the Iowa river and other small streams. Its surface is mostly undulating prairie, with a moderate growth of timber, in which oak and ash predominate. It has a fertile soil, particularly in the valley of the Iowa, producing immense quantities of wheat, every variety of grain, fruit, live stock in great numbers,
wine, tobacco, hops, wool, sweet potatoes, dairy products, honey in large quantities, and sorghum. Its mineral deposits are coal, limestone, and marble. Its leading industries are the quarrying of marble, and the manufacture of soap, wagons, flour, oil, saddlery, and harness. It has machine shops, steam saw-mills for sawing stone, iron foundries, and breweries. Seat of justice, Marshalltown.

M ARSHALL, a co. in n. Kansas; 900 sq.m.; pop. '80, 16,135—13,000 of American birth. It borders on Nebraska, and is traversed by the Big Blue and Little Blue rivers, and by the St. Joseph and Denver City and the Central Branch Union Pacific railroads. The surface is in great part a very fertile prairie, on which all the cereals are raised in large quantities. Chief city, Marysville.

M ARSHALL, a co. in w. Kentucky, having the Tennessee river for its e. and n. boundary near its confluence with the Ohio, and drained by Clark's river and other tributaries; 400 sq.m.; pop. '80, 8,647—9,619 of American death, 440 colored. It is intersected in the n. by the Paducah and Elizabethtown railroad. Its surface is uneven and two-thirds covered with timber. Its soil is adapted to the raising of live stock, fruit, every variety of grain, wool, sweet potatoes, wine, sorghum, maple sugar, and cotton. Among its manufactures are wagons, tobacco, and flour. Seat of justice, Benton.

M ARSHALL, a co. in n. Mississippi, on the border of Tennessee, watered by the Coldwater, Tippah, and Tallahatchie rivers; 750 sq.m.; pop. '80, 29,383. It is intersected by the Mississippi Central railroad. The surface is varied, generally undulating, and the soil fertile. Productions are Indian corn, sweet potatoes, wheat, butter, and cotton. Co. seat, Holly Springs.

M ARSHALL, a co. in central Tennessee, watered by the Duck river; 350 sq.m.; pop. '80, 19,290; the surface is generally level and the soil fertile. Productions are lumber, wool, grain, cattle, and live stock. Co. seat, Lewisburg.

M ARSHALL, a co. in the s. part of that portion of West Virginia known as the "Panhandle," having the Ohio river on the w. and Pennsylvania on the e.; intersected by the Baltimore and Ohio railroad; 290 sq.m.; pop. '80, 18,849. A level country along the shore of the river, farther back it is undulating, the soil in all instances being fertile and under generally high cultivation. The productions are live stock, grain, and wool; and this county is rich in coal measures, not as yet extensively worked. Co. seat, Moundsville.

M ARSHALL, the chief city of Calhoun co., Mich., and part of the township of the same name; pop. '70, 4,623. It is on the Kalamazoo river, and reached by the Michigan Central railroad; 108 m. w. of Detroit and 86 e. of Kalamazoo. The city was incorporated in 1859. Among the public buildings are a court-house, high school, and very fine union school, three banks, many churches, a paper mill, etc. The place is largely engaged in manufacturing flour, for which there are several great mills.

M ARSHALL, HUMPHREY, 1812–72; b. Ky.; graduated at West Point in 1832, and resigned from the army the following year. He studied law and practiced in Louisville. On the outbreak of the Mexican war he joined the command of gen. Taylor, and at the battle of Buena Vista he behaved with great gallantry, leading a memorable charge of the Kentucky volunteer cavalry. At the close of the war he retired to a farm in Kentucky, but in 1849 was elected to congress; and in 1852 represented the United States in China. From 1855 to 1859 he was again in congress, and in 1860 espoused the confederate cause, and received a general's commission in that army. He was defeated by gen. Garfield at Prestonbury, Jan. 7, 1862; but afterwards fought under the command of gen. Kirby Smith. He was a member of the confederate congress during the latter part of the war, having resigned his commission. The latter part of his life was passed in Louisville in the conduct of a lucrative law practice.

M ARSHALL, JOHN, LL.D., 1755–1833; b. Va.; educated at Westmoreland school and by a private tutor. He began the study of law in 1773, but before he was called to the bar the revolution broke out, and he soon joined the Culpeper Minutemen, a Virginia company, and participated in the battle of Great Bridge, where he led a flanking party. The next year he was transferred to the 11th Virginia regiment as a lieut., and in 1777 he was made a captain. He was with the American army in the New Jersey campaign, and was present at Brandywine, Germantown, and Monmouth. He resigned from the army in 1781, and began to practice law, whose study he had resumed at William and Mary college in the winter of 1779 when he was waiting in Virginia to take command of a new force, which was never raised. He was admitted to practice in 1780. His success at the bar was immediate and marked. In 1782 he was returned to the house of delegates from Fauquier co., and the same year became a member of the executive council. In 1787 he was a member of the legislature from Henrico co., to which he had removed. The next year he sat in the Virginia convention called to ratify or reject the constitution framed at Philadelphia. He and James Madison were the foremost supporters of the new instrument, which they succeeded in carrying through the convention. In 1789, 1790, 1791, Marshall served again in the delegates, this time as member for Richmond. He acted with the federalist party, to which the majority of Virginians were opposed; but he succeeded in retaining the confidence of his political opponents.
In 1792 he resumed his law practice, but in 1793 was again elected to the delegates. Jay's treaty had been most bitterly attacked in Virginia, but was defended by Marshall with such ability that the constitutional points, on which the house of delegates had wished to condemn it, were given up; and the delegates passed a simple resolution of its adoption. But many of his friends, which was large, had refused from Washington the offices of attorney-gen., and minister to France, constructed, after considerable demurrer, to go to Paris in 1797 as envoy extraordinary with gen. Pinckney and Elbridge Gerry. The object of their mission was to induce the French directory to remove the restrictions which it had laid upon American commerce. The negotiations proved fruitless, but the ambassadors were warmly received on their return to America in 1798. A public address was presented to Marshall, and members of both houses of congress united in giving him a public dinner. In 1799, at the urgent solicitation of Washington, he permitted the use of his name as federalist candidate for congress, and was elected by a narrow majority. While the canvass was going on, he had been offered, and had refused, a seat upon the U. S. supreme court. In congress he became the leader of the federal party, which was fast losing popular confidence. He did not support, without reserve, the alien and sedition laws, against which Virginia had resolved to protect herself by force, if necessary. In all other measures he supported the administration. His most notable speech was in the case of Jonathan Robins, who had murdered a man on a British frigate and escaped to this country. President Adams, in accordance with a provision in Jay's treaty, gave Robbins up to the British government, which claimed him as its subject. Mr. Livingston, for the republicans, introduced into congress a resolution censuring the president for his action. Marshall defended Adams in a powerful speech, showing that the surrender of Robbins was an act distinctly within the political power of the executive. In May, 1800, he was appointed by president Adams secretary of war, but before accepting he was made secretary of state. His instructions to Rufus King, our minister to England, in regard to several important controversies then pending between this country and England, form one of the ablest of American state papers. In 1801 he was nominated and unanimously confirmed chief-justice of the United States. His decisions in the supreme court raised it to a point of public respect and professional reputation which certainly have not since been surpassed. Chief-Justice Marshall's decisions, particularly in the departments of constitutional and commercial law, are of the highest authority. Many judges, more familiar with the books, have sat upon the supreme bench; but none with such an acute and penetrating judicial intellect, or so dispassionate in the hearing of causes. “He was,” said one of his admirers, “conscience made flesh, reason incarnate.” Between the years 1804 and 1807 appeared his Life of Washington, in 5 volumes, founded upon study of original documents then unprinted, and defending the political career of Washington and the measures of his administration from the attacks which both—and, it must be added, Washington's private life—had suffered from the republicans. The book received much adverse criticism from the English reviewers, on account of the alleged impurity of its English and its undue size. It was abbreviated and published in 2 volumes in 1832. Justice Story published, in 1839, a selection from Marshall's decisions and other papers under the name of The Writings of John Marshall upon the Federal Constitution. “His judgments,” says Justice Story, “are for power of thought, beauty of illustration, and authority, as well as clarity and comprehensiveness, among the highest reaches of the human mind.” In person and manner Marshall was not graceful, but his amiable and genial character made him a pleasant companion and gained warm friends.

MARSHALL, THOMAS FRANCIS, 1801-64; b. Frankfort, Ky.; nephew of the great chief-justice John. At an early age he began practice in the legal profession, and in 1831 opened an office at Louisville. Here he became noted as an eloquent speaker in political campaigns, and was made judge of the Louisville circuit of the superior court. From 1841 to 1843 he served in congress, where he distinguished himself by his eloquence and ready wit. He was a man of brilliant abilities and attractive personal qualities; but, unfortunately, the highest development of his powers was rendered impossible by habits of dissipation. A collection of his speeches and essays has been published by W. L. Barre.

MARSHALL, WILLIAM CALDER, b. Edinburgh, 1813; studied sculpture at the royal academy, under the instruction of Chantrey and Bailey, where he won a gold medal and traveling scholarship, and from 1836 to 1838 continued his studies in Rome. From the time of his return to London, 1839, he contributed to almost every annual art exhibition some graceful piece of statuary. His work may be classed in three divisions: idealistic statuary, historical sculpture, and decoration. Among his numerous productions in the first class may be mentioned: “The Creation of Adam” (1842); “Christ Blessing Little Children” (1844); “Paul and Virginia” (1845); “Sabrina” (1846), perhaps the most popular of all his figures; “The First Whisper of Love”; and “The Dancing Girl Reposing,” which last work gained the art-union prize of £500. In historical figures he has modeled the bronze statue of sir Robert Peel at Manchester, one of Dr. Jenner; and in the Westminster palace, busts of Chaucer, lord Clarendon, and lord Somers. In decoration, he has been extensively engaged in the ornamentation of the new houses of
parliament and the Wellington chapel in St. Paul's cathedral. He was also the designer of the Wellington monument. The style of all his productions is marked by simplicity and refinement, and the conception of his statues is especially delicate and poetical.

MARSHALLTOWN, capital of Marshall co., Iowa; at the intersection of the Chicago and Northwestern with the Central railroad of Iowa; pop. 70,434. It is the center of a prosperous agricultural region, has 7 churches, 3 banks, 3 public schools, a public library, 3 newspapers, 2 flouring-mills, 2 breweries, 3 grain elevators, and a foundry.

MARSHALSEA PRISON, in Southwark, London, was built in the 12th century. It was for a long time a king's bench prison, but finally used for confining poor debtors. It was broken open by the Gordon rioters in 1780. It was abolished, with the ancient Marshalsea courts, in 1849, and has since been torn down.

MARSH-GAS, or METHANE, also called light carbureted hydrogen and fire-damp. It is generated in muddy bottoms of pools in which water-plants grow. When the mud is stirred bubbles of gas rise to the surface, and are easily collected in an inverted bottle. This gas is a mixture of methane and carbonic acid; the latter is readily removed by agitation with limewater or caustic potash or soda. It is also often disengaged in coal mines, sometimes issuing in streams from fissures, having been pent up in the coal. It is one of the products of the distillation of coal in making illuminating gas. Its formula is CH₄, and it contains 12 parts of carbon and 4 parts of hydrogen, by weight. Its specific gravity is 0.559, having a little more than half the density of common air. Containing, as it does, a large proportion of hydrogen, it forms, when mixed with oxygen, a highly explosive compound. Mixed with common air it is also very explosive, as the terrible accidents in coal mines have unhappily demonstrated. It was a long time before marsh gas could be obtained pure by artificial means. That contained in coal gas and made by passing alcohol through a red-hot tube is exceedingly difficult of separation. Dumas, however, has discovered a method by which it can be readily procured in large quantities, perfectly pure. A mixture is made of 40 parts of crystallized acetate of soda, 40 parts of caustic soda, and 60 parts of quicklime in powder, strongly heated in a retort. The gas is given off in great abundance and may be collected over water. The reaction is as follows: \( \text{Na}_2\text{H}_4\text{O}_4 + \text{NaHCO}_3 = \text{CH}_4 + \text{Na}_2\text{CO}_3 \). It will be perceived that lime does not enter as an element in this calculation. It is introduced only to prevent the soda from attacking the glass of the retort.

MARSH-HAWK. See HARRIER, ante.

MARSH-HEN. See RAIL, ante.

MARSH-MALLOW, Althaea, a genus of plants of the natural order malvaceae, differing from the true mallows chiefly in the 6 to 9 cleft outer calyx. The species, which are not numerous, are annual and perennial plants, with showy flowers, natives of Europe and Asia. Only one, the COMMON MARSH-MALLOW (A. officinalis), is an undoubted native of Britain, and is common only in the south, growing in meadows and marshes, especially near the sea. It has a stem 2 to 3 ft. high, entire or 3-lobed leaves, both leaves and stem densely clothed with soft, starry down, and large, pale, rose-colored flowers on short 3 to 4 flowered axillary stalks. Lozenges made from it (pâtes de guimauve) are in use. The whole plant is wholesome, and in seasons of scarcity, the inhabitants of some eastern countries often have recourse to it as a principal article of food. It is said to be palatable when boiled, and afterwards fried with onions and butter. The hollyhock (q.v.) is commonly referred to this genus.

MARSHMAN, Joshua, D.D., an English missionary; 1767-1837; b. at Westbury-Leigh, Wiltshire. While young he showed a great passion for reading. His parents being poor, he was obliged to struggle for an education. In 1784 he became master of a school in Bristol, and at the same time a student of Bristol academy, where he studied Latin, Greek, Hebrew, and Syriac. Deciding to devote his life to the missionary work, he was sent in 1790 by the Baptist missionary society to India to join Carey and his colleagues. The East India company being opposed to missions in their territories, they established their mission at Serampore, a town on the Hooglee, 16 m. above Calcutta, containing a mixed population of Danes, Dutch, English, and natives. Finding soon after his arrival the support granted by the society insufficient for the wants of the colony, he, with the aid of his wife, opened two boarding-schools for European children, and shortly after a school for natives, which was soon filled, and the income from this enterprise, supplemented by that of Carey as instructor in the government college at Fort William, enabled them soon to make their mission independent of home support. But their course did not meet the approval of the committee of the society, who censured without sufficient information, pinched the mission, and dictated their management. Some American subscribers remonstrated "against any part of their contributions for training young men to the ministry being employed in teaching science." This disagreement continued for some time, threatening the success of the enterprise. In 1822 Dr. Marshman sent his son John to England to endeavor to restore amicable relations, which mission being unsuccessful, he himself in 1826 returned in order to confer with the society. But he failed in his object, and the matter ended in a separation of the Serampore mission from the society. He returned in 1829 to Serampore. He had experienced a great affliction in the death of cholera of Mr. Ward, with whom he and Dr. Carey
had labored for 23 years. The treatment of the parent society deeply distressed him: He became very melancholy, wandering about unable even to write a letter. In 1834 Dr. Carey died, leaving him alone. In 1836 his daughter, who had married the famous Christian soldier, Gen. Henry Havelock, barely escaped with her life from her bungalow, which had caught fire, losing one of her three children in the flames. Soon after Dr. Marshman died from complete nervous prostration. A few days before his death arrangements were made in London for the reunion of the Serampore mission with the parent society, and the retention of Dr. Marshman as superintendent. In addition to his special missionary duties, Dr. Marshman gave himself with great zeal to the study of the Bengalee, Sanskrit, and Chinese languages, which he mastered. He translated into Chinese the book of Genesis, the four Gospels, the epistles of Paul to the Romans and Corinthians. He published also a Dissertation on the Characters and Sounds of the Chinese Language; The Works of Confucius, containing the Original Text, with a Translation; Chinese Sino; Elements of Chinese Grammar, with a Preliminary Dissertation on the Characters and Colloquial Medium of the Chinese. He assisted Dr. Carey in preparing a Sanskrit Grammar and a Bengalee and English dictionary. Rammohun Roy having assailed the miracles of Christ in a work entitled The Precepts of Jesus the Guide to Peace, Dr. Marshman replied in a series of articles in the Friend of India (a periodical issued by the Serampore missionaries), subsequently republished in a volume under the title of A Defense of the Deity and Atonement of Jesus Christ. Rammohun Roy replied to this.

**MARSH-MARIGOLD,** *Caltha,* a genus of plants of the natural order ranunculaceae, having about 5 petal-like sepals, no petals, and the fruit consisting of several spreading, many-seeded connate follicles. *C. palustris* is very common British plant, with kidney-shaped, shining leaves, and large yellow flowers, a principal ornament of wet meadows and the sides of streams in spring. It partakes of the acidity common in the order; but the flower-buds, preserved in vinegar and salt, are said to be a good substitute for capers.

**MARSH-ROSEMARY,** the statice limonium, variety Caroliniana, natural order plumbaginaceae, a perennial plant, growing in salt marshes along the sea-shore of southern and western Europe. The variety Caroliniana is an American plant, growing in similar localities on the American coast. Extending northward along the coast of British America, it passes into *S. bahusensis.* Marsh-rosemary has a tuft of spatulate-oblong, bristly pointed, one-ribbed leaves, developing in August, a much-branched, panicled scape, from 1 to 2 ft. high, bearing numerous small lavender-colored flowers; fruit, a one-seeded utricule, contained in the base of the calyx. The root is used in medicine. Edward Parrish found it to contain about 12 per cent of tannin, a trace of volatile oil, a little caoutchouc-like matter, gum, and other vegetable principles. Chlorides of sodium and magnesium, and sulphates, are among the inorganic constituents. Marsh-rosemary was long ago a celebrated remedy for hemorrhages, and in recent times has been used for gargles in ulcerated sore throats.

**MARSH'S TEST.** See arsenious acid.

**Marsi,** an ancient tribe of central Italy, inhabiting the district around the lake Fucinus (Lago di Celano). Their origin, like that of other Italian tribes, is involved in obscurity and fiction. They were probably of Sabine origin. They are worthy of notice chiefly on account of their warlike spirit. The Marsians were at one time allies of the Romans, but, in 308 B.C., they revolted and joined the Samnites. After being subdued they again, 301 B.C., shook off the alliance of Rome, but were beaten in the field, and lost several of their fortresses. From this time they continued the firm allies of Rome, contributing by their valor to her triumphs until the Italians were aroused in 91 B.C. to demand a redress of their wrongs and a share in the privileges of Roman citizens. A war ensued, generally known as the social war, but frequently called the Marsie war, because the Marsi were prominent among the malcontents. Their leader was Silus Pompadusius. Their state after defeat, their perseverance gained the object for which they had taken up arms in 87 B.C. The Marsians, inhabiting a mountainous district, were simple and temperate in their habits, but hardy, brave, and unyielding. So marked was their valor that there was a proverbial saying recorded by Appian, "that Rome had achieved no triumph over the Marsi, or without the Marsi." The ancient Marsi were represented as enchanters, able to tame serpents and to heal their bites; and it is worthy of note that the jugglers who now amuse the people by handling serpents are natives of the region in the vicinity of Lago di Celano. Their only important town was Marruvium (San Benedetto), the ruins of which are visible on the east shore of the lake.

**Marso no Nuovo,** a t. in the Italian province of Potenza, 18 m. s. of the town of Potenza, built on a height, and exposed to violent winds. Pop. 72, 6,125.

**Marsilea Cee,** or Ricciocarpea, a natural order of acotyledonous plants, nearly allied to lycopodiaceae, but differing in the want of a stem and in the usually stalked leaves. The species are all inhabitants of ditches and pools, chiefly in temperate regions, and two of them occur in various parts of Great Britain. No species was known to be of any importance till the discovery of the nardoo (q.v.) of Australia.
MARSIPOBRANCHII, the second of the six orders of fishes instituted by Huxley, including the lampreys and the hag-fishes. They are the dermopterous fishes of Owen. See HAG; LAMPREY; ANTE.

MARSIVAN, or MARSOVAN, a village of Asia Minor, in the pashalik of Sivas, and 120 m. n.w. of the town of that name, in a wide undulating plain. Marsivan is a post station of the first class, has many mosques and fountains, and some manufactures of cotton stuffs. Its Greek name is Merziphone.

MARS-LA-TOUR, a village and commune of France, 15 m. from Metz, on the route between Metz and Verdun; pop. 652. It is a manufacturing place of woolens, hard ware, oils, and dye-stuffs. Lumber and grain also are products. In the 15th c. it had a fortified chateau. On Aug. 16, 1870, it was the scene of the bloody battle of Gravelotte between the French and the Germans.

MARSTON, Gilman, b. in Oxford, N. H., about 1815; graduated at Dartmouth college in 1837, and at the Cambridge law-school in 1840; settled at Exeter, N. H., in 1841; was a member of congress, 1859-63 and 1865-67. He served with distinction in the war for the union, first as col. of the 2d New Hampshire, and afterwards as a brig. gen. of volunteers.

MARSTON, John, 1575-1634; b. England; educated at Corpus Christi college, Oxford, according to Anthony Wood, though this, like many other points in the poet's life, is doubtful. He is satirized under the name of Demetrius in Ben Jonson's Poetaster, 1601. The hostility between the two poets seems to have been at an end in 1605, when Marston dedicated to Jonson his play of The Malcontent. The same year he joined with Jonson and George Chapman in the authorship of Eastward Hoe. James I. imprisoned the three authors on account of some satire which the play contained against the Scotch. Soon after their release the ill-feeling between Jonson and Marston broke out again, for the latter, in the preface to Sophonisba, 1606, taunts Jonson with his plagiarisms from Latin writers, and Jonson, in a conversation with Drummond of Hawthornden refers to an enmity of long standing between himself and Marston. The other works of Marston are: The Melanants of Pigmalion, 1598; Antonio and Melinda, a tragedy, 1602; Antonio's Revenge, a tragedy, 1602; The Dutch Courtesan, a comedy, 1605; Parasetaster, a comedy, 1606; What You Will, a comedy, 1607; The Insultant Countess, a tragedy, 1613; and The Scourge of Villani, a satire of great power. His miscellaneous poetical works were collected and published by Mr. Bowle in 1704.

MARSTON, Westland, LL.D., b. England, 1820; studied law, but left it for literature. He was at one time an editor of the National Magazine, and an occasional contributor to the Athenæum. He has published Gerald and other Poems (1842); a novel called A Lady in her own Right (1860); and a collection of stories called Family Credit and other Tales (1861). His principal literary activity, however, has been in the direction of dramatic literature, and of his numerous plays we may mention The Patriote's Daughter, a tragedy (1841); The Heart and the World (1847); Ann Blake (1853); The Favorite of Fortune, a comedy produced at the Haymarket theater in 1866; A Hero of Romance (1867); and Life for Life, a play in blank verse, produced at the lyceum theater in 1868, and whose principal character was played by the late Adelaide Neilson.

MARSTON MOOR, a plain in Yorkshire, England, where, July 2, 1644, the royalist force, under prince Rupert, was beaten by the parliamentary forces, English and Scotch, under Fairfax and the earl of Leven. The approach of Rupert forced Fairfax to abandon the siege of York, and he took up his position on Marston Moor, with about 25,000 men. Rupert, with about the same number, came up with him on the afternoon of July 2. It was not till about 7 o'clock that the battle, which had up to this time been little more than a desultory camoufle, began in earnest. Rupert, at the front of the royalist right, made a fierce charge upon the parliamentary left, which broke and fled in disorder. The parliamentary center had likewise been broken by the infantry royalist center, and had suffered heavily. The battle seemed irretrievably lost to the parliamentary leaders, who left the field. But while the royalists were dispersed in search of plunder or in pursuit of the enemy, Cromwell's famous 'Iron-side' brigade, with the Scotch regiments, commanded by David Leslie, and some others, rallied, charged the royalists vigorously, and remained masters of the field, capturing 1300 prisoners and all the royalist artillery. The killed and wounded on each side numbered about 2,000. This victory resulted in the occupation of York and the control of the whole north of England by the parliamentary force.

MARSTRAND, Wilhelm, 1810-73; b. Copenhagen; studied art there, at Munich, and at Rome. He attained high rank by his genre paintings, and became a professor and director of the Copenhagen academy. His most meritorious works are, perhaps, "Return of a Society from a Popular Festival," and "Erasmus Montanus."

MARSUPIALIA, or Marsupiata, an extensive order or group of mammals, differing essentially from all others in their organization, and especially in their generative system. The animals of this aberrant group originally received the name of animalia crumenata, or purse-bearing animals; and the names now employed have a similar signification, being derived from marsupium, a pouch or bag. This marsupium, or pouch, which is situated on the abdomen of the female, contains the teats, and serves for the protection
of the immature young; and is unquestionably the most marked characteristic of these animals. As the different genera of this order live upon various kinds of food—some being herbivorous, others insectivorous, and others, again, purely carnivorous—we find various modifications of their organs of progression, predilection, and digestion; but as the most important of these modifications are noticed in the articles on the principal genera, we shall confine ourselves to the characters common to the group.

The leading peculiarity presented by the skeleton is the presence of the marsupial bones (see Mammalia), which are attached to the pubis, and are imbedded in the abdominal muscles. Another constant but less striking peculiarity is a greater or less inversion of the angle of the lower jaw. The organs of digestion, including the teeth, vary extremely; according to the nature of the food; a complex stomach and a cecum of considerable size being present in some, while others (the carnivorous genera) have a simple stomach and no cecum. The brain is constructed on a simpler type than in the placental mammals. The mammal of the marsupials is in general a very small animal, with a comparatively large larynx, the cerebralum, and more or less of the optic lobes, and they are but partially connected together by the "fornix" and "anterior commissure," the great cerebral commissure known as the "corpus callosum" being absent. In accordance with this condition of the brain, these animals are all characterized by a low degree of intelligence, and are said (when in captivity) not to manifest any sign of recognition of their feeders. It is, however, in the organs of generation and mode of reproduction that these animals especially differ from all the ordinary mammals. Professor Owen, who has done more to elucidate this subject, and indeed the anatomy and physiology of marsupiata generally, than any other anatomist, observes that "in all the genera of this order the uterus is double, and the introductory passage more or less (sometimes wholly) separated into two lateral canals. Both the digestive and generative tubes terminate within a common cloaca (q.v.), and there are various other points in which these animals manifest their affinity to the oviparous vertebrates. The marsupial bones serve important purposes in connexion with their generative economy. In the female," he observes, "they assist in producing a compression of the mammary gland necessary for the alimentation of a peculiarly feeble offspring, and they defend the abdominal viscera from the pressure of the young as these increase in size during their marsupial existence, and still more when they return to the pouch for temporary shelter," while in the males they are subservient to the reproductive process. The marsupials belong to the aplacental division of the Mammalia (q.v.). The period of their gestation is short (20 days in the Virginian opossum, and 39 days in the kangaroo), and the young are produced in so immature a state that the earlier observers believed that they were produced like buds from the nipples to which they saw them attached. The appearance presented by a young kangaroo of one of the largest species, within 12 hours of its being deposited in the pouch, is described by professor Owen (from personal observation in the zoological gardens) as follows: "It resembled an earthworm in the color and semi-transparency of its integument, adhered firmly to the point of the nipple, breathed strongly but slowly, and moved its fore-legs when disturbed. The body was bent upon the abdomen, its short tail tucked in between the hind-legs, which were one-third shorter than the fore-legs. The whole length from the nose to the end of the tail, when stretched out, did not exceed one inch and two lines." The mother apparently employs her mouth in placing the young at the nipple, where it remains suspended, involuntarily absorbing milk for a considerable time (probably about two months on an average), after which it succeds spontaneously for some months. Although able from the first, by the muscular power of its lips, to adhere firmly to the nipple, it does not possess the strength to obtain the milk by the ordinary process of sucking. In the process it is assisted by the adaptation of a muscle to the mammary gland, which, by contracting, injects the milk from the nipple into the mouth of the adherent fetus; and to prevent the entrance of milk into the air-passage, the larynx is prolonged upwards to the aperture of the posterior nares, where it is closely embraced by the muscles of the soft palate. The air-passage is thus entirely separated from the throat, and the milk passes on either side of the larynx into the esophagus. The marsupialia are composed of two animal families, viz., Sarcophilus, Dendrolagus, Homo. According to the nature of their food. With the exception of one American and one Malayan genus, all known existing marsupials belong to Australia, Tasmania, and New Guinea.—For further details regarding this order, the reader is referred to Waterhouse's Natural History of the Mammalia, vol. i., and to Owen's article "Marsupialia" in the Cyclopaedia of Anatomy and Physiology.

MARSUPIALIA (ante), one of the two orders of non-placental mammals, including the opossum and kangaroo. The other order, monotremata (q.v.), includes the ornithorhynches, duck-mole or duck-bill (q.v.). The marsupialia, with the exception of the genus dasyphus (opossums), are exclusively natives of Australia, Van Diemen's Land, New Guinea, and neighboring islands. They are divided into two primary sections, Diprotodontia and Polyprotodontia. Diprotodontia contains three sub-classes, the Lophostomata, containing the wombat, a stout, heavy animal 3 or 3 ft. long, having curved, digging claws upon the fore-foot, and a dentition resembling that of the herbivorous rodents. There are two incisors in each jaw, growing from permanent pulps. There are no
canines, and the incisors and premolars are separated by a considerable space. Dental formula: $i., 1-1; c., 0-0; p.m., 3-3; m., 4-4=24$. It is nocturnal in habits, feeding upon roots and grass in Australia and Tasmania. 2. Poephaga. This section contains the kangaroo (q.v.) (Macropodidae) and the kangaroo rat (Hypsiprymnus). The kangaroo rats differ from the true kangaroos in their smaller size and well-developed upper canines, and also in having short tails, like the opossums. The dental formula of the kangaroo is: $i., 3-3; c., 0-0; p.m., 1-1; m., 4-4=28$. 3. Carpospaga. The typical animals of this section are the phalangers, so called from the fact that the second and third digits of the hind-feet are united almost to their extremities (see Phalanger and Flying-Phalanger, ante). Intermediate between the phalangers and the kangaroos is the Kangaroo-bear of the colonists, or the koala (q.v.) or Phascolarctos, whose dental formula is: $i., 3-3; c., 1-1; p.m., 1-1; m., 4-4=30$.

The second primary section, polyprotodontia, contains two sub-sections. 1. Enoto- 

The dental formula of the bandicoot (q.v.), the opossum (q.v.), and the banded ant- 

The dental formula in the opossum is: $i., 5-5; c., 1-1; p.m., 3-3; m., 4-4=48$. The 

The banded ant-eater, Myrmecobius fasciatus, is a small, rather pretty animal of south-western Australia, differing from the other Didelphidae in not having a prehensile tail. The fore- 

The teeth have five toes, while the hind-feet have but four each. It has a number of light and dark bands across its back. These animals are remarkable for the number of their molar 

They were very troublesome to the first settlers, as was also the urinivorous opossum, or "devil," committing various depredations.

The marsupials are regarded as the earliest developed mammals whose fossils have been 

The oldest known European mammal is the Microtus antiquus of the upper triassic formation, only the teeth of which have been found, and it is believed to have been a marsupial and related to the banded ant-eater. The two jaw-bones of an allied animal were found in the trias of North America by Prof. Emmons several years ago, and in the opinion of Prof. Owen they 

In the stone-field slate of the lower oolitic formation a great share of the mammalian remains belong to the small marsupials. In the upper oolite the remains are chiefly marsupial, of the size of a hedgehog and smaller. Fossil marsupialia, allied to the opossum, have been found in Europe in eocene and miocene, and also in the upper Jurassic of North America.

Marsupials, or Tortoise Engrinantes, a genus of extinct crinoids, established by Miller, and found only in the cretaceous formation. The calyx is of large size and the center of its base consists of a single plate, which may be regarded as the uppermost segment of a stem, although the animal is not pedunculated or attached. The pelvis, therefore, resembles a platted pough surrounded by two cycles of radials. See Chinoidea, ante.

Marsys, in legend, a Phrygian satyr who entered into a musical competition with Apollo, under an agreement that the defeated contestant should be at the mercy of the winner. The Muses were selected as judges, and awarded the superiority to Apollo, who accompanied his lyre with the voice, while Marsys played upon the pipe which had been thrown away by Athene. Apollo played Marsys alive, and the tears of the rural divinities for the satyr were said to have formed the river named after him, which flows into the Meander. The subject was a favorite one with the ancient sculptors.

Martaban, the name of a small t. in the province of Pegu, in British Burmah, on the banks of the river of the same name, and near its mouth in the gulf of Martaban, in lat. 16° 32' n., long. 97° 35' e., was the first that fell into the hands of the British in the Burmese war in 1852.

Martel, Charles. See Charles Martel.

Marcel Tower. Round towers for coast defense, about 40 ft. high, built most solidly, and situated on the beach. They occur in several places round the coast.
of the United Kingdom; but principally opposite to the French coast, along the southern shore of Kent and Sussex, where, for many miles, they are within easy range of each other. They were mostly erected during the French war as a defense against invasion. Each had walls of 51 ft. thickness, and was supposed to be bomb-proof. The base for the magazine also formed a recess for the gunners, and over the upper of these the flat roof, with a 44-ft. brick parapet all round. On this roof a swivel heavy gun was to be placed to command shipping, while howitzers on each side were to form a flanking defense in connection with the neighboring towers. Although the cost of these little forts was very great, they are generally considered to have been a failure; their armament have mostly been removed, and their garrisons of 6 to 12 pensioner-soldiers replaced by coast-guard men, or in some cases by old master-gunnery.

The name is said to be taken from Italian towers built near the sea, during the period when piracy was common in the Mediterranean, for the purpose of keeping watch and giving warning if a pirate-ship was seen approaching. This warning was given by striking on a bell with a hammer (Ital. martello, and hence these towers were called torri da martello.

**Marten**, Martes, a genus of digitigrade carnivorous quadrupeds of the family mustelide, differing from weasels in having an additional false molar on each side above and below, a small tubercle on the inner side of the lower carnivorous cheek-teeth, and the tongue not rough—characters which are regarded as indicating a somewhat less extreme carnivorous propensity. The body is elongated and supple, as in weasels, the legs short, and the toes separate, with sharp, long claws. The ears are larger than in weasels, and the tail is bushy. The martens exhibit great agility and gracefulness in their movements, and are very expert in climbing trees, among which they generally live. Two species inhabit the British Islands, and are the Common Marten, Marten (M. follis), and the Pine Marten (M. abietum), inhabiting chiefly the more rocky and wooded parts of the island; the former in the s., and the latter in the north. Both were once much more common than they now are, being sought after on account of their fur, and killed on every opportunity, because of their excessive depredations among game and in poultry-yards. The head and body are about 18 in. long, the tail nearly 10 inches. Both species are of a dark tawny color, the common marten having a white throat, and the pine marten a yellow throat. Many naturalists regard them as varieties of one species, of which also they reckon the sable (q.v.) to be another variety. The fur of the martens is of two sorts: an inner fur, short, soft, and copious, and long outer hair, from which the whole fur derives its color. The common marten is much less valuable for its fur than the pine marten, whilst the pine marten is much less valuable than the sable; but skins of the common marten are imported in great numbers from the n. of Europe, and they are often dyed, and sold as an inferior kind of sable. Pine marten skins are imported from the n. of Europe, Siberia, and North America.—The martens generally have their retreats in the hollow trunks of trees, or usurp the nest of a magpie or other bird, but sometimes among rocks. They are capable of a certain amount of domestication.

**Marten sen**, Hans Lassen, D.D., b. at Flensborg, Denmark, Aug. 19, 1808; studied theology at the university of Copenhagen; and in 1840 became professor at the university, first in philosophy, and afterwards in theology. In the same year appeared his first book, *Mester Eckart*, which was an essay on the mysticism of the middle ages. It was received with much enthusiasm both in Denmark and Germany. In 1841 appeared his *Outline of a System of Ethics*, followed, in 1849, by *Christian Dogmaties*. In the latter the author, as a disciple of Hegel, undertakes to reconcile faith and reason, revelation and science—a task which he performed with such acuteness and ingenuity as to excite the admiration of Christian readers in many countries. In 1845 he was appointed preacher to the Danish court, and in 1853 elevated to the bishopric of Sealand, the highest dignity of the Danish church. In this position, by his eminent scholarship, his catholic spirit, and his tireless activity, he has exerted a powerful and beneficent influence. In 1872 he published *A System of Christian Ethics*.

**Marten, Spotted**—or Long-tailed Dasyure. See *Marsupialia*.

**Martha's Vineyard**, an island on the s. coast of Massachusetts, 21 m. long, 6 m. in average width. Edgartown, settled in 1642 by emigrants from Southampton, England, is the largest town. The island has lately been noted for annual camp-meetings attended by 20,000 persons. Pop. '70, 3,688.

**Martha's Vineyard** (ante), an island 20 m. in length and 3 to 9 m. wide, off the s.e. coast of Massachusetts, is a part of Duke's co., and is separated from Barnstable co. by Vineyard sound, 34 to 7 m. in width; pop. '70, 3,678. It was discovered by Bartholomew Gosnold in 1602; and that at that time was heavily wooded, and contained deer and other game, berries and fruits in profusion, a fresh-water lake, springs, and many wild vines. Gosnold at first gave the name, doubtless in memory of some friend, to a barren islet (No Man's Land) lying s.w. of the larger island to which he afterwards transferred the name. At the period of its discovery, Martha's Vineyard was found to be valuable on account of its growth of sassafras, which was highly esteemed in Europe as a medicine, and of which cargoes were carried away from the island and the main-
and. In 1647 Thomas Mayhew, who had become governor of this island in 1641, by grant from the earl of Stirling, settled where Edgartown now stands, and where the Mayhew family remained in control until 1710. Members of this family conducted missionary enterprises on the island, among the natives, with great zeal and earnestness, and with such success that Christian villages abounded. The new converts proved their devotion by guarding the island during the progress of king Phillip's war; but later on they gradually died out. In 1856 the island of Martha's Vineyard was first used for the purposes of a camp-ground, 9 tents being pitched on the site of the present camp-ground. This institution continued to thrive until it had grown to its present importance and corporate scope. Of late years, the annual gathering for religious purposes has numbered as many as 25,000 persons, the meeting occurring in August, in a large grove of shade-trees. Here a settlement of tasteful cottages has grown up, the site being laid out in streets, lighted at night, and at such a time presenting a scene of fairy splendor. It has become a place of fashionable resort, families from Boston and other cities occupying the cottages during the season. East of the camp-grounds a ledge of bluffs extends along the edge of the shore, overlooking the sea from a height of about 30 feet. Here the village of Oak Bluffs was laid out in 1868, and has since become a fashionable watering-place, visited in the season even from so far s. as New York and Philadelphia. Oak Bluffs is connected with Edgartown by a narrow-gauge rail-road. Twenty m. distant, at the w. end of the island, is Gayhead, an abrupt and bold coast-line eminence, which is said to be of volcanic origin. Six m. e. of Oak Bluffs is Edgartown (q.v.), the principal town on the island; and beyond this is Katama bay, which is a place of resort for social entertainment, and has attractions in its beautiful scenery. The island is accessible by steamer from New Bedford and Wood's Hole.

MARTIAL (Marcus Valerius Martialis), the first of epigrammatists, was b. at Bilbilis, in Spain, 43 a.d. In 66 he came to Rome, where he resided till 100, when he returned to his native town. There he married a lady called Marcella, on whose property he lived till his death (about 104). When at Rome he soon became famous as a wit and poet, received the patronage of the emperors Titus and Domitian, and obtained from them the privileges which were fathers of three children, and, in addition, the rank of tribune and the rights of the equestrian order. He lived, seemingly, in influence in a mansion in the city, and in Nomentum, a suburban villa, to both of which he makes frequent reference. From Rome his reputation rapidly extended to the provinces; and even in Britain his Epigrammata, which, divided into 14 books, now form his extant works, were familiarly read. These books, which were arranged by himself for publication, were written in the following order: the first 11 (including the Liber de Spectaculis) were-composed at Rome, with the exception of the third, which was written during a tour in Gallia Togata; the 12th was written at Bilbilis, and the 13th and 14th at Rome, under Domitian. The last two, entitled Xenia and Apophoreta, describe, in distichs, the various kinds of souvenirs presented by the Romans to each other on holidays. To the other books we are also indebted for much of our knowledge of the manners and customs which prevailed under the emperors Nero, Galba, Otho, Vespasian, Titus, Domitian, Nerva, and Trajan, under whose collective reigns he spent 35 years of his life. His works have also a great literary and historical interest, embodying the first specimens of what we now understand by antiquities—not a mere inscription, but a line of two or more lines, containing the terms of an antithesis, which goes off with a reperception at the close. The wonderful inventiveness and facility displayed by Martial in this species of composition have always received the highest admiration, only qualified by his disgusting grossness, which, blameworthy in him, was even more so in the age by which it was demanded and relished. The best edition of Martial is that of Schneidein. He has never found an adequate translator.

MARTIAL LAW is a collective name for those laws to which the individuals composing the military and naval forces of a country are subject, but which do not apply to civilians. As, however, the soldier remains a citizen, he is governed by the common law in all matters not coming under the cognizance of the martial law, the degree to which the latter is applicable to his actions varying in different countries, and in times of peace and war. In France and Austria a soldier's offenses against the civil code are dealt with by a court-martial; while among British troops—unless serving against an enemy—the civil tribunals deal with non-military offenses. The maintenance of discipline and other obvious causes necessitate, for a body of armed men, a code of laws and regulations much more strict and severe in their penalties, as well as more prompt in their execution, than suffices for ordinary society. Accordingly there have always been martial laws, more or less clearly defined, where there have been armies. For the nature of the rules under which the discipline of the British army is kept up, see ARTICLES OF WAR and MUTINY ACT.

There is yet another phase of martial law, and that is the degree of severity which may be applied to an enemy. All authorities agree that the life of an enemy taken in arms is forfeit to his captor; but modern ideas preclude his being put to death, unless in open resistance; and the massacre of prisoners in cold blood, once thought lightly of, is now esteemed a barbarity, which nothing but the most urgent circumstances, such as their uprising, or their attempted rescue by their countrymen, could justify. The
slaughter of the captive Mamelukes at Jaffa has left an indelible stain on Napoleon's memory. As regards civil population and property, much amelioration has taken place with advancing civilization. Formerly the devastation of the country, and the destruction, accompanied even by torture, of the inhabitants, was deemed a legitimate feature of war. Now, the rule is to spare private property, to respect personal liberty, unless the inhabitants directly or indirectly aid the enemy, and only to lay waste so much ground as military necessities may require. Such at least is the principle professed; but few commandants are able to prevent their troops from deeds of violence. A province occupied by a hostile army is usually considered "under martial law." This means that civil law is defunct, and all government under military regimen; but it is impossible to define the bounds of this martial law; nor is any more correct dictum on the subject likely to be arrived at than that celebrated saying of the duke of Wellington when he described it as "the will of the commander-in-chief."

MARTIAL LAW (ante) must be distinguished from both military law and military government. The last denotes the rule of a conquered or insurrectionary district by military authority, while military law is that branch of the law which regards military discipline and the government of persons employed in the military service. Martial law, says Kent, supersedes and suspends the civil law, but military law is superadded and subordinate to the civil law. As good a definition as any of martial law, which is in its nature somewhat indefinite, is that given by prof. Joel A. Parker, in the North American Review, Oct., 1861: "It is," he says, "that military rule and authority which exists in time of war, and is conferred by the laws of nature and of nations on the commander of armed forces when dealing with and within the scope of active military operations, in carrying on the war; and which extinguishes or suspends civil rights and the remedies founded on them, for the time being, so far as it may appear to be necessary, in order to the full accomplishment of the purposes of war." It will be seen that martial law is in the highest degree arbitrary and capable of abuse. It may be decreed at will by competent military authority, and the only rule as to the propriety of its being established is the test of necessity. The duke of Wellington, from his place in the English house of lords, deprecated its employment, except under the most urgent pressure, and then only with great modifications.

In a celebrated Ceylon case the late lord chief-justice Cockburn was very reluctant to admit that civil law could be superseded by court-martial, except where, as in India, the military government was absolute; but in the same case Blackburn, J., laid down the dictum, universally accepted, in the United States, that the law is temporarily suspended by statutory provisions and founded on paramount necessity. Thus the question as to its nature is closely connected with the manner of its exercise, and this again with the responsibility for such exercise. As to its extent, we may refer to a decision of the U.S. supreme court in the case of Neal Dono v. Bradish Johnson, October term, 1879. It was held: that an officer of the United States, while in service in an enemy's country, was not liable to an action in civil courts for acts done in pursuance of a superior's orders; and when any portion of an enemy's country was in the military possession of the United States, the municipal laws were to be continued in force and administered through the ordinary channels for the protection and benefit of the inhabitants and others not in military service, but not for the protection or control of army officers or soldiers. In the supreme court of Missouri it has been held that the act of congress making the order or authority of the president a good defense for acts done or left undone during the rebellion, is unconstitutional (64 Mo., 564). Where an inferior commander, under the orders of his superior, destroyed large quantities of spirits to preserve the discipline of his command, the courts of Mississippi held that such order was no defense in an action for damages brought after the close of the war.

The whole subject of the relations of the civil and military authorities in time of war, and especially the constitutionality of acts passed distinctly as war measures, is of great interest, and, while much may be res judicata, there are many points not yet clearly determined.

MARTIGNY, or MARTINACH (the Octodurus of the Romans), a small t. of Switzerland, in the canton of Valais, is situated on the Drance, an affluent of the Rhone, about 24 m. s.s.e. from the e. end of the lake of Geneva. The two noted routes, one to the vale of Chamouni by the Tete Noire or the Col de Balme, and another to the great St. Bernard, branch off here. Martigny is on the Simplon road into Italy. It is a great resort for tourists, and has a population of about 1200.

MARTIGUES, a small t. of France, in the department of Bouches du Rhone, is situated on three islands, united by bridges, in the entrance to the Etang de Berre, 16 m. n.w. of Marseilles. From the peculiarity of its position, it has been called the Provencal Venice. Pop. '76, 4,950, engaged in the tunny and pilchard fisheries.

MARTIN. See SWALLOW.

MARTIN, a co. in s.w. Indiana, intersected by the Ohio and Mississippi railroad, drained by the East fork, or Driftwood fork, of the White river, entering it in the n.e. and forming part of its s.w. boundary; about 340 sq.m.; pop. '80, 13,475-13,240 of American birth, 16 colored. Its surface is hilly, with a large portion of tillable land
still covered with forests. Its soil is fertile, and adapted to the raising of live stock, and the production of fruit, buckwheat, oats, corn, rye, wheat, tobacco, wool, the products of the dairy, honey, sorghum, maple-sugar, and flax. Its mineral products are sandstone and coal, and there are sulphur springs in the n. portion. Among its manufactures are flour-mills, and lumber-mills, spoke factories, blast-furnaces, and distilleries.

Seat of justice, Shoals.

MARTIN, a co. in e. Kentucky, formed out of portions of Lawrence and Pike counties, has the Tug fork of the Big Sandy riv: for its e. boundary, separating it from West Virginia; about 320 sq.m.; pop. '80, 3,057—3,053 of American birth, 32 colored. A range of mountains forms its s.w. border, and its general surface is hilly, with a thick growth of hardwood timber on the hill-sides. Its soil, near the river and its tributaries, is fertile, and corn and live-stock are raised. Coal is found and is easily mined, and salt is manufactured. Seat of justice, Warfield.

MARTIN, an e. co. of North Carolina, touching on Albemarle sound, and having the Roanoke river for its n. boundary; 520 sq.m.; pop. '80, 13,140; traversed by the Seaboard and Raleigh railroad. The surface is level and in some portions swampy; the country is heavily wooded. The soil is fertile, producing corn and cotton. Co. seat, Williamston.

MARTIN, a co. in s. Minnesota, having the state line of Iowa for its s. boundary, drained by the Chanyuska river emptying into the Blue Earth river in the next county, with a few small lakes in the n., and Chalk lake in the s. portion; 720 sq.m.; pop. '80, 5,249—4,245 of American birth. Its surface is somewhat undulating, but spreads out into broad prairies for the most part. Its soil is fertile, and adapted to the raising of sheep, the production of Irish potatoes, dairy products, sorghum, honey, and every variety of grain. Its water-power is utilized by flour and saw mills. Seat of justice, Fairmount.

MARTIN, the name of five popes, of whom the fourth and fifth deserve a brief notice.—MARTIN IV. (Nicholas de la Brie), a Frenchman, was elected in 1281. His name is best known in connection with the memorable tragedy of the "Sicilian Vespers." Having been from the time of his election a devoted adherent of Charles of Anjū, he supported that monarch with all his influence, and even by the spiritual censures which he had at his command, in his effort to maintain French domination in Sicily; and it is to his use of the censures of the church in that cause that many Catholic historians ascribe the decline and ultimate extinction of the authority in temporals which the papacy had exercised under the distinguished pontiffs who preceded him. He died at Perugia in 1285.—MARTIN V. must be noticed as the pontiff in whose election was finally extinguished the great Western schism (q.v.). He was originally named Otho Colonna, of the great Roman family of that name. On the deposition of John XXIII. and the two rival popes Gregory XII. and Benedict XIII., in the council of Constance, cardinal Colonna was elected. He presided in all the subsequent sessions of the council, and the fathers having separated without discussing the questions of reform, at that period earnestly called for in the church, Martin undertook to call a new council for the purpose. The council was summoned accordingly, after several years, to meet at Siena, and ultimately assembled at Basel in 1431. Martin died in the same year.

MARTIN (ante) I., Saint, d. 655; son of Fabricius, succeeded Theodore I. in the papal chair, A.D. 640; opposed the will of the emperor Constans II. by assembling the first Lateran council at Rome in October, 649, in which the emperor's decrees were denounced, the pope presiding over 104 bishops from Italy, Sicily, Sardinia, and Africa. Five sessions were held, and the judgment of the council was pronounced in 20 canons, anathematizing all those who do not admit the existence in Jesus Christ of two wills and two operations; this being the question as to which the emperor Constans had pronounced for the opposite side. The opposition to his will on the part of Martin enraged the emperor, who ordered the imprisonment of the pope. He was accordingly taken to the island of Lefkas in the Aegean, 638, and remained there an exile until Sept. 17 of the following year. He was now taken to Constantinople, where he was detained in prison six months. As he still refused to recant his opinions, he was exiled to the Thracian Chersonese, where he suffered great indigencies and deprivation until his death. His body was afterwards removed to Rome, and the church of Rome commemorated his name. Eighteen encyclical letters are attributed to him, and are published in Labbe's Concilia and the Bibliotheca Patrum.—II., or MARINUS I., d. 884; a native of Montefiascone, in the papal states. He was three times papal legate to Constantinople: elected pope Dec. 23, 883, surviving his election only 14 months.—III., or MARINUS II., born in Rome, succeeded Stephen VIII. in 942, and held the papacy 4 years, until his death, which occurred in 946. He was a patron of learning, and was held in high repute as one whose example was Christian and noble.

MARTIN, Bishop of Tours, and a saint of the Roman Catholic church, was b. in Pannonia about the year 516. He was educated at Pavia, and at the desire of his father, who was a military tribune, entered the army, first under Constantine, and afterwards under Julian the apostate. The virtues of his life as a soldier are the theme of more than one interesting legend. On obtaining his discharge from military service, Martin
became a disciple of Hilary, bishop of Poitiers (q.v.). He returned to his native Pan
nenia, and converted his mother to Christianity, but he himself endured much persecu
tion from the Arian party, who were at that time dominant; and in consequence of the
firmness of his profession of orthodoxy, he is the first who, without suffering death for
the truth, has been honored in the Latin church as a confessor of the faith. On his
return to Gaul, about 360, he founded a convent of monks near Poitiers, where he him-
self led a life of great austerity and seclusion; but in 371 he was drawn by force from
his retreat, and ordained bishop of Tours. The fame of his sanctity, and his repute as
a worker of miracles, attracted crowds of visitants from all parts of Gaul; and in order
to avoid the distraction of their importunity, he established a monastery near Tours, in
which he himself resided. His life by his contemporary, Stipicixus Severus, is a very
curious specimen of the Christian literature of the age, and in the profusion of miracu-
loous legends with which it abounds, might take its place among the lives of the mediæ-
val or modern Roman church. The only extant literary relic of Martin is a short Con-
fession of Faith on the Holy Trinity, which is published by Galland, vol. vii. 559. In the
Roman Catholic church, the festival of his birth is celebrated on Nov. 11. In Scotland
this day still marks the winter-term, which is called Martinmas (the mass of St. Martin).
Formerly people used to begin St. Martin’s day with feasting and drinking, hence the
French expressions martenier and faire ta St. Martin, “to feast.”

MARTIN, ALEXANDER, LL.D., 1740-1807; b. N. J., of Irish parentage; graduated at
the college of New Jersey in 1756; removed in 1772 to Guilford co., N. C.; became
a member of the colonial assembly; was appointed in 1776 col. of a regiment, and fought
at Brandywine and Germantown; was state senator for several terms between 1779 and
1785; speaker of the senate in 1787-88, and acting governor in 1781-82; was elected
governor in 1782; re-elected in 1789; was a member of the U. S. constitutional conven-
tion; U. S. senator, 1793-99.

MARTIN, BENJAMIN NICHOLAS, D.D., b. at Mount Holly, N. J., Oct. 20, 1816; gradu-
ated at Yale college in 1837, and at the divinity school in 1840; settled as pastor of a
Congregational church in Hadley, Mass., 1843-47, and as pastor of the Fourth Pres-
byterian church in Albany in 1848-49. In 1852 he became professor of rhetoric and
intellectual philosophy in the university of the city of New York, which place he still
retains.

MARTIN, BON LOUIS HENRI, b. at St. Quentin, Feb. 20, 1810; son of a magistrate
of that city. At the age of 20 he was recognized as a youth of unusual elevation of
mind and independence of spirit, tempered with a mild and modest manner. Educated
for the practice of law he found time for his tendency to literary expression in other
channels and on many diverse subjects. In partnership with another youth he pub-
lished a novel entitled Tour du Loup in 2 volumes, and contributed quite a number of
little poems to the journals. These were followed by many other romances. While
working with Paul Lacroix, it was suggested that they should compile a history of
France, to be made up of extracts from different authors. One volume was published,
when Lacroix abandoned it, but Martin resolved to go on. It became an enormous labor.
The first volume of Martin’s work appeared in 1837, and 18 volumes followed down to
1854. In 1844 the academy of inscription gave him a prize of 1,000 francs; in 1851 he
received the first prize. In 1860 the work as far as completed was published in a new
form in 16 octavo volumes. With the history of France by Thierry, it occupies the
highest place. Martin is a distinguished member of the republican party in France.
In 1848 he was appointed by Carnot provisional minister of public instruction, but the
actionary methods of the government induced him to resign. On the fall of Napoleon
he was made mayor of one of the arrondissements of Paris, and endeavored, without suc-
cess, to dissuade the communists from their assumption of the government. He was
elected from two districts to the national assembly, which he entered early in 1871, and
took his seat with the extreme left. In July, 1871, he was elected a member of the
academy of moral and political science, and in October councilor-general of his native
department de l’Aisne. Besides the history of France the following are among his works:
Minuit et Midi, 1892, reprinted in 1855 under the title of Taverne de Rohan; L’Abbaye-
au-Bois, ou la Femme de Chamber; Histoire de Soissons, 1887; De la France, de son génie
est de ses destinées, 1847; Daniel Martin, 1855; L’Unité Italien et la France, 1861; Jean Bey-
naud, 1863; Pologne et Moravie, 1869; Verceilographie, 1865; La Russie d’Europe, 1869;
Histoire de France populaire, 1867; Etudes d’archéologie Celtique.

MARTIN, DAVID, 1639-1731; a French Protestant clergyman, exiled to Holland by the
edict of Nantes, where he became professor of philosophy and theology in Utrecht.
He was author of the History of the Old and the New Testament printed in French and
Dutch at Amsterdam in 1700. It was copiously embellished with fine engravings, and
is known as Mortier’s Bible.

MARTIN, FELIX, b. at Auray, France, in 1804. In 1842 he was sent as a French Jesuit
priest to Canada to revive the missions there; founded St. Mary’s college in Mon-
treal; collected material for the history of Canada, and has published and edited many
works throwing light on the old Canadian Jesuit missions; among which are the follow-
ing: Manuel du Pèlerin de Notre Dame de bon Secour, Montreal, 1848; Relation des Jesu-
}
an enlarged edition of O'Callaghan's work; *Mission du Canada, relations inédites,* Paris, 1861; *De Montcalm en Canada,* 1867. He assisted Carayon in a series of volumes on the Jesuit missions.

MARTIN, FRANCIS XAVIER, LL.D., 1764-1846; b. France; settled in Martinique, where he engaged in business, but failed. In 1786 he removed to North Carolina, and gave French lessons. He then learned the printer's trade, edited a newspaper, and published a number of works, among them a series of treatises on the duties of public officers, the fruit of his studies for the bar, to which he had already been admitted. He compiled the colonial statutes of North Carolina, and made digests of the state statutes. To him, also, are due the first published volumes of North Carolina state law reports. He served as a judge of the territory of Mississippi for a year, when he was appointed to a similar position in the territory of Orleans. He had already translated, while in North Carolina, the work of Pothier on * Obligations,* and his familiarity with the civil law enabled him to be of great service to the jurisprudence of the new state of Louisiana, whose first attorney-general he was. Two years later, in 1815, he was appointed a justice of the Louisiana state court, and remained in that office till his death. An almost total blindness, from which he suffered during the last ten years of his life, did not interfere with the discharge of his judicial duties. He reported the decisions of the Orleans superior court from 1819 to 1830, and of the Louisiana supreme court from 1813 to 1830. He published a history of North Carolina in 1829 and of Louisiana in 1827. Harvard and Nashville universities conferred upon him the degree of LL.D.

MARTIN, Sir JAMES RANALD, 1800-74; b. at Kilmuir, Skye; entered the medical staff of the Bengal army in 1818. He was appointed sanitary commissioner in England in 1841, knighted in 1850, and made examining physician of the secretary of state for India. He was inspector-general of hospitals, etc. His work *On the Influence of Tropical Climates,* published in 1855, is regarded as an authority.

MARTIN, JOHN, an English painter, was b. in the neighborhood of Hexham, Northumberland, July 19, 1789, went to London in 1806, and made his first appearance as an exhibitor at the royal academy in 1812. His picture was entitled "Sudak in Search of the Waters of Oblivion," and attracted much notice. It was followed within two years by the "Expulsion from Paradise," "Clytie," and "Joshua commanding the Sun to stand Still." This last, though popularly successful, was the cause of a quarrel with the academy, which cut him off from any of its honors. Till near the close of his life, he painted pictures in a style which was considered "sublime," by the sort of people who thought Montgomery's * Satan and Pollok's Course of Time equal to Paradise Lost.* The principal of these "sublime" productions are "Belshazzar's Feast" (1821); "Creation" (1824); "The Deluge" (1826); "The Fall of Nineveh" (1828); "Pandemonium" (1841); "Morning" and "Evening" (1844); "The Last Man" (1850). Martin died Feb. 9, 1854.

MARTIN, JOSIAH, 1737-86; b. Va.; entered the British army as ensign in 1756, and was afterwards promoted to the rank of lieut.col. In 1771 he was appointed governor of North Carolina, and at the breaking out of the revolutionary war took refuge on board a British man-of-war; was with the British fleet before Charleston in 1776, and with Cornwallis at the battle of Camden in 1780. After this he withdrew to Long Island, and thence to England, and died in London.

MARTIN, LUTHER, LL.D., 1744-1826; b. New Brunswick, N. J.; graduated at Princeton in 1766; was a prominent lawyer in Virginia and Maryland; a member of congress in 1784-85; attorney-general of Maryland in 1788 and 1818. As a member of the convention which framed the constitution of the United States, he earnestly opposed the adoption of that instrument. In 1814 he was appointed judge of oyer and terminer in Baltimore. He was a zealous friend of Aaron Burr, defending him on his trial for treason. Died in New York.

MARTIN, ROBERT MONTGOMERY, b. England about 1805; distinguished as a geographer and statistician; author of *The Colonies of the British Empire; The British Colonial Library; The History, Antiquities, Topography, and Statistics of Eastern India; Ireland Before and After the Union; China, Political, Commercial, and Social; The Hudson's Bay Territories; The Indian Empire; and Progress and Present State of British India* (1829). He was for several years editor of the *Colonial Magazine;* he also superintended the publication of *The Illustrated Atlas and Modern History of the World.*

MARTIN, THEODORE, was b. in Edinburgh in 1816, was educated at the high school, and studied at the university of that city. In 1846 he became a parliamentary solicitor in London. His first literary undertaking was editing Sir Thomas Urquhart's translation of Rabelais's *Gargantua and Pantagruel* (1838). In 1845 appeared the *Bon Gaulter Ballads,* the joint production of Martin and prof. Aytoun; his translation of *Poems and Ballads of Goethe* (1858); *Danish Dramas* (1857); *Odes of Horace* (1860); *Poems, original and translated* (1862); Dante's *Vita Nuova* (1862); *Faust* (1865); *Life of Professor Aytoun* (1867); *Life of H. R. H. the Prince Consort,* vols. i. ii. iii. (1874-77). Martin in 1851 married Miss Helen Faucit, the well-known actress; in 1875 was made a companion of the bath, and an L.L.D. of Edinburgh university.
MARTINA, a fine t. of the Italian province of Lecce, situated on a hill 18 m. n.n.e. of Taranto. Pop. '73, 18,102. It has a fine palace in the style of the great Roman palace of Pumilia.

MARTIN, AIME. See Aimé-MARTIN.

MARTINEAU, HARriet, an English authoress, was b. at Norwich, June 12, 1802. Her education was conducted for the most part at home; from an early age she was a lover of books, and was wont to amuse her solitary hours by committing her thoughts to paper. The deafness which she suffered from her youth no doubt strengthened her habits of study, and had much to do with the working out of her career. She appeared in print (in a religious periodical, the Monthly Repository) before she was out of her teens, and when, in 1829, she and her sisters lost their small fortunes by the failure of the house in which their money was placed, she continued to write as she had written before, though now under the new necessity of earning a livelihood. The subjects upon which her pen was exercised are of the most varied kind, including some—such as politics—which have rarely been before attempted by women. Her first volume entitled Devotions for Young People, appeared in 1823; and was followed in 1824 by Christmas Day, a tale, and by The Friend, a sequel, the year after. In 1826 she published Principle and Practice, and The Rioters; and for two years thereafter she was busily engaged in writing stories and a series of tracts on social matters, adapted mainly for the perusal of the working-classes. In 1830 she produced her Traditions of Palestine. During the same year, the association of Unitarian Dissenters awarded her prizes for essays on the following subjects: The Faith as Unfolded by many Prophets, Providence as Manifested Through Israel, and The Essential Faith of the Universal Church. Her next important literary venture was unique, and in one of the softer sex almost audacious, The Illustrations of Political Economy, a series of tales, which met with great and deserved success, and was followed by others Illustrative of Taxation, and Poor-Law and Paupers. In 1834 she crossed the Atlantic, and published her Society in America in 1837. In 1839 she published Dearbrook, and in 1840, The Hour and the Man. She afterwards produced a series of tales for the young, the best known of which are Feet on the Fiord, and The Croquet Days. During the period 1839-44, when she was more or less an invalid, she wrote Life in the Sick-room. Her recovery she attributed to mesmerism, an avowal, which was the cause of a fierce discussion in the scientific world, and exposed herself to much insult and ridicule. On her recovery she published Forest and Game-Law Tales. In 1846 she visited Palestine, and collected materials for Eastern Life, Present and Past, which she published on her return. Afterwards she completed Mr. Knight's History of England during the Thirty Years' Peace. In 1851, in conjunction with Mr. H. G. Atkinson, she published a series of Letters on the Laws of Man's Social Nature and Development, and in 1859, Biographical Sketches (collected from the Daily News). The long catalogue of her literary labors (she wrote more than 100 books) includes her translation of Comte's Positive Philosophy; Household Education; Health, Husbandry, and Handicraft; etc. Martineau was a constant contributor to the larger reviews, and the daily and weekly press. She died June 27, 1876; and her Autobiography, written and printed many years before, was published with an additional editorial volume in 1877.

MARTINEAU, JAMES, brother of the preceding, was b. at Norwich, April 21, 1805. He was educated for the ministry in connection with the Unitarian body of Christians, and was pastor of congregations in Dublin and Liverpool. He was for many years a professor in Manchester new college, and removed to London when that institution was transferred thither in 1858, becoming one of the pastors of the chapel in Little Portland-street. He became principal of the college in 1868, and retired from the pastorate of the chapel in 1874. He was one of the founders of the National Review, and has been a frequent contributor to its pages. This periodical may be taken as generally representing his theological views. Martineau is one of the most earnest and lofty of living religious writers. He is deeply read in German theology and philosophy, and is remarkable for strong grasp of thought and power of subtle analysis. He is a master of English style, and in elucidating the most abstract thought he has seldom been surpassed. His principal works are the Rationale of Religious Inquiry (1836); Endeavors After the Christian Life (1843); Miscellanies (1852); Studies of Christianity (1858); Essays, Philosophical and Theological (1869); and Hours of Thought on Scripture Things (1877).

MARTINEAU, JAMES (ante), is of French lineage. His father was in humble circumstances—a manufacturer of bombazines. From the beginning of his ministry his sermons attracted attention by their deep earnestness and strong grasp upon the gravest problems of human life. While he was preaching in Liverpool in 1839, he took part with J. H. Thom and Henry Gifford in a controversy with thirteen clergymen of the church of England upon themes involving the points of difference between Unitarians and evangelical Christians. The lectures on both sides were published in 2 vols., entitled Unitarianism Confuted, and Unitarianism Defended. The themes discussed by Mr. Martineau in these volumes were: "The Bible;" "The Deity of Christ;" "Victorious Redemption;" "The Christian View of Moral Evil;" and "Christianity without Priest and without Ritual." He ranks by universal consent among the profoundest thinkers and metaphysicians of the age, and probably is not surpassed by any living writer for the charming simplicity and forceful clearness of his style. He has done much for his sect, but far more for
Christianity itself by his efforts to reconcile the claims of faith and reason in religion. He has distinguished himself, especially in the last few years, as the champion of spiritual faith against the various schools of atheism and materialism, winning thus the admiration and gratitude of Christians of every name. His Religion and Modern Materialism was published in New York in 1874. Since that time he has written quite extensively for current reviews and magazines, though ill-health compelled him several years ago to retire from the pulpit.

MARTINDALE, John H., b. Sandy Hill, N. Y., 1815; graduated at West Point, and served for a time in the army, but resigned in 1836 to become a railroad engineer. In 1838 he settled in Batavia, N. Y., practicing law there until 1861, when he removed to Rochester. He enlisted in the war for the union in 1861, was appointed a brig. gen. of volunteers, and led a brigade in Porter's corps in the amphibious campaign of 1862. He was military governor of the District of Columbia from Nov., 1862, until May, 1864, when he joined the 18th corps of the army of the James, and was in the battles of Cold Harbor and the siege of Petersburg. He resigned on account of ill-health, Sept. 13, 1864, and was elected attorney-general of the state of New York in 1866.

MARTIN DE MOUSSY, Jean Antoine Victor, 1810-70; b. at Moussy-la-Vieix, France; studied medicine in Paris, and practiced in the military hospitals. In 1841 he went to Montevideo, S. A., where he was engaged in the practice of medicine for 12 years, keeping all that time a meteorological register. During the siege of Montevideo, which continued 9 years, he was director of the medical service to the French and Italian legions. After the downfall of Rossas, the Argentine dictator, in 1852, Dr. Martin de Moussy was employed by the government of president Urquiza to prepare a geographical description of the republic. In the execution of this task he spent 4 years in constant travel, visiting Paraguay, the Gran Chaco, portions of Chili and Bolivia, and all the Argentine provinces in succession. The results of his labors are embodied in his work in 3 vols., entitled, Description, géographique et statistique, de la Confédération Argentine. This work, with the atlas accompanying it, is of the highest authority. Dr. Martin de Moussy was also one of the editors of the Encyclopédie des Connaissances utiles, and of the Dictionnaire Politique. Died in Paris.

MARTINET, Achille Louis, b. Paris, 1806; studied engraving at Rome, where he won the second grand prize in 1828, and the first in 1830. He has engraved from the works of the great Italian painters and the most celebrated living artists as well. His earliest notable success was an engraving, exhibited in 1836, of Rembrandt's portrait of himself; and among his later works may be mentioned engravings of Murillo's "Nativity," 1869; and Heim's "Martyrdom of St. Juliette," 1873.

MARTINEZ DE LA ROSA, Francisco, 1789-1862; b. Spain; studied law at the university of Granada, and was appointed lecturer on ethics at the university of St. Miguel when less than 20 years old. The French had just invaded Spain, and he entered enthusiastically into the national movement. He was employed by the junta of Granada, his native town, to get arms and supplies for the Spanish cause from the English at Gibraltar, and he afterwards went to England on the same errand. There, in 1811, his first poem, Zarragoza, was published. He wrote also, while in London, a sketch of the Spanish war of independence for Blanco White's paper, El Español, then being published. On his return to Spain he produced, at Cadiz, a tragedy called La Vinda de Padilla, which was successful, and was followed by a comedy Lo que puede un Empleado, satirizing political life. In 1813 he was returned to the cortes from Granada, and at once took a high position as an orator. He was a supporter of the constitution of 1812, which king Ferdinand, on his return to Spain in 1814, overthrew, when Martinez was sentenced to imprisonment for 10 years. Released by an insurrection in 1820, he was for a short time secretary of state, but his opinions had somewhat moderated during his absence, and he lost favor with the populace, to avoid whose violence he resigned. The next eleven years of his life were passed in Paris, with an occasional trip to Italy and Germany. Between 1827 and 1837 he published at Paris a collection of 68 literary works in 5 vols. These contain, besides the Vinda de Padilla, 4 other plays: La Niña en Casa y la Madre en la Masacre; Edipo, a classical tragedy; Aton Ilumaya, founded on the Moorish insurrection under Philip II.; and La Conjuracion de Venecia, written in the manner of the French romanticists. In the collection are also included a Poética, or treatise on the art of poetry, and a number of essays on Spanish literature. In 1830 he was permitted to return to Spain, and began to write a historical novel, Doña Isabel de Solís, the last volume of which was not published till 1846. Meanwhile he became the head of a liberal ministry, and was the author of the royal statute of 1834, which created a constitutional government like the English, and took away the ancient privileges of the provinces. The abolition of these privileges caused a revolt by the Basque provinces, which attached themselves to Don Carlos; civil war broke out, Martinez de la Rosa and the moderates became more and more unpopular, an attempt was made on his life in 1835, and the next year he resigned. He distinguished himself in opposition in the cortes, but never took office; but the constitution of 1812 was restored, the royal statute annulled, and on the fall of queen Christina in 1840 he again went to Paris, and resumed the composition of Espiritu del Siglo, a work on political science, which had been begun in 1835, and whose tenth and last volume was pub-
lished in 1851. Upon the fall of Espartero he entered the Narvaez cabinet, and was afterwards ambassador to Paris and to Rome. Returning to Spain he was elected president of the chamber of the peers; and he was perpetual secretary of the Spanish academy.

**MARTINEQUE or MARTINICO**, called by the natives MADIANA, one of the Lesser Antilles, is 40 m. long, about 12 m. broad, and has an area of about 389 sq. m., and 75,160,831 inhabitants, of whom about 90,000 are black. The island was discovered by the Spaniards in 1493, colonized by the French in 1635, and now belongs to that nation. It is of an oval form, with much indented coasts, and is everywhere mountainous; the highest peak, Mount Pelée being considerably more than 4,000 ft. above sea-level. There are six extinct volcanoes on the island, one of them with an enormous crater. The cultivated portion of Martinique (about one-third of the whole) lies chiefly along the coast. The climate is moist, but, except during the rainy season, is not unhealthy, and the soil is very productive. Of the land in cultivation, about three-fifths are occupied with sugar-cane. Slavery was abolished in 1848. The island is liable to dreadful hurricanes. A floating dock was opened in 1867, at Fort-la-France, the capital (formerly Fort Royal); a telegraph line thence to St. Pierre (q.v.) was at work in 1866; and since then a railway has been set on foot. The exports exceed a million sterling in annual value.

**MARTIN MAR-PRELATE, CONTROVERSY OF.** Certain tracts; appeared in England about 1580, described by Hardwick in his church history "as a series of scurrilous libels in which the queen, bishops, and the rest of the conforming clergy were assailed with every kind of contumely." They are supposed to have been written by some Puritan radicals in the height of the controversy between the church and the Puritans. One writer thinks "there is reason to believe that the whole was a contrivance of the Jesuits;" but of this there is no evidence. Two Puritan divines, Udal and Penny, were tried, and charged with the authorship, but they refused to make any disclosures, and the real authorship of the lampoons was never known. Neale, in his history of the Puritans, gives their titles and contents.

**MARTINMAS, in Scotland, is one of the four quarter-days for paying rent—viz., Nov. 11.**

**MARTINSBURG, a t. in n.e. West Virginia, in the neighborhood of the Blue Ridge, a region of great fertility; pop. ’80, 6,384.** It is at the junction of the Martinsburg and Potomac division of the Cumberland Valley railroad and the Baltimore and Ohio, and is the center of an important and increasing trade. It is 78 m. e. of Cumberland, and 100 m. w. of Baltimore. It is lighted with gas, and has water-works erected at a cost of $80,000, a large court-house, 3 newspapers, 11 churches, 3 banks (one national), with a capital, collectively, of $200,000. It has a fine market, a variety of stores, and a number of railroad repair shops, employing 600 hands. Its industries are the manufacture of furniture and carriages; it has also distilleries, planing and flour mills. There are 6 excellent public schools, and 2 seminaries for girls.

**MARTIUS, CARL FRIEDRICH PHILIPP VON, one of the most distinguished of modern travelers and naturalists, b. at Erlangen, 1794.** He studied medicine at Erlangen, and had published two botanical works, when he was induced to proceed to Brazil as a member of a scientific expedition sent out by the Austrian and Bavarian governments, and by his researches in that country acquired a reputation inferior perhaps to that of no scientific traveler except Humboldt. He was specially intrusted with the botanical department, but his researches extended to ethnography, statistics, geography, and natural science in general; and his works, published after his return, exhibit a poet's love of nature and great powers of description. These works are: *Reise nach Brasilien* (3 vols. Munich, 1824–31); *Nova Genera et Species Plantarum* (3 vols. Munich, 1824–32); and *Icones Plantarum Cryptogamicarum* (Munich, 1828–34). He also published a most valuable monograph of palms, *Genera et Species Palmarum* (3 vols. Munich, 1823–49). He is the author of a number of other botanical works, some of which are monographs of orders and genera; also of works relative to tropical America, as *Die Pflanzenwelt des tropischen Amerika* (Munich, 1831); *Das Naturrecht, die Krankheiten, das Arzthum und die Heilmittel der Urbevölkerung Brasilien* (Munich, 1843); *Systema Medicina Vegetabilis Brasilianica* (Leip., 1843). He also contributed largely to the *Flora Brasilienica*; and wrote *Beiträge zur Ethnographie u. Sprachenkunde Americas zumal Brasilien* (1867, etc.). He was professor of ethnology and director of the botanical garden at Munich. He died in 1868.

**MARTLET, in heraldry, a bird resembling a swallow, with long wings, very short beak and thighs, and no visible legs, given as a mark of cadency to the fourth son. It is also otherwise used as a charge. The martlet was originally meant for the martin, and in the earliest heraldry, it is not deprived of its feet.**

**MARTOS, a t. of Andalusia, Spain, 16 m. s.w. of the city of Jaen, on a steep hill crowned by an old castle. It is resorted to for its mineral waters. Pop. stated at 11,000.**

**MARTYN, HENRY, 1781–1812; h. Truro, co. of Cornwall, England; of humble origin, his father being a laborer in the mines of Gwena. At the age of seven he was placed at the grammar school of Truro with Dr. Carden, where he made great proficiency in the classics. Remaining here till the age of fourteen, he offered himself as a candidate**
for a vacant scholarship at Corpus Christi college, Oxford, but, being unsuccessful, he returned to Dr. Carden’s school, and after two years’ study entered, in 1797, St. John’s college, Cambridge; obtained in 1801 the highest academical honor of “senior wrangler” and the prize for the greatest proficiency in mathematics; in 1803 was chosen fellow of his college, besides gaining the first prize for the best Latin prose composition. The sudden death of his father and the earnest preaching with the faithful counsel of Mr. Simeon, the university preacher, led to his conversion and dedication to the ministry. A mark of Mr. Simeon on the authorization, resulted from the services of Dr. Carden, and the author of the Life of David Brainerd, led to his deciding to be a missionary. Bright prospects of honorable distinction at Cambridge, intense enthusiasm in literary pursuits, an exquisite relish for the refined enjoyments of social life, affected not his purpose. After receiving ordination in 1806, he was curate of the rev. C. Simeon; in 1804 he was public examiner in St. John’s in the classics and Locke’s treatise on the understanding; in 1805 he sailed for India as chaplain in the East India company’s service, and reached Calcutta in May, 1806; in September received his appointment to Dinapore, and soon conducted worship among the natives in their own vernacular, and established schools for their instruction. He engaged while here in the study of Sanskrit, in revising the sheets of his Hindustani version of the New Testament, and superintending the Persian translation made by Sabat. He had religious discussions daily with his moonshee and pundit. In 1807 he completed the translation of the Book of Common Prayer into Hindustani. In March of the same year he finished a Commentary on the Psalms. In the following year he went to Cawnpore. He suffered exceedingly in the journey from Dinapore from the intense heat. And soon after his arrival he preached to a thousand soldiers in a hollow square, in the open air, with the heat so great that even before sunrise many dropped down from its effect. He continued his work among the hundreds of heathen mendicants who crowded around him. Having perfected himself in the Persian language, he decided to extend his labors to that country, and took up his residence at Shiraz, where he revised, with the aid of learned natives, his Persian and Arabic translation of the New Testament, and held discussions with the mollahs and sufis, many of whom were greatly impressed.

“Henry Martyn,” said a Persian mollah, “was never beaten in argument; he was a good man, a man of God.” In view of the effect of his frequent discussions, and of his being engaged in a translation of the New Testament into Persian, the preceptor of all the mollahs wrote an Arabic defense of Mohammedanism. To this Martyn replied in Persian. At Shiraz he held a public discussion with the professor of Mohammedan law, and another time he debated with Mirza Ibrahim in a suit of the concourse of Persian princes, where was collected a large body of mollahs. Having finished his translation of the New Testament, he commenced a version of the Psalms from the Hebrew. Having ordered two copies of the New Testament to be prepared, one for the king of Persia, the other for the prince Abbas Mirza, his son, he left Shiraz for Talais to make the presentation, but was seized with fever on the way and so prostrated that he found it necessary to seek a change of climate. Compelled thus to relinquish his purpose, sir Gore Ouseley, the British ambassador, promised to present the New Testament at court, which he did, and the king publicly expressed his approbation of the work. The ambassador also carried the MS. to St. Petersburg, where, under his superintendence, it was printed and put into circulation. Martyn now decided to return to England, and Sept., 1812, set out for Constantinople, reaching Tocat in Asia Minor, where his utter prostration compelled him to stop. Either falling a victim to the plague then raging in the sinking under the disease which had so greatly reduced him, he died Oct. 16, 1812, in the 32d year of his age. A monument was erected at Tocat in 1856. He was the author of Sermons, Controversial Tracts, Journals and Letters.

MARTYNIA, a genus of plants belonging to the order bignoniaceae (q. v.). They are low, branching annuals with thick stems; leaves simple, rounded; flowers in racemes, large, bell-shaped, and somewhat 2-lipped; fertile stamens, 4, sometimes only 2. The fruit is a pod with a long incurved beak; when ripe the pod splits into 2-hooked horns, one longer than the other. The seeds numerous, black, with a thick, wrinkled coat. The plant has a rather unpleasant fragrance. There are seven or eight species, which are natives of warm countries, except M. proboscis, which is a native of the United States, growing on the banks of the Mississippi, in southern Illinois, and south-westward. It is called the unicorn plant, and is cultivated in gardens for its fruit, which, when the pods are young, are used for making pickles. The leaves of this species are heart-shaped, oblique, entire, the upper alternate; corolla dull white or purplish, or spotted with yellow and purple: endocarp of the fruit crested on one side, long beaked. M. fragrans, from New Mexico, has violet purple flowers, rather a pleasant odor, somewhat like that of vanilla.

MARTYR (Gr. martyr, a witness), the name given in ecclesiastical history to those who, by their fearless profession of Christian truth, and especially by their fortitude in submitting to death itself rather than abandon their faith, bore the “witness” of their blood to its superhuman origin. Of the same use of the word, there are some examples also in the New Testament, as in Acts xxii. 20, Apoc. ii. 13, and xvii. 6. But this meaning, as its technical and established signification, is derived mainly from ecclesi-
astical writers. During the persecutions (q.v.) of the Christians in the first three centuries, contemporary writers, as well pagan as Christian, record that many Christians, preferring death to apostasy, became martyrs or witnesses in blood to the faith, often in circumstances of the utmost heroism. The courage and constancy of the sufferers won the highest admiration from the brethren. It was held a special privilege to receive the martyr's benediction, to kiss his hands, to visit him in prison, or to converse with him; and, as it was held that their great and superabundant merit might, in the eyes of the church, compensate for the laxity and weakness of less perfect brethren, a practice arose by which the martyrs gave to those sinners who were undergoing a course of public penance, letters of commendation to their bishop, in order that their course of penance might be shortened or suspended altogether. See INDULGENCE. The day of martyrdom, moreover, as being held to be the day of the martyrs' entering into eternal life, was called the "natal" or "birth" day, and as such was celebrated with peculiar honor, and with special religious services. Their bodies, clothes, books, and the other objects which they had possessed were honored as relics (q.v.), and their tombs were visited for the purpose of asking their intercession. See INVOCATION. The number of martyrs who suffered death during the first ages of Christianity has been a subject of great controversy. The ecclesiastical writers, with the natural pride of partisanship, have, it can hardly be doubted, leaned to the side of exaggeration. Some of their statements are palpably excessive; and Gibbon, in his well-known 16th chapter, throws great doubt even on the most moderate of the computations of the church historians. But it is clearly shown by Guizot in his notes on this celebrated chapter (see Milman's Gibbon's Decline and Fall, i. 398), that Gibbon's criticisms are founded on unfair and partial data, and that even the very authorities on which he relies demonstrate the fallaciousness of his conclusions. Those who are interested in the subject will find it discussed with much learning and considerable moderation in Ruinart's Acta Primitiva et Sincera Martyrum. Considerable difference of opinion also has existed as to what, in the exploration of the ancient Christian tombs in the Roman catacombs, are to be considered as signs of martyrdom. The chief signs, in the opinion of older critics, were (1), the letters B. M.; (2), the figure of a palm-tree; and (3), a vial with the remains of a red liquor believed to be blood. Each of these has in turn been the subject of dispute, but the last is commonly regarded as the conclusive sign of martyrdom. The first recorded martyr of Christianity, called the "proto-martyr," was the deacon Stephen, whose death is recorded Acts vi. and vii. The proto-martyr of Britain was Alban, of Verulam, who suffered under Diocletian in 286 or 303.

MARTYR, Peter, Italian historian. See ANGHIERA.

MARTYR, Peter, Protestant reformer. See VERMIGLI. PIETRO MARTIRE.

MARTYRLOGY, a calendar of martyrs and other saints, arranged in the order of months and days, and intended partly to be read in the public services of the church, partly for the guidance of the devotion of the faithful toward the saints and martyrs. The use of the martyrology is common both to the Latin and to the Greek church, in the latter of which it is called Menologion (from μένος, a month), or "month-calendar." The earliest extant Greek martyrology, or menology, dates from the 9th century. It was published in 1757 by cardinal Urbini. The oldest Latin martyrology is that attributed to St. Jerome, published in the 11th volume of the collected edition of his works by Vallars; but the genuineness at least of some portions of it is more than doubtful. In the 16th century, the Symonides and other authors published versions in Greek; and in these and in the version of the 17th century by Verdianus of France by Floris, Ado, and Usuard; and in Germany by St. Gall. Nolter, and Rabanus Maurus. The so-called "Roman Martyrology" is designed for the entire church, and was published by authority of Gregory XIII., with a critical commentary by the celebrated cardinal Baronius in 1586. A still more critical edition was issued by the learned Jesuit, Herebert Roswech.

MARUT is, in Hindu mythology, the god of wind; his wife is Anjanā, and his son Hanumān (q.v.). Bhima, the second of the Pāṇḍu princes (see MAHĀBHĀRATA), is likewise considered as an offspring of this god.

MARVELL, Andrew, an English writer and politician, was b. Nov. 15, 1620, at Hull, in Yorkshire, where his father was master of the grammar-school and lecturer of Trinity church. He studied at Trinity college, Cambridge, and afterwards spent several years in various parts of the continent, "to very good purpose," according to Milton. He returned to England about 1653, and was employed by Oliver Cromwell as tutor to a Mr. Dutton; in 1657 he became assistant-secretary to Milton; and in 1660 was chosen by his native town to represent it in parliament. Marvell's parliamentary career was both singular and honorable. Without fortune or influence, possessing no commanding talent as a speaker, nor, indeed, brilliant intellectual qualities of any kind, he maintained a character for integrity so genuine and high that his constituency felt itself honored by his conduct, and allowed him to the end of his life a "handsome pension." Otherwise, it would have occasionally fared ill with this incomparable patriot, for he was often reduced to great pecuniary straits. Charles II. made many but fruitless efforts to win him over to the court-party. The story of the interview between Marvell and the lord treasurer Danby, who had found out the patriot's lodgings (with difficulty) "up two
pair of stairs in one of the little courts in the Strand, " is believed to be essentially true, and indicates a certain noble republican simplicity of nature which cannot be too highly admired. Marvell died Aug. 16, 1678, not without suspicion of poison. His writings, partly in verse and partly in prose, are satirical, sharp, honest and pithy (like his talk), but they relate to matters of temporary interest, and are now well-nigh forgotten. An edition of them was published, along with a life of the author, by capt. Edward Thompson. London, 1776.

MARVEL OF PERU. See JALAP

MARVIN, ExOD M., D.D., b. Warren co., Mo. June 12, 1823; in 1841 became a minister of the Methodist Episcopal church and a member of the Missouri conference. He was elected a bishop of the M. E. church, south, at the general conference held in New Orleans in 1866. He enjoys a high reputation as a preacher, and has published a treatise on The Work of Christ. His official residence is at St. Louis.

MARWAR. See JODPORE, ante.

MARX, Karl, b. Prussia, 1818; educated at Bonn and Berlin; in 1842 went to Cologne, where he edited the Rheinische Zeitung for a year, when it was suppressed. He now established himself in Paris and undertook, with Arnold Ruge, the publication of an edition of Hegel's Philosophy of Jurisprudence, revised, and other literary labors. Having employed the press to attack Prussia, the Prussian government asked his expulsion from France, which was granted, and he settled in Brussels in 1846. He had now become interested in the International, the new socio-political organization, and devoted himself with ardor to the promulgation of advanced views concerning the rights of labor and of the laboring-class. After the revolution of 1848 he again went to Paris, his sentence of banishment being now rendered inoperative; but soon afterwards established in Cologne the Neue Rheinische Zeitung, in the interest of social and political liberty. He was by this time a pronounced agitator, constantly embroiled with the authorities on account of the progressive character of his ideas and the boldness of his utterances. In 1849 he committed himself in the instance of the Baden insurrection, and was expelled from Germany, retiring once more to France and thence to London, where he has resided ever since. In 1864 he became a member of the International; and having been chosen to prepare the constitution and other initial documents of the organization, these were adopted at the congress of Geneva in 1868. In framing these important documents, Marx competed with Mazzini and Proudhon, both of whom prepared programmes for this occasion. The statement by Marx of the foundation and motive of the International, is precise, definite, and conclusive, without being so radical and revolutionary as the ideas of some of its members, including Marx himself; who, on the occurrence of the atrocities of the commune in Paris, did not hesitate to issue a pamphlet indorsing the action of the communists. The rules of the International, as framed by Marx and adopted by the congress of Geneva, were as follows: "Considering that the emancipation of the working classes must be conquered by the working classes themselves; that the struggle for the emancipation of the working classes means not a struggle for class privileges and monopolies, but for equal rights and duties, and the abolition of all class rule; that the economical subjection of the man of labor to the monopolizer of the means of labor, that is, the sources of life, lies at the bottom of servitude in all its forms, of all social misery, mental degradation and political dependence; that the economical emancipation of the working classes is therefore the great end to which every political movement ought to be subordinate as a means; that all efforts aiming at that great end have hitherto failed, from the want of solidarity between the manful division of labor in each country, and from the absence of a fraternal bond of union between the working classes of different countries; that the emancipation of labor is neither a local nor a national, but a social problem, embracing all countries in which modern society exists, and depending for its solution on the concurrence, practical and theoretical, of the most advanced countries; that the present revival of the working classes in the most industrious countries of Europe, while it raises a new hope, gives solemn warning against a relapse into the old errors, and calls for the immediate combination of the still disconnected movements: for these reasons, the first international workingmen's congress declares that this international association, and all societies and individuals adhering to it, will acknowledge truth, justice, and morality as the basis of their conduct toward each other and toward all men, without regard to color, creed, or nationality. This congress considers it the duty of a man to claim the rights of a man and a citizen, not only for himself, but for every man who does him duty. No rights without duties, no duties without rights. And in this spirit they have drawn up the following rules of the international association: 1. This association is established to afford a central medium of communication and co-operation between workingmen's societies existing in different countries and aiming at the same end, viz.: the protection, advancement, and complete emancipation of the working classes. 2. The name of the society shall be "The International Working Men's Association." 3. The general council shall consist of workingmen belonging to the different countries represented in the international association. It shall from its own members elect the officers necessary for the transaction of business, such as a president, a treasurer, a general secretary, corresponding secretaries for the different countries, etc. The congress appoints annually the seat of the general council, elects a number of mem-
bers, with power to add to their numbers, and appoints time and place for the meeting of the next congress. The delegates assemble at the appointed time and place without any special invitation. The general council may, in case of need, change the place, but has no power to postpone the time of meeting. 

4. On its annual meetings, the general congress shall receive a public account of the annual transactions of the general council. In cases of urgency it may convoke the general congress before the regular yearly term.

5. The general council shall form an international agency between the different co-operating associations, so that the working men in one country be constantly informed of the movements of their class in every other country; that an inquiry into the social state of the different countries of the world be made simultaneously, and under a common direction; that the questions of general interest mooted in one society be ventilated by all; and that when immediate practical steps should be needed, as, for instance, in case of international quarrels, the action of the associated societies be simultaneous and uniform.

When it seems opportune, the general council shall take the initiative of proposals to be laid before the different national or local societies. To facilitate the communications, the general council shall publish periodical reports.

6. Since the success of the working men's movement in each country cannot be secured but by the power of union and combination, while, on the other hand, the usefulness of the international general council must greatly depend on the circumstance whether it has to deal with a few national centers of working men's associations, or with a greater number of small and disconnected local societies, the members of the international association shall use their utmost efforts to combine the disconnected working men's societies of their respective countries into national bodies represented by national names and faces. It is of good omen, however, that the success of the plan will depend upon the peculiar laws of each country, and that, apart from legal obstacles, no independent local society shall be precluded from directly corresponding with the general council.

7. The various branches and sections shall, at their places of abode and as far as their influence may extend, take the initiative not only in all matters tending to the general progressive improvement of public life, but also in the foundation of productive associations and other institutions useful to the working class.

8. Each member of the international association, on removing his domicile from one country to another, will receive the fraternal support of the associated working men.

9. Everybody who acknowledges and defends the principles of the international working men's association is eligible to become a member. Every branch is responsible for the integrity of the members it admits.

10. Every section or branch has the right to appoint its own corresponding secretary. While united in a perpetual bond of fraternal co-operation, the working men's societies joining the international association will preserve their existent organizations intact.

12. Everything not provided for in the present rules will be supplied by special regulations, subject to the revision of every congress."
posed as suitors for the hand of Mary by the supernatural sign of a dove issuing from his rod and alighting upon his head. See Protevangelion, cap. viii. As to her history after the ascension of her son, the traditions differ widely. A letter ascribed to the council of Ephesus speaks of her as having lived with John at that city, where she died and was buried. Another epistle, nearly contemporaneous, tells that she died and was buried at Jerusalem, at the foot of the mount of Olives. Connected with this tradition is the incident which has so often formed a subject of sacred art, of the apostles coming to her tomb on the third day after her interment, and finding the tomb empty, but exhaling an "exciting sweet fragrance." On this tradition is founded the belief of her having been assumed into heaven, which is celebrated in the festival of the assumption. The date of her death is commonly fixed at the year of our Lord 68, or, according to another account, the year 48. Another tradition makes her survive the crucifixion only 11 years.

Many theological questions regarding the Virgin Mary have been raised among Christians of the various churches, which would be quite out of place here. One of these, which possesses present interest, has been treated under a separate head. See IMMACULATE CONCEPTION. The perpetual virginity of Mary is not explicitly attested in Scripture, and there are even certain phrases which at first sight seem to imply that children were born of her after the birth of Jesus, as that of his being called (Matt. 1. 25. Luke ii. 7) her "first-born son," and that of James and others being more than once called "brothers of the Lord." On the latter argument, no critic acquainted with the wide scriptural use of the word "brother" would ever rely. The former, which was used in a metaphorical sense, but was not interpreted as a true fact, is not a tradition, but is based upon the presupposition that the virginity of Mary, which is certain from the testimony of Scripture, is rendered impossible by the facts regarding her. The perpetual virginity of Mary is held as a firm article of belief in the Roman and eastern churches. Protestants hold nothing positively on the subject. The controversies regarding the Virgin Mary have reference to the lawfulness of the worship which is rendered to her in some Christian communities. See MARIA LATRY.

MARY, MOTHER OF JESUS (ante), was of the lineage of David and probably a daughter of Hel, who stands in Luke's genealogical record first after Joseph. It is stated concerning her in the New Testament: That the home of her youth was in Nazareth; that she became the espoused wife of Joseph, a descendant of David, but before their marriage was told by the angel Gabriel, sent from heaven to Nazareth, that, by the power of the Holy Ghost, she was to become the mother of the Son of God, whom she should name Jesus, and who, raised to the throne of his father David, would reign thereon for ever; that, after Joseph also had been divinely informed of the truth concerning her, she was received by him as his wife, and as such retained her virginity until the birth of Jesus, her first-born son, which took place at Bethlehem under the circumstances related by Luke; that, by divine direction, she and Joseph fled into Egypt with Jesus in order to defeat Herod's designs against him; that after Herod's death she returned with her husband and child to Nazareth; and, except during her annual visits to Jerusalem at the feast—in one at least of which, when Jesus was 12 years old, he went with her—remained with him in their home there until his public life and ministry began. After that time she is brought forward four times only in the New Testament: 1. At the marriage in Cana of Galilee, where she said to Jesus, "They have no wine." 2. At Capernaum, when Jesus was teaching a great multitude who were seated attentively around him. Mary, with his brethren, unable to force her way to him, sent messengers, who cried out to him that his mother and his brethren were standing outside wishing to see and talk with him: Jesus did not go out to her or send her any answer; but, without ceasing his instructions, said "Who is my mother and who are my brethren?" and, stretching forth his hand towards his disciples, thus answered his own question, "My mother and my brethren are those who are hearing and doing the word of God"—and with wider application still to all places and all times—"Whosoever is willing to do the will of my Father in heaven, he is my brother and sister and mother." 3. John records that Mary the mother of Jesus, with three or four of her friends, having been standing firmly by the cross, probably from the beginning of the crucifixion, Jesus, just before his death, seeing there her and the beloved disciple standing by her, said to her, "Woman, behold thy son," and to him, "Behold thy mother." After this, knowing that then all things had been accomplished, he spake his last words and uttered his final cry. Thus, amidst all its brevity, the Scripture narrative makes it clear that she who had heard the first infant cry of Jesus heard also his closing cries of anguish; and from that very hour she was comforted in what became to her a beloved home. It is related, also, that she saw the tomb in which his body was laid. 4. After the ascension of Jesus to heaven Luke records the presence of Mary with the apostles, the company of the women, and the brethren of Jesus in the upper room at Jerusalem; where she and they continued strenuously in prayer until, on the day of Pentecost, the Holy Spirit was poured upon them from on high. This is the last scriptural notice of her, and it supplies the last thing certainly known concerning her earthly life. As the inspired narrative introduces her by recording the heavenly benediction pronounced upon her, and her own magnificent song of humble, grateful praise; so it leaves her praying, in common with the rest of the disciples, for the promised blessing from on high. All beyond the above that is related of
Mary, Maryland.

544

her by multitudes of writers in various ages of the church is mere legend. A tender
interest and the respect due to her mysterious and sublime relation to the Christ of God,
natural concerning her in the minds of all devout Christians, may have been in some
degree prevented by the claims for her worship which have been advanced by large
portions of the church.

MARY I, Queen of England, daughter of Henry VIII. by his first wife, Catharine of
Aragon, was b. at Greenwich on Feb. 18, 1517. She was in her early years a great
favorite with her father, who had her carefully educated after the masculine fashion of
her time. Erasmus praises particularly the style of her Latin letters. At the age of
seven she was betrothed to the emperor Charles V.; but when Henry sought a divorce
from queen Catharine, the Spanish monarch broke off the engagement. Her father then
tried to marry her to Francis I. of France, but his design did not succeed. Francis,
however, asked for his second son, the duke of Orleans, but Henry in turn refused.
After the birth of Elizabeth, Henry's affections were diverted to that princess; and when
Juana, queen of Castile and Aragon, died, she succeeded to the throne of Spain by
her marriage to Philip II. It is said that the issue of such union might imperil the right of Anne Boleyn's children to the

This was virtually condemning Mary to celibacy, and doubtless had the effect of making
her still more attached to the Catholic party, to which, on account of her training, her
natural tendencies, and the wrongs of her mother, she was already closely allied. Several
other matrimonial negotiations, with the prince of Portugal, the duke of Cleves, and the
duke of Bavaria, also came to nothing. About this time she was in great danger of
losing her life, on account of her strong attachment to her mother's interests. Toward
the close of Henry's reign, better prospects opened out for her; in 1544 she was restored
to her place in the line of succession, of which she had been deprived, and she lived on
very good terms with Catharine Parr, the last of her father's numerous wives. During
the reign of her half-brother, Edward VI., she lived in retirement, but had three more
offers of marriage—from the duke of Brunswick, the markgraf of Brandenburg, and the
infante of Portugal—none of which was accepted. On the death of Edward in 1553 she
was proclaimed queen; and after a brief and ineffectual struggle on the part of those who
advocated the claims of lady Jane Grey, was crowned in October of the same year by
Stephen Gardiner, bishop of Winchester. A fierce spirit in favor of the papacy soon
began to show itself, although it does not appear that Mary herself was at first disposed
to be severe; she even occasionally interfered to mitigate the cruelties of Gardiner and
Bonner; but after her marriage with Philip of Spain (July 25, 1554), to whose father she
had been betrothed many years before, a worse spirit took possession of her, or at least
worse counsels prevailed; and those bloody persecutions began which have given her an
odious name in history. Her domestic life was wretched; Philip, whom she loved with
a morbid passion, proved a sour, selfish, and heartless husband. She had no children,
and exasperation and loneliness working upon a temper naturally obstinate and sullen,
without doubt rendered her more compliant to the sanguine policy of the reactionary
bishops. Fortunately for England, her reign was brief. She died—after much suffer-
ing from dropsy and nervous debility—Nov. 17, 1558. She has been made the subject of
a tragedy by Alfred Tennyson.

MARY II, Queen of Great Britain. 1662-94: b. England; daughter of James
II. and Anne Hynde, who was daughter of the earl of Clarendon. At the age of fifteen
she was married to William, prince of Orange, and went with him to England in 1689.
During the same year parliament declared the crown of England vacant by the abdication
of James II., and crowned William (III.) and Mary. She is said to have been meek
and gentle in her disposition, not interfering in the administration of the government,
except in the absence of her husband. She died of the small-pox, and left no children.

MARY, BROTHERS OF, a Roman Catholic society founded at Bordeaux in 1817 by
G. J. Cheminade, a priest, for the purpose of instruction; confirmed by the pope in 1839;
introduced into the United States in 1849, where in 1875 there were 28 houses.

MARYLAND, one of the original 13 American states, lies immediately s. of Pennsyl-
vania, and is bounded on the e. by Delaware and the Atlantic ocean, between lat. 37° 53'
to 39° 44', and long. 75° 4' to 79° 33' west. Area, 11,134 sq. m., or 7,119,360 acres;
pop. 70, 780,094: income for the year 1877, $2,109,193. The line of Atlantic coast is but
33 m., but including Chesapeake bay, is 411 miles. This bay, 15 m. wide at its mouth,
exands to a breadth of 80 m., with numerous islands, and reaches nearly across the
state. The country rises gradually from the coast to the tops of the Alleghanies, with great
varieties of formation, including deposits of coal, iron, copper, chromate of iron, silicates
and hydrates of magnesia, marl, etc. The climate is temperate, and the soil fertile, pro-
ducing wheat, Indian corn, cotton, tobacco, apples, plums, peaches, grapes. Its chief
towns are Baltimore, Annapolis, Fredericktown, Cumberland. Vast quantities of fruit
and of oysters are exported from Maryland. The annual produce of coal is valued at
about $2,000,000. Maryland has upwards of 890 m. of railway. In 1870 there were 1737
schools in the state—1457 public, 72 classical, professional, and technical (including 3
universities and 19 colleges), and 290 boarding and other schools. There were also 1816
public libraries, 88 newspapers, and 1839 churches. Maryland was settled by a colony
of Roman Catholic gentry from England, under a grant to the second lord Baltimore,
1632, when it received its present name in honor of the English queen, Henrietta Maria.
In 1649 it was made, as has been well said, "a land of sanctuary," by the toleration of all religious denominations; but the Puritans, expelled from Virginia, made great trouble in the colony. Organized as a state in 1776, Maryland took a prominent part in the revolution. In the war of 1861, its sympathies were with the south, and the first blood of the war was shed by General Massachusetts volunteers having been killed on their way to Washington. During the war it was invaded from Virginia, and made the scene of bloody conflicts.

MARYLAND (ante). The first settlement within the state was that of Capt. William Clayborne and his party, on Kent island, in Chesapeake bay, in 1631. George Calvert, the first lord Baltimore, explored the Virginia settlements and Chesapeake bay in 1628, and was delighted with the country; but being a Roman Catholic, and finding the church of England party had full sway, he is supposed to have returned to his possessions in Newfoundland. In 1632, having returned to England, he obtained from the king a renewal of his Newfoundland charter, enlarged to include the territory now forming the states of Maryland and Delaware. He died before the papers were executed, and they were issued by Charles I. to his son Cecilius Calvert, second lord Baltimore, June 20, 1632. The charter conferred upon him and his heirs forever, absolute ownership of the territory, and also civil and ecclesiastical powers of a feudal sort. The name of Maryland was given to the colony in compliment to the queen, Henrietta Maria. Lord Baltimore did not emigrate to America, but made his brother, Leonard Calvert, manager of the expedition, which consisted of 200 persons. They sailed from Cowes, Isle of Wight, Nov. 22, 1638, in two small vessels, the Ark and the Dove, and, after touching at several of the West India islands, landed at point Comfort, Va., Feb. 24, 1634. From this point they sailed, Mar. 3, up the Chesapeake and into the Potomac, landing at an island which they called St. Clement's, where, on the 25th, they "offered for the first time in this region of the world the sacrifice of the mass," and erected a large wooden cross as "a trophy to Christ the Savior," chanting before it on bended knees the litany of the cross. Proceeding n. about nine leagues, they entered a river which they called St. George's, and landed on its right bank, where, on Mar. 27, 1634, with appropriate religious and military ceremonies, they consecrated the spot on which they proposed to build a city, to which they gave the name of St. Mary's, of which scarcely a trace remains. The colonists were nearly all Roman Catholics and gentlemen of wealth and respectability, and the intention of lord Baltimore was to found a Catholic province upon a feudal basis, with a hereditary nobility, primogeniture, etc. This scheme was defeated by the operation of a clause in the charter which prescribed that laws could be made only with the "advice, assent, and approbation of the freemen of said province, or of the greater part of them, or of their delegates or deputies." There was a dispute between the assembly and lord Baltimore as to which of them had the right to initiate legislation, but it was settled in 1638 by the concession of the latter that the power should be exercised by the former, and in the next year the first statutes of Maryland were enacted. Clayborne and his colony on Kent island refused to acknowledge allegiance to the new government, and he and his adherents were expelled. In 1649 a company of Puritans, excluded from Virginia for non-conformity, settled at Providence, now Annapolis, and put themselves in opposition to the government. Clayborne also returned from England and regained possession of Kent island. The governor attempted in vain to dispossess him, and he and the colonists were expelled. In 1652, because of the deaths of Clayborne, Capt. John Smith and Capt. Frederick Calvert, lord Baltimore, and the ill treatment of the Catholics, Clayborne, the troublesome opponent of the government founded under lord Baltimore, compelled the governor to flee into Virginia. In 1647 the governor returned with a military force and recovered possession of the province. By act of the assembly in 1639 the Roman Catholic religion was made the creed of the state. Ten years later, in 1649, an act was passed declaring that "no person or persons whatsoever, professing to believe in Jesus Christ, shall from henceforth be any way troubled, molested, or discontented for and in respect of his or her religion, nor in the free exercise thereof, nor in any way compelled to the belief or exercise of any other religion against his or her consent." The Puritans continuing still to be turbulent, their settlement by way of conciliation was, in 1650, erected into a separate county named Anne Arundel, and as other Puritans still arrived from England, Charles county was shortly afterward organized for their benefit. Their numbers increased to such an extent that in the next assembly they had a majority. In 1652, the royal government of England having been superseded by the commonwealth, commissioners from the mother country visited Maryland, with whom were associated Clayborne, the troublesome opponent of the government founded under lord Baltimore, and Bennett, the Puritan leader of Anne Arundel county. The authority of the English commonwealth was completely established in the colony, and Kent island was given up to Clayborne, while he also acquired Palmer island at the mouth of the Susquehanna. Gov. Stone was first removed, then reinstated. In 1654 lord Baltimore attempted to regain possession of the province and re-establish the proprietary government, but without success. The Puritans established a commission for the government of the colony, placing capt. Fuller at its head. A severe conflict ensued. Providence (now Annapolis) was attacked Mar. 25, 1655, by the proprietary party; but the assault was repulsed, the whole invading force being either killed or taken prisoners. Gov. Stone among the latter. Many of the prisoners were condemned to death, and several were executed. In 1658, U. K. IX.—25
however, the proprietary government was restored. Charles Calvert, son of lord Baltimore, was governor from 1662 to 1676, when the latter died and the former succeeded to his rights, and appointed Thomas Otway as governor. After the overthrow of the commonwealth in 1688, sir Lionel Copley was sent out as governor, and the capital was removed from St. Mary's to Providence, which was thereafter known as Annapolis. In 1714 Charles Calvert, the lord proprietary, died, and was succeeded by his son, Benedict Leonard Calvert, who in turn died in the following year, and was succeeded by his son Charles, a Protestant. Hart, the last of the royal governors, was retained in office. Baltimore was laid out in 1730, Frederick city was founded in 1745, and Georgetown, now in the District of Columbia, was laid out in 1751. In spite of the efforts of the British government to repress manufactures in the colonies, eight copper furnaces and nine forges were in operation in Maryland in 1749, and wine to some extent was produced. The great staple export was tobacco, which was made a legal tender in 1732 at one penny a pound. Maryland took an active part in the war which resulted in the extinction of the French domination upon this continent. The colony was also among the first to oppose the aggressions of the British government which led to the war of the revolution. As early as 1747 the proprietary government was superseded by the authority of the people. A bill of rights and a constitution were adopted in Nov., 1776. The first republican legislature assembled at Annapolis Feb. 5, 1777, and Thomas Johnson was the first republican governor. Maryland took a most efficient and honorable part in the revolutionary war. In 1788 congress met at Annapolis, and it was there on Dec. 28, at the close of the war, that Washington resigned his commission as general-in-chief. The federal constitution was adopted in the Maryland convention April 28, 1788 by a vote of 63 to 11.

The part of the state called the Eastern Shore, lying between Chesapeake and Delaware bays, and the Atlantic, is for the most part level, and in some places swampy. Toward the n. extremity the peninsula is somewhat rocky and broken. The Western Shore, lying between Chesapeake bay and the Potomac, is in the s. portion level and sandy, and in some places marshy; but n. of the point just above Washington on the Potomac, it is first billy and afterwards mountainous. The main ranges of the Alleghanies pass through the narrow portion of the state extending westward between Pennsylvania and Virginia. The highest mountains are not more than 2,500 ft. high. The most beautiful scenery in the state is in a part of the Cumberland valley, in Washington co., near the Pennsylvania line. The state has on the Atlantic only 38 m. of coast and not a single good harbor; but Chesapeake bay, extending nearly through the state from s. to n., furnishes a coast-line of nearly 500 miles. The bay is navigable through its whole extent, and has some good harbors. Baltimore, the principal city of the state, lies upon an arm of the Chesapeake called Patapsco bay. The Potomac, the principal river, is navigable for about 123 m. on the w. border. The other rivers of the state are: on the Western Shore, the Wicomico, Patuxent, South Severn, Patapscos, Bush, and Susquehanna; on the Eastern Shore, the Pocomoke, Manokin, Nanlike, Choptank, St. Michael's, Wye, Chester, Sassafras, Elk. Many of these rivers might properly be called estuaries of Chesapeake bay. Chincoteague, Sinepuxent, and St. Martin's bays are sounds lying between the Eastern Shore and the island reefs and barriers which receive the Atlantic surf. Pocomoke sound, Tangier sound, and Eastern bay are a part of the Chesapeake, in which are numerous islands, among them Kent, Bloodworth's, Holland's, Smith's, Tangier, Halfmoon, and Assateague. Copper, hematitic iron, galena, and manganese, are found in the central portion of the state, while bituminous coal is abundant in the n.w., and bog-iron in the east. Marble, of several varieties, and limestone and sandstone for building, are abundant in the central portion of the state, while traces of gold, nickel, and cobalt have been found in some places.

The wild animals of the state are those usually found on the Atlantic coast. Bears are common in the w., and even the deer has not been exterminated. The fox, raccoon, and opossum are frequently met with. Wild ducks, in great variety, pigeons, partridges, snipe, and quails are abundant in the state. Fish of excellent quality, are abundant, and the oysters of Chesapeake bay are large and finely flavored.

The principal forest trees of the lowlands are the gum, cypress, cedar, juniper, dogwood, magnolia, holly, elm, cherry, locust, persimmon, beech, sycamore, sassafras, poplar, and red maple, while in the mountainous districts are found several species of oak, maple, walnut, hickory, ash, chestnut, birch, pine, and spruce.

The soil of the e. part of the state is a sandy loam, easily made productive by fertilization. Peaches and market-garden products grow here in great perfection. In the valleys of the central and northern portions of the state the soil is exceedingly fertile, producing large crops of tobacco, wheat, and corn. The climate is equable, subject neither to the severe cold of the north nor to the extreme heat of the south. The low and marshy lands on the Chesapeake and the lower Potomac are to some extent marshy, but the rest of the state is generally healthful. The mean annual temperature varies from 54° to 64°. The mercury rarely falls below zero, while the summers are little if any warmer than in Pennsylvania.

The number of farms in 1870 was 27,000; number of acres of improved farm land, 2,914,007; cash value of farms, $179,369,684; of farming implements and machinery, 546
$3,208,676; amount of wages paid in the year, $8,560,367; value of all farm productions, $33,343,927; value of orchard products, $1,319,405; of produce of market gardens, $1,039,792; of forest products, $613,209; of home manufactures, $63,603; of animals slaughtered or sold for slaughter, $4,631,418; of live stock, $18,433,668; wheat produced, 5,774,503 bush.; rye, 307,089 bush.; corn, 11,701,817 bush.; oats, 3,221,643 bush.; Irish potatoes, 1,632,305 bush.; sweet potatoes, 218,706 bush.; tobacco, 15,780,329 lbs.; wool, 435,213 lbs.; butter, 51,044,729 lbs.; cheese, 6,732 lbs.; hops, 2,800 lbs.; flax, 39,760 lbs.; maple sugar, 70,464 lbs.; honey, 118,938 lbs.; wine, 11,583 gallons; milk sold, 1,520,101 gals.; sorgham molasses, 38,563 gals.; hay, 223,119 tons; number of horses, 89,696; mules and asses, 9,880; milch cows, 94,794; working oxen, 22,491; other cattle, 98,674; sheep, 129,697; swine, 257,893; horses not on farms, 12,520; cattle not on farms, 16,040. The wheat crop of 1873 has been estimated at $2,562,000 bush., and valued at over $8,000,000; the rye crop at 309,000 bush., valued at $247,200; corn, 10,451,000 bush., valued at $560,620; Irish potatoes, 1,306,000 bush., valued at $935,000; oats, 2,795,000 bush., valued at $1,231,120; tobacco, 10,500,000 lbs., valued at $1,468,100; number of horses, 104,500; of mules and asses, 10,700; of milch cows, 96,600; cattle, 125,600; of sheep, 138,300; of swine, 256,300.

In 1875 Maryland had 5,812 manufacturing establishments, employing 44,860 persons, and having capital amounting to $36,488,729; wages paid, $13,682,817; value of annual products, $76,598,613. The chief lines of manufacturing industry were: refining sugar and molasses, clothing, cotton goods, flouring-mill products, boots and shoes, iron, tin, copper, and sheet-iron ware, tobacco and cigars, canned fruits and vegetables, canned oysters and fish, bread and bakery products, leather, furniture, lumber, malt and distilled liquors, bricks, printing and publishing, and copper smelting. The value of the oysters and fish canned in Baltimore in 1874 was estimated at more than $6,000,000.

The valuation of the property of the state for 1879 was $496,470,985. Adding to this the stock and assets of corporations, estimated at $42,472,886, to total assessment for tax purposes, amounted to $538,943,871. The average amount of tobacco received and shipped for the seven years ending 1875, was 52,785 bbls. per annum, or an aggregate of 369,306 bbls. The cost of the labor of handling this crop was $532,592. The estimated production of the Clearfield coal region for 1879 was about 1,600,000 tons, an increase over the previous year of 330,000 tons. The Cumberland region shipped 1,702,935 tons.

In 1875 there were in Maryland and the District of Columbia 1825 m. of railroad, costing with their equipment $57,318,219. The principal roads are: the Baltimore and Ohio, one of the four great trunk roads across the continent; the Annapolis and Elk Ridge; the Philadelphia, Wilmington, and Baltimore; the Philadelphia and Baltimore Central; the Northern Central; the Frederick and Pennsylvania; the Cumberland and Pennsylvania; the Western Maryland, and the Southern Maryland.

The foreign commerce of the state is confined almost entirely to Baltimore. The imports for the year ending June 30, 1874, were valued at $29,302,311, the foreign exports at $179,585; domestic exports, $27,514,721. There were entered in Baltimore in 1874: 259,500 American vessels, aggregating 2,858,584 tons burden, and employing 3,952 men and boys, and 345 foreign vessels, of 147,705 tons burden, and employing 5,033 men and boys. Clearances in the same year for foreign ports, 256 American vessels, of 91,635 aggregate tons and manned by 3,006 men and boys; and 348 foreign vessels, of 154,917 tons burden, and employing 4,980 men and boys. The coastwise trade embraces oysters, which are taken in immense quantities in Chesapeake bay. Not less than 15,000,000 bush., mostly canned or in jars, are shipped annually, representing a value of from $15,000,000 to $20,000,000.

Flour, grain, tobacco, coffee, refined sugar, molasses, cotton, coal, wool, hides, leather, provisions, guano, naval stores, iron, whisky, fish and canned fruits are also among the articles which enter largely into the coastwise and internal traffic. In the year ending June 30, 1874, 1943 steamers engaged in this branch of commerce, and aggregating 1,588,858 tons, entered the ports of the state. Number of sailing vessels in the same trade, 414. The clearances of vessels in the same trade during the same year were: steamers, 2,046, sailing vessels, 345. The total number of entrances and clearances was 4,781 vessels, of 3,908,708 tons burden, and manned by 94,175 men. The value of the export of Baltimore in 1877 was $98,510,266. The shipments of petroleum in 1876 amounted to 40,812,598 gals.

The number of national banks in 1874 was 33, with an aggregate capital of nearly $14,000,000, and an outstanding circulation of over $9,000,000. In 1875 there were also 13 state banks, with a capital of nearly $4,000,000; also 5 savings banks, with deposits of over $1,700,000, and 22 private banks. In 1878 there were 13 fire insurance companies, all in Baltimore, their premiums in the state amounting to $439,577,29, and their losses to over $86,000. There was also in Baltimore one marine insurance company, premiums $24,000, losses $10,000. There were also in the state 15 mutual insurance companies, premiums nearly $123,000, losses $91,000. Number of fire and marine insurance companies of other states doing business in Maryland, 107—premiums nearly $890,000, losses over $490,000. There were 2 Maryland life insurance companies—premums $104,000; payments to policy-holders nearly $85,000; 20 life insurance companies of other states, premiums over $1,000,000, payments $1,083,000. The aggregate capital of all the joint-stock insurance companies of the state was $2,738,855; assets, $5,440,990.
liabilities, $3,516,843. The 15 mutual fire insurance companies had assets amounting to nearly $4,000,000, while their liabilities were over $1,660,000.

The debt of the state, on which interest has to be provided, is a little short of $8,000,000. The receipts of the state treasury for the fiscal year ending Sept. 30, 1879, were $2,126,326; in treasury before, $204,165; total, $2,330,491; disbursements, $1,747,283; balance in treasury, $583,208.

The population of Maryland has increased steadily from the first. In 1790 it was 319,728; in 1850, 583,034; in 1870, 790,894, of whom 175,391 were colored; in 1880, 934,632. The number of church organizations in 1870 was 1,420, of church editors 1,289; amount of church property, $12,058,650. The principal denominations were Baptists (including Mennonites, Dunkers, etc.), Episcopalians, Methodists, Roman Catholics, Presbyterians, Lutherans, Friends, German Reformed, and United Brethren in Christ. The latest school statistics are those for the year ending July 31, 1879. Number of schools, 1899; pupils, 156,274; average attendance, 81,839; number of teachers, 3,071. In Baltimore the schools were opened 10 months of the year; in other counties, a little over 8 months. Total expenditures of the year for school purposes, $1,593,359. There are separate schools for colored children. The state normal school at Baltimore was opened in 1865, and in 1870 had an income from productive funds of $9,500, and a library of 1,250 volumes. The Howard normal school for colored pupils has an annual income of $2,000, and a library of 1,750 volumes. Normal instruction is also given in St. John's college, Annapolis. The provisions for higher education in Maryland are comparatively ample. The McDonogh bequest, from which the sum of $500,000 had been realized up to 1870, is the foundation of a farm school for boys, now in successful operation. The Peabody Institute in Baltimore, endowed by the late Mr. George Peabody with $1,200,000, besides buildings, is intended to found a great library, support an extensive system of lectures, and a conservatory of music. The Johns Hopkins university, founded in 1874 by the late Johns Hopkins of Baltimore, and endowed by him with the sum of $3,500,000, has already taken rank among the best universities of the country. The state agricultural college in Prince George's co. was founded upon the avails of the public lands given for the purpose to the state by the United States. It has a farm of 300 acres. It embraces a collegiate course of four and a scientific course of three years. Provision is also made for students desiring to remain but a single year. The other colleges of the state are Frederick college, at Frederick, Loyola college at Baltimore; Rock Hill college at St. Charles; St. John's college at Annapolis; Washington college at Chestertown; Western Maryland college at Westminster. Number of instructors in these institutions, 113; of students, 629. There are also several flourishing seminaries for the instruction of young ladies, and a number of professional schools. The United States naval academy at Annapolis has a library of 10,828 volumes. There are two medical schools; one of them a department of Washington university, the other of the university of Maryland. The Maryland college of pharmacy was founded in 1841; the Baltimore college of dentistry, the oldest of the kind in the world, was founded in 1840. The Maryland dental college was founded in 1873. In 1870, there were in the state 3,353 libraries, containing 1,713,483 volumes; of these, 2,637, containing 1,142,538 volumes, were private. There were 88 newspapers and periodicals — 8 daily, 1 tri-weekly, 2 semi-weekly, 69 weekly, and 8 monthly.

The state institutions are the penitentiary, the asylum for the blind (white), and that for the colored blind and deaf at Baltimore; the hospital for the insane, at Spring Grove, Baltimore co.; the institution for the deaf and dumb, at Frederick; and house of refuge for juvenile delinquents, near Baltimore.

The governor of the state is elected for four years. His veto can be overcome only by a three-fifths vote of both houses of the legislature. He has a salary of $4,500. The governor, comptroller, and treasurer constitute the board of public works. The legislature, which meets biennially, consists of a senate and house of representatives. The senators, 26 in number, one from each county, and one from each of the three legislative districts of Baltimore, are elected for four years, one-half retiring biennially. The delegates, 85 in number, are elected for two years by districts defined by the legislature after each census. Members of the legislature are paid $5 per day during the sessions, besides mileage. The court of appeals, composed of the chief judges of the first seven circuits and a judge specially elected in Baltimore, has appellate jurisdiction only. The state is divided into 8 judicial circuits, the city of Baltimore constituting the eighth. In each circuit, except the eighth, a chief judge and two associate judges are elected; and in each county a circuit court is held, having original jurisdiction, both civil and criminal, and appellate jurisdiction of the judgments of justices of the peace. The city of Baltimore has five courts, viz.: the superior court, the court of common pleas, the city court, the circuit court, and the criminal court. A chief judge and four associate judges, constituting the supreme bench of Baltimore, designate one or more of their number to hold these several courts, and any three or more to hold general terms with limited appellate powers. Judges are elected by the people of their respective circuit for a term of 15 years, but cannot serve after they are 70 years of age. The legislature is prohibited from lending the credit of the state to any individual, association, or corporation. Amendments to the constitution must be proposed by three-fifths of each house of the legislature and ratified by the people. Once in every.
20 years the people must vote upon the question of holding a convention to revise the constitution. A married woman may acquire, hold, and manage property independently of her husband, and dispose of the same as if single. Her husband must join her, however, in the execution of any deed.

The position of Maryland in the war of the rebellion was peculiar. As a slaveholding state, her sympathies were naturally to a great extent with the south; but her proximity to the north served to modify her feelings in this respect and to keep her from taking a prominent part in the war. The people were divided in sentiment as to secession, but a very large majority were strongly opposed. Great efforts were made to keep the state in a neutral position, but without success. A considerable number of men enlisted in the confederate army, but of those who remained at home a majority were loyal to the union. Attempts were made in Baltimore in the first days of the war to prevent the passage of union troops through that city to Washington and the south, and several Massachusetts soldiers were killed in consequence; but the enemies of the union were effectually subdued by the power of the national government, aided by the better portion of the citizens of the state. In spite of the circumstances above mentioned, Maryland contributed 49,780 men to the union armies. The battle of Antietam and several others of less importance were fought on Maryland soil.

The electoral votes of Maryland for president and vice-president have been as follows:—789, 6 for Washington and R. H. Harrison of Maryland—2 vacancies; 1792, 8 for Washington and Adams; 1796, 7 for Adams and 4 for Jefferson for president; and 4 for Pinckney, 3 for Burr, 3 for John Henry, and 2 vacancies, for vice-president; 1804, 5 each for Jefferson and Burr for president; and 5 each for Adams and Pinckney for vice-president; 1804, 9 for Jefferson and 2 for Pinckney for president; and 9 for Clinton and 2 for King for vice-president; 1812, 6 for Madison and 5 for Geo. Clinton for president; and 6 for Gerry and 5 for Jared Ingersoll for vice-president; 1816, 8 for Monroe and 3 vacancies for president; and 8 for Tompkins and 3 vacancies for vice-president; 1820, 11 for Monroe for president; and 10 for Tompkins and 1 for Robert C. Harper for vice-president; 1824, 7 for Jackson, 3 for J. Q. Adams, and 1 for W. H. Crawford for president; and 10 for Calhoun and 1 for Jackson for vice-president; 1828, 5 for Jackson and 6 for J. Q. Adams for president; and 5 for Calhoun and 6 for Rush for vice-president; 1832, 3 for Jackson, 5 for Clay, and 2 vacancies, for president; and 5 for Sargent, 3 for Van Buren, and 2 vacancies for vice-president; 1836, 10 for Harrison and R. M. Johnson; 1840, 10 for Harrison and Tyler; 1844, 8 for Clay and Frelinghuysen; 1848, 8 for Clay and Fillmore; 1852, 8 for Fillmore and King; 1856, 8 for Fillmore and Donelson; 1860, 8 for Breckinridge and Lane; 1864, 7 for Lincoln and Johnson; 1868, 7 for Seymour and Blair; 1872, 8 for Thomas A. Hendricks and B. Gratz Brown; 1876, 8 for Tilden and Hendricks; 1880, 8 for Hancock and English.

MARY OF THE INCARNATION (MARIE GUYARD), 1599-1672, b. France; married at the age of 17, a silk manufacturer named Martin, who died two years afterwards. She carried on the silk factory till her son reached the age of 12, when, Jan. 25, 1631, she became an Ursuline nun. In 1639 she settled in Canada, and founded an Ursuline convent in Quebec. She studied and became familiar with some of the Indian languages, and gave instruction to French and Indian scholars. In the political affairs of New France her judgment was highly esteemed, and she sought to impress upon the home government the necessity of controlling the mouth of the Hudson, as a means of protection against Dutch and English assaults. Her life has been written by her son, Dom Claude Martin, who became a Benedictine monk; and by Father Charlevoix, and there is a modern biography of her by the abbé Casgrain, which appeared at Quebec, in 1864.

MARY MAGDALENE. See MAGDALENE, MARY, ante.

MARYPORT, a seaport of Cumberland, England, at the mouth of the Ellen, 28 m. s.w. of Carlisle by railway. Its origin dates from 1750. Shipbuilding and its kindred employments are carried on extensively, and there are in operation iron-foundries, sawmills, flour-mills, tanneries, breweries, etc. A very large quantity of coal and coke is shipped, especially to Ireland. Maryport has abundant railway connection, and possesses a floating dock and two patent slips. It is a place of resort for sea-bathing. In 1878, 520 vessels, measuring 63,767 tons, entered the port, and 2,003, measuring 290,077 tons, cleared. Pop. '71, 7,445.

MARY, SOCIETY OF, an association of Roman Catholic priests, established at Lyons, France, in 1815, by J. C. M. Colin; sanctioned by the pope in 1831, 1836, and 1879; introduced into the United States in 1862. Its objects are religious instruction and domestic and foreign missions.

MARY STUART, QUEEN OF SCOTS. This beautiful and accomplished, but most unhappy princess was the daughter of King James V. of Scotland by his second wife, Mary of Lorraine, daughter of Charles, Duke of Guise, and widow of Louis of Orleans, Duke of Longueville. She was b. at Linlithgow, on Dec. 8, 1542. Her misfortunes may be said to have begun with her birth. Its tidings reached her father on his deathbed at Falkland, but brought him no consolation. "The devil go with it!" he muttered, as his thoughts wandered back to the marriage with Bruce's daughter, which
brought the crown of Scotland to the Stuarts—"it came from a woman, and it will end in a woman!" Mary became a queen before she was a week old. Before she was a twelvemonth old, the regent Arran had promised her in marriage to prince Edward of England, and the Scottish parliament had declared the promise null. War with England followed, and at Pinkie Cleuch the Scots met a defeat only less disastrous than Flodden. But their aversion to an English match was uncommeasurable; they hastened to place the young queen beyond the reach of English arms, in the island of Inchmahome, in the lake of Montcith, and to offer her in marriage to the eldest son of Henry II. of France, and Catharine de' Medici. The offer was accepted: and in July, 1548, a French fleet carried Mary from Dumbarton, on the Clyde, to Roscoff, in Brittany, whence she was at once conveyed to St. Germain-en-Laye, and there allained to the dauphin.

Her next ten years were passed at the French court, where she was carefully educated along with the king's family, receiving instructions in the art of making verses from the famous Ronsard. At a somewhat later period, she had the great Scottish scholar Buchanan for her Latin master. On April 24, 1558, her marriage with the dauphin, who was about two years younger than herself, was celebrated, with every circumstance of pomp and splendor, in the church of Notre-Dame, at Paris. It was agreed, on the part of Scotland, that her husband should have the title of king of Scots; but this was not enough for the grasping ambition of France, and Mary was betrayed into the signature of a secret deed, by which, if she died childless, both her Scottish realm and her right of succession to the English crown (she was the great-granddaughter of king Henry VII.) were conveyed to France. On July 10, 1559, the death of the French king called her husband to the throne by the title of Francis II. The government passed into the hands of the queen's kinsfolks, the duke of Guise and the cardinal of Lorraine; but their rule was short-lived. The feeble and sickly king died on Dec. 5, 1560, when the reins of power were grasped by the queen-mother, Catharine de' Medici, as regent for her son, Charles IX. Mary must have been prepared, and her indemnity circumvented, to quit a court which was now swayed by one whom, during her brief reign, she had taunted with being "a merchant's daughter." But there were other reasons for her departure from France. Her presence was urgently needed in Scotland, which the death of her mother, a few months before, had left without a government, at a moment when it was convulsed by the throes of the Reformation. Her kinsmen of Lorraine had ambitious projects for her marriage; great schemes were based on her nearness of succession to the English crown; and both these, it was thought, might be more successfully followed out when she was seated on her native throne. She sailed from Calais on the 15th, and arrived at Leith on Aug. 19, 1561, having escaped the English ships-of-war which Elizabeth despatched to intercept her. She wept as the shores of France faded from her sight, and her tears flowed anew when she beheld the rudeness and poverty of Scotland. Her government began auspiciously. The Reformation claimed to have received the sanction of the Scottish parliament, and if Mary did not formally acknowledge the claim, she was at least content to leave affairs as she found them, by stipulating only for liberty to act in all private circumstances. Her choice fell, somehow, on the earl of Arran. The contrary party decided to throw off the government of Mary, and her marriage was broken off with the French, who were in league with Prince Henry of England. He was thus among the nearest heirs to the English crown, and his claims to the succession were believed to have the support of the great body of English Roman Catholics. But except this, and his good-looks, he had no other recommendation. He was weak, needy, insolent, and vicious; his religion, such as it was, was Roman Catholic; his house had few friends and many enemies in Scotland; and he was two or three years younger than Mary. Her best friends, both Roman Catholic and Protestant, warned her against him, but in vain. The marriage was celebrated at Holyrood on July 29, 1565. It was the signal for an insurrection by Murray and the Hamiltons, who hoped to be joined by the whole Protestant party. But their hope was disappointed; and the queen, taking the field in person, at once quelled the revolt, and chased the rebels beyond the Tweed. Her triumph was scarcely over when her eyes began to open to the great mistake of her marriage. Her husband's worthlessness and folly became only too apparent; she was disgusted by his debauchery, and alarmed by his arrogance and ambition. She
had given him the title of king, but he now demanded that the crown should be secured to him for life, and that if the queen died without issue it should descend to his heirs. Mary hesitated to comply with a demand which would have set aside the settled order of succession; and what she refused to grant by favor, the king prepared to extort by force.

Mary's chief minister, since Murray's rebellion, had been David Rizzio, a mean-looking Italian of great ability and many accomplishments; but generally hated beyond the palace walls as a base-born foreigner, a court favorite, and a Roman Catholic. The king and Rizzio had been warm friends, sharing the same table and even sleeping in the same bed, but when the king was now persuaded that it was Rizzio who was the true obstacle to his designs upon the crown. In this belief he entered into a formal compact with Murray, Ruthven, Morton, and other chiefs of the Protestant party, undertaking, on his part, to prevent their attainder, or procure their pardon, and to support and advance the Protestant religion; while they, on the other part, bound themselves to procure the settlement of the crown upon him and his heirs, and to take and slay, if need were, even in the queen's palace and presence, every one who opposed it. The result of this conspiracy was the murder of Rizzio on Mar. 9, 1566, the king leading the way into the queen's cabinet, and holding her in his grasp while the murderers dragged the poor Italian into an ante-chamber, and, mangling his body with more than 50 wounds, completed what they believed, and Knox pronounced to be, "a just act and most worthy of all praise." When Mary learned what had been done she broke out in reproaches against the king as to blame for all. "I shall be your wife no longer," she said, "and because you have killed my favorite, I am at this present." As had been agreed beforehand among the conspirators, Mary was kept prisoner in Holyrood; while the king, of his own authority, dismissed the parliament which was about to forfeit Murray and his associates in the late insurrection. The plot was thus far successful; but Mary no sooner perceived its objects than she set herself at work to defeat them. Dissembling her indignation at her husband's treachery and the savage outrage in which he was the ring-leader, she succeeded by her blandishments in detaching him from the conspirators, and in persuading him not only to escape with her from their power by a midnight flight to Dunbar, but to issue a proclamation in which he denied all complicity in their designs. The conspiracy was now at an end; Ruthven and Morton fled to England, while Murray, by renouncing their cause, hastened to make his peace with the queen; and the king, hated by both sides, because he had betrayed both sides, became an object of mingled abhorrence and contempt.

It was an aggravation of the murder of Rizzio that it was committed, not in the queen's presence, at least within a few yards of her person, only three months before she gave birth (on June 19, 1566) to the prince who became king James VI. As that event drew near the queen's affection for her husband seemed to revive; but the change was only momentary; and before the boy's baptism, in December, her estrangement from the king was greater than ever. Divorce was openly discussed in her presence, and darker designs were not obscurely hinted at among her friends. The king, on his part, spoke of leaving the country; but before his preparations were completed he fell ill of the small-pox at Glasgow. This was about Jan. 9, 1567. On the 25th Mary went to see him, and traveling by easy stages brought him to Edinburgh on the 31st. He was lodged in a small mansion beside the kirk of the field, nearly on the spot where the s.e. corner of the university now stands. There Mary visited him daily, and slept for two nights in a room below his bed-chamber. She passed the evening of Sunday, Feb. 9, by his bedside, talking cheerfully and affectionately with him, although she is said to have dropped one remark which gave him uneasy forebodings—that it was much about that time twelvemonth that Rizzio was murdered. She left him between 10 and 11 o'clock to take part in a masque at Holyrood, at the marriage of a favorite valet. The festivities had not long ceased in the palace when, about two hours after midnight, the house in which the king slept was blown up by gunpowder; and his lifeless body was found in the neighboring garden.

The chief actor in this tragedy was undoubtedly James Hepburn, earl Bothwell, a needy, reckless, vainglorious, profligate noble, who, since Murray's revolt, and still more since Rizzio's murder, had enjoyed a large share of the queen's favor. But there were suspicions that the queen herself was not wholly ignorant of the plot, and these suspicions could not but be strengthened by what followed. On April 12 Bothwell was brought to a mock-trial and acquitted; on the 24th he intercepted the queen on her way from Linlithgow to Edinburgh, and carried her, with scarcely a show of resistance, to Dunbar. On May 7 he was divorced from the young and comely wife whom he had married little more than a twelvemonth before; on the 25th Mary publicly pardoned his seizure of her person, and created him duke of Orkney; and on the 15th—only three months after her husband's murder—she married the man whom every one regarded as his murderer.

This fatal step at once arrayed her nobles in arms against her. She was able to lead an army against them, but it melted away without striking a blow on the field of Carberry (June 15), when nothing was left to her but to abandon Bothwell and surrender herself to the confederated lords. They led her to Edinburgh, where the insults of the rabble and grief at parting with Bothwell threw her into such a frenzy that she refused
and all knowledge, and rushing to the window of the room in which she was kept prisoner called for help, and showed herself to the people half-naked, with her hair hanging about her ears.

From Edinburgh, she was hurried to Loch Leven, where, July 24, she was prevailed upon to sign an act of abdication in favor of her son, who, five days afterwards, was crowned at Stirling. Escaping from her island prison May 2, 1568, she found herself in a few days at the head of an army of 6,000 men. On the 12th, it was met and defeated by the regent Murray at Langside, near Glasgow. Four days afterwards, in spite of the entreaties of her best friends, Mary crossed the Solway, and threw herself on the protection of Queen Elizabeth, only to find herself a prisoner for life. From Carlisle, her first place of captivity, she was taken, in July, to Bolton; from Bolton, she was carried, in February, 1569, to Tutbury; from Tutbury, she passed in succession to Wingfield, to Coventry, to Chatsworth, to Sheffield, to Buxton, and to Chertsey. She was removed, last of all, to Fotheringhay, in September, 1586, there to be tried on a charge of complicity in a plot against the life of Elizabeth. Sentence of death was pronounced against her Oct. 25; but it was not until Feb. 1, 1587, that Elizabeth took courage to sign the warrant of execution. It was carried into effect on the 8th, when Mary laid her head upon the block with the dignity of a queen and the constancy and resignation of a martyr. Five months afterwards, her body was buried with great pomp at Peterborough, whence, in 1612, it was removed to king Henry VII.'s chapel at Westminster, where it still lies in a sumptuous tomb erected by king James VI.

The character of Mary was long one of the most fiercely vexed questions of history, and is still in debate, although the great preponderance of authority seems now to be on the side of those who believe in her criminal love for Bothwell and her guilty knowledge of his conspiracy against her husband's life. Her beauty and accomplishments have never been disputed. "She was confessedly by every one"—says Mr. Joseph Robertson, one of the latest writers on her life—"she was confessed by every one to be the most charming princess of her time. Her large sharp features might perhaps have been thought handsome rather than beautiful, but for the winning vivacity and high joyous spirit which beamed through her face. It has been questioned whether her eyes were hazel or the gray, but there is no question as to their starlike brightness. Her complexion, although in youth clear and fair, would seem to have been more or less of the same color as her hair, rather than the blue that is so common among our island beauties. Her hair appears to have changed with her years from a ruddy yellow to auburn, and from auburn to dark brown or black, turning gray long before its time. Her bust was full and finely shaped, and she carried her large stately figure with majesty and grace. She showed to advantage on horseback, and still more in the dance. The charm of her soft, sweet voice is described as irresistible; and she sang well, accompanying herself on the harp, the virginals, and still oftener on the lute, which set off the beauty of her long, delicate, white hand. The consciousness how that hand was admired may have made it more diligent in knitting and in embroidery, in both of which she excelled. Her manner was sprightly, affable, kindly, frank perhaps to excess, if judged by the somewhat austere rule already beginning to prevail among her Scottish subjects. She spoke three or four languages, was well and variously informed, talked admiringly, and wrote both in prose and in verse, always with ease, and sometimes with grace or vigor. In the ring of which she was the center, were statesmen like Murray and Lesley, soldiers like Kyrkealdy of Grange, men of letters like Buchanan, Lesley, sir Richard Morland, and the publisher Robertson, of whom she, as one of her Henry VIII.'s favorites, could say with truth: "Adieu, pleasant pays de France," from the Louvre, to which she had been banished for the absence of her brilliant court; Damville, the flower of French chivalry, repined at the fate which called him away from it so soon; Brantôme and the younger Scaliger delighted to speak, in old age, of the days which they passed beneath its roof."}

Mary's prose writings have been collected by the enthusiastic devotion of prince Alexander Labanoff, in his Recueil des Lettres de Marie Stuart. Setting aside the twelve sonnets which she is said to have written to Bothwell, and which survive only in a French version of an English translation, no more than six pieces of her poetry, containing in all less than 300 lines, are now known. They have no remarkable merit. The best is the poem of eleven stanzas on the death of her first husband, Francis II., printed by Brantôme. The longest is a Meditation of a hundred lines, written in 1572, and published two years afterwards by her ever faithful follower, bishop Lesley of Ross. All are in French, except one sonnet, which is in Italian. The most peculiarly simple lines begin a novel. "Adieu, pleasant pays de France," so often ascribed to her, are the work of A. G. Meusnier de Querlon, a French journalist, who died in 1750. A volume of French verse on the Institution of a Prince, which she wrote for the use of her son, has been lost since 1627, along with a Latin speech in vindication of learned women, which, when no more than thirteen, she delivered in the hall of the Louvre, in presence of the French court.

To enumerate all that has been written on Mary would fill a volume. Among the chief works are S. Jebb's De Vita et Rebus Gestis Mariae Scotiae Reginae (Lond. 1725, 2 vols. fol.); J. Anderson's Collections Relating to the History of Mary, Queen of Scotland (Lond. 1737-28, 4 vols. 4to); bishop Keith's History of the Affairs of Church and State in Scotland (Edin. 1734, 4 vol.; 1844-1850, 3 vols. 8vo); W. Goodall's Examination of the Letters said to be written by Mary, Queen of Scots, to James, Earl of Bothwell (Edin. 1754, 2 vols. 8vo); Principal Robertson, History of Scotland; W. Tytler's Inquiry into the Eti-
dence against Mary, Queen of Scots (Edin. 1759, Svo; Lond. 1790, 2 vols. 8vo); M. Laing’s History of Scotland; G. Chalmers’s Life of Mary, Queen of Scots (1818, 2 vols.; 1822, 3 vols.); P. F. Tytler’s History of Scotland; Prince Labanoff’s Recueil des Lettres de Marie Stuart (1844); David Laing’s edition of John Knox’s History of the Reformation (1846-48); Miss Agnes Strickland’s Lives of the Queens of Scotland (Edin. 1850-59, 8 vols. 8vo); A. de Montaiglon’s Latin Themes of Mary Stuart (Lond. 1853, 8vo); Prince Labanoff’s Notice sur la Collection des Portraits de Marie Stuart (1856); M. Mignet’s Histoire de Marie Stuart (1852); M. Teulet’s Lettres de Marie Stuart (1856); M. Cheruel’s Marie Stuart et Catherine de Medicis (1855); Robertson’s Catalogue of the Jacob, Dresser, Furniture, Books, and Paintings of Mary, Queen of Scots (1858); Hœsack’s Mary, Queen of Scots, and her Accusers (1870-74); History of Mary Stuart, Queen of Scots, translated from the MSS. of Petib. by C. de Flandre (1874); Marie Stuart: son Procès et son Exécution, d’après le Journal inédit de Bourgoing, by Chantelauze (1876).

The best representations of Mary are the contemporary portraits by the French painter, Francis Clouet, more commonly called Jehannot or Janet, and the statue, by an unknown sculptor, on her tomb at Westminster. All portraits which cannot be reconciled with these types may safely be rejected as spurious.

MARYSVILLE, a city of California, U. S., on the north bank of the Yuba river, 100 m. n. n. e. of Benicia, and 50 m. n. of Sacramento, having steam-boat communication with San Francisco. It is a great resort of gold-miners, and has a variable population, given in the census of 1870 at 4788.

MARYSVILLE (ante), a city in n. California, incorporated 1851; at the confluence of the Yuba river and the navigable Feather river, opposite Yuba city with which it is connected by a bridge. It is at the junction of the Roseville to Redding division of the Central Pacific, and the Oroville to Marysville branch, and is the largest and most important city in the state n. of Sacramento; pop. ’70, 4,738. It is 116 m. from San Francisco, and 70 m. by water from Sacramento, and being at the head of navigation, surrounded by fertile agricultural and rich mining districts, is the center of an important trade. It does an extensive commission business, and is engaged largely in manufactures. It is built, mostly of brick, on a level plain, and is regularly laid out with wide streets. It is supplied with water, lighted with gas, has 4 banks, 8 churches, a convent, graded public schools and 8 private institutions of learning, a masonic hall, a public library, 5 hotels, and manufactories of carriages, woolen mills, steam flour mills, breweries, and iron foundries.

MARYVILLE, a t. in e. Tennessee, the present s. terminus of the Knoxville and Augusta railroad; pop. ’70, 811. It is the seat of Maryville college, a Presbyterian institution, organized 1819, chartered 1843; open to both sexes, with a distinctive course of 4 years for ladies, and in ’74, a library of 2,000 vols. The college buildings, 8 in number, costing $50,000, are pleasantly located on an estate of 65 acres. The Society of Friends have a school here called the Freedman’s college. In the town are 7 churches, 1 newspaper, flour and saw mills, a tannery, and a manufactury of woolen goods.

MASACCIO, 1401-48; b. San Giovanni Val d’Arno, Florence, in the early part of the 15th century. His real name was Tommaso Guidi, but on account of his incapacity for the duties of life he was nicknamed at an early age Tommasaccio, shortened to Masaccio, or Helpless Tom. He received his first lessons in art from Masolino da Panicale. He was employed under him in painting the frescos in the Brancacci chapel at Florence. He studied the sculptures of Ghiberti and Donatello, and learned perspective from Brunelleschi. About 1420 he visited Rome, where he executed several important works. In 1434, on the return of Cosmo de’ Medici from exile, he went back to Florence, and was engaged to complete the paintings of the Brancacci, left unfinished by the death of his master, Marsolino. When in Rome he painted in the church of St. Clemente a series of frescos from the life of St. Catharine. “By the easy posture of his figures, the simplicity and dignity of his draperies, and his natural and harmonious coloring,” he surpassed all his contemporaries, and introduced a new era in the annals of painting. He had great readiness of invention and unusual truth and elegance of design, and was remarkably well-skilled in perspective. The frescos in the church of the Carmine at Florence were his masterpieces, and were carefully studied by Raphael and other great painters of the 15th and 16th centuries. In his epitaph, written by Annibale Cavo, it is said that Michael Angelo, who, as the teacher of other painters, was the pupil of Masaccio. His portrait by himself is in the national gallery. He was envied by his competitors, and some think that he was poisoned.

MISANIELLO (properly, TOMMASO ANTELLO), a fisherman of Amalfi, was the leader of the revolt which took place in Naples in July, 1647, against the Spanish viceroy, the duke of Arcos. The people had been exasperated by oppression, and great excitement had been produced by a new tax laid upon fruit. Masaniello himself was indignant at the rude treatment which his wife had received when she was detected in the attempt to smuggle a little flour. He entered into a conspiracy with some others who cherished feelings similar to his own; and an opportunity being afforded them by a tumult at the customs’ houses on July 7, 1647, when the new tax on fruit was to be levied, they stirred up the multitude to a revolt. Their triumph was complete; palaces and public buildings.
were destroyed, a bloody popular justice was executed, and the viceroy was terrified into the greatest concessions, and entered into a regular treaty with Masaniello in the church of the Carmelites on July 13. But success and the flatteries of the viceroy turned the fisherman's head; he gave himself up to drunkenness and every excess, and his capricious despotism immediately became terrible to his own associates, who assassinated him on July 16. See Angelo Suavedra, duke of P'vas, Insurrection de Napoli en 1647. 2 vols., Madr. 1849.

MASAYA, one of the oldest towns of Nicaragua, Central America, close to a lake of the same name, 40 m. n.n.w. of Nicaragua city, and 8 m. from the n. shore of the lake o' Nicaragua, near the volcano of Masaya—a broad, low mountain, about 3,500 ft. high, with one large and several minor craters. The last great eruption of this mountain was in 1670, when the lava spread in a northern direction to a distance, of more than 20 miles. This great lava-field is said to resemble an ocean of ink slowly flowing, and to have made the air black. In 1849, the mountain showed signs of renewed activity. The town is the center of a very fertile district, and has a pop. of 16,000, chiefly Indians, who are said to be thriftv and industrious.

MASCARA, a very old t. of Algeria, in the province of Oran, and 50 m. s.e. of the town of that name, on the slope of the Atlas mountains. Mascara was built by the Turks upon the site of a Roman colony. During the first years of the French occupation, it was a favorite residence of Abd-el-Kader, but was taken by the French in 1835. Pop. about 9,000, of whom more than a half are natives.

MASCARENE, Jean Paul, 1684-1769; b. at Castres, France, of a Huguenot family; educated at Geneva, and naturalized in England in 1706. Entering the army as lieutenant, he accompanied the British troops to Nova Scotia in 1711, and remained there nearly 50 years. He was a member of the council in 1720, and acted with the governors of Massachusetts and New Hampshire in negotiating the treaty of 1725 with the eastern Indians; was acting governor of Nova Scotia from 1740 to 1749; took part in the defense of the province against the French in 1744, and became maj. gen. in 1758. Died in Boston.

MASCARENE ISLES, or MASCARENAS, the collective name given to islands of Bourbon (q.v.), and of Isle-de-France or Mauritius (q.v.). The island of Rodriguez, 360 m. further e., is sometimes reckoned as one of them.

MASCLE (from macula, the mesh of a net), in heraldry, a lozenge-shaped figure perforated and showing a narrow border. The term mascally is applied to a field divided by diagonal lines into lozenge-shaped compartments of alternate tinctures, each having its center voided of the opposite tincture. Lozenge-mascally is a field composed of lozenges and muscles alternately. In the earlier heraldry, mascally was used for what was afterwards called lozenge. Crosses and other ordinaries may be formed of mascles, in which case they should begin with half a masce.

MASCOUTINS, an Indian tribe of the Algonquin family, very well known in the 17th c., and appearing constantly in the history of the early French settlers. Their habitat was the country about the northern lakes, and they were found on the Wisconsin and Fox rivers about 1669, and later on in the vicinity of the Ohio, in what is now Indiana. They appear to have been on friendly terms with the Kickapoos, Foxes, and Miamis, but quarreled with the Ottawas. In 1765 they attacked a party under the English col. Croghan on the Wabash river, and in 1777 endeavored to perform an act of treachery affecting col. Clarke, an American officer operating in their country. As early as 1712 they had united with the Kickapoos and Foxes against the French. Indeed, this tribe appears to have antagonized the whites from the time of the first settlement, inciting other tribes to join them in their warfare. By the Hurons the Mascoutins were called, in their own language, Asistaeronon, the "fire-nation," but the name Mascoutin is said to mean prairie. Since the last century the Mascoutins have died out as a separate organization, and are not now known to the U. S. government as a tribe. It is, however, probable that they are still represented on some of the reservations.

MASÉNA, a t. of Negroland, Africa, capital of the country of Bagirini, in lat. 11° 35' n., long. 16° e., about 100 m. s.e. of lake Tchad. It covers an area 7 m. in circumference, and was formerly much larger. Its present reduced condition has been induced by disastrous civil and foreign wars. Only about half the area of the town is inhabited. The palace of the sultan, who is reported to have from 300 to 400 wives, consists of irregular clusters of clay buildings, and huts surrounded by a wall built of baked bricks. The town is walled, and has 9 gates. It has on the whole a dilapidated appearance.—Barth's Travels in Central Africa.

MASÉRES, or MAZÉRES, Francis, an English mathematician, commonly called baron Masères; 1731-1834, b. London. His father was a physician, driven from France by the revocation of the edict of Nantes. The son was educated at Clare Hall, Cambridge, taking the highest rank in the classics and mathematics. Having obtained a fellowship in the college, he removed to the Temple; was in due time admitted to the bar; was appointed attorney-general for Canada, and resided in Quebec till 1778. Returning to England he was appointed to the office of curator of the exchequer, which office he held till his death. He was also at different times deputy recorder of
LONDON and senior judge of the sheriff's court. He published Elements of Plane Trigonometry; Principles of the Doctrine of Life Annuities; and Logarithmæ, a collection, in 6 vols. quarto, of writings on the subject of logarithms, the works of Kepler, Napier, Snell, etc., being interspersed with original tracts on kindred subjects; and Optica, a reprint of the optical writings of James Gregory Descartes, Shoote, Huygens, Halley, and Barrow. He reprinted also a large number of tracts on English history. The expense of Hales's translation on Fluxions was defrayed by him.

MASHAM, AnGAIL, Lady, 1670-1734; b. London: daughter of a merchant named Francis Hill and Miss Jennings, an aunt of the duchess of Marlborough. Her father lost his fortune by speculation, and Anigail became waiting-woman to Lady Rivers. Soon after the influence of the duchess of Marlborough, she was appointed a lady of the bedchamber to princess Anne. She became the confidant of the princess, and, after the latter became queen, did all she could to destroy the Marlborough influence at court. In 1707, Anigail was married, by consent of the queen, to Samuel Masham, a gentleman of the bedchamber to prince George of Denmark. This marriage brought about an open rupture with the Marlboroughs. The intrigues of Mrs. Masham finally resulted in the overthrow of the whigs, the elevation of Harley to power, and the dismissal of the duke of Marlborough. The high-church principles of Mrs. Masham recommended her from the first to Anne, who had been compelled to accept a whig government, but whose political sympathies lay with the Tories. Mrs. Masham was engaged in plots to bring back the Stuarts; and she seems always to have used her position for her pecuniary advantage. Her husband was raised to the peerage in 1711. Lady Masham retired to Bolingbroke in the quarrel between him and Oxford. After the death of queen Anne in 1714 she lived in retirement.

MASHENA, a t. of Bornu, central Africa, in lat. 13° 3' n., long. 10° 5' e., about 240 m. from Lake Chad. It lies on the gentle southern slope of an eminence, the top of which is crowned with a rocky crest, and is surrounded with a clay wall. According to Barth, it is a considerable place for this country, having a pop. of certainly not less than 10,000, but without the least sign of industry.

MASINISSA, or Massinissa, King of the Massylans; b. c. 239-148; a famous African prince, son of Gala. He was educated at Carthage, and in 213 B.C. induced his father to form a league with the Carthaginians. In the same year he sailed for Spain at the head of a troop of Numidian cavalry, and displayed great zeal and valor in the war against the Romans. But the defeat of the Carthaginians at Slipia in 206 B.C., and the generosity with which his nephew, Massiva, was treated by Scipio Africanus, led him to become a faithful ally of the Romans. The crown of his country, which, after the death of his father Gala, had passed in rapid succession to his uncle Escales, and his cousin Capusa, was seized at this time in the name of an infant brother of the latter by Mezetulus. On hearing of this usurpation, Masinissa crossed to Africa, defeated Mezetulus in a pitched battle, and forced him to flee into the kingdom of Syphax. The Carthaginians, however, irritated at his open avowal for the Romans, incited Syphax to make war upon him. Defeated and stripped of his sovereignty, he was compelled to seek refuge near the Syrtis minor, where he bravely defended himself until the arrival of Scipio in 204 B.C. He identified his cause with that of the Romans, and his knowledge of the habits of the enemy contributed greatly to the two victories gained over Hasdrubal and Syphax. He then, after a march of 15 days, captured Carta, the capital of Syphax. In the decisive battle of Zama which followed the arrival of Hannibal in Africa (202 B.C.), he made a brilliant charge at the head of his Numidian horse, drove the cavalry of Hannibal from the field, and was, therefore, the first to turn the tide of battle against the Carthaginians. For this service he received the greater part of the kingdom of Syphax in the following year. He now profited by the leisure which peace afforded him, devoting his attention to the organization of his government and to the civilization of his semi-barbarous subjects. But his lust of conquest was never satiated, and in his ninetieth year he marched into the territories of Carthage. Although several of his chiefs had deserted him, he adroitly circumvented the enemy, and forced them to capitulate.

MASK (Med. Latin, masque; Fr. masque), a disguise or covering of the face, the use of which, perhaps, originated in the harvest festivals of the Grecian peasantry of the most ancient times, and appears subsequently to have been associated with the representation of Satyrs, Silenus, and Bacchus in the orgies of Bacchus. Greek tragedy having originated in close connection with the worship of Bacchus, masks were employed in it from the first; but it is uncertain when they were introduced in comedy. The masks used by actors were of very various form and character. They were often provided with metallic mouthpieces, for the purpose of increasing the power of the voice; this being rendered requisite by the immense size of the ancient theaters; their whole use being indeed adapted to such vast buildings, and to a style of dramatic representation in which the ideal prevailed, and the reality of individual impersonation was far less thought of than in modern times. Much information on the subject of ancient masks may be found in the work of Pacichelli, De Muscheris, Capillamentis et Chirothecis (Naples, 1693); in the magnificent work of Pietro Contucci Ficoroni, De Larvis Societibus et Figuris Comiciis (Rome, 1754), and in Berger's De Personis vulgo Larvis seu Mascharis (Frankf. 1728).
The use of masks in the modern theater originated in the Italian commedia dell' arte, which may itself be traced back to the ancient Roman mimes and pantomimes, and has always been confined to that class of entertainments in which the very names of the characters, Pantaloon, Harlequin, etc., have been borrowed from Italy.

MASK, Masked, a military expression used in several senses. A masked battery is one so constructed, with a grassy glacis, etc., as to be hidden from the view of the enemy, until, to his surprise, it suddenly opens fire upon him—on his flank, perhaps. The fire of a battery is masked when some other work, or a body of friendly troops, intervenes in the line of fire, and precludes the use of the guns. A fortress or an army is masked when a superior force of the enemy holds it in check, while some hostile evolution is being carried out.

M ask, The Man with the Iron. See Iron Mask, ante.

MASKELYNE, Nevil, an English astronomer and physicist, was b. in London, Oct. 6, 1732. He was educated at Westminster school, whence he was removed to Catherine hall, and subsequently to Trinity college, Cambridge, where he obtained a fellowship in 1756. In 1758 he was elected a fellow of the royal society, and resolved to devote himself to astronomy. In 1768 he made a voyage to Barbadoes, to test the newly invented Harrison chronometers, and, after his return, was (1765) appointed astronomer-royal. During the 46 years that he held this situation, he acquired universal respect by his diligence and the accuracy of his investigations, made several improvements in the arrangements and employment of the instruments, and was the first to mark the time to tenths of a second. In 1744-46 he made his expedition to Schehallion, for the purpose of determining the density of the earth. See Earth. Maskelyne was the means of originating the Nautical Almanac (q.v.), and also obtained leave to have his observations printed at the expense of the government. He published very few works out of his official capacity, but of the others, no fewer than 53 appeared, many of which have been found of immense service (especially his Astronomical Observations) to subsequent astronomers. Maskelyne died Feb. 9, 1811.

MASKINONGE, a s.w. co. of Quebec, Dominion of Canada, having lake St. Peter on the s.e.; 3,221 sq.m.; pop. '71, 15,979. It is watered by the Gatineau, Du Lièvre, Maskinongé, and Du Loup rivers. The population is nearly all of French extraction or origin. Capital, Rivière du Loup.

MASKS, in architecture, are carved as decorations on keystones and other prominent positions.

MASON, a co. of central Illinois, having the Illinois river on the n. and the Sangamon on the s.; 550 sq.m.; pop. '80, 16,244. It presents a surface of low prairie land, very fertile. Intersected by division of the Chicago and Alton, the Springfield and North-western, and the Peoria, Pekin and Jacksonville railroads. It produces very largely of Indian corn, wheat, oats, butter, hay, and potatoes. Co. seat, Havana.

MASON, a co. in n.e. Kentucky, having the Ohio river on the n.; drained by the n. fork of the Licking river, and Limestone and Lee's creeks; 236 sq.m.; pop. '80, 20,469. The surface toward the n. is billy, elsewhere more level, the soil being generally fertile. Productions are wheat, oats, rye, barley, Indian corn, tobacco, wool, butter, and hay. There are some thriving manufacturing industries prosecuted, including agricultural implements, woolen and cotton goods, carriages, and wagons. Co. seat, Maysville.

MASON, a co. in w. Michigan, on lake Michigan; 460 sq.m.; pop. '70, 3,263; watered by the Great and Little Sable, the Marquette, and the Nolipeskago rivers. It is characterized by a generally level surface, and very fertile soil. Productions are Indian corn, wheat, oats, potatoes, and hay. Co. seat, Pere Marquette.

MASON, a co. in w. central Texas, drained by branches of the Colorado, the Llano, and the San Saba; 910 sq.m.; pop. '80, 2,655. The surface is mostly fertile land, but a considerable portion of it is heavily wooded. Stock raising is the principal industry. Productions are Indian corn, hay, sweet potatoes, wool, and butter. Co. seat, Mason.

MASON, a co. in w. part of Washington territory, bounded on the e. by Puget sound; 1600 sq.m.; pop. '80, 639. It is crossed by the Olympic and Coast mountains, which are separated by broad valleys of very fertile land. The principal industry is lumbering, the farm products—oats, hay, and potatoes,—being unimportant. The sound makes up into the land at many points, forming inlets which are excellent harbors. Co. seat, Oakland.

MASON, a co. in the w. part of West Virginia, having the Ohio river on the n. and w.; and intersected by the Great Kanawha river and its affluents; 300 sq.m.; pop. '80, 22,293. The surface varies in character, the soil being generally fertile. There are iron ore, coal, and salt springs. The productions are Indian corn, wheat, oats, potatoes, tobacco, wool, and hay. Co. seat, Point Pleasant.

MASON, ARMISTEAD THOMSON, 1787-1819; b. Va.; son of Stevens. He graduated at William and Mary college, and became a farmer. He served through the war of 1812 as col. of a cavalry regiment, distinguishing himself at the defense of Norfolk; and he was afterward made a brig. gen. in the Virginia militia. He was elected to the Virginia house of representatives and to the U. S. senate, from which he resigned in 1812.
to become a candidate for the lower house of congress, hoping by means of his unbounded personal popularity to defeat the federalist candidate, Mercer. The election was bitterly contested; but Mercer was returned by a narrow majority. The campaign gave rise to a number of heated controversies and several duels; and Mason himself was killed in a duel by his own cousin, Col. John Mason McCarty.

MASON, Charles, 1730-87; b. England, and long employed as an assistant at the Greenwich observatory; was sent with Jeremiah Dixon to the cape of Good Hope in 1761 to observe the transit of Venus. In 1763 the same gentlemen were employed by the proprietors of Maryland and Pennsylvania to survey the boundary line between their respective possessions; a task upon which they were engaged until Dec. 26, 1767. The boundary fixed by them has since been known as "Mason and Dixon's line" (q.v.). They also, at the request of the Royal society, fixed "the precise measure of a degree of latitude in America," for which service the society granted them £200. The particular of this work are recorded in vol. viii. of the society's Transactions. In the same volume may be found Astronomical Observations made at the Forks of the Brandywine for the purpose of determining the going of a clock sent thither by the Royal society in order to find the difference of gravity between the observatory at Greenwich and the spot where the clock was set up in Pennsylvania." Mr. Mason recorded in his private journal a minute account of his proceedings in America, his haps and mishaps, as well as of his scientific observations on a great variety of subjects, with interesting notices of the Indians of various tribes whom he met on his route or who rendered assistance to him and his companions. He describes with enthusiasm the beauty and grandeur of American scenery, and gives a tolerably accurate account of the valley of the Mississippi, as received by him from an aged Indian chief. Mason and Dixon returned to England in the autumn of 1768. In the following year Mason went to Cavan, Ireland, to observe the transit of Venus, his report of which appeared in the Philosophical Transactions for 1770. He was also employed by the bureau of longitudes to verify the lunar tables of Tobias Mayer, in which he made some corrections. At an unknown date he returned to America, and died in Philadelphia in 1787. His private journal, field notes, etc., were found among a pile of waste paper in the cellar of the government-house at Halifax, Nova Scotia, in 1860, and an account of their contents was published by Porter C. Bliss in the Historical Magazine for July, 1861.

MASON, Ebenezer Porter, 1819-40; b. Washington, Conn.; graduated at Yale in 1839. He was distinguished for his early proficiency in mathematical and astronomical studies, and shortly after his graduation was appointed a member of the commission for defining the boundary between Maine and Canada. Not long after this he published Observations on Nebula, a paper which was highly commended by Sir John Herschel. D. at Richmond, Va., a few days after attaining the age of 21 years. His Life and Writings were published by prof. Denison Olmsted.

MASON, Erskine, D.D., 1805-51; the youngest child of Dr. John Mitchell Mason; b. New York; graduated at Dickinson college, Carlisle, Penn., of which his father was then president; studied theology at Princeton seminary; was pastor of the Presbyterian church at Schenectady, N.Y., 1827-30; and of the Bleecker street church, New York city, 1830-51. He was stated clerk of the general assembly of the Presbyterian church, N.S., 1838-43; and acting professor of church history in the Union theological seminary, New York city. He ranked very high as an argumentative preacher, and drew many eminent men, both citizens and strangers, to listen to his eloquent appeals. A selection from his sermons, with a short memorial notice by his friend Dr. William Adams, was published soon after his death in a volume entitled A Pastor's Legacy.

MASON, Francis, D.D., 1799-1874; b. York, Eng.; left the parish school to work at the trade of his father who was a shoemaker. While thus employed he happened to find a work on geography and astronomy, which led him to attend an evening-school where he learned algebra, geometry, and trigonometry. In 1818 he came to the United States and worked at his trade at various places at the West. In 1824 he went to Boston, and worked at Randolph and Canton, Mass. At Canton he married, joined the Baptist church, and studied languages with his pastor. In 1827 he studied at Newton theological seminary, and in 1830 was sent as a missionary to Burmah. His labors were chiefly among the Karens, among whom he had great success. In two dialects of their language he translated the Bible and other religious books, and conducted a seminary for the training of preachers and teachers. He published in 1852 a work on the natural productions of Burmah, pronounced by Dr. Hooker "the most valuable addition to the history of the fauna and flora of British Burmah." A second edition was published under the title of Burmah: its People and Natural Productions. He published also a grammar, chrestomathy, and vocabulary of the Pali, besides translations from the Burman, Pali, and Sanskrit: Life of Ko-Thal-Byu, the Karen Apostle; A Memoir of Mrs. Helen M. Mason; a Memoir of San Qualls, a Karen Conft; The Story of a Working-man's Life, with Sketches of Travel.

MASON, George, a member of the English parliament in the reign of Charles I. He opposed the arbitrary policy of the king towards the colonies, but disapproved of extreme measures against him. He was an officer in the army of Charles II., and when
defeated at Worcester in 1651, he escaped in disguise to Virginia, losing all his possessions in England.

MASON, GEORGE, 1726-92; b. at Doeg's Neck, Fairfax co., Va.; a descendant of col. George Mason who was a member of the English parliament in the reign of Charles I.; settled in Truro parish; built Gunston hall on the Potomac, and became the intimate friend of Washington, for whom he drafted the "non-importation resolutions," which were offered by Washington, and adopted by the Virginia assembly in 1769. One of these was that the Virginia planters should purchase no slaves imported after Nov. 1. of that year. At a meeting of the people of Fairfax, July 18, 1774, he offered 24 resolutions on questions at issue between Great Britian and the colonies, which were sanctioned by the Virginia convention in August, and reaffirmed by the continental congress in October. At that time he was a member of the Virginia convention. In May, 1776, he drafted the declaration of rights and the plan of government, which were adopted by a unanimous vote. He was a member of the continental convention in 1777, and of the constitutional convention in 1787, taking decided ground against all measures tending to perpetuate slavery. He disapproved of the proposed instrument and refused to sign it, declaring that it would "result in a monarchy or a tyrannical aristocracy." He was a member of the convention called to consider the federal constitution, and with Patrick Henry, opposed it, insisting on 29 alterations. Some of these were afterwards adopted by congress and the states. He was elected the first United States senator from Virginia, but declined. His statue stands with those of Washington, Jefferson, Henry, and other distinguished Virginians in front of the state capitol at Richmond.

MASON, JAMES MURRAY, 1768-1871, b. Va.; a grandson of George. He began the practice of law at Winchester, in 1820; and six years later took his seat in the Virginia legislature, to which he was twice re-elected. In 1837 he was elected to congress, but at the end of his term, he refused a re-nomination, and resumed the practice of his profession. In 1847 he was appointed to fill a vacancy in the U. S. senate, to which he was elected in 1849, and again in 1855. He occupied a conspicuous position in the senate, where he was for a number of years, chairman of the committee on foreign affairs. Among the important measures with which he was connected, may be mentioned the fugitive slave law of 1850, which was drawn up by him. He was an ardent secessionist, and was expelled from the senate in 1861. He was soon appointed a commissioner for the confederate states to England and France, and on Nov. 8, 1861, with his fellow commissioner John Slidell, was taken off the British mail steamer, Trent, by captain Charles Wilkes. He was imprisoned in fort Warren, Boston, till Jan. 2, 1862, when he was surrendered to the English government. During the remainder of the war, he lived for the most part in Paris, still representing the confederate government. At the close of the war, he came to Canada, and after spending three years there, went to Virginia.

MASON, JEREMIAH, LL.D., 1768-1848, b. Conn., son of Jeremiah Mason, a col. in the revolutionary war. He graduated at Yale, in 1788, and was called to the bar in 1791. He began the practice of his profession at Westmoreland, N. H., near Walpole, whither he removed in 1794. Three years later, he removed to Portsmouth, which was his home for the next 35 years. He was soon recognized as the head of his profession, in a state whose bar was then, and perhaps since, unequaled in this country, and which could number among its members Ezekiel and Daniel Webster, and Jeremiah Smith. He held the office of attorney general for the state in 1802, and was elected to the U. S. senate, in 1813. He became one of the foremost debaters in that body, his speech delivered in 1814, on the embargo, being especially powerful. But he was, before everything else, a great lawyer, and he soon tired of politics, and in 1817, resigned his seat in the senate, and resumed the practice of his profession. He afterwards served, for a number of terms in the New Hampshire legislature, where his service had little connection with politics, but was given largely to revising and codifying the state laws. It was he who framed for the legislature its report on the Virginia resolutions with regard to the repeal of the Missouri compromise, and the state enjoyed in many other directions the benefit of his legal learning and sagacity. But he felt the need of a larger field for the display of his talents. and in 1832, removed to Boston, where the Websters had long preceded him. He was employed in Boston upon many great cases, and maintained till his age compelled him to retire, the high reputation which he had won elsewhere. His was one of the most acute legal minds in America. He was a greater lawyer than Webster, however inferior to him in other respects; and Webster, who had abundant occasion to conceive a respect for Mason's abilities, while they were both engaged in the trial of causes at the New Hampshire bar, does not exaggerate in giving his estimate of Mason: "Of my own professional discipline and attainments whatever they may be, I owe much to that close attention to the discharge of my duties, which I was compelled to pay for 9 successive years, from day to day, by Mr. Mason's efforts and arguments at the same bar." "The characteristics of his mind," he adds, "as I think, were real greatness, strength, and sagacity. He was great through sound sense and sound judgment."

MASON, JOHN, d. 1635; b. at Lynn Regis, Norfolk, England, and served in 1610 in the navy; in 1616 went to Newfoundland as governor of the colony, and in 1620 pub-
lished a description of the country, to which he added a map in 1626. He explored the New England coasts in 1617; in 1622 obtained a grant of a region called Mariana, now the n.e. part of Massachusetts; in the same year, in connection with Sir Ferdinand Gorges, procured a patent for the province of Maine; and in 1623 sent a colony to the Piscataqua river. In 1624-29 he was treasurer and paymaster of the English armies in the Spanish war. In 1629 he obtained a patent for the New Hampshire colony, and with Gorges took one also for Laconia, a region including Lake Champlain. He held various honorable positions in England, in 1635 being a Judge in Hampshire and vice-admiral of New England. His rights in New Hampshire were sold in 1691 to Governor Samuel Allen. Died in London in Dec., 1635.

MASON, JOHN, 1600-72, b. England; served under Sir Thomas Fairfax in the Netherlands; emigrated in 1630 to Dorchester, Mass.; removed in 1635 to Connecticut, and aided in founding Windsor. A party of whites having been massacred by the Pequot Indians at Wethersfield in 1637, he was appointed by the general court to attack the Pequots at the mouth of the Pequot river. With a force of 90 English and 70 friendly Mohegans under Uncas, he landed, May 23, in Narragansett bay, near point Judith. Aided by 200 Narragansets under Miantonomah he marched to the two principal forts of the Pequots near the Mystic river. Though nearly deserted by his frightened allies, he attacked the nearest fort, May 26, 1637, but, unable to dislodge the Indians, he set fire to their wigwams, the whites and their allies surrounding the forts to prevent escape. Between 600 and 700 Pequots perished, seven were captured, and seven escaped; two of the English were killed and twenty wounded. He then pursued the remnant of the Pequots toward New York, killed and captured many, distributing those that remained among the Mohegans and Narragansets. The peace now secured with the Indians continued for 40 years. Mason removed to Saybrook, at the request of the inhabitants, for the defense of the colony, and in 1639 removed to Norwich. He was a maj. of the colonial forces for 30 years, deputy-governor of Connecticut 1660-70, and a magistrate 1642-68. He prepared, at the request of the general court of Connecticut, an account of the Pequot war, which was reprinted by Increase Mather in 1677.

MASON, JOHN MITCHELL, D.D., 1770-1829; b. New York; graduated at Columbia college, 1789, and continued his studies at the university of Edinburgh; after his father's death in 1792 succeeded him as pastor of the Associate Reformed church (Presbyterian); in 1804 became professor of theology in a seminary of which he was one of the founders. In 1811 the trustees of Columbia college, in order to enjoy the benefit of his eminent talents, created for him the office of provost, which he filled until 1816, taking charge of the senior class, and giving new life to the lecture-room; from 1821 to 1824 he was president of Dickinson college at Carlisle, Penn., and during that time connected himself with the Presbyterian church. As a pulpit orator he had great power and fervor; his eloquence is one of the traditions of the city of New York. When Robert Hall heard him deliver his celebrated discourse on "Messiah's Throne," he is said to have exclaimed, "I can never preach again." His aspect was on a scale of grandeur corresponding to the majesty of the mind within. Tall, robust, straight, with a head modeled after Greek and Roman standards, yet combining the dignity of one and the grace of the other; with an eye that shot fire, especially when under the excitement of earnest preaching, yet tender and tearful when the pathetic chord was touched; with a forehead broad and high, and a mouth expressive of decision, Dr. Mason stood before his audience a prince of pulpit orators.

MASON, JOHN Y., LL.D., 1799-1859; b. Va.; educated at the university of North Carolina, and admitted to the bar. After serving for a number of terms in the Virginia assembly, he entered congress in 1831, and remained till 1887, when he was appointed judge of the U. S. district court for Virginia. He continued to hold that office till 1844, when President Tyler made him secretary of the navy. He entered the cabinet of President Polk as attorney-general, but was transferred in 1846 to the department of state. In 1854 President Pierce made him minister to France, where he remained till his death.

MASON, Lowell, 1792-1872; b. Mass.; commenced his musical career in Savannah, where he was appointed choir leader in 1812. In 1821 he published a volume entitled Handel and Haydn Collection of Church Music, which attracted considerable attention. He removed to Boston in 1827, and devoted himself to the instruction of classes in vocal music; introducing musical instruction into the public schools of Massachusetts; and securing the establishment of the Boston academy of music. He made numerous compilations of glee-books, text-books, collections for family and Sunday use, etc. In 1837 Dr. Mason visited Europe, to make himself thoroughly familiar with the continental methods of musical instruction. In 1855 he was made doctor of music by the university of New York, the first degree of that character conferred in America. His chief claim to distinction rests on his efforts to make vocal music popular among the masses and on his hymn tunes, several of which are in constant use by all denominations in the United States, and have in some instances been given by the severer musical criticism of the present day a rank scarcely less high than that accorded them by continuous popular favor.

MASON, Richard B., d. 1850; b. Va.; a grandson of George. He entered the army as a lieutenant in 1817, was promoted to a captaincy in 1819, and served through the Black
Hawk war in the dragoons. He was made a col. in 1846 and was at the head of the American troops in California, of which he was for a time military and acting civil governor. In recognition of his services in the Mexican war, he was brevetted brig. gen., May 30, 1848.

MASON, STEVENS THOMSON, 1769-1803; b. Va.; a son of Thomson. He was educated at Williams and Mary college, but entered the American army, in which, while hardly 20 years of age, he held the rank of col.; and he was a gen. at its close. He served for a number of years in the Virginia house of delegates, and was a conspicuous member of the constitutional convention of 1788. From 1794 till his death, he was a member of the U. S. senate.

MASON, STEVENS THOMSON, 1811-43; b. Va.; grandson of Stevens Thomson. He received his education in Kentucky, where his father, gen. John T. Mason, had settled. In 1831 he was appointed secretary of the territory of Michigan, which had just been organized; and when its governor, Lewis Cass, entered Jackson's cabinet as secretary of war, Mason became acting governor of the territory. He continued to serve in this capacity during the dispute in regard to the proper boundary between Ohio and Michigan; and the final peaceful settlement of the controversy was, in no small degree, rendered possible by his tact and moderation. As soon as Michigan was erected into a state in 1835, Mason was unanimously chosen governor; and he was honored with a re-election, retiring in 1839. The last three years of his life were spent in New York, where he had begun to practice law.

MASON, THOMSON, 1730-85; b. Va.; a brother of George. He read law in the temple, London, after which he returned to Virginia, and made his home in Loudon county. He took a conspicuous part in the revolutionary movement in Virginia, and in 1774 published a series of papers, advocating resistance to the claims of England. In 1778 he was appointed to a seat upon the state supreme court, then just established, and soon after he served upon the commission to codify and revise the state laws. In 1779 and again in 1783, he was chosen a member of the state legislature.

MASON, WILLIAM, an English divine and poet; 1725-97; educated at Cambridge, and admitted fellow of Pembroke college in 1747; became rector of Aston in Yorkshire, and chaplain to the king; subsequently was for 22 years precentor and canon residentiary of the cathedral of York. He published a monody to the memory of Pope; Jula, an elegy; the dramatic poems of Caractacus. In 1756 he published a small collection of odes as an imitation of Gray. In 1763 he produced some fine elegies. He is considered in point of morality as the purest of poets, and one of the warmest friends of civil liberty. In 1772 was published the first book of a descriptive poem entitled The English Garden; and the remainder in 1781. In 1775 he published the poems of Gray, with a memoir of his life and writings prefixed; in 1783 an elegant translation of Dufresnoy's Latin poem on the art of printing, and An Historical and Critical Essay on English Church Music. In addition to his poetical reputation, he was skilled in painting and music. A tablet to his memory is placed in the poets' corner in Westminster Abbey. A complete edition of his poems was published in York in 1771.

MASON, WILLIAM, b. Mass., 1829, son of Dr. Lowell Mason. He studied music in Europe with Hauptmann, Moscheles, and Liszt, and returned to America in 1854, after having appeared as a piano performer at Prague, Frankfort, Weimar, and London. His first concert in this country was given at Boston, which was followed by several very successful concert tours. He then settled in New York, devoting himself to teaching and composing. From 1855 to 1868 he played the piano in connection with the well-known string quartet composed of Theodore Thomas, Joseph Mosenthal, George Matsuila, and Carl Bergmann. In 1872 he received from Yale college the degree of doctor of music. He has held several prominent positions as organist, and many of his compositions have been republished in Europe.

MASON AND DIXON'S LINE, a line running along the parallel of lat. 39° 43' 26.8", and separating Pennsylvania from Maryland, drawn by two distinguished English astronomers and mathematicians, Charles Mason and Jeremiah Dixon. For about 80 years after 1681, there were constant dissensions between the lords Baltimore and the Penn family, the rival proprietors in Pennsylvania and Maryland, in regard to the position of the boundary-line between their colonial possessions. An agreement was come to in 1760, in accordance with which a party of surveyors commenced to make out the real boundary. The proprietors in London, not understanding the length of time required for such an undertaking, and growing impatient, sent out Mason and Dixon to complete the surveys, who commenced the work in Dec., 1763. They concluded their task towards the end of 1767, having marked out a line of 244 m. in length, passing through forests, over mountain ridges, etc. At the end of every fifth mile a stone was planted, on which was engraved on one side the arms of lord Baltimore, on the other those of the Penns. The intermediate miles were marked by smaller stones with an M on one side and a P on the other. All the stones came from England. The surveys were revised in 1849, and found substantially correct.

This line must be distinguished from that of 36° 30', which separated the free and slave states of the original confederation. The latter is also the compromise line, which
in 1890 was fixed as the most northern limit of such slave states as should be admitted into the union.

MASON AND DIXON'S LINE (ante) originated in the difficulties which occurred in tracing the boundary line of a tract of land granted to William Penn in 1681. This land lay w. of the Delaware and n. of Maryland, and a part of its southern boundary was defined to be "a circle drawn at 12 m. distant from Newcastle northwards and westwards into the beginning of the 40° of northern latitude." Later, Penn received another grant, and, his agent being unable to agree with the authorities in America as to the just boundary, he came to this country himself in 1682 to establish his claim and take possession of his land. He was opposed by lord Baltimore, the matter was referred to the committee of trade and plantations, a change in the reigning monarch of England took place, and it was not until 1760 that the final deed was issued to the heirs of Penn, closing the controversy. But even then the question of surveying the disputed territory, with a view of defining the boundary-line opened new disagreement; and it was to arrange this that Charles Mason and James Dixon, "mathematicians and surveyors," were mutually agreed upon by the contestants, Thomas and Richard Penn, on the one part, and lord Baltimore, the great-grandson of Cecilius, the first patentee, on the other, "to mark, run out, settle, fix, and determine all such parts of the circle, marks, lines, and boundaries as were mentioned in the several articles or commissions, and were not completed." The two surveyors commenced their work in 1764, and did not finish it until 1767; the delay being partly owing to Indian troubles, involving negotiations with the Six Nations in their settlement. The line, as finally drawn, has been popularly supposed to have been the dividing line between the free and the slave states; but this is an error, as slavery existed throughout Delaware, which is both e. and n. of the line, until abolished by the 14th amendment to the constitution. To this line is owing the peculiar tract of land known as the "pan-handle," where a part of Virginia runs up between Pennsylvania and the Ohio river.—Very little is known of the two "surveyors of London," as they were styled. Mason was an assistant of Dr. Bradley at the royal observatory at Greenwich; both were members of the American philosophical society; both were sent by the royal society to the cape of Good Hope to observe the transit of Venus in 1769. Dixon died in Durham, England, in 1777; and Mason died in Pennsylvania in 1787.

MASON BEE, a name given to those species of bee which build their nests of agglutinated earth or grains of sand. See BEE. Megachile muraria is a British species, black, the wings tinted with violet. The nest is attached to walls or stones in sunny places. The interior contains about a dozen cells, in each of which is deposited an egg, with a piece of paste for the food of the larva. These bees sometimes repair old nests, and have fierce combats for the possession of them.

MASONED, in heraldry, a term used to describe the lines formed by the junction of the stones in building.

MASONRY, the art of construction in stone. The earliest existing examples are among the most magnificent specimens of the art. No nation has excelled the ancient Egyptians in stonework, whether we consider the size of the materials, or the unequalled exactness with which they are fitted together. The Egyptians did not use mortar in their important structures, such as the pyramids, the joints being all carefully polished and fitted. Cyclopean masonry, of which remains exist in many parts of Greece and Italy, also exhibits stones of great size and with carefully-adjusted joints. The walls of Mycenae are among the earliest examples. These are built with huge irregular blocks, the spaces between being filled up with smaller stones. The Etruscan specimens are more carefully executed; the stones are not squared, but they are all carefully fitted together. In some cases, the beds or horizontal joints are made level, and the upright joints left unsquared. No mortar is used in cyclopean masonry.

The masonry of the Greeks and Romans was very closely resembled that of the present day: Rubble-work (opus incertum), in which the stones are not regularly coursed; coursed-work, where the joints are all level, and the stones of equal height; ashlar, resembling the latter, but built with larger stones all carefully dressed on the joints. Many of the Roman buildings in the eastern empire were constructed with blocks of enormous size, as at Baalbec, where some of the stones are 60 ft. in length. Ashlar-work is frequently used for the exterior surface of walls, the inside being "backed up" with rubble-work. This kind of work is sufficient for ordinary purposes; but where great strength is required, the whole thickness must be built with solid blocks. Ashlar-work is generally bedded in fine mortar, with one inch of oil-putty on the outer edge. The early medieval masonry was of very bad construction, being, in fact, little better than common rubble, with an occasional use of herring-bone work. The Normans improved upon this kind of work, but their masonry was also so bad that most of the towers built by them either fell or had to be taken down. The fall of the tower of Chichester cathedral, a few years ago, was occasioned by defective Norman masonry. The art gradually improved with the advance of Gothic architecture, and ashlar was reintroduced for all important works. The ashlar-work so constantly used in Renaissance buildings, has lately given place to a more picturesque style of masonry called hammer-dressed and squared work—the money saved upon this cheaper work being

U. K. IX.—96
applied with good effect in improving the appearance of the doors, windows, and other prominent features of the buildings.

There is one very simple rule, too little attended to in modern masonry—viz., that all stones, at least when stratified, should be laid on their natural bed, for if set on edge, they are sure to scale off and decay under the influence of the weather.

Special materials sometimes produce special kinds of work; thus, in Norfolk and Suffolk, where large flints abound, the walls are often faced with these, split so as to form a clean face and good joints, and arranged in bands or panels between stonework or brickwork.

In Aberdeenshire, where granite is the usual building material, ashlars or ashlar work is almost universal, large blocks being more easily obtained and dressed than smaller ones. Again, where rag-stone only can be got, it is frequently neatly used in a similar manner to the flint above described.

**Masons, Free.** The mason brotherhoods of the middle ages were organized corporations, not substantially different in their nature from the other guilds, governed by rules of their own, and recruited from a body of apprentices who had undergone a period of probation and trials. The imagination have traced the origin of free-masonry to the old Roman empire, the Pharaohs, the temples of Baal, or even the times of the ark of Babel. The Masonic craft in reality sprang into being about the same time, and from the same set of causes, as other incorporated crafts; but a variety of circumstances combined to give it an importance and influence beyond the rest. Men skilled in the hewing and setting of stones were naturally prized in an eminent church-building age. Their vocation necessarily involved traveling from place to place in search of employment. Wherever a great church or cathedral was built, the local masons had to be reinforced by a large accession of craftsmen from other parts; and the masons from neighboring towns and districts flocked to the spot, and took part in the work, living in a camp of huts reared beside the building on which they were engaged. A master presided over the whole, and every tenth man was a warden having surveillance of the rest. A mason, therefore, after going through his apprenticeship and probations, could not settle down, like another craftsman, among his neighbors and acquaintances, but must travel from place to place to find employment; hence it became desirable or necessary to devise means by which a member of the fraternity might be universally accepted as such, without requiring, wherever he went, to give fresh evidence of his skill, or having to undergo a renewed examination on his qualifications. In order to accomplish this, and to enable a mason traveling to his work to claim the hospitality of his brother-masons on his way, a system of symbols was devised, in which every mason was initiated, and which he was bound to keep secret. This symbolism, invented for the convenience of intercourse between members of the same craft, is the sole shadow of foundation for the popular notion that the masonic brethren were in possession of secrets of vital importance, the knowledge of which had been from generation to generation confined to their own order. It has been supposed that the possession of the masonic secrets enabled the masons to design the great cathedrals of the 13th and 14th centuries, whereas it is now certain that during the purest ages of Gothic architecture, both in France and in England, the architects were not men that the masonic fraternity at all, but either of skilled masons, or architects, who in the mysteries of mason-craft, or of the masters who worked from the architect's design, were, at the same time, not the mere human machines that modern workmen too generally are, but men who, in carrying out an idea imparted to them, could stamp an individuality of their own on every stone. Architecture was then a progressive art, and the architect of every great church or cathedral had made himself acquainted with the works of his predecessors, and profited by experience, adopting their beauties, and shunning their defects. The nature of the advance which architecture was then making, has been compared by Mr. Fergusson to the advance with which we are familiar in the present day in ship-building and other useful arts. "Neither to the masons nor to their employers, nor to the abbé Suger, Maurice de Sully, Robert de Susarches, nor Fulbert de Chartres, is the whole merit to be ascribed, but to all classes of the French community carrying on steadily a combined movement towards a well-defined end. Neither to the masons of the 14th c., who had however a wonderful skill in carving and in constructing arches, overtopped the original functions, took a great extent the office of architect into their own hands; and it is undeniable that the churches designed by German masons, though rich in the most exquisite workmanship, are not comparable, in the higher elements of beauty, to the works of non-masonic architects.

The epithet "free" was applied to the craft of masons in consequence of their being exempted by several papal bulls from the laws which regulated common laborers, and exonerated from various burdens thrown on the working-classes at large both in England and on the continent. Like all the other guilds, the masons were bound by their rules to the performance of specific religious duties; but a craft one of whose principal functions was church-building, was naturally under the more especial protection of the clergy. Yet a considerable time before the reformation, we find the jealousy of the church excited from time to time by the masonic brethren, partly in consequence of their assuming other functions besides those of mere builders. In England, an act, passed in the minority of Henry VI., at the instigation of Henry of Beaumont, cardinal of Winchester,
prohibited the masons from holding their wonted chapters and assemblies. But this act was never enforced; and Henry VI., on coming of age, himself countenanced the masonic exercise. Henry VII. became their grand master in England.

The history of freemasonry has been overlaid with fiction and absurdity, partly from an exaggerated estimate of its importance in the development of architecture, and partly from a wish to connect mediaeval masonry with the institution that passes under the same name in the present day. Modern (or so called "speculative") freemasonry is an innocent mystification unconnected either with the building craft or with architecture. It is of British origin, and dates from the 17th century. According to the peculiar phraseology of the masonic brethren, it is founded in the "practice of moral and social virtue;" its distinguishing characteristic is charity, in its most extended sense; and brotherly love, relief, and truth are inculcated by its precepts. Its real founders were Elias Ashmole and some of his literary friends, who amused themselves by devising a set of symbols, borrowed in part from the knights templar, between whom and the old masons an intimate relation is said to have subsisted, and in part from the Rosicrucians (q.v.). These symbols, which have since been adopted as the distinguishing badge of the brotherhood of "free and accepted masons," include the sun, the moon, the compasses, square, and triangle. A number of so-called degrees or grades of masonry with fantastic names were established and conferred on the members.* Charles II. and William III. were masons; and the appearance of a connection with operative masonry was kept up by the appointment of sir Christopher Wren to the office of grand master. The "lodges" of Scotland profess to trace their origin to the foreign masons who came to Scotland in 1150 to build Kilwinning abbey; those of England go still further back, to an assemblage of masons held by St. Alban, the proto-martyr, at York in 926; and the mother-lodges of York and Kilwinning were, with insignificant exceptions, the parents of all the several lodges erected in different parts of Great Britain. Toward the close of last century, it was in some quarters made a charge against freemasonry, that under its symbolism was concealed a dangerous conspiracy against all government and religion. The accusation was probably groundless enough as regards British freemasonry, and any little effect was produced by it, that, in that an act passed in 1799 for the suppression of secret societies, an exception was made in favor of freemasons. On the continent, political intriguers may sometimes have availed themselves of the secrecy afforded by freemasonry to further their schemes. In 1717 a grand lodge was formed in London, with power to grant charters to other lodges. Under its sanction, the first edition of the constitutions of the fraternity was published. The grand lodge was for a length of time on an unfriendly footing with the lodge of York, in consequence of having introduced various innovations not approved of by the older lodge, and of having granted charters within the district which York claimed as its own. In 1742 the duke of Cumberland was elected grand master of the grand lodge; and on his death, George IV., then prince of Wales, succeeded to the office, which he continued to hold till he was appointed regent, when, it being considered unsuitable that he should longer exercise any personal superintendence, he took the title of grand patron. In 1819 an understanding and a union took place between the two rival lodges by their respective grand masters, the dukes of Kent and Sussex. The fraternity has since been managed by the "united grand lodge of ancient free and accepted masons of England," consisting of the grand master, with his deputy, grand wardens, and other officers, the provincial grand masters, and the masters and wardens of all regular lodges, with a certain number of stewards annually elected, who meet four times a year for the dispatch of business, besides which there is an annual masonic festival, at which every mason is entitled to attend. The grand lodge of England has at present above a thousand lodges under its protection, and has H.R.H. the prince of Wales as its grand master.

In Scotland the masons, when they were a real company of artificers, were, like other handicrafts, governed by wardens of districts appointed by the king. In 1598 a re-organization of the mason lodges was effected under William Schaw, principal warden and chief master of masons, who in the following year confirmed the three "held lodges" in their ancient order of priority—Edinburgh first, Kilwinning second, and Stirling third. At about the same time, in masonic lodges having become absorbed in speculative masonry, the grand lodge of Scotland was instituted by the representatives of 34 lodges, by whom also William St. Clair of Roslin was elected grand master, on account of his ancestors' alleged ancient connection with the mason craft, as patrons and protectors. Priority was assigned to the lodges according to the antiquity of their written records. The lodge of Edinburgh (Mary's chapel) was placed first, and Kilwinning second. The lodge of Kilwinning did not formally object to this till 1744, when it withdrew from the grand lodge and resumed its independence. On relinquishing this position in 1807, it was re-admitted into the grand lodge by the title of Mother Kilwinning, with precedence over the other lodges, and the provincial grand mastership of Ayrshire rendered hereditary in its master. For the foregoing information, we are

*The three principal grades are apprentice, fellow-craft, and master-mason; there being peculiar ceremonies at the making of each; and it is only on attaining to the degree of master-mason that a brother enjoys the full benefits and privileges of the craft.
indebted to Lyon's *Freemasonry in Scotland*, published by Messrs. Blackwood & Sons (1859)—a work of acknowledged historical value on the subject of which it treats.

Besides granting charters of affiliation, the chief use of the grand lodge, whether of England, Ireland, or Scotland, consists in its acknowledged authority to enforce uniformity of ceremonial and other observances, and to settle all disputes that may arise within the lodges under its charge. The officers of the grand lodge are to a large extent delegates from the respective lodges; the delegation being in the form of proxy masters and wardens. As a source of revenue, for each member made by a lodge, a fee must be remitted to the grand lodge, whereupon a diploma of brotherhood will be issued.

Modern freemasonry spread from Britain to the continent, to America, and to India. It was introduced into France in 1735, Russia in 1731, and Germany in 1740. Grand lodges now exist in France, Belgium, Netherlands, Denmark, Sweden and Norway, Prussia, Saxony, Hamburg, Switzerland, Italy, Portugal, Greece, Canada, Nova Scotia, and New Brunswick, in Central and South America, and in British Columbia. Lodges in connection with European grand bodies exist in India, Africa, China, Polynesia, Turkey, Palestine, West Indies, Australia, and New Zealand. There are about forty grand lodges in the United States. Freemasonry is prohibited in Austria, Poland, Russia, and Spain, and by the pope.

The deep symbolic meaning supposed to be couched under the jargon of the masonic fraternity is probably as apocryphal as the dangers of masonry to government and order. A set of pass-words and a peculiar grip of the hand enable the initiated to recognize each other, and give a zest to their convivial meetings; and if the institution possesses any practical utility, it is in its enabling a mason, in a place where he is a stranger, to make himself known to his brother-masons, and claim their protection and assistance.

Masons, Free (ante). The claims of freemasonry to origin in a period of remote antiquity have recently received a certain amount of support. In the process of making the necessary preparations for the removal of the Egyptian obelisk at Alexandria to its new site at New York, in 1880, certain discoveries were made which were alleged to be of distinct masonic reference. These discoveries included a number of objects masonic in character, and the fact that the foundations and position of the monument had been established according to rules which form a part of the traditions of the order. In regard to this whole matter of antiquity, there is nothing in the traditions of the order so exceptionally remarkable as to make any special demand on our credulity. Men have been constituted after the same fashion from the beginning of time; and, given the same motive and the same or a similar environment and like opportunities, they may be assumed to act in the same way. The organization of the craft-guild in northern and central Europe as early as the 7th century is a sufficient illustration of the tendency to association among men, and particularly among the laboring or "craft" classes, to prove this. We know that among the Greeks, and Romans also, such association occurred in various directions, and there is no sound reason for disbelief in the possible combination of the architects and master-builders of Rome in the time of Numa Pompilius, as is claimed by the masons. Whether we are to accept the traditions which point to Solomon's temple, and refer to the figures of the ancient Egyptians for the period of the foundation of the order, is a matter not of vital importance; though in no sense reasoning that answers in the case of Rome is equally sound in that of Egypt. Certainly when one contemplates the pyramids, Memphis, Thebes, Denderah, and the other ruins of marvelous structures built by the Egyptian masons and architects, there is nothing absurd in the supposition that then, as now, associated effort might have been concerned; and that the associations concerned might have organized on some such basis as is involved in the traditional history of freemasonry. The Roman colleges of builders are said to have been created by Numa Pompilius in 715 B.C. In 390 A.D. the corporations of constructors were established in Great Britain. In A.D. 290 Carausius, commander of the Roman fleet, is said to have renewed the ancient constitution and privileges of the Roman colleges, with a view to gaining the favor of the builders, who were a very powerful association: the architect Albanus, sent to Great Britain as an inspector of the constructors, or masons, is credited with having been the first Christian martyr in Britain, he having been beheaded for preaching the doctrine of Christ. His rank of inspector became later on that of grand master. At this period, which was in the latter part of the 4th c., the city of York contained the most important lodges or colleges of builders in Britain. In the 4th and 5th centuries corporations of artists and operators, so called, were instituted in Great Britain, and manuscript copies of their statutes are said to be still in existence in certain of the French libraries. In 614 pope Boniface IV. conferred by diploma upon the masonic corporations the exclusive privilege of erecting all religious buildings and monuments, and made them free from all taxation. The civil wars of this period paralyzed the development of the masonic corporations, and they took refuge in the monasteries, which thus became the schools of architecture—sending forth such architects as St. Aloysius, bishop of Noven; St. Perol, of Limoges; Dalmau, bishop of Rhodes; and Agricola, of Chalon (869-700). In some of the Anglo-Saxon documents which still exist in the libraries of England the masonic freemasons are styled "freemasons." In 925 A.D. Athelstan convoked all the masonic
lodges of Great Britain; the order was re-organized; and the city of York was established as the seat of the grand mastership: 34 years later the archbishop of Canterbury, St. Dunstan, was named grand master of the fraternity. In 1040 Edward the Con-
fessor assumed the protectorate of the order; and in 1100 king Henry IV. accepted the grand mastership. In 1145 the freemasons from upper Normandy were called to the aid of the builders of the cathedral of Chartres, and were publicly blessed by the archbishop of Rouen; they made a triumphal entry into the city of Chartres. In 1250 the grand lodge of Cologne was re-constituted: and in 1275 a masonic congress was convoked to solemnize the burning of the cathedral of Strasbourg. In 1329 Pope Boniface IV. was confirmed by diploma issued by pope Nicholas III. in A.D. 1277; and these were again confirmed by pope Benedict III. in 1324. In 1360 Germany had five grand lodges, Cologne, Strasbourg, Bern, Vienna, and Magdeburg, upon which were dependent the local lodges of France, Belgium, Hesse, Swabia, Thuringia, Switzerland, Franconia, Bavaria, Austria, Hungary, and Styria. In the 15th c. the assemblies of freemasons in England were suppressed by act of parliament, but a few years later Henry VI. was initiated into the fraternity, his example being followed by nearly all the gentlemen of his court. In 1452 a new constitution was compiled at Strasbourg, and in 1459, 54, and '69 masonic congresses were held in Ratisbon and Spire. A grand lodge of master masons was held in London in 1502, presided over by the king, Henry VII., who laid the corner-stone of the chapel of Westminster which bears his name. A congress of masons was held at Basle in 1568, and at Strasbourg in 1564; and in 1607 king James I. of England proclaimed himself protector of the freemasons. In 1663 a general assembly was held at York, at the request of king Charles II. In 1666, at the time of the great fire in London, there were but seven lodges of masons in the city; and in 1708 these had declined to four, though Sir Christopher Wren, the aged grand master, exhibited great zeal in endeavoring to foster the progress, and increase of the order. In France, in 1538, Francis I. suspended all the corporations of workmen, and freemasonry became extinguished in that country, not to be revived until 1721. It is claimed by the masons that this act of Francis I. resulted in the abandonment of the practice of Gothic architecture, and the substitution for it of the renaissance style, of which school were the architects Delorme and Bullant, who built the Tuileries in 1577; Lesec and Goryon, the architects of the Louvre, built in 1571; Blondel and Bullet, who constructed the gates of St. Denis and St. Martin, of Paris, between 1674 and 1686; Mansart, who built the palace of Versailles and the Invalides in 1700 and 1725; and J. Soufflot, who erected the Pantheon: none of these architects were freemasons. It was in the year 1703 that the English masons forming the lodge of St. Paul, having completed the erection of the cathedral, passed the resolution which opened the doors of the order to others than practical masons and builders. This resolution reads as follows: "Resolved, that the privilege of masonry shall no longer be confined to operative masons, but be free to men of all professions, provided that they are regularly approved and initiated into the fraternity." This important decision entirely changed the nature of the society, and transformed it into the body as we find it to-day. In 1717 the grand lodge of London was constituted, and put into execution the resolution of 1703: see MASONs, FREE, ANTE. In 1864 the three grand lodges of Great Britain controlled 109 provincial grand lodges, with 1507 operative lodges under their jurisdiction, which extended their connections to every part of the globe. Freemasonry was introduced into Denmark, in 1763; France, 1721; in Sweden, in 1786; Russia, in 1751; Belgium, 1721; Holland, 1725; Germany, 1737; Switzerland, 1737; Italy, 1729; Portugal, 1735; Spain, 1737. It is claimed that a lodge was established in Halifax, Nova Scotia, as early as 1750, the first in the British dominions in America; but this statement is not fully credited. Of the five provinces which comprise the dominion of Canada Prince Edward Island alone has its lodges subject to the grand lodges of Great Britain. The first lodge in the New England colonies was opened in Boston in 1733. After the war of independence, grand lodges were organized in all the states. The statistics of the order in America showed the following membership in the different states in 1880, including also the British provinces, or Dominion of Canada, and New Mexico:

MASON WASP, Odynurus murarius, a species of wasp, which makes its nest by boring a cylindrical hole in hard sand, or even in the plaster of walls, on which an exudation from the mouth seems to act so as to soften it sufficiently. At the orifice an outer tube is constructed, sometimes two or three inches in length, of pellets formed in the
excavation. In the interior an egg is deposited with a number of little caterpillars ready for food of the larva when hatched.

MASO'RA, or MASSORETTI. See MASSORA, ante.

MASOVIA, or MAZOVIA, a district of Poland, bounded n. by Plock, e. by Podlachia, s. by Sandomir, w. by Kalisch and Posen; 7,646 sq. miles. During the early period of the independence of Poland it was a duchy on both sides of the Vistula which flows through it. In 1815 it formed a palatinate in the Russian kingdom of Poland with Warsaw as its capital. It is now under Warsaw, which forms a distinct government.

MASQUE, a species of dramatic performance much in vogue in England towards the close of the 16th and the beginning of the 17th century. It was in fact, the favorite form of private theatricals at the time. The masque appears to have originated in the practice of introducing in any solemn or festive procession men wearing masks, who represented either imaginary or allegorical personages. At first it was simply an "acted pageant," as in the well-known progress of queen Elizabeth; but gradually it expanded into a regular dramatic entertainment, and in the hands of men like Fletcher and Ben Jonson attained a high degree of literary beauty. Jonson's masques were represented at court and were greatly relished. The taste for this kind of amusement, however, died away in the reign of Charles I.; nevertheless, to the time of that monarch belongs the finest masque, and one of the most splendid poems ever written—the Comus of Milton (1634). See Masson's Life of Milton (vol. i. page 542, et. seq.).

MASQUERADE, or MASKED BALL, a festive meeting in which the host and guests assume fictitious characters, and disguise themselves more or less for the occasion, the name being derived from the use of the mask. The public mummeries of former times, Easter plays, festivals of fools, etc., which were frequent in most parts of Europe, but somewhat various in different countries, probably suggested the idea of the masquerade, which, however, was not open to all, according to the well-understood rules of these ancient amusements, but was limited to some select class, or to those who paid a certain sum. For admission Catherine de Médicis introduced the regular masquerade at the French court. It found its way to England in the reign of Henry VIII., but did not reach any of the courts of Germany till the end of the 17th century. The bal costumé is a very modified and much less objectionable form of the masquerade. During the carnival, public masquerades are held in all the theaters and dancing-saloons of Paris, and on these occasions scenes of the most disgraceful profligacy are said to be enacted in spite of the strict supervision of the police.

MASS (Lat. Missa), the name given in the Roman Catholic church to the eucharistic service which in that church, as well as in the Greek and other oriental churches, is held to be the sacrifice of the new law, a real though unbloody offering, in which Christ is the victim, in substance the same with the sacrifice of the cross, and instituted as a commemoration of that sacrifice, and as a means of applying its merits, through all ages, for the sanctification of men. The doctrine of the mass, as understood by Roman Catholics, presupposes the eucharist, although the latter doctrine does not necessarily involve the notion of a sacrifice, and may even be held by those who deny the sacrificial character of the eucharistic rite. The arguments for and against this belief, on which the mass is founded, do not fall within our province, which limits us to a brief history and explanation of the rite as it is found among Catholics and the members of other communions in which it is observed. Without entering into discussions as to the primitive character of the eucharistic rite, it will be enough to observe that the very earliest records of Christian history, whether in the Acts of the Apostles, the canonical Epistles, or the writings of the most ancient of the fathers, plainly evince the existence from the beginning of a rite, which it is impossible not to regard as in its general character identical with that which still constitutes in most Christian communities the chiefest and most solemn part of their public worship. This rite is believed by Roman Catholics to have been partly a sacrifice, partly a communion and participation thereof by the faithful; and of the names by which it is called in the works of the early fathers, some—as for example, agape, and hagia sumnisis, refer to the latter, while others—as thusia, prophor, hieron—indicate the former signification. The etymology of the name now in use is somewhat obscure, but it is commonly referred to the proclamation made by the deacon of the close of the service—"Ite; missa est" ("Go; the assembly is dismissed"). By primitive use the communion of the faithful appears always, unless in exceptional cases, to have formed part of the eucharistic service; but afterwards it came to pass that the officiating priest only communicated, whence arose, especially in the Western church, the practice of "private masses," which has been in later times a ground of complaint with dissentients from Rome, even those who in other respects approach closely to the Roman doctrine. In the ancient writers a distinction is made between the "mass of the catechumens" and the "mass of the faithful"; the former including all the preparatory prayers, the latter all that directly regards the consecration of the elements and the communion, at which the "discipline of the secret" forbade the presence of the catechumens. With the cessation of this discipline, the distinction of names has ceased, but the distinction of parts is still preserved, the mass of the catechumens comprising all the first part of the mass as far as
“the preface.” The mass is now, in general, denominated according to the solemnity of the accompanying ceremonial, a “low mass,” a “chanted mass,” or a “high mass.” In the first a single priest simply reads the service, attended by one or more acolytes or clerks. The second form differs only in this, that the service is chanted instead of being read by the priest. In the high mass, the service is chanted in part by the priests, in part by the deacon and sub-deacon, by whom, as well as by several ministers of inferior rank, the priest is assisted. In all these, however, the service, as regards the form of prayer, is the same. It consists of (1) an introductory prayer composed of the 41st Psalm, together with the “benediction” formula followed by the three-repeated petition, “Lord, have mercy,” “Christ, have mercy,” and the hymn, “Glory to God on High”; (8), the collect, or public and joint prayers of priest and people, followed by a lesson either from the Epistles or some book of the Old Testament, and by the gradual (q.v.); (4), the gospel, which is commonly followed by the Nicene creed; (5), the offertory (q.v.), after the reading of which comes the preparatory offering of the bread and wine, and the washing of the priest’s hands in token of purity of heart, and the “secret,” a prayer read in a low voice by the priest; (6), the preface, concluding with the trisagion or “thrice holy,” at which point, by the primitive use, the catechumens and penitents retired from the church; (7), the “canon,” which is always the same, and which contains all the prayers connected with the consecration, the elevation, the blessing, and the communion of the host and of the chalice, as also the commemorations both of the living and of the dead; (8), the “communion,” which is a short scriptural prayer, usually appropriate to the particular festival; (9), the “post-communion,” which is recited by the priest in the presence of the priest and people together; (10), the dismissal with the benediction, and finally, the first chapter of St. John’s gospel. Great part of the above prayers are fixed, and form what is called the “ordo” or “ordinary” of the mass. The rest, which is called the “proper of the mass,” differs for different occasions; some masses being “of the season,” as of lent, advent, passion-tide, “quarter-time,” etc., others of “mysteries,” as of the nativity, the circumcision, the resurrection; others again, of saints, as of an apostle, a martyr, or a confessor; others again, “votive,” as “of the passion,” “of the dead,” “for peace,” etc. In all these various classes, as well as in the individual masses under each, the “proper” portions of the mass differ according to the occasion, and in some of them certain portions of the “ordinary,” as the “Glory to God on High,” the “gradual,” or the “Nicene creed” are omitted. On one day in the year, Good-Friday, is celebrated what is called the “mass of the presanctified,” in which no consecration takes place, but in which the priest consecrated the elements on the preceding day. This usage is found also in the Greek church, not alone on Good-Friday, but on every day during the Lent, except Saturday and Sunday. In the celebration of mass the priest wears peculiar vestments, five in number—two of linen, called “amice” and “alb”; and three of silk or precious stuffs, called “maniple,” “stole,” and “chasuble,” the alb being girt with a cincture of flaxen or silken cord. The color of these vestments varies with the occasion, five colors being employed on different occasions—white, red, green, purple or violet, and black, and they are often richly embroidered with silk or thread of the precious metals, and occasionally with precious stones. The priest is required to celebrate the mass fasting, and, unless by special dispensation, is only permitted to offer it once in the day, except on Christmas day, when three masses may be celebrated.

In the Greek and oriental churches the eucharistic service, called in Greek theia leitourpia (the divine liturgy), differs in the order of its parts, in the wording of most of its prayers, and in its accompanying ceremonial from the mass of the Latin church (see Liturgy), but the only differences which have any importance as bearing upon doctrine are their use of leavened bread instead of unleavened; their more frequent celebration of the “mass of the presanctified,” to which reference has already been made; the Latin use of private masses, in which the priest alone communicates; and, in general, the much more frequent celebration of the mass in the Latin church. The sacred vestments, too, of the Greek and eastern rites differ notably from those of the Latin; and in some of the former—as, for example, the Armenian—a veil is drawn before the altar during that part of the service in which consecration takes place, which is only withdrawn at the time of the communion. The service sometimes used on shipboard, and improperly called misa sica (dry mass), consists simply of the reading of the prayers of the mass, but without any consecration of the elements. It was resorted to with a view to avoiding the danger of spilling the sacred elements, owing to the unsteady motion of the ship. It is sometimes also called misa nautica (ship mass).

MAS'SA, a t. in the province of Carrara-Massa, central Italy; pop. '74, 18,083. It is on the Frigida, and commands a fine prospect of the sea on the w., and of picturesque and fruitful hills on the n.e. The climate is almost unrivaled in Italy for mildness and salubrity. Much of the town is on a hill; the newest part, with its fine buildings and spacious streets and squares, on the plain below. Among the buildings is a national palace, a noble structure, built by the princes of the house of Cybo. The history of the town is traced back to the 9th century. It was then and for a long time subject to the republic of Lucca, but in the 15th c. the Cybo family became its feudal lords.
MASSAC, a co in s. Illinois; has the Ohio river for its s. boundary, separating it from Kentucky; 230 sq. m.; pop. '80, 10,443—9,900 of American birth, 1,703 colored. Forests of oak, elm, maple, ash, hickory, and the tulip tree diversify its surface, and the cypress grows luxuriantly in its swamps. An under-stratum of carboniferous limestone is the foundation of the soil, which, in land not subject to overflow, is fertile, and produces a large yield annually of tobacco, sweet-potatoes, butter, honey, and sorghum, and all varieties of grain and fruit. Cattle, sheep, and swine are raised, and the vine is cultivated to some extent. Its mineral products are coal and lead. Among its industries are the manufacture of wagon materials, tobacco, and snuff. It has flouring mills, potteries, and ship-yards on the Ohio river. Seat of justice, Metropolis.

MASSACHUSETTS, one of the 13 original states of the American union, and oldest of the New England states, lies between lat. 41° 15'-42° 53' n., and long. 69° 56'-73° 32' w., being 160 m. from c. to w., and from 47 to 110 from n. to s., with an area of 7,800 sq. m.; it lies s. of Vermont and New Hampshire, and borders on the Atlantic. There are 14 counties, and the chief towns are Boston, the capital, Lowell, Lawrence, Salem, New Bedford, Fall River, Lynn, Springfield, Cambridge, and Worcester. On the south-eastern coast are the islands of Nantucket and Martha's Vineyard. The principal rivers are the Connecticut, Merrimac, and Housatonic, which afford water-power to many manufacturing cities and villages. The country is hilly, and much of the soil sterile, but in the river-valleys it is fertile. The most important mineral products are granite and syenite, sand for glass, and iron. The chief agricultural products are Indian corn, apples and pears, grass and hay; but the manufactures are very large and various. In 1870 there were 194 cotton-mills, producing goods to the value of $59,679,153, and 182 woolen-mills, producing goods worth $39,459,242, besides numerous carpet-mills, iron-foundries, rolling-mills, nail factories, and machine shops. The manufacture of boots and shoes for the same year was $88,399,583. There are 60 railway companies, and in 1878 above 2,000 m. of railway were open. The fisheries of Massachusetts have long been one of its leading industries. There are over 200 national banks, about 180 savings-banks, numerous asylums, etc. Massachusetts has about 6,000 schools, a university, and 7 colleges; and in 1878 there were 345 newspapers and periodicals. The state income for 1877-78 was $7,344,900: the debt in 1878 was $33,020,000. Massachusetts was discovered by the Cabots in 1497. In 1614 it was visited by capt. John Smith. In 1620 the Mayflower, 180 tons, sailed from Southampton with 102 Puritan settlers, and landed at Plymouth, Mass., Sept. 21, 1620. In 1637 the colony suffered from Indian massacres; and in king Philip's war, 1675, 12 towns and 600 houses were burned. The war of the revolution of 1776 began in Massachusetts with the battles of Lexington and Bunker Hill. Pop. '10, 472,040; '60, 1,231,065; '70, 1,459,551; '75, 1,651,652.

MASSACHUSETTS (ante). There is reason to believe that portions of south-eastern Massachusetts, including the islands of Nantucket and Martha's Vineyard, were inhabited by the Norsemen as far back as 1000 A.D., and that various settlements were made in the next 300 years, none of which, however, gained permanence. In 1497 John and Sebastian Cabot again discovered the Massachusetts coast, and the English claimed it on that account. In 1602 Bartholomew Gosnold and 22 English colonists made a settlement on the Elizabeth islands, between Buzzard's bay and Vineyard sound, now constituting the township of Gosnold in Dukes co.; but it was in a short time abandoned. There were other expeditions to the coast in subsequent years, but the Plymouth colony was the first that proved successful. On Sept. 6, 1620 (O. S.), this colony, composed of about 100 English, who had sought exemption from religious persecution in Holland, having embarked from Delft Haven, set sail from Plymouth, England, in the Mayflower, of 180 tons, to find a home in America. On Nov. 9 they reached Cape Cod, and anchored in the roadstead off Provincetown. An exploring party was sent in search of a suitable place to found a settlement, and the colonists landed at Plymouth, Dec. 22 (N. S.). Before landing they drew up and subscribed a compact or frame, or frame, of the new colony, on Dec. 16, 1620, and the land was purchased. In four months nearly one-half of the colonists died from exposure to the cold and the lack of wholesome food. Shortly after landing they entered into a treaty of peace with the Indian chief Massasoit and his tribe, which remained unbroken for a long time. Through the influence of capt. Miles Standish the disputes with other tribes were soon settled. In the spring of 1621 the Mayflower returned to England, and soon afterwards governor Carver died and was succeeded by William Bradford, with Isaac Allerton as assistant. During the next two years the colonists endured many privations, but in 1623 they were relieved by a bountiful harvest. The plan of property in common, which they adopted at first, was now abandoned. In 1622 a Mr. Weston, of London, who had been connected with the Plymouth colonists, obtained a patent and founded a new settlement in Wessagusset, now Weymouth. The Plymouth colony failed to obtain a patent, and was forced to carry on its government independently of the royal sanction. This they did, however, with perfect success, upon a plan not unworthy of the democracy of our times, since the right of the people to govern themselves was fully recognized. In 1628 an expedition, organized by an English company, and commanded by John Endicott, landed at Salem. The company had obtained a grant of the territory lying between the
Atlantic and Pacific, and extending to a point 3 m. s. of the river Charles and 3 m. n. of the river Merrimac. After persistent efforts a royal patent was obtained for "the company of the Massachusetts bay," and the associates were constituted a body politic, with a governor, deputy, and 18 assistants, to be annually elected, and a general assembly of the freemen, with legislative powers, to meet four times in a year, or oftener if necessary. In 1629 the colony was reestablished, and the government and patent of the company were transferred from London to New England. The old officers resigned, giving place to others chosen from among those who were about to emigrate, John Winthrop being elected governor. From this time the colony grew rapidly, receiving an accession at one time of about 1000 persons, who came over in 17 vessels. Charlestown, Boston, Watertown, Dorchester, Roxbury, Mystic, Salem, Saugus (Lynn), and other places became fortified, and for several years a naval base. The colonists endured great hardships, losing many of its members by death, while others returned in discouragement to England. But new emigrants came to take the places of the departed, and still the colony grew. A spirit of religious intolerance, which was characteristic of all parties in those times, and which was partly the product of the bitter persecutions from which the colonists had fled, manifested itself in the banishment of Roger Williams and Anne Hutchinson, and a general persecution of the Quakers. Some disputes between the magistrates and people as to their respective powers, caused no little commotion. At first the colonists were allowed to manage their affairs without the interference of the home government; but at length they were suspected by the crown of a design to make themselves independent, and an attempt was made to annul their charter, a commission for their government being formed with archbishop Laud at its head. An order was issued to the colony to surrender its charter, but the settlers firmly refused to do so. They were at that time governed by an alderman and a mayor, and the former had charge of the courts. The governor, Charles Town, Charlestown, and Dorchester against a possible assault. The colonists found their best protection, however, in the political agitations of the mother country, which so absorbed the attention of the government that it had no time to prosecute its schemes in America. The restoration of the Stuarts created fresh troubles for the colony, but at length, in 1692, the king confirmed the charter and made a conditional promise of amnesty for past political offenses. He insisted, however, upon his right to interfere in the affairs of the colony, demanded the repeal of all laws derogatory to his authority, required the complete toleration of the church of England, the taking of an oath of allegiance, and the administration of justice in his name. To these demands some of the colonists were disposed to yield for the sake of peace, while others steadily resisted them. Commissioners were sent over from England to investigate the affairs of the colony, but, being unable to accomplish anything, they were finally recalled. In 1643 the colonies of Massachusetts Bay, Plymouth, Connecticut, and New Haven entered into an alliance for mutual protection, which lasted 20 years and was superseded by a still closer confederation. In 1675 king Philip's war broke out, lasting more than a year, and subjecting the colonists to great loss of life and property. No less than 12 or 13 towns were destroyed by the Indians, 600 houses were burned, one in 20 of the men of the colony were killed on the field, and a debt of $500,000—an enormous sum for that day—was incurred. The troubles with the king continued; Massachusetts lost her jurisdiction over New Hampshire, and retained possession of Maine only by purchase. In 1684 the difficulties with the crown being still unsettled, the charter was declared forfeited. Joseph Dudley was appointed president of Massachusetts, the general court was dissolved, and a royal commission superseded the government under the charter. In 1686 Dudley was superseded by sir Edmund Andros, whose arbitrary proceedings have left a blot upon his name. In 1689 the men of Boston, aided by others from the country, rose in arms against him, put him and others in prison, reinstated the former magistrates, and restored the general court to its authority. Plymouth joined in the revolt, imprisoning the agent of Andros, and reinstating the former governor. A new charter, uniting the Massachusetts and Plymouth colonies, was granted in 1692. Under this charter the governor, lieutenant-governor, and secretary were appointed by the king. Sir William Phips was the first governor, and it was at about this period that the witchcraft delusion which had long held sway in Europe, broke out in the colony, blotting its history with a record of superstition and blood. It is to the honor of Massachusetts, however, that it so soon awoke from this inherited delusion; long after the evil had been exposed and forsaken here, the courts of European countries were still sentencing "witches" to death. There were fresh troubles with the Indians, which did not terminate till 1725:

Massachusetts was deeply involved in the struggles between England and France for ascendency in the new world, which did not finally cease until the union of Canada to England and of Louisiana to Spain in 1763. Then followed the controversies with England, which led step by step to the war of the revolution, which ended in the recognition of the United States as an independent nation. In these controversies Massachusetts always took the lead, as she had done in the war with itself, against the foundations of the new republic. The British government imposed the most onerous taxes upon the colonists, and sought to collect them by force, in the face of the most earnest remonstrances. The colonists at length refused to submit to exactions which they regarded as subversive of the fundamental principles of English liberty. They insisted that they could not be justly taxed while they were excluded from representation in parliament, and upon this issue
they were willing, if necessary, to go to war. The commerce of the colony, moreover, was hampered by the most arbitrary and irritating restrictions. The spirit of liberty, which the colonists had brought with them from their old home, had been developed in their self-governing church and state until, in the hearts of their children, it had grown too strong to be subdued, and found expression in every form of indignant remonstrance—fist at last blows were substituted for words. The other colonies were appealed to—and not in vain—for sympathy and support. The first blood in this contest was shed in the Boston massacre, a street riot in 1770; next came the destruction of the tea in Boston harbor in 1773, the opposition to the port bill in 1774, the representation of the colony in the general congress, the seizure of the arsenal at Charlestown, etc., and finally, on April 17, 1775, the bloody contest at Lexington and Concord, which was the actual opening of war.

The surface of the state is mostly uneven, and in some places rough and mountainous. Two separate ranges of the Green mountains, the Tachkanic and the Hoosic, enter the western part of the state from the n., and, with their outlying hills, present some of the most picturesque scenery to be found in New England. The Tachkanic is the highest and most westerly of these ranges, its principal elevations being Saddle mountain, or Greylock, 3,595 ft., and Mt. Everett, 2,624 ft. in height. The Hoosic range, in its highest part, does not rise above 1600 feet. Near the western bank of Connecticut river are several isolated peaks, Mt. Tom and Sugarloaf being the most prominent, while on the eastern side of the river, near South Hadley, stands Mt. Holyoke, in solitary beauty, commanding an extensive and lovely prospect. Another isolated mountain is the Wachusett, in Princeton, near the center of the state, which has an elevation of 2,018 ft. That portion of the Connecticut valley which lies within the boundaries of the state is remarkable for beauty of scenery and fertility of soil. The western part of the state is less broken; some of it, including Cape Cod, is level and sandy. The Connecticut river runs through the state from n. to s. for more than 50 miles. About one-third of the state lies westward of this river. The Housatonic, still further w., rises in the Green mountains on the n. border, and flows s. through Connecticut to Long Island sound. The Hoosic, one of the tributaries of the Hudson, rises in the n.w. corner of the state, but soon passes beyond its limits. The principal western tributaries of the Connecticut are the Westfield and Deerfield rivers, which are of considerable size; while the tributaries of the same streams from the e. are Miller's and Chicopee rivers. The Merrimac, which rises in New Hampshire, flows 35 m. to its mouth through the n.e. corner of the state, receiving on the way the Nashua and Concord rivers, and furnishing immense water-power for the great manufacturing towns, Lowell, Lawrence, Haverhill, etc. The rivers at the e. portion of the state are the Charles, on whose banks are Newton, Cambridge, and other large towns, and at whose mouth lies the city of Boston; the Blackstone, with almost unlimited water-power, and whose charming valley is lined with a cordon of manufacturing villages; and the Taunton, with its numerous branches. There are in the state many lakes and ponds, some of which are of unrivaled beauty, but none of them large enough to be useful for navigation. The coast is indented with numerous bays, large and small, and dotted with islands, some of which are of considerable size. The principal bays or sounds are Buzzard's, with many inlets and harbors, Vineyard, Edgartown, Nantucket, Cape Cod, Wellfleet, Duxbury, Massachusetts, Lynn, Nahant, Marblehead, Salem, Beverly, Gloucester, and Annisquam. The harbor of New Bedford, on Buzzard's bay, is, next to that of Boston, the best in the state. The principal islands are Nantucket, Martha's Vineyard, and the Elizabeth group of off Cape Cod.

The minerals of the state have not thus far been a source of much profit. In Bristol and Plymouth counties are deposits of anthracite, but of a very poor quality. In some places in the Connecticut valley are veins of lead, copper, and zinc, but not in quantities to justify working. Beds of iron ore in the Housatonic valley have been worked for many years, and the disintegrated quartz beds yield glass-sand of the finest quality. In 1874 deposits of silver, lead, and gold were discovered in Essex county, near Newburyport, the working of which has not thus far proved profitable. In some portions of the Connecticut valley are found extensive fossil footprints of birds and other animals, some of which must have been of gigantic size. The valleys of the principal streams are productive, but the other portions of the state can be made so only by enrichment.

Wild animals have been nearly exterminated. Bears, wolves, panthers, wildcats, and deer, formerly plentiful, are now almost never seen. Squirrels, rabbits, and game-birds are numerous. Owls, hawks, gulls, wild-ducks, and a great variety of song-birds are common. Reptiles exist in considerable variety, but few of them are venomous. The edible fish on the coast are abundant, embracing cod, halibut, mackerel, haddock, bass, and many other species. The climate on the coast is variable, with prevailing e. winds, especially in the spring and early summer. In the interior it is more equable, and in the mountainous regions the winters are very cold. The mean annual temperature is about 48°.

Of the whole area of the state less than one-half is improved. In 1870 the number of farms was 26,300, embracing 1,736,291 acres of improved land, 706,714 acres of woodland, and 287,545 acres of other land unimproved. The cas: value of farms was $116,432,784; of farming implements and machinery, $5,000,879; wages paid during the year,
Massachusetts.

$5,821,032; total estimated value of all farm products, $39,192,378; of orchard products, $939,854; of produce of market-gardens, $1,980,321; of forest products, $1,616,818; of home manufactures, $79,378; of animals slaughtered or sold for slaughter, $4,324,658; of all live stock on farms, $17,049,228. The chief productions were: Wheat, 34,648 bush., about one-half of which was spring and the other half winter; rye, 239,227 bush.; corn, 1,387,007 bush.; oats, 797,664 bush.; barley, 133,071 bush.; buckwheat, 58,049 bush.; peas and beans, 24,690 bush.; potatoes, 3,026,363 bush.; hay, 597,455 tons; tobacco, 7,913,885 lbs.; wool, 306,635 lbs.; butter, 6,559,161 lbs.; cheese, 2,245,873 lbs.; hops, 55,910 lbs.; maple sugar, 399,800 lbs.; honey, 25,299 lbs.; milk sold, 15,284,057 gallons. Horses on farms, 11,008; horses not on farms, 45,227; milch cows, 114,771; working oxen, 24,430; other cattle on farms, 78,851; neat cattle not on farms, 52,263; sheep, 78,560; swine, 49,178.

In proportion to the mechanical industries of Massachusetts exceed those of any other state. The latest statistics now accessible (Jan., 1881) are those of the state census of 1875. Whole number of manufacturing establishments, 10,915; total value of buildings, $89,997,503; value of average stock on hand, $89,061,506; value of machinery, $73,484,914; total capital invested, $267,074,802; number of persons occupied in manufacturing and mechanical employments, 316,459, of whom 233,252, were males and 83,207 were females. Of the males, 229,469, and of the females, 77,238, were above 15 years of age. The average yearly wages of both sexes and all ages was $475.76. Total amount of wages for the year, $126,711,583. The leading industries of the state, aside from agriculture and commerce, with the amount of their products respectively, as reported by the census of 1870, were as follows: Agricultural implements, $41,980; machinery and dyeing, $22,530,429; boots and shoes, $88,399,388; carpentering and building, $12,429,739; clothing, $21,752,780; cotton goods, $56,237,580; cotton thread, twine, and yarn, $8,069,543; curried and tanned hides, $6,215,225; drugs and chemicals, $1,617,904; fisheries (exclusive of whale), $1,800,399; flouring and grist-mill products, $9,720,374; furniture, $11,369,148; glass, including cut and window, $2,552,000; hardware, $2,515,429; hats and caps, $8,416,191; hosiery, $2,313,481; india rubber and elastic goods, $3,183,218; iron, forged and rolled, $6,699,907; iron nails and spikes, $5,986,144; wrought iron pipe, $1,407,000; iron castings, including stoves and hollow ware, $7,046,702; tanned leather, $9,984,497; leather currie, $19,211,330; morocco, tanned and curried, $3,158,029; lumber, planed and sawed, $6,651,670; machinery of all kinds, $16,426,742; marble and stone work, $3,178,450; molasses and sugar refined, $7,665,485; musical instruments, $3,906,179; oil (fish and linseed), $3,551,766; paper of all kinds, $12,657,481; printing cotton and woolen goods, $17,325,150; printing and publishing of all kinds, $8,390,976; ship-building and repairing, $2,070,301; shovels and spades, $1,820,526; stone, $1,294,145; straw goods, $4,869,514; tin, copper, and iron ware, $2,785,674; upholstery, $2,424,457; watches, $1,351,160; wire, $2,854,672; woolen goods, $39,489,242; worsted goods, $8,250,541; mining and quarrying, $1,408,522; fisheries, $6,215,325.

The imports in 1874 amounted to $52,737,250; foreign exports, $2,380,772; domestic exports, $28,455,515. Vessels entered during the year at the several ports, 8,066, aggregating 789,541 tons; cleared, 2,983, aggregating 708,048 tons; registered, 2,568, aggregating 456,873 tons. The number of vessels entered in the coastwise trade was 2,665, of 2,167,386 tons; cleared, 2,700, of 2,191,292 tons. Vessels engaged in the general fisheries, entered at Newburyport, 105, of 3,677 tons; cleared, 116, of 3,922 tons. The most important centers of the fishing trade are Gloucester and New Bedford, the former unsurpassed for the magnitude of its cod and mackerel fisheries, the latter the leading market for the products of the whale. The product of the American whale fisheries for the year ending June 30, 1874 (nearly all from Massachusetts), amounted to $2,291,596, including sperm oil valued at $1,350,987; other whale oil, $775,919; and whalebone, $264,990. The number of vessels in the state engaged in the whale fisheries was 170; in the cod and mackerel fisheries, 1036, of 49,578 tons. According to the census of 1870, more than half the products of the fisheries of the United States (exclusive of the whale fisheries) were the fruits of Massachusetts enterprise and industry. The capital invested in the business was $4,287,871; number of persons employed, 8,993; value of products, $6,215,325. The number of vessels built in the state in 1874 was 77, of 31,499 tons, including 5 steamers of 699 tons.

The rivers of Massachusetts are not navigable to any considerable extent, but a network of railways, extending to almost every part of the state, offers unbounded facilities for trade and travel. Trunk lines lead from Boston in every direction, and branches extend to or near a vast number of the smaller towns, so that by far the greatest number of inhabitants outside of that city may, if they wish, leave their homes in the morning, go the business of the day, transact business, and return the same evening. The cost of the first line (that between Boston and Lowell, 53 m.) was opened for use in 1833. In 1874 the number of miles of railway in operation in the state was 1782. More than one-fourth of the main lines are laid with steel rails. There are over 60 corporations, but, owing to the combinations between different lines, 31 boards of direction control all the roads. The average cost of these roads per mile was nearly $57,000; the cost of equipment about $7,700 per mile. One of the lines, extending through the state in a n.w. direction from Boston,
passes through Hoosac mountain by means of a tunnel 44 m. in length, costing over $14,000,000, for which the state lent its credit. The aggregate capital stock of the 63 companies in 1876 was $118,170,201; amount of their indebtedness, $52,914,825; gross income, $30,008,513; net income, $8,344,088. All the roads are under the supervision of a board of railroad commissioners appointed by the state, and wielding large powers. The board settles disputed questions between the different roads and between the roads and the public, it is compelled to hear and investigate all complaints against the roads, and find out and recommend a remedy, and its supervisory powers extend to the care of accounts, the examination of tracks, bridges, etc., and the investigation of accidents.

In 1876 the cost of this supervision was one-twentieth part of one per cent of the gross receipts of the roads.

The number of national banks in the state in 1874 was 220, with a capital of $93,039,350, circulation outstanding, $59,051,019. In 1876 there were 176 savings-banks, with deposits amounting to $244,596,614; number of depositors, over 700,000. There were also 4 loan and trust companies, with $1,700,000 of capital, and $6,924,270 of deposits. The number of fire and marine insurance companies was 124, with $52,197,870 of capital, and net assets aggregating $8,924,270. The number of life insurance companies in 1874 was 6, 4 of them mutual. The assets of the 6 companies amounted to $25,218,611, their total liabilities to $22,291,740, their total income to $6,749,554; amount insured by existing policies, $132,951,879, of which $90,000 was reinsured.

The population of Massachusetts 1790 was 575,787; 1810, 472,040; 1820, 610,408; 1830, 904,514; 1840, 1,231,066, 1870, 2,647,351, of whom 759,779 were males, 755,572 females, and 18,947 colored; with 759,844 were engaged in agriculture, 191,291 in professional services, 88,078 in trade and manufacture, and 293,605 in manufacturing and mechanical employments. Pop. '80, 1,753,012.

Massachusetts has always taken high rank in educational affairs. The school statistics of 1876-77 are: Number of public schools, 5,556; number of children between 5 and 15, 296,375; number in the schools, 307,832, number of male teachers, 1176; of female teachers, 7,344; teachers who have attended normal schools, 1898; average term of the schools, 8 months and 15 days; average monthly wages of male teachers, $82.22; of female teachers, $34.20; amount raised by taxation for the support of schools, $4,331,675; income of funds appropriated at the option of the towns for the same object, $39,229; amount of local school funds, $1,988,891; income of local school funds, $119,968; income of state school funds, $76,320; amount expended in building and repairing school-houses, 936,483; number of high schools, 216; number of incorporated academies, 44; average number of academy scholars, 3,939; number of private schools and academies, 853; evening schools, 92; total annual cost of public education, $3,582,519. There are 5 normal schools, one each at Framingham, Westfield, Bridgewater, Salem, and Worcester, and a normal art school in Boston. Total annual appropriation of the state for normal instruction, $76,000. The state school fund amounts to $2,067,581; the Todd normal school fund to $12,100; the agricultural college fund to $360,067. The institutions for collegiate and scientific instruction are numerous and of a high order of excellence. The oldest of these is Harvard college at Cambridge, founded in the infancy of the colony in 1636. The others, in the order of their organization, are: Williams college (Congregational), Williamstown; Amherst college (Congregational), Amherst; college of the Holy Cross (Roman Catholic), Worcester; Tufts college (Universalist), Medford; Boston college; Boston university (Methodist Episcopal); Mount Holyoke seminary for girls (Congregational), South Hadley; Soplin Smith college for women, Northampton; Wellesley college for women, Needham. The theological institutions are: Andover theological seminary, Andover; Congregational: Newton theological institution, Newton, Baptist; Harvard divinity school, Unitarian; New Church theological school, Waltham; Boston university school of theology, unsectarian (under Methodist auspices); Episcopal theological school, Cambridge; Tufts college divinity school, Universalist. There are 2 law schools, that of Harvard college and that of the Boston university. The schools of medicine are 6 in number, viz. Boston university school, Harvard medical school, New England female medical college, Boston dental college, Harvard dental school, Massachusetts college of pharmacy. The schools of science are 4 in number, viz. : Massachusetts agricultural college at Amherst, Massachusetts institute of technology in Boston, Lawrence scientific school at Cambridge, Worcester county free institute of industrial science. The number of professors and instructors in all these institutions in 1874 was 421, of students, 3,381; value of grounds and buildings, $4,962,700; amount of endowments, $8,314,173; income from productive funds, $469,676; aggregate number of volumes in libraries, 337,132.

The institutions for special classes are as follows: Clark institution for deaf mutes, Newton; Boston Boys' school for deaf mutes; Perkins institution and Massachusetts asylum for the blind, Boston; Massachusetts school for idiotic and feeble-minded youth, Boston, institution for education of feeble-minded youth, Barre; Hillside school, Fayville. The state provides for the deaf and dumb also at the American asylum for the deaf and dumb, Hartford, Conn. The reformatory, industrial and truant schools are as follows: State reform school, Westboro; state industrial school, Lancaster; Massachusetts infant asylum, Brookline; state primary school, Monson; Boston house of reformation: Lowell house of reformation: Plummer farm school, Salem; industrial school, Lawrence.
Massachusetts.

1860, 1856, 1852, 1854, 1856, 1858, 1860, 1862, 1864, 1867, 1869, 1870, 1871, 1872, 1873, 1874, 1875.

The number of libraries in the state, of all classes, was 3,169, of which 1,544 were public. The public libraries contained 2,010,609, and the private 1,007,204 volumes. There is reason to believe that these figures, too small at the time, might safely be doubled in amount now.

In 1875 the number of newspapers and periodicals in the state was 341, including 26 dailies, 222 weeklies, and 56 monthlies, with an aggregate circulation of 141,774,392 copies annually. According to the census of 1870 there were in the state 1845 religious congregations, 1764 church edifices, and $24,482,355 of church property. The principal denominations in order of members, are as follows—Congregational, Methodist, Baptist, Roman Catholic, Unitarian, Episcopal, Universalist, Christian, Friends, Spiritualist, Free-will Baptist, Swedenborgian, Episcopalian. The number of church-members was 5,020.

The state debt, Jan. 1, 1879, was $333,020,464; debts of cities and towns in 1878, $68,864,685. The cash value of real estate in 1874 was $1,289,308,763; of personal property, $542,292,402; total taxes, state, county, city, town, and highway, $28,700,605; number of dwellings in the state, 249,738.

The constitution is in substance that of 1780, with amendments adopted at different periods since. The governor, with the other principal executive officers, is elected annually by the people, and has a salary of $5,000. A council composed of 8 members elected annually by districts, gives him advice upon matters of official duty. The legislative power is vested in a general court, composed of a senate of 40 members and a house of representatives of 240 members, elected respectively by senatorial and representative districts. The councilors are paid $5 for each day's attendance, and $2 for every 10 miles' travel. Senators and representatives are paid at the same rate, and $1 for every 5 miles' travel from their homes. The election occurs annually, on the Tuesday following the first Monday in November, and the general court or legislature meets on the first Wednesday in January. The supreme judicial court consists of a chief-justice (salary, $5,500), and five associate justices (salary, $5,000 each). The superior court consists of a chief-justice (salary, $4,500), and nine associate justices (salary, $4,000 each). The judges of both these courts are appointed by the governor, with the advice and consent of the council, and hold office during good behavior. Slavery in Massachusetts was judiciously abolished at an early day, by the operation of a clause in the bill of rights of 1780.

In 1786 occurred the revolt known as "Shay's rebellion," in the western part of the state. It was occasioned by the poverty of the people after the revolutionary war, which made them impatient under taxation, and was soon suppressed, though not without some loss of life.

A survey has been made for a ship canal across Cape Cod, and the work of making it has already been commenced. When completed it will greatly shorten the distance by sea between Boston and New York, and enable masters of vessels to avoid some of the worst perils of the voyage as at present conducted.

The electoral votes of Massachusetts for president and vice-president of the United States have been cast as follows—1789, 10 for Washington and Adams; 1792, 16 for Washington and Adams; 1796, 16 for John Adams for president, and 13 for Pinckney; 2 for S. Johnston, and 1 for Oliver Ellsworth for vice-president; 1800, 16 for Adams and Pinckney; 1804, 19 for Jefferson and George Clinton; 1808, 19 for C. C. Pinckney and Rufus King; 1812, 22 for George Clinton for President, and 20 for Jared Ingersoll and 2 for Elbridge Gerry for vice-president; 1816, 22 for Rufus King and John E. Howard; 1820, 15 for Monroe for president, and 8 for R. Stockton and 7 for D. D. Tumpkins for vice-president; 1824, 15 for Adams and Calhoun; 1828, 15 for Adams and Rush; 1832, 14 for Clay and Sargeant; 1836, 14 for Webster and Francis Granger; 1840, 14 for Harrison and Tyler; 1844, 12 for Clay and Frelinghuyzen; 1848, 12 for Taylor and Fillmore; 1852, 13 for Scott and Graham; 1856, 13 for Premoni and Dayton; 1860, 13 for Lincoln and Hamlin; 1864, 12 for Lincoln and Johnson; 1868, 12 for Grant and Colfax; 1872, 13 for Grant and Wilson; 1870, 13 for Hayes and Wheeler; 1880, 13 for Garfield and Arthur.

Massachusetts Agricultural College, at Amherst, Mass., was opened for students in 1867. Its endowment was derived from the public lands appropriated for the purpose by act of congress in 1862, and the faith of the state is pledged for its maintenance and support. The endowment is estimated at $360,000, and the annual income is $16,000. The college possesses a farm of 400 acres, on which the various buildings, embracing extensive dormitories, laboratory, chapel, professors' houses, museum, conservatories, etc., are centrally located. The real estate is valued at $200,000.
Massachusetts.  
Masse.  
574

and the personal property of the farm at $6,000. The laboratory is extensive and fully equipped, and the natural history collection is very fine. The library contains 2,500 volumes. Number of professors in 1880, 6, of students, 100; of alumni, 160. It is specifically an agricultural college, and not connected with any other institution. Its course of study extends over a period of four years, and the graduates receive the degree of B.S. It has special courses to accommodate those who desire to pursue scientific studies related to agriculture, but are unable to spare time from the farm to take a full course. The number of such, to whom certificates have been given on leaving, is 500.

Every student is required to practice military tactics and drill three hours per week, and is taught the science and art of war by a government officer, who is a graduate of West Point. All students are required to labor six hours weekly on the farm, at the barn, in the orchards, vineyards, nurseries, or conservatories, for instruction in those departments, and wages are paid to those who desire to labor in order to earn the means for procuring an education. There is a postgraduate course for students who desire to become candidates for the degree of Ph.D.

MASSACHUSETTS BAY, an indentation on the eastern coast of Massachusetts, between cape Cod and cape Ann, 70 m. long and 25 m. wide, but including in its irregular form Plymouth bay, Cape Cod bay, and several others, with numerous small islands.

MASSACHUSETTS INDIANS. The Plymouth colonists, on their settlement in Massachusetts bay, found that part of the country populated by tribes of the Algonquin family, one of the three great aboriginal races of red men that inhabited the basin of the St. Lawrence, and a tract of country as far south as that portion settled by the Pilgrims. These tribes were five in number, the Massachusetts and Nausets, on Massachusetts bay and cape Cod; the Nipmucks, or Nipets, who dwelt in the central part of the colony which is now the state of Massachusetts; the Pennacocks, who extended north into New Hampshire; and the Pokanokets, or Wampanoags, who occupied the south-eastern part, and whose chief was the celebrated Massasoit. The new settlers speedily entered into friendly relations with these tribes, and as early as 1644 the Mayhews of Martha's Vineyard (q.v.), and in 1646 John Eliot had undertaken missionary labors among them. See Eliot, John. These efforts bore fruit, and in 1674 there were 600 converted Indians in Plymouth colony, 1500 in Martha's Vineyard, and 1100 in the Massachusetts bay colony. But though thus successful in conversion, the settlers had not been equally so in their general relations with the Indians, and in 1675 an irritated condition which had been gradually growing among the latter, culminated in the outbreak which has become known as king Philip's war. This trouble originated with Philip Metacomet, son and successor of Massasoit, under whom the Pokanokets or Wampanoags rose, and were joined by the Nipmucks, Narragansetts, and Pennacocks, until a general Indian war had ravaged all the settlements. In this situation not even the new religious faith which had been instilled into the natives acted as a preventive, and the converted Indians joined with the rest in a general onslaught upon the whites. The struggle lasted a year, and only ended with the death of Philip, Aug. 12, 1676. The Pennacocks retired northward, and the other tribes submitted; but it is on record that numbers of those who were captured were carried to the West Indies as slaves. From this time the Massachusetts Indians followed the general course of their race, dying out, or retiring before the white man, or assimilating with the latter or with the negroes. In 1681 a census showed the Indian and half breed population of the state to be 1610, of whom 306 were on Martha's Vineyard, at Christiantown and Gayhead; 438 at Mashpee and elsewhere on cape Cod; and the remainder scattered. The United States census of 1870 made return of only 150 Indians in the state of Massachusetts, so had the process of reduction, or of assimilation, progressed in nine years.

MASSACHUSETTS INSTITUTE OF TECHNOLOGY, in Boston, was founded in 1861 and went into operation in 1864. Its endowment consists of one-third part of the income derived by the state from lands appropriated for such purposes by congress in the act of 1862. It provides a series of scientific and literary studies, so arranged as to offer a liberal and practical education in preparation for active pursuits, as well as a thorough training for most of the scientific professions. The courses of a distinctively professional character are: 1. Civil and topographical engineering; 2. Mechanical engineering; 3. Mining engineering, or geology and mining; 4. Building and architecture; 5. Chemistry; Five other courses have been established, as follows: 6. Metallurgy; 7. Natural history; 8. Physics; 9. Science and literature; 10. An elective course. Each of these courses extends through four years, and for proficiency in any one of them the degree of bachelor of science is conferred. Special laboratories are provided for the instruction of women, the design being to afford them facilities for the study of chemical analysis, industrial chemistry, mineralogy, and biology. Instruction will be given to women on other subjects, also so far as suitable arrangements can be made for them. The particular course of study, which a candidate for the degree of doctor of science wishes to pursue, must be submitted to the faculty in writing, and must meet their approval. A knowledge of the Latin language is not required for admission, but strongly recommended for the better understanding of the terminology of the sciences. The school of mechanic arts affords instruction in carpentry and joinery, wood-turning, pattern-making, foundry work, iron-forging, vice-work, and machine tool work. Candidates for
a degree in physics take practical courses in microscopy, photography, lantern projections, and meteorology. The institute has 16 professors, 8 instructors, 8 assistants, and 248 graduates President, Wm. B. Rogers, LL.D.

MASSA DUCA'LÉ, or DI CARRA'RA, so called to distinguish it from the many towns of the same name, is a small city of northern Italy, 58 m. s.w. of Modena, and formerly capital of duchy of Massa-Carrara. Pop. 5,600. It is a bishop's see, has a public library a little library called a basilica, and a palace, or terraced. Massa stands in a beautiful situation, sheltered by a background of mountains, and surrounded by the plain and fertile country of the rivers Arno, Tagliamento, and seeking. In the middle ages the duchy of Massa was held by a succession of feudal lords, and passed to the house of Este, dukes of Modena, toward the close of the 15th century. Bonaparte invested his sister, the princess Eliza, with the principality of Massa and Carrara; but in 1829 it was reunited to Modena, and in 1860 became a province of the kingdom of Italy. Pop. '71, 161,994.

MASSAF RA, a t. of the Italian province of Otranto, 11 m. n.w. of Taranto, situated in a plain in the midst of hills more productive than salubrious. Pop. 9,100. Its site is partly that of the ancient Massapia, from which the whole district takes its name.

MASSA GETE, a nomadic people who inhabited the broad steppes on the n.e. of the Caspian sea, to the northward of the river Araxes or Jaxartes. Herodotus says that they had a community of wives; that they sacrificed and devoured their aged people; that they worshiped the sun, and offered horses to him; that they lived on the milk and flesh of their herds, and on fish; and fought on horseback and on foot with lance, bow, and double-edged axe. Cyrus is said to have lost his life in fighting against them, 530 B.C. Niebuhr and Böckh are of opinion that they belonged to the Mongolian, but Humboldt and others, to the Indo-Germanic or Aryan family.

MASSA LUBRENSE, a pleasant Italian t., 17 m. s. of Naples by sea. Pop. 3,600. Massa Lubrense stands amidst the loveliest scenery of Italy, and is built on a cliff projecting into the sea, and commanding a fine view of the bay of Naples. It dates from the early Greek period, and contains many remains of Roman antiquities. It is famed for the beauty of its women.

MASSA MARITTIMA, a t. in Italy, on the n.w. coast in the province of Grosseto, near the barren and unhealthy district of the Maremma; pop. 13,032. It has been a subject of dispute between the cities of Siena and Pisa, each having claims on the town, which is the seat of a bishopric formerly having a cathedral and a church, and composed of several contiguous villages. The coast in its vicinity is traversed by a railroad.

MASSARUNI, or MAZARUNI, RIVER, in British Guiana, takes its rise in the mountains of Venezuela, lat. 4° 30' n., long. 60° w., and flows in an extremely irregular course in a general n.e. direction until it joins the Guayuni (or Guyuni), through which it empties into the estuary of the Essequibo river. The river has been explored for several hundred m. and is marked by a number of small islands at its mouth, and by wild scenery and bold granite cliffs in its upper course.

MASSASOT, sachem of the Wampanoag or Pokanoket Indians. His territory at one time extended over nearly all the southern part of Massachusetts from cape Cod to Narragansett bay, and his tribe numbered 30,000, but at the time of the landing of the Pilgrims they had been reduced by disease to about 300. In 1621, Mar. 29, he visited Plymouth three months after it was founded, with 60 armed and painted warriors, for the purpose of making a friendly league with the white men. Governor Carver was so much pleased with the frank and friendly bearing of Massasoit, that on behalf of the colony he concluded a treaty of peace and mutual protection with the Wampanoags. This was sacredly kept for 50 years. Massasoit always remained friendly to the colonists. He resided in Pokanoket, or what is now the town of Bristol, R. L., where commissioners from the adjacent settlements often visited him. When Roger Williams was banished from Massachusetts, he was entertained on his way to Providence by Massasoit for several weeks. Although the English committee reported misgivings upon his lands and liberties, he was their friend; formerly having lived, imbued his people with the love of peace, and gave notice to the Pilgrims when they were in danger from other tribes. He had several sons, grandsons, and brothers. Before his death, which is supposed to have been in 1662, he had been induced to cede away at different times, nearly all his lands to the English. His two eldest sons, Wamsutta and Pometicom, or Metacomet, had English names, of which the following account is given: "After Massasoit was dead his two sons, called Wamsutta and Metacomet came to the court at Plymouth, pretending high respect for the English, and therefore desired that English names might be given them; whereupon the court there named Wamsutta, the elder brother, Alexander, and Metacomet, the younger brother, Philip." Massasoit was succeeded by his eldest son Alexander, who dying a few months after, Philip became by the order of succession head chief of the Wampanoags. These two sons, after their father's death, were regarded with much jealousy by the English, and were suspected of plotting against them; and Philip afterwards was distinguished by his wars with the English.

Masse, Gabriel, b. France, 1807; studied law and was called to the bar of Paris in 1833. He met with great success in his practice, but is best known as the author of a number of legal treatises and as editor of the Recueil des Arrêts. His best work, Lé
Droit Commercial dans ses Rapports avec le Droit des Gens et le Droit Civil was printed from 1844 to 1848 and republished in 1863. In 1874 he became a member of the academy of moral and political sciences.

MASENNA, a t. of St. Lawrence co., N. Y., pop. '70, 2,709, situated on the Grass and Racket rivers, and bounded on the n. w. by the St. Lawrence. The township comprises Massena Center, Massena Springs and the village of Massena. The three streams furnish abundant water power, and the chief industry is the milling of flour. The portion called Massena Springs is quite popular as a watering place and has four or five hotels.

MASENNA, André, Duke of Rivoli, prince of Essling, and a marshal of France, was born at Nice, May 8, 1758. In his youth, he served as a ship-boy in a small vessel, and afterwards 14 years in the Sardinian army, but left it because his plebeian birth precluded him from promotion. Early in the French revolution, he joined a battalion of volunteers, and soon rose to high military rank. In Dec., 1793, he was made a general of division. He greatly distinguished himself in the campaigns in upper Italy. After Jourdan's defeat at Stockach on Mar. 25, 1799, the chief command of the army in Switzerland devolved on him in circumstances of great difficulty, but he kept his ground against the archduke Charles, and finally, by his victory over the Russians at Zürich, Sept. 25, 1799, freed France from the danger of invasion. After the battle of Marengo, Bonaparte gave him the command of the army of Italy. In 1804 he was made a marshal of the empire. In 1805 he again commanded in Italy; and subsequently he signalized himself in the terrible contest for the village of Aspern (q.v.). In 1810 he was intrusted with the chief command in Spain, and compelled the British and their allies to fall back to Lisbon; but being unable to make any impression on Wellington's strong position at Torres Vedras, he resigned his command. He offered his services, however, again, when Napoleon was preparing for the Russian campaign, but was only intrusted with the command in Provence, and in this position he remained till the restoration, when he gave in his adhesion to the Bourbons, and was made a peer. On Napoleon's return from Elba, he invited Massena to follow him, but received no response. After the second restoration, Massena retired into private life. He died April 4, 1817.

Massena was one of the ablest of Napoleon's generals, but he was as extortionate as a Roman proctor. His master called him a robber, and is said to have offered him a present of 1,000,000 francs if he would give up peculation.

MASSEY, Gerald, b. in Herefordshire, 1828, of poor and illustrious parents who could give him no education. He was set to labor in a silk mill when 8 years old, and afterwards at straw plaiting. At 15 he found employment in London as errand boy, and got hold of a few books, among them Pilgrim's Progress, and Robinson Crusoe. At 17 he was in love, and began to write verses. But his themes embraced also the sufferings of the poor, and showed deep thoughtfulness and feeling concerning the inequalities of human condition. The French revolution of 1848 awakened in his mind the desire to contribute something to the amelioration of his own class through political efforts, and in company with fellow-workmen he started a weekly reform paper under the title of the Spirit of Freedom. The rev. Charles Kingsley and other prominent philanthropic political agitators of the time gave their council and aid, and called public attention to the poetic faculties of Massey. He afterwards became a lecturer on Spirituality in England, and in 1873 in the United States. The English government granted him a pension, and lord Brownlow presented him with a cottage in his native county, where he resides. His published works embrace The Ballad of Babe Christabel and other Poems, 1853; Craigrook Castle, 1856; Robert Burns and other Lyrics, 1859; Voices of Freedom and Lyrics of Love, 1859; Haweck's March, and other Poems, 1861; Shakespeare's Sonnets, never before Interpreted, 1866; and A Tale of Eternity, and other Poems, 1870.

Mассего, a mountain in the province of Terra di Lavoro, Naples, Italy, famous in ancient and modern times for the wines produced from its vineyards. On its southern slope is a town of the same name. It was here that Appius Claudius gained his victory over the Samnites.

Mассикот, a mineral, occurring in shapeless masses of a yellow color, brittle, with earthy fracture. Chemoically, it is protoxide of lead. It is used as a pigment.

Mассий, Nathaniel, 1763-1813; b. in Goochland co., Va.; at 17 years of age entered the revolutionary army; became a surveyor, and settled in Kentucky in 1783; removed to Manchester, Ohio, in 1790, and laid out the town of Chillicothe upon lands owned by himself; took part in the Indian wars of the northwest, gaining the rank of general of Ohio militia; was a member of the convention which framed the first constitution of Ohio in 1802; was often a member of the legislature, and served one term as speaker of the senate: was declared to have been elected governor in 1807, but resigned before entering upon office.

Массилла. See Марсель, ante.

Massillon, a city in n.e. Ohio, on the e. bank of the Tuscarawas river, and on the Ohio canal, connecting it with Lake Erie; pop. '74, 7,000. It is a junction of the Pittsburg, Fort Wayne and Chicago; the Cleveland, Tuscarawas Valley and Wheeling; and the Massillon and Cleveland division of the Cleveland, Mount Vernon and Delaware rail-
roads. It is the center of the famous coal fields of Tuscarawas valley, and has a prosperous community, engaged in farming and important industries and mining. In the vicinity are 3 quarries of white sandstone, which is largely exported. It is a shipping point for large quantities of grain, wool, butter, and beef. Its industries are represented by blast furnaces for pig-iron, rolling-mills, flour-mills, sash factories, machine shops, iron-bridge factories, paper-mills, the Russell mills for the manufacture of agricultural implements, the Massillon excelsior works, and the Massillon harvester works for the manufacture of machinery, sold extensively at the west. It has 3 newspapers, and a library for the use of members of the young men's Christian association. The first surveys for the township were made in 1826. It presents a fine appearance, being regularly built, and containing many residences and substantial public edifices, and is lighted by gas. It has a number of educational advantages, including a school supported by charitable people; 11 churches, 3 banks, 2 of which are national, and an opera house erected at a cost of $100,000.

MILL, MASSILLON, JEAN BAPTISTE, one of the most distinguished of modern pulpitorators, was b. at Hiéres, in France, June 24, 1663. His father, a notary, designed the boy for his own profession; and it was only after repeated and persistent efforts that Massillon obtained his father's permission to enter the congregation of the oratory in 1681. It was while he was engaged in teaching theology in one of the houses of the congregation in the diocese of Meaux that he made his first essay in the pulpit at Vienne. His funeral oration on M. Villars, the archbishop of Vienne, was eminently successful, and led to his being called by the superiors of the oratory to Paris, where he first had the opportunity of hearing Bourdaloue, whose style and manner, without being exactly taken by Massillon as a model, had great influence in forming the taste of the young aspirant. Like Bourdaloue, he avoided the declamatory manner and theatrical action then popular in the French pulpit; but the earnest impressiveness of his look and voice more than supplied the vigor and energy which other speakers sought from these adventitious aids. His course of ecclesiastical conferences, delivered in the seminary of St. Magloire, established his reputation. The criticism of Louis XIV., after his advent course at Versailles, that "when he heard other great preachers he felt satisfied with them, but when he heard Massillon he felt dissatisfied with himself," well expresses the characteristics of the eloquence of this great orator, who, more than any of his contemporaries, was able to lay bare the secret springs of human action, and to use the feelings and the passions of his audience as arms against themselves. He was again appointed to preach the Lent at Versailles in 1704; but although the king was again equally warm in his admiration of the preacher, Massillon was never afterwards invited to preach in the presence of this monarch; yet his funeral oration on the prince de Conti, in 1709, was one of the greatest triumphs of his oratory. Soon after the death of Louis XIV., Massillon, in 1717, was named bishop of Clermont, and in the same year was appointed to preach before the young king Louis XV., for which occasion he composed his celebrated petit carême—a series of ten sermons. It was not till 1719 that he was consecrated bishop of Clermont, in which year also he was elected a member of the academy; and in 1723 he preached the funeral oration of the duchess of Orleans, his last public discourse in Paris. From this time he lived almost entirely for his diocese, where his charity, gentleness, and amiable disposition gained him the affections of all. He died of apoplexy in 1742 at the age of 79 years. His works, consisting mainly of sermons and other similar compositions, were collected in 19 vols., by his nephew, and published in 1745-46. Later editions are those of Beaucé (4 vols. 1817), Mequignon (15 vols. 1818), and Chalandon (3 vols. 1847).

MILLINGBERD, FRANCIS CHARLES, 1800-72, b. in Lincolnshire, England, and educated at Magdalen college, Oxford. After graduating with high honors he entered the exclusive residence of South Ormsby in his native county (1825). In the Lincoln cathedral he was made a prebendary in 1847, and in 1852 chancellor. In addition to many papers and discussions on ecclesiastical subjects he was the author of Church Reform (1857), History of the English Reformation, Law of Church and State, and Lectures on the Prayer Book (1864).

MILLINGBERD, PHILIP, an English dramatist, was b. in 1584 at or near Wilton, it is supposed, the seat of the earls of Pembroke, of which family his father was a retainer. Of his boyish days, and of the place of his education, nothing is known. From his plays we are, however, certified that he was a classical scholar. He entered St. Alban's hall as a commoner in 1602, and quitted the university suddenly, and without obtaining a degree, on the occasion, it is surmised, of his father's death. After leaving Oxford his career cannot be clearly traced. He came to London, and wrote for the stage, sometimes on his own account, frequently—as was the fashion of the time—in conjunction with others. He produced many plays, the dates of which are obscure. He seems to have lived in straitened circumstances, and to have been of a melancholy turn of mind. On the morning of Mar. 16, 1640, he was found dead in his bed. He was buried in the church-yard of St. Saviour's by the hands of the actors. In the parish register stands the pathetic entry: "March 30, 1639-1640, buried Philip Millinger, a stranger."

Taken as wholes, Massinger's plays do not strike one much; their merits consist in detached passages. He was of a grave and serious mood, and his reflective passages rise into a rich elaborate music. His finest writing is contained in The Virgin Martyr, but his
best plays are The City Madam and the New Way to Pay Old Debts—the last of which has
even yet some slight hold on the stage. The best edition of his works is that by Gifford
(Lond. 1805, reprinted 1815).

MASSINISSA. See MASSINISSA.

MASSON, DAVID, b. Aberdeen, Scotland, 1822; educated at Marischal college,
Aberdeen, and the university of Edinburgh, became editor of a Scottish provincial
paper at the age of nineteen; went to London in 1844, remained a year, contributing to
 Fraser's Magazine and other periodicals. For two or three years he was in Edinburgh,
writing for periodicals. In 1847 he returned to London where he remained 18 years,
and while there was chosen professor of the English language and literature at the Uni-
versity college, London. He retired from this post in 1863, having been
appointed professor of rhetoric and English literature in the university of Edinburgh.
He contributed numerous articles to the Quarterly, British Quarterly, and the North
British Review, to the Encyclopaedia Britannica, and the English Cyclopedia, and in 1859—
69, was the editor of Macmillan's Magazine. To this he contributed an article on
Soferim, certain titles of which he has reprinted. His best-known papers are on Carlyle's Letter-Day Paragraphs; Dickens and Thackeray;
Rebelais; Literature and the Labor Question; Pre-Raphaelism in Art and Literature;
Theories of Poetry; Shakespeare and Goethe; Hugh Miller; De Quincey and Porn-tvriting.

He has published Essays, Biographical and Critical, chiefly on English Poets; Life of John
Milton; British Novels and their Styles; Recent British Philosophy, a Review with Criti-
cism, including some Remarks on Mr. Mill's Answer to Sir W. Hamilton; Chatterton:
A Story of the year 1779; Essays on Wordsworth, Shelley, Keats. In 1873 he published a
biography of the poet Drummond, entitled, Drummond of Hawthornden: The Story of his
Life and Writings: The Three Deeds—Luther's, Milton's, and Goethe's. His life of Milton
is of high authority.

MASSO RAH, variously derived from massar (to hand down to posterity—tradition),
and assar (to bind, to fix within strict limits), denotes chiefly a certain collection of critical
notes on the text of the Old Testament, its divisions, accents, vowels, grammatical
forms, letters, etc.; all the more necessary for the more accurate preservation of the
sacred documents, as, according to the early mode of Semitic writing, only the conson-
ants, and these without any stop or break, were put down; a proceeding which, in the
course of time, must naturally have produced a vast number of variants, or rather different
ways of reading and interpreting the same letters, by dividing them into different
words, or crowns, or accents. The origin of the Massorah, which, particu-
larly, an immutable reading upon each verse, word, and letter, put an end to the exercise of
unbounded individual fancy—which, for homiletical purposes alone, was henceforth free
to take its own views—is shrouded in deep mystery. The first traces of it are found in
certain Halachistic works treating of the synagogue rolls of the Pentateuch, and the
mode of writing them. Some of the earliest works on the subject have survived in their
titles only, such as The Book of the Crotons, The Book of the Sounds, etc., attributed to the
Soferim, or masters of the Mishna (q.v.). There can hardly be a doubt that the Masso-
rah, like the Halaeha and Haggrada, was the work, not of one age or century, but of
many ages and centuries, as, indeed, we find in ancient authorities mention made of dif-
f erent systems of accentuation used in Tiberias, Babylon (Assyria), and Palestine. It
was in Tiberias also that the Massorah was first committed to writing, between the 6th
and 9th centuries A.D. Monographs, memorial verses, finally glosses on the margins of the
text, seem to have been the earliest forms of the written Massorah, which gradually
expanded into one of the most elaborate and minute systems, laid down, in the "Great
Massorah" (about the 11th c.), whence an extract was made known under the name of the
"Small Massorah." A further distinction is made between Massorah textualis and
finialis, the former containing all the marginal notes; the latter, larger annotations, which,
for want of space, had to be placed at the end of the paragraph. The final arrangement of
the Massorah, which was first printed in Bomberg's Rabbinical Bible (Ven. 1555), is due
to Jacob ben Chajim of Tunis, and to Felix Pratensis. The language of the Massorah
is Chaldee, and besides the difficulty of this idiom, the obscure abbreviations, contrac-
tions, symbo lical signs, etc., with which the work abounds render its study exceedingly
hard. Nor are all its dicta of the same sterling value; they are not only sometimes
utterly superfluous but downright erroneous. Of its "countings," we may adduce that it
enumerates in the Pentateuch 18 greater and 45 smaller portions, 1594 verses, 65,467
words, 70,100 letters, etc.—a calculation which is, however, to a certain degree at vari-
ance with the Talmud. An explanation of the Massorah is found in Eliaj Levita's
(Massorah textualis and finialis) Masoroth Hamassoroth (trans. into German by Semler, Halle, 1772), and Buxtorf's
Tiberias (1825), a work abounding with exceedingly curious information on the text of
the Old Testament.

MAS SOWAH, or MASOUA, an islet and t. on the w. coast of the Red Sea, in lat. 15°
36' n., and long. 39° 21' e., close to the boundary between Nubia and Abyssinia. At
present it is politically connected with Nubia rather than with Abyssinia, being in the
possession of the viceroy of Egypt, and ruled by a governor appointed by him. The
island is of coral, the soil partly formed from the rock, partly from sand and broken
shells. It is only about a mile and a quarter in circumference, and is distant from the
main-land only about 200 yards. It is almost wholly occupied by the town, and contains
a pop. of about 8,000, mostly Arabs. The Abyssinian coast is very destitute of harbors, and Massowah is of great importance as a seat of commerce. It carries on a large trade by sea with Bombay and with the Arabian coast, particularly with Jiddah and Yembo; and a large trade also by caravans with Cairo on the one hand, and with Gondar and the whole interior of Abyssinia on the other. Caravans start at all seasons for Cairo and for Gondar; but most numerously in January, at the end of the rains, and in June, before the swelling of the waters. Wheat, rice, milate, durra, salt, tobacco, gunpowder, sugar, cotton and silk goods, scarlet cloth, glass-wares, arms, and hardwares are among the principal imports from the more distant parts of the world. From Abyssinia and the coasts of the Red Sea, Massowah receives and exports ivory, rhinoceros horns, wax, ostrich-feathers, tortoise-shell, myrrh, senna, pearls, etc. Massowah has all the worst characteristics of an oriental town. Its streets are mere lanes, and excessively dirty. Massowah was originally chosen as the place of debarkation of the British expedition to Abyssinia (1867), and the starting-point of its operations; but it was soon found unsuitable, and Annesley bay, about 15 m. further to the south—the deepest inlet on the Abyssinian coast—was chosen for that purpose instead.

**MAST**, an upright or nearly upright spar, resting on the keelson (q.v.) of a ship, and rising through the decks to a considerable height, for the purpose of sustaining the yards on which the sails are spread to the wind. It is usually in joints or lengths, one above the other, the lowest and strongest being the *mast* proper, distinguished by its position as the fore, main, or mizen mast. Above this come successively the *top-mast*, the *top-gallant-mast*, the *royal-mast*, and—though very rarely used—the *sky-scraper*. The full height of all the masts together, in a first-rate ship of war, was about 350 feet. As when a strong wind is blowing, the pressure upon the canvas carried by a mast amounts to many tons, the mast itself must be of great strength. In some modern vessels hollow iron masts are used, with great success, as being much lighter than those of wood; but the majority are of Norway fir of the best quality. In small vessels the mast is made of one tree; but it is considered stronger when "a made mast," that is, when constructed of several pieces riveted together, and strengthened by iron hoops. The mast is sustained, when fixed, by the shrouds, as supports on each side, by the *stay* (q.v.) in front, and the back-stays behind. See **MAST**.

**MASTER**, in the royal navy, was an officer ranking with, but junior to, lieuts., and charged with the details of sailing the vessel, under the general orders of the capt. In recent years the title has been changed to "navigating lieut.," the change of name carrying, in several particulars, an improved status. It is his duty to take charge of such of the ship's stores as are not under the pay-master; in short, he is the navigator and storekeeper for the vessel; as such, holding a most responsible and onerous position. For his assistants, he has the junior officers in his own department—the navigating sub-lieuts., navigating midshipmen, and navigating cadets—and the ship's quartermasters. The full pay of a navigating lieut., exclusive of store and other allowances, ranges from 12s. to 22s. a day; of a navigating sub-lieut., from 5s. to 7s. 6d.; and of a navigating midshipman, from 3s. to 4s. a day; while as alpha and omega, the staff-cap. has 22s. a day, and the navigating cadet, 1s. a day (which is, of course, meant merely for pocket-money).

In the merchant navy, the master of a vessel, usually by courtesy denominated the captain, is the officer commanding her. His duties comprise the maintenance of discipline, the sailing of the ship, the charge of her cargo, and many other mercantile functions. His responsibilities to the ship's owners are of course settled by distinct agreement, applicable to the special case. Towards the public, however, many acts of parliament determine his responsibility. The master is bound to come to a written agreement with each of his men, before sailing, as to the wages to be paid. He is bound to bring home and subsist (to the number of 4 for every 10 tons), seafaring persons—British subjects—who may have been cast away, captured by the enemy, or by other unavoidable accident left upon a foreign shore; for these he is granted head-money by the admiralty. The master is compelled to keep a proper log-book, and must produce it, with his ship's papers, on the requisition of the commander of a ship-of-war of his own nation. Masters of vessels of a certain size are required to obtain certificates of qualification from the board of trade. Certified masters are eligible for the Royal Naval Reserve (q.v.), with the rank of lieutenant.

**MASTER** (Ger. *meister*, Lat. *magister*, from *magis*), one who rules, governs, has servants under him. As a complimentary appellation of respect, it is prefixed to the Christian name and surname, or surname simply, contracted into Mr. in writing, and pronounced "Mister." The eldest son of a baron in the peerage of Scotland is generally known by the title of the "master of—," prefixed to his father's title of peerage.

**MASTER-AT-ARMS** is a petty officer on board a ship-of-war, charged with the care and instruction in the use of small arms, except as regards the marines. He is also employed in maintaining discipline, order, and cleanliness among the crew. His assistants in his duties are the "ship's corporals."

**MASTER of ARTS** (abbreviated M.A., and sometimes, particularly in Scotland, A.M.), is a degree conferred by universities or colleges. In the universities of England,
this title follows that of bachelor (q.v.). It is the highest in the faculty of arts, but subordinate to that of bachelor of divinity. A master becomes a regent shortly after obtaining his degree, and thereby obtains the privilege of voting in congregation or convocation at Oxford, and in the senate at Cambridge; and in the Scotch universities, of becoming a member of the general council. See Degree.

MASTER OF THE BUCKHOUNDS, an officer in the master of the horse's department of the royal household, who has the control of all matters relating to the royal hunts. A salary of £1500 is attached to the office, which is regarded as one of considerable political importance. The master of the buckhounds goes out of office on a change of ministry.

MASTER OF THE CEREMONIES, an office instituted at the court of England in 1603, for the more honorable reception of ambassadors and persons of distinction. The same term was afterwards extended beyond the court, by being applied first to Beau Nash, the famous "master of the ceremonies," or president of the amusements at Bath, and then to other persons exercising the same function in ordinary assemblies.

MASTER OF COURT is the title given in England to the chief officers under the judges, their duty being to attend the sittings of the courts during term, and make minutes of their proceedings. They also tax all the bills of costs of the parties arising out of the suits and matters before the courts. They are appointed by the chief judge of the court, and hold their offices for life during good-behavior. Masters in chancery were similar officers in the court of chancery, but were abolished, and the duties are now performed partly by the judge, and partly by the registrars.

MASTER OF THE GREAT WARDOBE, an officer at the court of England, who had, in former times, the superintendence of the royal wardrobe. The office existed from a very early period down to 1782, and was considered a position of great honor. Its duties are now transferred to the lord chamberlain.

MASTER OF THE HORSE, the third great officer of the court, who has the superintendence of the royal stables, and of all horses and breeds of horses belonging to the queen. He exercises authority over all the equerries and pages, grooms, coachmen, saddlers, and farriers, and has the appointment and control of all artificers working for the queen's stables. He is responsible for the disbursement of all revenues appropriated to defray the expenses of his department; but his accounts are audited and examined by the board of green cloth. He has the privilege of making use of the royal horses, pages, and servants, and rides next to her majesty on all state occasions. The office is one of great antiquity, and is considered to be a position of great honor. The master of the horse is appointed during pleasure, by letters-patent; but his tenure of office depends on the existence of the political party in power. The salary is £2,500 a year.

MASTER OF THE HOUSEHOLD, an officer in the lord steward's department of the royal household, whose specific duties consist in superintending the selection, qualification, and conduct of the household servants. He is under the treasurer, and examines a portion of the accounts. The appointment is during pleasure, and is not dependent on political party. The salary is above £1100 per annum.

MASTER IN CHANCERY, an officer of a chancery court, appointed to assist the chancellor. His duties, in general, are prescribed by statute. It is a common practice to refer causes to a master for hearing, particularly causes involving intricate accounts, and requiring computations. A master is often appointed to examine witnesses, to take depositions, to inquire into and report the facts of a case, to make settlements under deeds, to discharge special acts under the direction and in behalf of the court, etc. Masters in chancery were formerly clerks in chancery, 12 in number, with the master of the rolls at their head. They were at first called preceptors, and were not called masters, till the time of Edward III. The office has been abolished in England, where the duties formerly belonging to masters are discharged by judges or registrars. In most of the United States the office still exists, with the duties already described annexed to it, subject to statutory modification in the various states. In some states, officers with the same functions as masters in chancery, are called commissioners.

MASTER OF THE ROLLS, the president of the chancery division of the high court of justice in England, and in rank next to the lord chief-justice of England, and the lord chancellor. He was an ancient officer of the court, and was formerly the chief of the masters in chancery. He is the only superior judge in England who can now be elected to represent a constituency in the house of commons. The master of the rolls had originally the custody of the rolls or records; in the course of time this charge became merely nominal, the custody having vested in officers not in his appointment or control; an anomaly which was remedied by 1 and 2 Vict. c. 94, which restored the custody to him with extensive powers. The salary is £6,000 a year.

MASTER AND SERVANT. The relation of master and servant is constituted in Great Britain entirely by contract; for there being no status of slavery recognized in law, one person can only serve another with his or her own free consent. Being a mere contract, it may, like other contracts, be broken at will, subject only to the usual consequence that the party in the wrong is liable to pay damages for the breach. In England and Ireland the engagement or hiring of a servant may be either verbal or in writing; but if
the engagement is for more than one year, it must be in writing. If for an indefinite time, no writing is necessary. When a servant continues in the service after the first year, a renewal of the contract is presumed on the same terms. Sometimes it is difficult to say whether an engagement of an indefinite kind is by the year, or by the month or week; in such cases a material fact is how the wages were to be paid, for if they are paid weekly, the presumption will be that the hiring was by the week, unless there are other circumstances to show that a yearly hiring was meant. The difference between a yearly contract and a week to week contract is that if the servant is discharged without cause during the year, he is entitled to wages up to the end of the year; and on the other hand, if he leave without cause during the service, he is entitled to no wages at all.

A servant undertakes to have competent skill for the duties of the service, and is bound to use due diligence, and to conduct himself respectfully. He is bound to obey all lawful orders of his master during the engagement, if they are within the scope of the particular service for which he was engaged. Thus, a coachman is not bound to do the duties of a cook, and vice versa. Every servant is bound to take due care of his master’s property, and he is liable to an action at the suit of his master for gross negligence, and also for fraud and misfeasance. A master is not entitled to chastise a servant, whatever the age of the servant may be, though, in the case of an apprentice under age, a moderate chastisement is justifiable. The grounds on which a servant may be lawfully discharged are willful disobedience, gross immorality, habitual negligence, and incompetence. If any person entice away a servant and thereby cause loss to the master, the latter may sue such person for the injury. If the servant is a female, and is seduced, and thereby is unable to continue her service, the master may also sue against the seducer for any loss of service caused thereby; and on the same principle a master may bring an action against a third party who causes personal injury to the servant.

In the case of the bankruptcy of the master, a preference is given to the servant’s wages if due and unpaid, but this extends only to two months’ wages, and the servant is an ordinary creditor for the balance beyond that sum. The death of the master is a discharge of the contract; and in many cases the servant is not entitled to recover wages for the time actually served, though there is an exception as to domestic servants. If a servant is rightfully discharged he is not entitled to wages for the broken time since the previous periodic payment of wages; and so in the case of the servant’s death during the currency of the term, the servant’s executors cannot recover payment for the broken time; but it is otherwise in the case of domestic servants. When a servant falls sick the master is not bound to provide medical attendance whether the servant lives under his roof or not; but as in such cases a doctor is often sent for by the master without any express understanding between the parties, the master is frequently made liable on the ground that the doctor was sent for by and gave credit to the master. As a general rule, the servant takes the risk of all the ordinary accidents attending the particular service; and if he suffer from an accident met with in the course of the service, the master is not liable for the consequences, unless there was some personal negligence on his part. Thus, it often happens that servants are engaged in a manufactory or building where machinery is used and accidents frequently occur. Another case often occurs where two or three servants of the same master are engaged together, and one servant is injured by the negligence of another. In such a case the rule is that the injured servant can sue the master, except where the servants at the time were engaged in a common operation, and the latter case the servants are or ought to be a check on each other. In cases where a servant injures a third party, the rule is that the master is liable, provided the servant at the time was acting in the ordinary course of his duty, and within the scope of the master’s orders, expressed or implied. Hence, if a coachman carelessly run down a person on the highway, or do injury to another, the master is liable; but if the coachman was driving the master’s carriage without or contrary to the orders of the master, the servant alone is liable. So the master is not in any way responsible for the crimes or criminal offenses committed by his servant; yet sometimes he is involved in fines. The above are the general rules as regards servants generally; but in England there is a distinction in many instances observed between domestic servants and other servants. The leading distinction is that if nothing is said as to the length of service, it is presumed that the service can be terminated at any time, on giving a month’s notice on either side, or in case of the discharge of a domestic servant without notice, then on payment of a month’s wages. It is often popularly thought that a domestic servant cannot be turned out of the master’s house at a moment’s notice, even on paying a month’s wages, but this can always be done with or without cause. In case of discharge without cause, the servant is entitled to a month’s wages, but not board wages; she also gets wages only up to the master’s death. He is not compelled to give a character to the servant; it is entirely optional; but the servant must give one, otherwise an action will lie for defamation. But if a master without malice, and acting bona fide, gives an untrue character, he is not liable, for the communication is held to be privileged. If a master knowingly give a false character to a servant who is engaged by a third party on the faith of it, and robs such third party, the latter can sue the former master for the damages. Persons personating masters, and giving false characters, and servants using such false characters, are liable to be summarily convicted, and fined £50.

In general, a servant, if he refuse to enter the service, or leave it without cause, is
merely liable to an action of damages for breach of contract, which is no remedy at all, as few servants are worth the expense of a suit. As this conduct, however, might often cause great hardship to masters, especially where they are employed in trade or manufactures, statutes have been passed which give a power to justices of the peace to compel the servant to remain in the service until he give the legal notice to leave. This was formerly done by punishing the servant who left the service without just cause by imprisonment. This law, complained of by workmen as one-sided, was modified by the employers and workmen act (1875), which gives county courts enlarged powers in regard to payment of money, rescission of contract, and taking of security as between employers and workmen; and by the conspiracy act (1875), which, while deciding that in trade disputes no combination shall be indictable if the act contemplated done by one person would not be so, makes special criminal provision in case of persons employed by gas and water companies.

In Scotland the law as to master and servant differs from the above in several particulars, of which the following are the most important. With regard to domestic servants, in towns, if nothing is said, then the hiring is for half a year, and cannot be put an end to without 40 days' warning before the end of the half year; and if the servant is dismissed without just cause, he or she can claim not only wages but board-wages till the end of the term. In case of the master's death the servant can claim wages for the whole of the current term, but is bound in that case to serve the executors, or look out for another situation. In case of the master's bankruptcy the servant is a privileged debtor for the wages of the current term. In most other respects the law as to servants is the same as in England. The statutes enabling justices of the peace to imprison defaulting workmen and artificers have been modified.

MASTER AND SERVANT. [From Supplement.] The act 30 and 31 Vict. c. 141, called the master and servant act, 1867, having caused profound dissatisfaction among workmen, a royal commission was appointed to investigate and report. The first two sections were found to be objectionable because they conferred a power to inflict simple imprisonment as the penalty for breaking a purely civil contract. The 14th section was found to be equally open to objection, as it authorized imprisonment for three months, with hard labor, in cases of an exaggerated character. Upon the above report are based the existing acts—the employers and workmen's act (38 and 39 Vict. c. 90) and the conspiracy and protection of property act (id. c. 86)—which repeal that of 1867, and came into force on Sept. 1, 1875. The first act, which is divided into five parts, empowers county courts, in respect of disputes between employers and workmen, to make orders of payment of money; to set off one claim against another, whether liquidated or unliquidated; to rescind any contract, and to accept in room of damages security for so much of the contract as remains unperformed. A court of summary jurisdiction may exercise all the powers as above when the sum in dispute is under £10. Disputes between master and apprentice may also here be tried as to indentures or contracts. The term 'workman' in this act does not include a domestic or menial servant, but any person engaged in manual labor, under or above 21 years of age, who has entered into or works under a contract for his employer. It does not apply to seamen or apprentices to the sea service. The second or conspiracy act, in relation to trade disputes, declares that in an agreement or combination of two or more persons they cannot be indicted for conspiracy to do that which if done by any one singly would not be punishable. The law of 1867 made punishable by act of parliament, nor alter the law as to riot or unlawful assembly. But crime under this section is defined as an offense punishable either on indictment or summarily, by imprisonment, either absolutely, or as an alternative for some other punishment. The imprisonment is limited to three months. Workmen breaking a contract in connection with the supply of gas or water are liable to conviction either summarily or on indictment, and the offense is punishable by a fine of £20, or imprisonment for three months, with or without hard labor. Willful breach of contract or of hiring, with the probable consequences of danger to human life, incurs a penalty of £20, or imprisonment for three months with or without hard labor. Should a master who is legally liable to provide food, clothing, etc., for a servant or apprentice neglect to do so, he incurs a penalty not exceeding £20. The offender may be tried and may be indicted. The parties, and their husbands and wives, are competent witnesses. In Scotland proceedings may be on indictment either in justiciary or sheriff court.

MASTER AND SERVANT (ante). In the United States the common-law rules governing this relation have been modified by statutory enactment in a very slight degree only. The law of contracts almost always governs without being restrained by legislation arising from class distinctions or rank. The principles of common law apply in this country more completely than in England, where there are many special statutes on the subject. The terms master and servant are used in more than one sense, and may indicate a relation of service in fact, or such a relation existing only by construction of the law. As applied to domestic service and apprenticeship there is little of importance to be said. The latter relation is now not very common in this country, and the legal principles applicable have long since been well settled. When the words are used in a broader sense the relation indicated is often very like that of principal and agent, and
the general laws of agency apply. The law of this country recognizes no distinction between the hiring or liability of domestic or agricultural servants and others. In the contract there must be mutual engagements, but they need not necessarily be co-extensive. Thus the servant may agree to serve for a year without binding the hirer to retain him for the contract that period. The contract of service comes under the statute of frauds, and should, therefore, be in writing if for more than one year. If the contract be "entire," that is, for the whole of a definite period, the servant cannot recover unless he serves for the whole time. The master may dismiss for refractory or immoral conduct, and can sue his servant for damages incurred by refusal to perform his duties. On the other hand, if after contract made the master refuse to furnish work, the servant may sue for the whole amount of his wages if he present himself at the proper time in readiness to perform. Thus an opera singer may sue a manager for full contract salary, though the singer may never have been allowed to sing a note. The liability of the master to his servants for damages incurred from one another while in his employment can be based only on neglect by him to furnish proper tools or the willful hiring of incompetent persons. But it has been held, in Davis vs. Detroit R.R. Co., 20 Mich., 105, that though a servant was injured by the negligence of a very incompetent fellow-servant, yet he could not recover because, being aware of the incompetence, he voluntarily took the risk. See also 3 Cushing, 270, and 20 Barber (N.Y.), 449. But if the service is of its very nature dangerous, and the servant undertakes it knowingly, he can have no remedy for injuries. More important are the distinctions as regards the liability of the master to third persons for the acts of his servant. The principle which governs is based upon the control or non-control of the latter by the former. The general rule is that the master is liable for all tortuous acts done by a servant when in his service and acting within the scope of his proper employment. A general contractor, however, is not under the control of his employer; and, therefore, the latter is not liable for his acts. But in the case of corporations and particularly in railroad cases the courts of the several states have, from motives of public policy, seen fit to consider the corporation as in fact itself present in the persons of its servants. Again, it was formerly held that a master could not be liable for the willfully wrongful act of his employee, when not acting under direct authority; but in 39 Miss., 242, a railroad was held responsible for the willful and wanton act of an engineer; and the tendency of modern cases is strongly towards enlarging the limits of the doctrine of respondeat superior as applied to great corporations which assume extraordinary powers and hold human life and immense property interests in their hands. But notice of want of authority in servants by the superior officers of a railroad will relieve them of liability for the acts of such servants. In 14 Howard, 468, it was held that it made no difference that an inferior disobeyed orders of a superior, provided that he was acting strictly within the scope of his own employment, and the company was held liable. The relations of employer and employed in the railway system have been productive of the most important discussions and decisions as regards the law of master and servant which have arisen in this country. See Redfield on Railways.

MASTER SINGERS. See MINNESINGERS, ante.

MASTERWORT, Paeonraum ostrichium, a perennial plant of the natural order umbellifera, having a stem from 1 ft. to 2 ft. high, broad bi-ternate leaves, large flat umbels of white flowers, and flat, orbicular, broadly margined fruit. It is a native of the n. of Europe and the n. of America, and is found in moist pastures in some parts of Britain, but apparently naturalized rather than indigenous, its root having formerly been much cultivated as a pot-herb, and held in great repute as a stomachic, sudorific, diuretic, etc.; its virtues being reckoned so many and great that it was called dictum remedium. It still retains a place in the medical practice of some countries of Europe, although, probably, it is nothing more than an aromatic stimulant. The root has a pungent taste, causes a flow of saliva, and a sensation of warmth in the mouth, and often affords relief in toothache.

MASTIC, a species of gum-resin yielded by the mastic or lentisk tree (pistacia lentiscus, natural order terebinthaceæ). It oozes from cuts made in the bark, and hardens on the stem in small round tear-like lumps of a straw-color, or if not collected in time, it falls on the ground; in the latter state it acquires some impurities, and is consequently less valuable. The chief use of this gum-resin is in making the almost colorless varnish for varnishing prints, maps, drawings, etc. It is also used by dentists for stopping hollow teeth, and was formerly used in medicine. It is imported from small quantities, chiefly from the Morocco coast, but some is occasionally brought from the s. of Europe. The name of mastic is also given to oleaginous cements, composed of about 7 parts of litharge and 93 of burned clay, reduced to fine powder, made into a paste with linseed oil.

MASTIFF, a kind of dog, of which one variety has been known from ancient times as peculiarly English, and another is found in Thibet. No kind of domestic dog has more appearance of being a distinct species than this, and it shows little inclination to mix with other races, although the English mastiff has been in part crossed with the stag-hound and blood-hound. The English mastiff is large and powerful, with a large head, broad muzzle, large, thick, pendulous lips, hanging ears of moderate size, smooth hair, and a full but not bushy tail. It is generally from 25 to 28 in. high at the shoulder,
Mastodon. \\
Mat.

but a still greater size is sometimes attained. The mastiff is very courageous, and does not flee even from the lion, for which three or four of these dogs are said to be a match. The Gauls trained British mastiffs and employed them in their wars. The mastiff is now chiefly valued as a watch-dog, for which no dog excels it; and whilst it faithfully protects the property intrusted to it, it has the additional merit of refraining from the infliction of personal injury on the invader. It becomes much attached to its master, although not very demonstratively affectionate; it is excelled by many kinds of dog in sagacity. The English mastiff is usually of some shade of buff color, with dark muzzle and ears. The ancient English breed was brindled yellow and black. The Mastiff or Tintet is still larger than the English; the head is more elevated at the back; the skin from the eyebrow, forms a fold which descends on the hanging lip; the hair is very rough, and the tail bushy; the color mostly a deep black.

Mastodon, a genus of fossil proboscidian pachyderms, nearly allied to the elephant, but with simpler grinding teeth, adapted for bruising coarser vegetable substances, or perhaps fitted for an animal of more omnivorous character than its modern representative. The teeth were roughhills mamilillated, hence the name, meaning tooth-tooth. Eleven or twelve species have been described from the miocene, pleistoce, and pleistocene strata in Europe, Asia, and America.

Mastodon (ante). The mastodons are distinguished from the elephants principally by their dention. As in the elephants, the upper incisors grew from permanent pulps and constituted the tusks. In most cases, moreover, the mastodons have lower incisors, and these often formed short tusks, which, however, usually disappeared in the adult. But the more important distinction is found in the molar teeth, which are more numerous in the mastodon, and have nipple-shaped tubercles. These tubercles are in rows, the number of which varies in different species. For this reason Dr. Falconer divided the mastodons into two principal sections, trilophodon and tetralophodon. In trilophodon are mastodon giganteus, of the post-pliocene of North America; M. tapiroides and M. angustidens of the miocene, in which there are three rows of tubercles. In tetralophodon are M. latidens and M. longirostris of the mocene, and M. arceornis of the pliocene, in which the molars have four rows of tubercules. In M. scelarasis from the upper mocene of India the molar teeth have five rows, and the last six rows of tubercules. For this Dr. Falconer proposed the name of pentalophodon. The distribution in time of the mastodon differs in the two hemispheres. In Asia and Europe the genus commenced in the post-pliocene, and the mastodonts of many species and genera were discovered. Their horns of the same period. The mastodon giganteus of North America ranged from Canada to Texas. The most complete skeleton perhaps which has been found was discovered in 1845 at Newburg, Orange co., N. Y., in a swamp usually covered with water, and described by Dr. J. C. Warren, of Boston, in which city the skeleton now stands. In this specimen the cranium is flatter than in the elephant, narrow between the temporal fossae, the face becoming much wider below the nasal opening. The temporal fossae are very large, indicating great power in the muscles of the jaws. The cervical vertebrae have short spinous processes, except the last, which is 6 inches. The spinous process of the third dorsal vertebra is 28½ in. long, the others gradually becoming less, the last being 4 inches. The first lumbar vertebra measures, across the transverse processes, 17 in., the body measuring 5 inches. The sacrum consists of five bones and is 20 in. in length on the lower side. The same number of bones and a very strong blade occurred in the commencement of the tail. There are 20 ribs, 13 true, and 7 false or of lower order. The first one is 28 in., and the ninth, the longest, 54½ in. long; the last is 21 inches. The shoulder-blade is more nearly equilateral than in the elephant, and the glenoidea cavity, for the reception of the head of the humerus, is 11 by 5 inches. The humerus is 39 in. in length and the same in its largest circumference. The circumference of the elbow joint is 44 inches. The radius is 29 in. long and 6½ in. wide at the lower end; the ulna larger and 34 in. long. The foot is nearly 2 ft. broad. The thigh-bone, about the length of the humerus, is 17 in. in circumference at the middle and 30 in. at the lower end; the knee-pan is nearly globular; tibia 28 in. long, 30 in. in circumference at the upper end where it articulates with the thigh-bone, and 13½ in. at the middle. The skeleton is 11 ft. in height and 17 ft. long from end of face to commencement of tail, which is 6 ft. 8 in. long. The circumference of the skeleton around the ribs is 16 ft. 5 in., and the tusks are 11 ft. long. 8 ft. 8 in. projecting beyond the sockets. About 30 species of mastodon are described by Dr. Warren in his work The Mastodon Giganteus of North America, 2d ed. 4to, Boston, 1855. A species similar to the giganteus existed during the same time in South America; also species belonging to the European type.

Mastodontaurus. See Labyrinthodon, ante.

Masts, Iron and Steel. As far back as 1838, the city of Dublin steam-packet company had a steamer with hollow iron masts, the masts acting also as ventilating funnels for the caldrons. From that time, iron has been frequently used in sailing-ships as well as in steamers. The plan has usually been to make them of plates bent to the proper curvature, jointed by internal strips, and strengthened by an internal cross flange of plates secured by angle-irons; but sometimes the plates are lapped. The plates vary from 3/8 to 5/8 in. in thickness. Mr. Grantham (Iron-shipbuilding) states that
Iron masts are lighter and stronger than timber masts; and when compared with the built-up masts of large vessels, are rather less expensive. For vessels of the same tonnage, the difference of weight is nearly two to three in favor of iron.

Iron is used for yards as well as masts. An iron yard was made in 1847 for the Australian clipper-ship Schonberg, 112 feet long, and varying in diameter from 14 to 28 in.; it weighed 73 tons. It was calculated that a timber yard of the same size would weigh 121 tons. Iron masts have since that time been employed in many ships in the royal navy, made of three vertical ranges of plates bent to the required curvature, with batt joints, and riveted to three T-irons which cover the joints on the inside.

Capt. Cowper Coles (drowned in the Captain, a martyr to his own inventiveness, 1870), the inventor of the turret system for war, introduced tripod iron masts. The real mast is strengthened and upheld by two others, the three forming a tripod. The central tube, or real mast, is carried up to form the topmast; while the side tubes are carried up only to the height of the lower yard. The main tube rests upon the keelson; while the side tubes, which are on either side of it and behind it, rest upon parts of the bottom-framing; but all three are fastened to the deck as they pass through. The lower mast only forms the tripod, and is self-supporting, without shrouds, etc.; the topmast is secured with stays, backstays, and out-riggers. Capt. Coles enumerated many advantages which he believed this construction to possess.

Since the use of steel in shipbuilding has become recognized, the employment of the same metal for masts has engaged attention: steel plates, we know, can now be made almost as easily as plates of iron; and it becomes a question of increased efficiency against increased cost as to which metal shall be adopted. Steel being a stronger metal than iron, masts of equal strength would weigh less if constructed of the former than of the latter metal. The ship, not altogether unfounded distrust felt towards steel in the present state of its manufacture, has prevented its adoption from making such rapid progress as it was once thought it would. Actual use in war and in stormy weather will be necessary, however, to determine all the relative advantages of iron and steel for masts.

The subject of the stability of iron masts is treated with much fullness by Mr. Lampert, in a paper read before the Institute of Naval Architects in 1863.

MASUDI, or AL MASUDI (ABUL HASAN ALI BEN HUSEIN BEN ALI), b. Baghdad, 9th c. descended from the great family of the Abbãdallah-âen-Malik, one of whose members had attended Mohammed, on his flight to Medina. Masudi early devoted himself to profound studies, to which he added by prolonged travels in Spain, Russia, and throughout the east. In the year 303, of the hegira, he was in China, where Arabic colonies already existed: thence he passed through Arabia and Persia to the Caspian sea. Thirty years later, we find him in Syrin, and the second edition of his Golden Meadows, his last work, was written in Egypt. He is supposed to have died at Cairo, in the 345th year of the hegira, A.D., 966. He was a most voluminous writer upon a great variety of subjects, and no Arabian author enjoys a higher reputation with his countrymen. He was a geographer, a philosopher, a student of religions, to whom Confucianism and Christianity were as familiar as Mohammedanism, and a historian acquainted with the ancient and modern history of the east and west. His History of the Times, a history of all nations, has never been printed. A manuscript of it in twenty quarto volumes is in the library of the mosque of St. Sophia. His Book of the Middle, devoted largely to geographical inquiry, is known in Europe, only by quotations from it in Arabic writers. As his other works were in some part lost, or never written down, the volumes which he published were a series of extracts from the History and Book of the Middle, and published them, with some additions, under the title of Meadows of Gold and Mines of Gems. This work contains a general view of the political, religious, and social history of the most important Asiatic and European countries; and it includes a treatise on their geography. A partial translation of the Meadows, appeared at London, in 1841, from the pen of Dr. Aloysius Sprenger, and as El Masudi's Historical Encyclopaedia; and there is a French translation called Les Prairies d'Or, by Durenburg. Among Masudi's often quoted works, but existing in manuscript only, are The Book of Consideration, which treats of the order of succession to the Khalifat; the treatise On Sincerity, which gives an account of the various Mohammedan sects, and a treatise on The Principles of Religion. Dr. John Nicholson published in 1840 An Account of the Establishment of the Fatimite Dynasty in Africa, from a manuscript ascribed to Masudi.

MASULIPATAM, also called KISTNA or KRISHNA, a maritime district of British India, in the government of Madras, Area, 8,036 sq. m.; pop. '71, 1,452,374. Along the shore to a distance of 40 or 50 m. inland, the surface is exceedingly low, lower in some places than the shore itself, and the beds of the Kistnah and the Godavary, the chief rivers. The commercial crops are chay-root, indigo, tobacco, and cotton. Chief town, Masulipatam, on a wide bay, in lat. 16° 13' n. Pop. '72, 30,189, who carry on cotton manufactures to some extent.

MAT—MATTING, a product of the manufacture of diverse materials, multiform in shape and varied in design, for purposes differing with the climate and habits of the people where they are made. Flags, rushes, straw, cocoa-nut, and other palm-fiber, grass, rattan, the strands of rope, and the inner bark of trees are used. Some are of primitive pattern and rough workmanship, for the promotion of neatness in the home as a door-mat, to recline on for lack of a bed, for sails instead of canvas, and for doors.
and windows. In recent, more refined development of the art, such rude fabrics have served only for protection in moving household and other goods, or preserving trees and plants from the severity of the weather. The manual process of plaiting fibrous material into mats is understood to be the rudimentary intertexture which has resulted—after passing through many gradations growing out of the luxurious habits of the Turks and Persians, and the need of the Mussulman for a portable mat to kneel upon—in the formation of textile fabrics out of threads and yarn, the almost fabulous product of the looms of Persia and India. Rush mats were used in palaces during the reign of queen Mary and queen Elizabeth, even after the importation of carpets from the east, and lord Bacon, in describing a reception at which he was present, refers to a chair with "a table and carpets before it," meaning small carpets or rugs, which were then imported and considered very choice, straw and rushes being good enough for common wear. The first departure from this primitive manner of weaving was the insertion with the fingers of little tufts of woven yarn between the threads of the warp. The same painfully slow process is employed at the present day in the manufacture of the famous Gobelin tapestries. In the South Sea islands the grass-mats made by the natives are noted for fine quality and brilliancy of coloring. In Japan a peculiar kind of rush is found, soft and elastic. In China floor-mats are made of a kind of grass cultivated in the south, and table-mats are made of rattans and rushes; the familiar Canton matting and Japanese mats being also made of rushes. In Spain and Portugal they are made from reeds and rushes, and in Russia the manufacture is a branch of common industry. It is used for packing all their exports, and is made of the bark of the lime or linden tree, sometimes called "bast," which calls the whole people into the woods in the early summer to collect the bark, especially in the domains of Viatka and adjoining districts. The last trees of n. Europe (the linden or basswood of the United States), used also in the culture of bees, supply an inner bark, which, made into strands and woven and twisted into the required form, are called bast mats or Russia matting. The mats are usually from 1½ to 2 yards square, and are of great importance in the manufacture and exports of Russia. The importation in one year amounting to 14,000,000 mats. In America bast from the linden is sold for tying plants in grafting. In Russia the bast is prepared by steeping the bark in water for a few days, taking it from young and tender trees. After the steeping process its layers readily come apart, and are used for different purposes according to their texture. In Spain and Portugal esparto grass, a species of rush found in the s. of Spain, is used principally for the manufacture of cordage, but is said to make beautiful mats. Sugar and grain imported from the Mauritius comes packed in mats made of leaves. India matting is woven from papyrus cymbiform, according to Simmonds, by others said to be papyrus Pangorei, a kind of sedge resembling grass, but with a solid stem.

**MATADOR** (Spanish, "slayer"). See BULL-FIGHT.

**MATAGORDA,** a co. in s.e. Texas, having the gulf of Mexico for its s. and s.e. boundary, the Matagorda bay in the extreme s., and Live Oak bay in the s.e.; drained by the navigable Colorado river, flowing through it centrally and emptying into Matagorda bay; 1300 sq. m.; pop '80, 3,940—3,725 of American birth, 2,520 colored. It is bounded on the e. and s.e. by San Bernard creek. Its surface is generally level, and has a good supply of timber, oak, and cedar; the pecan, hackberry, and other tropical trees grow on the river banks, the alluvial soil of which as well as the rich sandy soil of the level prairies, furnishes nutrition grass, and produces corn, tobacco, cotton, wool, sweet potatoes, butter, and sugar cane. Seat of justice, Matagorda.

**MATAGORDA**, a sea-port and bay on the gulf of Mexico, at the mouth of the Colorado river, Texas, United States of America, 80 m. w.s.w. of Galveston, an important outlet of a country rich in cotton, sugar, rice, etc. The town was destroyed by a storm in 1834, but has been rebuilt, and contains a population of about 2,000.

**MATAGORDA ISLAND,** a long, sandy island in Calhoun co., Texas, separating Espiritu bay from the gulf of Mexico; lat. 28° 20' 49" n., long. 96° 23' 30" west. On its northern end, near Pass Cavallo, is an iron light-house with a flashing light.

**MATAMORAS,** a river-port of Mexico, in the department of Tamaulipas, is situated on the s. bank of the Rio Grande, 40 m. from the mouth of that river in the gulf of Mexico. Pop. 30,000. The chief exports are specie, hides, wool, and horserides; the chief imports, manufactured goods from Great Britain and the United States.

**MATAMOROS, MARIANO, 1770-1814:** of Mexican birth; very little is known of his early life or education. He is first heard of as a priest at a small village called Jaltecolco, in the district of Cuernavaca, but in 1811, aroused by the constant atrocities and insults of the Spanish troops, he joined the army of insurgents under command of the patriot, Morelos. By him he was given the rank of col., and took a most important part in the battles of Cuautla (1812), Oaxaca, and most notably at the victory of San Augustin del Palmar (1813), which was due almost entirely to his military genius. Had his nominal superiors relied implicitly on Matamoros' judgment as a gen., the issue of the revolution might have been reversed; but rashly attempting the attack on Valladolid, the Mexican leader's forces were routed and "the right hand of Molero," as Matamoros was popularly named, captured and shot at the city of Valladolid, Feb. 13, 1814. His
name has been bestowed on the large city of Matamoros, on the banks of Rio Grande, and upon many smaller towns and districts of the country. By the historians of the time he is regarded as, of all the revolutionary leaders of the period, the one best fitted, from a military point of view, to command success.

MATANZAS, a fortified t. and sea-port on the n. coast of the island of Cuba, 55 m. e. of Havana, with which it is connected by railway. It is situated in an exceedingly rich and fertile district, has an excellent, well-protected harbor, and a pop. of 36,000. After Havana, it is the most important trading place on the island.

MATAPAN, CAPE. See CAPE MATAPAN, ante.

MATARO, a flourishing city and seaport of Spain, in the province of Barcelona, 174 m. n.e. by railway from the city of that name. There are here cotton-spinning mills, several of which are driven by steam, sailcloth factories, tanneries, several iron-foundries. Pop. 17,500. At the harbor, there are docks, at which ship-building is carried on.

MATCHES, pieces of various inflammable materials prepared for the purpose of obtaining fire readily. One of the first forms of this useful article was the brimstone match, made by cutting very thin strips of highly resinous or very dry pine-wood, about 6 in. long, with pointed ends dipped in melted sulphur; thus prepared, the sulphur points instantly ignited when applied to a spark obtained by striking fire into tinder from a flint and steel. This was in almost universal use up to the end of the first quarter of the present century, when several ingenious inventions followed each other in rapid succession, and dispelled it so completely that it would be now very difficult to purchase a packet of brimstone matches. The first of these inventions was the "instantaneous-light box," which consisted of a small tin box containing a bottle, in which was placed some sulphuric acid with sufficient fibrous asbestos to soak it up and prevent its spilling out of the bottle, and a supply of properly prepared matches. These consisted of small splints of wood about 2 in. long, one end of which was coated with a chemical mixture, prepared by mixing chlorate of potash, 6 parts; powdered loaf sugar 2 parts, powdered gum-arabic, 1 part; the whole colored with a little vermilion, and made into a thin paste with water. The splints were first dipped into melted sulphur, and afterwards into the prepared paste. They were readily inflamed by dipping the prepared ends into the sulphuric acid. There were several disadvantages in this invention, especially those arising from the use of so destructive a material as sulphuric acid, which also had another drawback: Its great power of absorbing moisture soon rendered it inert by the absorption of moisture from the atmosphere. The lucifer match succeeded the above, and differed materially: the bottle of sulphuric acid and all its inconveniences were dispensed with; the match was either small strips of pasteboard or wood, and the inflammable mixture was a compound of chlorate of potash and sulphuret of antimony, with enough of powdered gum to render it adhesive when mixed with water, and applied over the end of the match, dipped as before in melted brimstone. These matches were ignited by the friction caused by drawing them through a piece of bent sand-paper. So very popular did these become, that although they have since passed away like their predecessors, they have left their name behind, which is popularly applied to other kinds since invented. Next to the lucifer in importance was the congreve, which is the one generally used at present. The body of the match is usually of wood, but some, called vestas, are of very thin wax-taper. The composition consists of phosphorus and niter, or phosphorus, sulphur, and chlorate of potash, mixed with melted gum or glue, and colored with vermilion, red-lead, umber, soot, or other coloring material. The proportions are almost as varied as the manufacturers are numerous. The congreve match requires only a slight friction to ignite it; for which purpose the bottom or some other part of the box is made rough by attaching a piece of sand-paper, or covering it, after wetting it with glue, with sand. Amidou, or German tinder, is largely made into congreve matches or fusees, as they are often called, for the use of smokers to light their pipes or cigars. One of the latest and best introductions is that of Bryant and May, which is properly called the "special safety match." With every variety of lucifer and congreve, there are certain dangers attending the use, for in both a slight friction will ignite them, and as, from the very nature of their application, they are apt to be carelessly thrown about, they are consequently exposed to the risk of accidental friction, and have doubtless been the cause of numerous and serious conflagrations. The congreves are exposed to further risks of accidental ignition arising from the employment of phosphorus, which, from its very inflammable nature, will ignite spontaneously if the temperature is a little higher than ordinary. The match of Messrs. Bryant and May, although a new introduction, was invented in Sweden, under the name of the Swedish safety match, by a Swede named Landström— a large manufacturer of matches at Jönköping, in 1853 or 1856, and patented in this country by the firm above mentioned. The only essential difference from the congreves is in leaving out the phosphorus from the composition applied to the match, and instead, mixing it with the sand on the friction-surface, thus separating this highly inflammable material from its intimate and dangerous connection with the sulphur and chlorate of potash. This simple invention seems to have removed all the objections from the use of this class of matches. They light "only on their own box."

Many ingenious inventions have been introduced for making the wooden splints.
The principal use of mate is in the preparation of a drink, similar to tea, made by steeping the dried leaves in hot water. The drink is consumed for its stimulating and refreshing effects, and is also used as a base for various flavorings, such as sugar and milk.

The leaves of the yerba mate tree are also used in traditional medicine for their alleged health benefits, such as reducing cholesterol levels and improving digestion. Additionally, the leaves are used in the production of a type of alcoholic beverage called chimarrão, which is made by steeping the leaves in hot water and then mixing with alcohol.

In summary, yerba mate is a versatile plant with many uses, from traditional medicine to modern-day drinks and beverages. Its popularity in South America and beyond is a testament to its enduring appeal and cultural significance.
MATERIA, a t. in the province of Macerata, or, as it is sometimes called, Macerata-Camerino, one of the former papal states and a part of the district known as the Marches. It is a walled town of from 3,000 to 3,500 inhabitants, situated on the San Angelo river and not far from 15 m. s.w. of the town of Macerata. The place contains several convents and churches. The inhabitants are chiefly engaged in agriculture, the raising of fruit, and, to a small extent, in woolen manufactures.

MATERA, a c. of the Italian province Potenza, situated between lovely valleys, 37 m., n. w. of Taranto. Pop. 14,225. It has an episcopal palace, a cathedral, and a college, but its lower classes are reputed the most uncivilized of southern Italy; they dwell chiefly in ancient caverns, excavated in the side of the deep valley surrounding the town, and are much afflicted with cretinism. Matera has manufactures of leather and arms, and a trade in nitre and agricultural produce.

MATERIAL CAUSE, in metaphysics, is the first in order of the four kinds of causes which Aristotle points out, and which later philosophers generally adopt. As thus defined it is the physical basis for the existence of a thing; or, in other words, the matter of which the thing is made. The material cause of a thing is, consequently, to some extent the thing itself; for example, it has been said that the material cause of a marble statue is marble, yet of any particular block of marble, parts must be cut away in order that the finished statue may appear.

MATERIALISM. This the name for a certain mode of viewing the nature of mind, namely, to regard it either as mere matter, or as a product of the material organization. The opposite view is called spiritualism, and means that the mind, although united with the body, is not essentially dependent on bodily organs, but may have an existence apart from these. There has been much controversy on this question; and although in later times the immateriality of the mind has been the favorite view, and been treated by many as a supposition essential to the doctrine of man's immortality; yet, in the earliest ages of the Christian church, the materialistic view was considered the most in unison with revelation, and was upheld against the excessive spiritualizing tendencies of the platonic schools. Tertullian contended that the scriptures prove, in opposition to Plato, that the soul has a beginning, and is corporeal. He ascribes to it a peculiar character or constitution, and even boundary, length, breadth, height, and figure. (This last view is incompatible with the definition of mind. See Mind.) To him, incorporeity was another name for nonentity (aulé est incorpore, nisi quod non est); and he extended the same principle to the body, who, not conceived, must have a body. He could not comprehend either the action of our inward things, the mind, or the power of the mind to originate movements in outward things, unless it were corporeal.

The state of our knowledge at the present time shows us more and more the intimacy of the alliance between our mental functions and our bodily organization. It would appear that feeling, will, and thought are in all cases accompanied with physical changes; no valid exception to this rule has ever been established. Mind as known to us, therefore, must be considered as reposing upon a series of material organs, although it be totally unlike, and in fundamental contrast to, any of those properties or functions that we usually term material—extension, inertia, color, etc. We never can resolve mind into matter; that would be a confounding of the greatest contrast that exists in the entire compass of our knowledge (see Mind); but we are driven to admit, from the whole tenor of modern investigation, that the two are inseparably united within the sphere of the animal kingdom. Our consciousness in this life is an embodied consciousness. Human understanding and belief are related, in a variety of ways, to the original and successive acts or the bodily organism from birth to death. Observation and experiment prove the important practical fact that the conscious life on earth of every individual is dependent on his organism and its history (professor Fraser's Rational Philosophy). See Lange's Able Geschichte des Materialismus (Eng. transl. 1877).

MATERIALISM (ante). One difficulty in treating this subject is that of giving a definition of the term satisfactory to all parties. Webster defines a materialist as "one who denies the existence of spiritual substances, and maintains that the soul of man is the result of a particular organization of matter in the body." Knight's English cyclopedia defines materialism as "a name applied to any philosophical system which denies the existence of a spiritual or immaterial principle in man, called the mind or soul, distinct from matter; or in other words, denies the immateriality of the soul." The Encyclopaedia Britannica says "materialism is the name given to that speculative theory which resolves all existence into a modification of matter." The latter definition is practically the most comprehensive and correct, although some materialists might with justice object to it without modification, for there are those who are practically materialists, if they do not call themselves such, who do not deny the existence of God, at the same time that they maintain that matter contains within itself—either endowed, or originally possessing—properties by which it is capable of transforming itself into the various forms of life, and moreover that this power is not essentially the active presence of Deity. The belief of the union or the unity of God and matter is pantheism (q.v.). It is common to denote the opposite doctrine to materialism by the term idealism; but this fails to make sufficient distinction, and is not as appropriate as the word spiritualism in
its proper sense, as used to designate a belief in a spiritual being who created the universe and controls its phenomena by laws or by continuous force, and who has moreover endowed certain of the higher animals with certain degrees of intelligence, giving to man especially intellectual powers which are generally believed to result from the possession of a material body, and to the spirit materialist, as it is called, the dissolution of the body, is to continue its existence in another world, and, moreover, as those who accept divine revelation believe, is to be rewarded or punished. The terms materialism and materialist have often been misapplied, and it is sometimes difficult to form an opinion as to whether the views of some of the ancient, as well as modern philosophers are essentially materialistic or not. Democritus is usually classed as a materialist; but such a disposal of his philosophy cannot accord with a rational treatment of the subject of materialism as it meets us to-day, for one of his propositions is as follows: "The soul consists of fine, smooth, round atoms, like those of fire. These atoms are the most mobile, and by their motion, which permeates the whole body, the phenomena of life are produced. Democritus also believed that this matter was distributed throughout the universe, producing the phenomena of heat, light and life. Epicurus, who may be considered in some respects as a follower or disciple of Democritus, taught that the soul was a fine substance, distributed through the whole mass of the body, and most resembles the air, with an infusion of warmth. This soul was not, however, immortal, but ceased to live on the dissolution of the body; but it was something superior to the matter of the body. This, therefore, was at least a modified form of materialism, and not that which invests the matter of the body itself with vital and intellectual power. It was not so spiritual a doctrine as that held by Socrates and Plato, the soul, according to them, being indestructible and devoid of all grossness. The author of the article "Materialism" in Knight's English cyclopaedia says: "The systems to which the name materialism is applied may be roughly distributed under a threefold division. First, it is applied to a system (like that of Hartley) which admits the existence of a soul, but which, attempting to explain mental phenomena physically, or by movements arising out of the bodily organization, seems to imply materialism. Secondly, it is applied to the system of Hobbes and Priestley, and of the French school of writers of which De la Mottrie may be taken as a specimen, which distinctly deny the existence of a soul as a separate principle in man, but which do not deny either a God or a future state. In the systems of these writers is evolved the pure and proper idea of materialism divested of all unnecessary consequences. Thirdly and lastly, the name is applied to systems like that of the ancient Epicureans, which deny both a future state of rewards and punishments, and a divine creator, systems for which atheism would be the better name, inasmuch as materialism fails to denote their more important and distinctive ingredients." Upon further mention of Priestly this writer says: "He does not deny the immortality of man and a future state of rewards and punishments. On the contrary, he distinctly affirms these on the authority of Scripture. It is needless to add that Dr. Priestley does not deny the existence of a God." It is therefore perceived that there are various ideas as to what constitutes materialism.

It would be unprofitably occupying the space assigned to this article to undertake even to give a summary of the history and development of the various theories connected with the doctrine of materialism. Its history is found scattered through various works of ancient philosophers and philosophers who have from time to time in all ages propounded theories; in philosophical histories of different epochs and nations; in philosophical and religious disquisitions and sermons; in various works on metaphysics and philosophy, and in systematic histories. No attempt will therefore be made even to assign many of those who have written upon the subject their just and proper position. It would be impossible to give a fair representation of their views in a few pages, when long dissertations have failed. As far, therefore, as regards the history of the subject the reader is referred to the various biographical notices of persons which may be found in this work, such as Democritus, Pythagoras, Socrates, Plato, Aristotle, Lucretius, Empedocles, Epicurus, Bacon, Locke, Hobbes, Berkeley, Gassendi, Descartes, Leibniz, Kant, Spinoza, Hegel, Holbach, and Priestley, and to the accessible works of these philosophers, as well as to those of more modern authors, on both sides of the subject, metaphysicians and scientists, such as sir William Hamilton, Paley, Jonathan Edwards, Mark Hopkins, Charles Hodge, Edward Hitchcock, Maudsley, Herbert Spencer, Huxley, Tyndall, James D. Dana, John W. Draper, William B. Carpenter, Joseph Le Comte (Religion and Science), Bastian, Lionel Beale, Hermann Lotze, Heckel, Charles Darwin, and Du Bois Reymond, and to Lewes's History of Philosophy, and Lange's History of Materialism.

What are the evidences in favor of materialism, what are the evidences against it, and what is the nature of these evidences? On the one hand, physical examination fails to find, or at least to demonstrate, any physical power in the living organism which cannot be accounted for by correlation of physical forces, and it is contended that the performances of various functions follow each other consecutively, according to external circumstances. As far as the doctrine of evolution may be made use of to favor that of materialism, it is contended that geology and zoology furnish evidence of the gradual progression in development from lower to higher forms of life. There are connecting links, it is asserted, which show that one form of animal organization has been trans-
Numerous questions have arisen from time to time through the conflicts of materialism with opposing doctrines, and it will be found that these questions have been brought to definite issues, in our day, for final settlement." This is either hoping for too much or for a questionable result. It is more probable that human investigation will never bring the question to a settlement, but that it will ever elude the grasp of the investigator, and it is probably a wise provision that it is so. It is a conflict out of which flows the most beneficial effects upon human character and understanding; for it is a law of nature that all our faculties, physical as well as mental, are strengthened and more perfectly developed in combating with opposing forces. No machine, intellectual or physical, can accomplish work without opposing force or resistance. Moreover, if we possessed complete evidence that we totally perished when our bodies underwent dissolution, or that our spirits were immortal, coupled with a foresight of our destiny, no beneficial result could follow, but we would, with the natures we now possess, perhaps be rendered miserable. One of the principal evidences which have been brought forward against the doctrine of materialism is the almost universal aspiration after a future life. Dr. John William Draper, in his History of the Conflict between Religion and Science, says: "Nature has thus implanted in the organization of every man means which impressively suggest to him the immortality of the soul and a future life." But this is a belief and will probably always continue a belief. Leibnitz attempted to prove the existence of the soul by his doctrine of monads, but probably no writer has furnished more ideas to fortify the doctrines of materialism than he; the essence of his doctrine was indeed materialistic. The atom produces its own sensations from itself, and it develops itself in accordance with its own internal laws of life. Every monad is a world to itself, and no one is like another, but the ideas of all the monads consist in an eternal system, in a complete harmony, which was ordained from the beginning of time, and which constantly persists through the continuous vicissitudes in all the monads. Every monad represents to itself, confusingly or clearly, the whole universe, the whole sum of all that happens, and the sum of all the monads in the universe. The monads of inorganic nature have only ideas which completely neutralize themselves, as those of a man in a dreamless sleep. The monads of the organic world are higher, the lower animals being formed of dreaming monads. In the higher, they have sensation and memory, and in man they have thought. Lange observes: "The monads with their pre-established harmony reveal to us the true nature of things as little as the atoms and the laws of nature. They afford, however, a pure and self-contained conception of the world, like materialism, and do not contain more inconsistencies than this doctrine but what especially secured the popularity of the Leibnitian system is the ductile looseness of its notions, and the circumstance that its radical consequences were much better marked than those of materialism. In this respect nothing is more useful than a thoroughgoing abstraction. The tyro who shudders at the thought that the ancestors of the human race might once have been compared with the apes of to-day, comfortably swallow down the monad theory, which declares the human soul to be essentially like all the beings of the universe, down to the most despised mote, which all mirror the universe in themselves, are all small divinities to themselves, and bear within them the same content of ideas, only in various arrangement and development. We do not immediately observe that the ape monads are also included in the series, that they are as immortal as the human monads, and that they may yet, perchance, in the course of development, attain to a beautifully ordered content of ideas.

It is very much the same with the much-exulted and much-abused optimism of Leibnitz's system. Viewed in the light of reason, and tested by its real presuppositions and consequences, this optimism is nothing but the application of a mechanical principle to the foundation of the facts of the world. God, in choosing the best of possible worlds, does nothing that would not be quite mechanically produced if we suppose the essences of things to act upon each other. In all this, God proceeds like a mathematician in solving a problem, and he must so proceed, because his perfect intelligence is bound to the principle of sufficient reason—in the result it all comes to the same thing as if we were to deduce the development of the universe from the mechanical presuppositions of a Laplace and a Darwin." (Lange, History of Materialism. Boston: Houghton, Osgood & Co., 1880, pp. 130, 181, 182.) The question ever recurs, how can matter produce thought? The assertion by Leibnitz that it is the inherent principle of the monad, it is contended, is only an assertion, a product of the imagination, and the doctrine that a certain combination of atoms produces it, is likewise held to be just as much the result of imagination. That
it requires organization to produce manifestations of thought, which we, as physically constituted beings, can comprehend or perceive, is a necessity of the case, and a condition which limits human knowledge. We cannot make a physical demonstration of a purely spiritual subject. If the mind acts or exists without the intervention of matter we are necessarily unconscious of it, and are obliged to search for other evidences than material phenomena, and for the advocate of the production of thought by the correlation of atomic energy to demand that the spiritualist shall accept only physical evidences is equivalent to the dictating the limits of controversy. Four thousand years of experience and 2,000 years of controversy have not settled the question. Perhaps if an instance could be cited in which rapidity of thought had far outstripped all the possibilities of physical methods, it would furnish strong evidence of the immateriality of the human mind, unless, indeed, we adopt Leibnitz's doctrine of monads. Have they been such instances? Is it possible that there ever was a case in which the nervous mechanism, or a part of it, admitted a perfectly unobstructed performance of an intellectual function by the immaterial principle or mind? Can we account in any other manner for the remarkable mathematical calculating powers of Zerah Colburn (q.v.), who could answer accurately, almost in an instant, such questions as the following, and others much more difficult: How many seconds are there in 11, 15, or 16 years? What is the square of 999,999? etc. This is an instance of the almost perfect adaptability of nervous organization to its uses. It is so much in excess of ordinary—what we term, perhaps improperly—normal mental activity, that it becomes a question whether we are not compelled to regard it as the result of the comparatively unobstructed operations of a spiritual intelligence. The fact that this remarkable talent left him at about the age of 24 would be explained by a spiritualist in one way, and by a materialist in another. An unsolvable question is always the result of receiving of most of the evidence and possibilities may very greatly preponderate to one side, but they are not sufficient to convince, and the most sincere minds may be so constituted as to form opposite conclusions. When the experiments in spontaneous generation above alluded to were shown to be faulty, it was believed by many that the doctrine of evolution, as well as that of more decided materialism, had received a severe blow, but an evolutionist was among the foremost in demonstrating the failure of spontaneous generation, and the majority of evolutionists are probably opposed to the doctrine of spontaneous generation. The results of such experiments do not, however, affect permanently either the doctrine of evolution or of materialism or spontaneous generation. If spontaneous generation ever takes place, it may require conditions which are incompatible with the sealing of boiled infusions in flasks, or their protection from the descent of atmospheric germs by the bending down of open capillary beaks of the flasks. But if it could be satisfactorily proved that spontaneous generation never occurs, it would not aid the establishment of the doctrine of spiritualism. The truth is that the nature of the question does not admit of physical or experimental proof, and, indeed, does not seem to be affected by geological evidence.

The argument for the existence of an intelligent spirit independent of the body, and not subjected to the variations of its physical functions, must, from the necessity of the case, be carried on by the reasoning powers, with perhaps some reliance upon physiological facts as means of explanation; but the most important part of the argument, leaving out the question of a revelation, rests upon the evidences of design. If it is admitted that the works of nature furnish such evidence, then there is a Being whose attributes must be such as to make it probable that the mind of man has not been endowed with intellectual powers and aspirations which are destined to end in nothingness. To maintain that inorganic matter could have arranged itself in the various living forms with all the adaptations of means to ends, both as regards use and beauty, because the Creator does not manifest himself in person, because we are not permitted to perceive him with our senses, is, as Paley has logically said, quite as inconsistent as to deny that a watch is the product of mechanical design merely because the process of its construction had not been the subject of personal observation. The processes of nature do, indeed, take place in ways that are perfectly mysterious and unknown to us. Certain invariable effects are called laws, but the secret springs by which those laws are executed are entirely beyond our ken. We call a certain force the attraction of gravitation, but what, in reality, that attraction is, is no more known to us than if we had not learned to measure or to trace the paths of the planets. We cannot cast aside the evidence furnished by inexorable logic, and that logic tells us that if circumstantial evidence is of value, all matter is moved by supernatural power. Leibnitz and others thought they had discovered that power as residing in the matter itself, but others, and among them perhaps the most acute and broadly observing experimental philosopher the world has ever known, Faraday, have placed it in points and lines of force, for the purpose of giving a scientific expression to certain facts, at the same time acknowledging their ultimate imposibility to comprehend any nearer a solution. Faraday, in a lecture on mental education, in 1834, used the following words: "High as man is placed above the creatures around him, there is a higher and far more exalted position within his view; and the ways are infinite in which he occupies his thoughts about the fears, or hopes, or expectations of a future life. I believe that the truth of the future cannot be brought to his knowledge by any exertion of his mental powers, however exalted they may be; that it is made known to him by
other teaching than his own, and is received through simple belief of the testimony given. Here is the testimony of one of the most rigid of scientific investigators that the highest evidence of spiritual existence is internal; and why, we may ask, may not such evidence, coming as it does from hundreds of thousands of all classes of persons, the most highly cultured as well as others, be received as well as speculations about the properties of protoplasm or of monads? If unanimity of testimony is of value, certainly there is more of it among the thousands who believe than among the disputants in the scientific arena. But we dismiss all these points with the remark that, although, as Faraday says, in a subsequent sentence to the above, that man by reasoning cannot find out God, he is compelled to use his reasoning powers in the study of nature in such a way as to lead him to adopt the best methods of forming a belief as to his relations to time, as well as his present surroundings. The world is full of what to the human understanding are inexplicable facts. Certain persons perform the most irrational acts, not only those which appear to the ordinary understanding to be irrational, but which, according to all the laws of mental philosophy, are known to be irrational; and yet we can give no satisfactory explanation of them. To say that the organism is deranged proves nothing for either side of the question, for the mind, it may be said by one, requires an instrument not deranged to manifest itself, while the other contends that rational thought can only be produced by an organism which retains to a certain degree the harmony of its parts, or, in other words, which possesses certain physical relations. In either case, whether the brain is the instrument or the producer of thought, it requires to be in order, and it will be seen that an attempt to demonstrate either the presence or the absence of spiritual power will fall short of actual proof, and that the best we can do is to form a well-founded belief. The great fact that design is stamped upon all the works of nature, must always be borne in mind. We can conceive of no designing power independent of Him whom we call Providence or God, and when we acknowledge his existence we are forced to admit that his creation must have been the subject of his care, and that he has not left them to grope in blindness throughout all the ages of their past existence without a light more than that which can be furnished by physico-scientific investigations. What, then, it may be asked, is the value of physical research? Its proper fruits or objects, if we reason from analogy and observe the beneficial provisions of surrounding nature, are intellectual enjoyment and the cultivation of a faith, that highest attainment of the understanding, which rests with confidence upon the eternal justice of the unseen government of the universe, and which shall finally show to mankind that their highest aspirations do not identify to selfish or morbid longings which have no foundation in the constituted order of nature.

We see in nature the most perfect adaptation of means to ends. The mechanism of the human body offers the most perfect examples of this. The mechanism of the human hand has furnished a subject for one of the most profound and elegant of the Bridgewater treatises, by sir Charles Bell, and the contrivances found in the structure of the eye are still more illustrative of design. The evidence, however, offered in some of the lower forms of animals, are, as being simpler, more conclusive to the non-scientific observer. We walk along the sea-beach and pick up a mollusk which has recently been washed ashore or dug out of the sand. We remove the shell from the animal, and perceive that its hinge is casued over and interlaced with an elastic, gluey substance, which not only serves to assist in holding the shells in place, but by their elasticity to open them. In some cases the materialist, or the evolutionist, might suppose that the living molecules in a certain part of the mollusk might, in accordance with certain physico-chemical properties, arrange themselves for the purpose of accomplishing what might be termed an impending function, or a function becoming immediately necessary for the purposes of evolution or further development; but we open another species of bivalve mollusk, and instead of the mere addition or coating of a little elastic glue, we find at the hinge in either shell a chamber, hollowed out as by a mechanical instrument, and occupying the space so formed by the two little caps, an independent and detached elastic pad whose action is that of a spring in opposition to the muscles which close the shells. Nobody can make the examination without being almost startled at what, without irreverence, might be called the legible autograph of the Creator's hand. It is impossible to conceive how any process of gradual evolution, or of abrupt self formation, if such a phenomenon can be imagined, could bring about such a result. Now, it is not within the possibilities of science to demonstrate whether this mechanism has been brought about by the voluntary act of the Creator or by evolution. We are, therefore, left to adopt the most reasonable, the most probable conclusion; and it is evident, people will always differ. Some will contend that evolution is the only natural process of creation, while the mass of mankind will probably always think that the wonderful works of nature are too vast, too mighty, to be the production of anything less than omnipotent design.

Philosophers have been censured by believers in Bible revelation for sometimes calling the human body a human machine; but if the soul is independent and superior to the body, then the body must be a machine. Looking upon the subject in this light we can explain the influence of education, and also why the mind cannot manifest itself till its instruments, the parts of the nervous mechanism, are properly prepared. A perfectly intelligent soul might inhabit the body and yet not be able to manifest itself. Further.
than this it has so far been, and will probably always continue to be, unavailing to attempt to reason upon this subject with the expectation of producing any positive evidence of the existence of a spiritual nature. This is the point at which belief or disbelief is adopted, and upon the foundation of either of these conclusions man's reason may continue to build systems, which, indeed, from the influence they exert upon the individual and upon society, may furnish evidences of their correctness or falsity. To be able to have a clearer view of the unseen world than that which science or logic offers, the veil which conceals the truth from us must be lifted, or we must believe it has been lifted, that a revelation has been made, and that the human race has not been obliged to live for thousands of years with no light except that furnished by human reason—that reason, notwithstanding its wonderful powers, which we often have cause to distrust, since the most powerful intellects have come to such opposite conclusions, starting from the same premises. To what extent is it reasonable and just to place ourselves under the guidance of faith? In the discussion of human affairs we perceive that it is one of the noblest of qualities, and that without it society would be a thousand times worse than the severest pessimist asserts. Therefore faith is one of the fundamental principles of our nature, and by no means to be excluded from the elements of evidence which we are to examine in forming an opinion as to whether this is a spiritual as well as a material world, and all the reasoning which might be attempted could never prevent the mass of mankind from resting on a foundation which ministers to their hopes, their sentiments, their affections; but, on the other hand, all the persuasive eloquence of the most exalted zeal of thousands of the believers in the spirituality of man's nature will be powerless in the presence of the restless efforts of many earnest and sincere minds, who cannot find it in their natures to relinquish the search after a truth which their opponents tell them can be found only by the aid of faith.

MATHEMATICIANS (Lat. mathematici), the name given by the Romans to the professors of astronomy, from the fact that, in all cases, those who practiced astrology also to some extent cultivated mathematical science. The Romans, unlike the Greeks, appeared not to comprehend the attractions possessed by mathematical studies, and being consequently unable to distinguish between the student of pure science and the fanatic enthusiast who attempted to derive a knowledge of future events on this earth from the position of the stars, joined them together in a common condemnation, under the name of “mathematici.”

MATHEMATICS (Gr. mathema, learning), the science which has for its subject-matter the properties of magnitude and number. It is usually divided into pure and mixed; the first including all deductions from the abstract, self-evident relations of magnitude and number, and the second the results arrived at by the application of certain relations found by observation to exist among the phenomena of nature. The branches of pure mathematics which were first developed were, naturally, Arithmetic, or the science of number, and Geometry, or the science of quantity (in extension). The latter of these was the only branch of mathematics cultivated by the Greeks, their cumbrous notation opposing a barrier to any effective progress in the former science. Algebra (q.v.), or the science of numbers in its most general form, is of much later growth, and was at first merely a kind of universal arithmetical, general symbols taking the place of numbers; but its extraordinary development within the last two centuries has established for it a right to be considered as a distinct science, the science of operations. Combinations of these three have given rise to Trigonometry (q.v.) and Analytical Geometry. The Differential and Integral Calculus (q.v.) makes use of the operations, or processes of geometry, algebra, and analysis indifferently; the calculus of finite differences is in part included under algebra, and may be considered as an extension of that science; and the calculus of variations is based upon the differential calculus. The term “mixed mathematics” is calculated to lead to error; “applied mathematics” is a more appropriate name. This.
part of mathematics includes all those sciences in which a few simple axioms are mathematically shown to be sufficient for the deduction of the most important natural phenomena. This definition includes those sciences which treat of pressure, motion, light, heat, sound, electricity and magnetism—usually called Physics—and excludes chemistry, geology, political economy, and the other branches of science, which, however, receive more or less aid from mathematics. For a notice of the separate sciences, see Astronomy, Optics, Mechanics, Hydrostatics, Hydrodynamics, Heat, Acoustics, Electricity, Magnetism, etc.

MATHER, Cotton, an American colonial divine, son of Increase, was born at Boston, Feb. 12, 1663. He entered Harvard College when 12 years old, and his precocity and piety excited great expectations. He entered upon a course of fasting and vigils, cured a habit of stammering by speaking with "dilated deliberation," studied theology, became the colleague of his father in the ministry, and wrote in favor of the political ascendency of the clergy. The phenomenon termed "Salem witchcraft" having appeared in the colony, he investigated it, and wrote, in 1685, his Memorable Providences relating to Witchcraft and Possessions. He found that devils or possessed persons were familiar with dead and foreign languages, etc., and eagerly advocated the adoption of desperate remedies for the diabetic disease. It is well-known that Mather was responsible for the shedding of much innocent blood; and he himself admitted that "he had gone too far." In 1692, he published Wonders of the Invisible World, to which a reply appeared at London in 1700 by Robert Caleit—the effect of which was to dissipate the somber and superstitious influence of the New England divine. With a remarkable industry, he wrote 382 works. His Essays to do Good have been highly commended by Franklin; and when we think of his misdeeds, which were serious, it ought also to be remembered that he helped to introduce into the States inoculation for the small-pox. He died Feb. 13, 1728. His life was written by his son, Samuel Mather (1729).

MATHER, Cotton, D. D. (ante), having received his elementary education under his father's care, and at the free school in Boston, was able on entering Harvard college, at the age of 12, to read not only Virgil and other Latin classics, but Homer and Isocrates in Greek. On taking his first degree at the age of 16 the president addressed him in a Latin speech, praising his past conduct and attainments, and predicting a glorious future. The descendant of a long line of ministers, he himself desired to enter the ministry, but an impediment of speech prevented, and he began to study medicine. Having overcome the infirmity he studied theology, and in 1680 became assistant to his father in the North church, Boston, and in 1684 was ordained as co-pastor. While zealous and faithful as a preacher, he found time to write for the press, and published numerous sermons and books on practical piety, at the same time accumulating materials for various intended treatises. He began also the study of some modern languages, among them the Iroquois Indian. He believed that ministers should concern themselves in politics, and, desirous of maintaining the ascendency of the clergy in civil affairs which had long prevailed, but which he saw declining, he prepared in 1689 the declaration of the people justifying the imprisonment of governor Andros. Sharing in the superstitions of the age, he firmly believed in witchcraft, and suspecting that there were in Boston devotes of Satan, he applied himself earnestly to detect them. An Irish woman having been denounced as a witch, and Mather having no doubt that she was under the influence of an evil spirit, she was tried, condemned, and executed. His book on witchcraft, published with the recommendation of all the ministers of Boston and Charlestown, was entitled Memorable Providences relating to Witchcraft and Possessions; with Discoveries and Appendix. It was eagerly read in the colony, and was republished in England with a preface by Richard Baxter; being pronounced perfectly convincing. With magistrates and people Mather urged the necessity of eradicating the sin. In 1692 the children of Mr. Parris, a minister of Salem, becoming strangely afflicted, accused an Indian servant of having bewitched them by her incantations. She was cast into prison, and confessed that she was guilty. The girls began to accuse others of being witches. The magistrates applied to Mather for advice, and he urged the adoption of the most stringent measures. The excitement was intense. By May, in Salem, 100 persons were in jail. The deputy-governor and 5 magistrates went from Boston to conduct the preliminary examinations, and on the arrival of the new charter a special court was appointed to try the accused. Several, though protesting innocence, were declared guilty and hung. Those who confessed their guilt and were penitent, had their lives spared. By September 20 persons had been put to death; 8 more were under sentence of death; 55 had confessed their guilt and escaped; above a hundred more were lying in jail, and twice that number were at large, suspected. The last execution was that of a Mr. Burroughs, formerly a minister at Wells, which made a deep impression on the country. A cry of horror was raised. A reaction began which Mather could not arrest. He drew up, with the concurrence of the governor, the president of Harvard university, and the ministers, an elaborate justification of what had been done, expressing "pious thankfulness to God for justice being so far executed among us," in a work entitled The Wonders of the Invisible World: Observations upon the Nature, the Number, and the Operations of the Devils. But it had no effect. In the trials that followed all the accused were acquitted. While some of the judges in the religious assem- blies prayed for pardon if they had shed innocent blood, Mather showed no signs of
penitence or regret. In his *Magnalia Christi*, published 9 years afterwards, he indeed admits that perhaps there had been “a going too far in that affair.” His influence now declined. Though admitted to be pre-eminent among his countrymen for genius and learning, he was twice passed over in the election of president of Harvard college. But he continued to labor with zeal. He was a voluminous writer. His *Magnalia Christi Americana* was a collection of facts for an ecclesiastical history of New England. Among his other works are *Essays to do Good; Christian Philosopher; and Directions to a Candidate for the Ministry*. The work on which he labored from his 31st year to his death is entitled *Illustrations of the Sacred Scriptures*, and the manuscript is now in the library of the Massachusetts Historical Society. He was the first, with Dr. Boylston, to introduce into this country inoculation for small-pox. In 1713 he was elected, on account of his *Curiosa Americana*, a fellow of the royal society of London, the first American who had received that distinction.

MATHER, INCREASE, an American colonial divine, son of Richard Mather, an English nonconformist minister, who emigrated to Massachusetts in 1635, was b. at Dorchester, Mass., Jan. 21, 1639. He was educated at Harvard college, Massachusetts, and Trinity college, Dublin, and settled for 62 years as pastor of the North church, Boston. In 1684 he was also chosen president of Harvard college, for which he obtained the right to confer the degrees of B.D. and D.D. An industrious student, he spent 16 hours a day in his study, and published 93 separate works, most of which are now very scarce. One of these, entitled *Remarkable Providences*, was republished in the library of old authors (London, 1699). His influence was so great in the colony that he was sent to England in 1688 to secure a new charter, and had the appointment of all the officers under it. Mather died at Boston, Aug. 23, 1723.

MATHER, RICHARD, D.D., 1596-1697; b. Lowton, Lancashire, Eng.; studied at Oxford in 1618; became parish minister of Toxteth, Lancashire, where he remained 15 years; was suspended in 1634 for non-conformity to the established church, was restored three years later on the assurance of his friends, but again suspended in 1637, and moved to New England in 1635; was minister at Dorchester, Mass., 1636-69. Of his six sons, four were distinguished ministers and authors. He was the author of some theological treatises, chiefly on church government, and at the request of the Cambridge synod in 1648 he drew up a form of discipline, which was adopted. His *Journal, Life and Death*, was published for the Dorchester antiquarian and historical society. He was an earnest preacher, and a man of learning. He assisted Eliot in the New England version of the Psalms. He published a discourse on the *Church Covenant*; a treatise on *Justification*, and an elaborate defense of the churches of New England.

MATHER, SAMUEL, 1638-71; b. Toxteth, Eng.; graduated at Harvard college in 1643; preached at Boston, Oxford, and Dublin. At Trinity college, Dublin, he became senior fellow. He is the author of *Old Testament Types Explained and Interpreted*.

MATHER, SAMUEL, D.D., 1706-85; son of Cotton Mather; graduated at Harvard college in 1723; was ordained in 1732, and was pastor of several Congregational churches in Boston. He wrote a *Life of Cotton Mather* in 1729, and also some sermons, pamphlets, and short poems.

MATHews, REV. THEOBALD, commonly known as FATHER Mathews, was descended from an illegitimate branch of the Llandaff family, and was born at Thomastown in Tipperary, Ireland, Oct. 10, 1790. On the death of his father, while Mathews was still very young, the kindness of the Llandaff family enabled the boy to enter the Catholic college of Kilkenny, whence he was transferred, as a candidate for the Roman Catholic priesthood, to the college of Maynooth in 1807. He left that college, however, in the next year. He relinquished the secular priesthood for that of the religious order of the Capuchins, in which he took priest’s orders in 1814, and was sent to the church of his order in the city of Cork. His singularly charitable and benevolent disposition, his gentleness and affability, his simple and effective eloquence, and the zeal and assiduity with which he discharged all the duties of his ministry, won for him the universal love and esteem of rich and of poor. To him was due the introduction of the religious, *Mather, Mathews. 596*
and was accompanied by the presentation of a medal, to which the utmost reverence was attached by the recipient; and an opinion prevailed among the poor that the mission of the "apostle of temperance" was marked by many miraculous manifestations of the assistance of heaven. It is difficult to form an exact estimate of the number of his associates, but it included a large proportion of the adult population of Ireland, without distinction of rank, creed, or sex; and so complete was the revolution in the habits of the Irish people that very many distilleries and breweries ceased from working. Among the sufferers from this great moral revolution the members of Father Mathew's own family, who were largely engaged in the distilling trade, were some of the earliest and most severely visited; and it is painful to have to add that the latter years of this great benefactor of his country were embittered by pecuniary embarrassments arising out of the engagements into which he entered in the course of his philanthropic labors. Although very large sums of money passed through his hands, in payment for the medals which were distributed to the members of the association, yet the exceeding munificence of his charities, and the enormous expenses connected with his various missions, and perhaps his own improvident and unhonorable habits, involved him in painful difficulties. A pension of £300 was granted to him by the crown in acknowledgment of his eminent public services, and a private subscription was also entered into for the purpose of releasing him from embarrassment. He died in 1856, but the fruit of his labors is still visible in Ireland. Very many, it is true, of those who were enrolled in his association ceased after some years to observe the pledge of total abstinence; but very many also continued faithful; and while but few of those who abandoned the society relapsed into the extreme of drunkenness, the general tone of the public mind in Ireland as regards the use of intoxicating drinks may be truly said to have undergone a complete revolution, which endures to the present day.

MATHEWS, Charles, an English comedian, was born on June 28, 1776, and was educated in London. His father was a bookseller, and intended his son to follow the same profession; but his early inclination for the stage overcame parental counsel, and he made his first appearance as an amateur—curiously enough, in the part of Richard III.—at the Richmond theater in 1793, and as a professional comedian in the Theater Royal, Dublin, the following year. He first appeared in London at the Haymarket, and subsequently he transferred his services to Drury Lane. In 1818 he gave his "At Home" in London, and achieved an immense success. He visited America twice. In the autumn of 1838 he became joint proprietor of the Adelphi theater. He died at Plymouth on June 28, 1835, and was buried in that town.

Mathews was a wonderful master of personification and mimicry; and while imitating every one, he never lost a friend, or hurt the feelings of the most sensitive. His taste was as instinctive as his wit. His wonderful variety of facial expression and his gentlemanly sarcasm are still fondly remembered by old playgoers. His son Charles also achieved a brilliant reputation in the same department of histrionic art. Born Dec. 26, 1808, he died June 24, 1878.

MATHEWS, Charles James, 1803-78; son of Charles Mathews, the comedian; educated as an architect and gave promise of success in that profession, but his natural taste was for the stage, and as a light comedian he soon achieved a high place. He married in 1838 the noted actress and singer, Madame Vestris, and in connection with her carried on successively the Olympic and Lyceum theaters, London. He visited the United States in 1839, 1838, and 1889, and on the second occasion married his second wife, Mrs. Davenport, known on the stage as Lizzie Weston. He played also in Paris and Australia, and everywhere made many warm admirers, not only of his professional talent but also of his personal qualities. He was the author of several plays, perhaps the best of which was My Wife's Mother. He also produced several entertainments after the manner of his father's "At Home."

MATHEWS, Cornelius, b. N. Y., 1817; educated at the university of the city of New York, and in 1837 called to the bar. Before and after his admission he contributed in verse and prose to various periodicals, such as the Knickerbocker Magazine, the New York Review, and the American Monthly Magazine. He has also contributed to the Literary World, and he was for a time an editor of Arethusa, a now forgotten monthly magazine. Of his voluminous works we may mention Behemoth, a romance, 1858; The Politicians, a comedy, 1840; Witchcraft, a tragedy, which was produced on the stage in 1846, and subsequently republished in London; and False Pretenses, a comedy, 1856. He has worked for many years in behalf of an international copyright, has published a number of addresses on that subject, and organized a copyright club, for whom he drew up an Address of the Copyright Club to the American People.

MATHEWS, George, 1774-1836; b. near Staunton, Va., and admitted to the Georgia bar in 1799; in 1805 was appointed judge of the superior court of the territory of Mississippi, and in 1806 transferred in the same capacity to New Orleans. After the organization of Louisiana as a state he was appointed presiding judge of the supreme court, and filled the post to the time of his death. His decisions form an important part of the judicial history of the state.
MATHIAS, THOMAS JAMES, 1750–1835; b. England; educated at Trinity college, Cambridge, of which he became a fellow. He was appointed treasurer of the household to Queen Charlotte, from which office he retired with a pension in 1818. The latter part of his life was passed at Naples; and during his long residence in Italy he became thoroughly acquainted with its language and literature. He wrote Italian verses with considerable fluency, but his principal service to Italian literature was his edition of Tiraboschi’s standard work, *The History of Italian Poetry*. His first English production, which appeared in 1781, was an imitation from the Norse, called *Runie Odes*. This was followed, two years later, by an *Essay on the Evidence relating to the Poems attributed to Thomas Rowley*. His best work is *The Pursuits of Literature*, which was published anonymously between 1794 and 1797. The chief interest of the *Pursuits* lies in its satirical critical notes, which made a sensation at the time.

MATHIAS CORVINUS, King of Hungary, was the second son of John Hunyady (q.v.), and was b. in 1443. Having been released from the hands of the treacherous Frederick III. of Germany by Podiebrad, king of Bohemia, he returned to Hungary, and was elected king in 1458. His accession was hailed with the utmost enthusiasm over the whole country. But the Hungarian crown at this time was no chaplet of roses; two sovereigns, alike formidable, the one, Mohammed II., from his military talents and immense resources, the other, Frederick III., from his intriguing policy, were busily conspiring against the boy-king. To meet these dangers, Mathias rapidly carried out his measures of defense, the most important of which was the formation of a regular force of cavalry, to form which one man was enrolled out of every 20 families. This was the origin of the famous *Herzogen* which soon made the Hungarians the price of every knight. While Frederick III. with the aid of Matthias fell on the Turks, who had ravaged Hungary as far as the river Tintesvar, inflicted upon them a bloody defeat, pursued them as far as Bosnia, took the stronghold Dayeza, where he liberated 10,000 Christian prisoners, and thence returned to Weisenberg, where he was crowned with the sacred crown of St. Stephen in 1464. He next suppressed the disorders of Wallachia and Moldavia; but feeling that his plans were counteracted by the intrigues of Frederick III. to gain possession of Hungary, Mathias besought the assistance of pope Pius II., but to no purpose. After a second successful campaign against the Turks, he turned his attention to the encouragement of arts and letters, and adorned his capital with the works of renowned sculptors, in addition to a library of 50,000 volumes. He sent a large staff of literary men to Italy for the purpose of obtaining copies of valuable manuscripts, and adorned his court by the presence of the most eminent men of Italy and Germany. He was himself an author of no mean ability, and he possessed a delicate appreciation of the fine arts. At the same time the affairs of government were not neglected. The finances were brought into a flourishing condition, industry and commerce were promoted by wise legislation, and justice was strictly administered to peasant and noble alike. But the promptings of his ambition, and the pressure exercised by the Catholic party, cast an indelible blot on Mathias’s otherwise spotless escutcheon; he wantonly attacked Podiebrad, his father-in-law, the Hussite king of Bohemia, and after a bloody contest of seven years’ duration between these kings, the greatest generals of the age, the Hungarian power prevailed, and Moravia, Silesia, and Lusatia were wrested from Bohemia. Immediately after the conclusion of this war Mathias went to meet his old enemies, the Turks, and inflicted upon them, at Kenyérmező (1479), such a defeat as kept them quiet for the next 46 years. After defeating an invading army of Poles, he had at length a fair opportunity for settling his differences with Frederick, and taking revenge on the insidious plotter who had imbuttered his whole life. The Austrian fortresses fell before him in rapid succession. After an obstinate defense, Vienna shared the same fate (1483), and the emperor was reduced to beg his bread from village to village. Mathias now took up his residence in Vienna, but while on the pinnacle of glory he was struck down by a fit of apoplexy, and died at Vienna in 1490. To the patriotism and bravery of his father, Mathias added a taste for letters, and the highest abilities as an administrator and politician; even his secret enemy, Castelli, testifies that for subtlety and daring he had no equal among the princes of the age.

MATHILDA, Countess of Tuscany, well known in history through her close political connection with pope Gregory VII., was a daughter of Boniface, count of Tuscany, and was born in 1046. She is said to have married Godfrey (surnamed Il Gobbo, or the ‘Hunchback’), duke of Lorraine, in 1069, by procuration; but if so, her husband did not make his appearance in Italy until 4 years after the wedding-ceremony, and the two, if they were ever united, soon afterwards separated. Godfrey went back to his duchy, and became a supporter of the emperor Henry IV., while Mathilda made herself conspicuous by the zeal with which she espoused the cause of Gregory VII. She became his inseparable associate, was ever ready to assist him in all he undertook, and to share every danger from which she could not protect him. In 1077 or 1079 she made a gift of all her goods and possessions to the church. In 1081 she alone stood by the pope, when Henry poured his troops into Italy, burning to avenge his humiliation at Canossa; she supported him with money when he was besieged in Rome; and after his death at

* Even at the present day the remains of the celebrated *Collectio Corvinae* are eagerly sought after.
Matilda, the wife of the emperor, died in 1115. Mathilda's death gave rise to a new feud between the emperor and pope, which finally resulted in the former wrestling from the latter a portion of Mathilda's possessions, but even what remained constituted nearly the whole of the subsequent "Patrimony of Peter."

MATICO, Arianthe elongata, a shrub of the natural order piperaceae, a native of Peru, remarkable for the styptic property of its leaves, which are used for stanching wounds, and also useful as an aromatic stimulant in mucous discharges.

MATIN DOG, a large kind of dog, now almost peculiarly French; but supposed to have been introduced into France from the n. of Europe. It is allied to the Danish dog. It has rough hair; a rather flat forehead; a rather pointed muzzle; the ears erect, but bent down at the tips. It is generally of a whitish color, clouded with brown. It is fierce, but not very courageous. Buffon, without reason, imagined it to be the original of many kinds of dogs.

MATINS. See Canonical Hours.

MATRICA'MIA. See Chamomile.

MATSUMAI, a t. and port of Japan, and the largest center of commerce and population in the island of Yesso. It is on the s. coast, about 60 m. w. of Hakodadi, and contains, it is said, 60,000 inhabitants. It extends along the margin of an open bay, facing which is an island with a beacon, sheltering a harbor capable of receiving the largest ships.

MATSYS, or MESSYS, QUENTIN, 1460-1530; b. in Louvan; bred a blacksmith, early enamored with a painter's daughter, and led to become a painter. His subjects are principally religious, marked by a hard treatment in outline, but great force of expression. His "Descent from the Cross," in the Antwerp museum, was praised by sir Joshua Reynolds for heads scarcely exceeded by those of Raphael. "The Misers," which has been made familiar by engravings, is one of his noted works, which are to be found in nearly every great gallery in Europe.

MATTAWA, the proposed e. terminus of the Canadian Pacific railway, at the junction of the Ottawa and Mattawa rivers, in Nipissing district, Ontario, 189 m. above Ottawa. The Hudson's Bay company had a trading-post at this point.

MATEAWAN, a village in the t. of Fishkill, Dutchess co., N. Y., situated on the Dutcheess and Columbia river and on Fishkill creek, 14 m. from the Hudson, at Fishkill Landing; pop. about 2,000. It has manufactures of felt goods, hats, files, lawnmowers, wood-working machinery, etc.; also four churches, a newspaper, and good schools.

MATTER. From a physical point of view, matter is anything that can affect the senses, or that can exert, or be acted on by, force. The existence of matter, in the sense of substance, has been doubted by many philosophers, including some of the greatest of experimenters. Indeed, as we can know matter only by the forces it exerts, it is obvious that the opposition of mere geometric points, capable of exerting force (technically called centers of force), will satisfactorily account for all observed phenomena as any other idea of the ultimate nature of matter. Here, however, we are dealing with a question confessedly beyond the reach of experiment, and belonging to the domain in which metaphysics professes to deal. See PERCEPTION.

Although experiment cannot lead to a knowledge of the ultimate nature of matter, it may lead to important discoveries as to the arrangement of the molecules of different bodies, and their similarity or dissimilarity. Some of the questions to which we may expect an answer, though not a speedy one, have already been mentioned in the article FORCE, CONSERVATION OF; but in order to render intelligible the short account which we intend to give of some very interesting ideas recently propounded by Graham (q.v.), it will be necessary to repeat some of them.

The old idea of the transmutation of metals (see ALCHEMY) implicitly contains the assumption that all kinds of matter are ultimately one. Far from being a startling assumption, this is the simplest and most easily conceived notion we can entertain on the subject; and it offers a remarkably simple explanation of that extraordinary property of matter which Newton proved by careful experiments, that the weight of a body depends only on the quantity, not on the quality of the matter that composes it. One idea, then, of matter is, that the atoms (or smallest parts, whatever these may be) of all bodies are identical, but that the molecules (each of which is a single atom, or a definitely arranged group of atoms) differ from one body to another. Thus (to take an instance merely for explanation, not as at all likely to be correct), if hydrogen be supposed to consist of the simple atoms of matter: oxygen, each molecule of which is 8 times as heavy as one of hydrogen, may have each molecule formed of 8 elementary atoms, arranged in a group such as the corners of a die; carbon, 6 times as heavy per molecule, might be composed of 6 simple atoms grouped as at the corners of an octahedron; and so on. It is obvious that here each atom must be supposed capable of exerting force on every other. This leads us naturally to speculations as to the medium
through which this force, if it be exerted at a distance, is propagated (see Force, Conservation of); and then we have introduced matter of a more refined character than our supposed elementary atoms. This difficulty has suggested to various philosophers the idea that there is no actio in distantis, that all pressure, for instance, in a gas is due to incessant impacts of its particles upon each other and upon the containing vessel. But from various experiments, we know that all bodies of motion is incapable of being transferred from one body to another, of being increased or diminished by change of temperature, and is, in fact, heat itself, one form of kinetic energy. This, if there be no ultimate difference between kinds of matter, could never be the cause of their apparent difference. Hence, in Graham's view, though all ultimate atoms are identical in substance, they have special motions of their own, by which one is distinguished from another, these motions not being capable of transfer from one atom or group of atoms to another. It is difficult to conceive energy in such a form as not to be transferable, so that we refer the reader to Graham's own papers for the further development of his theory—remarkable, in conclusion, that no theory of the nature of matter can be considered as at all complete till it account for the mutual action of separate atoms; for this the existence of a continuous material medium in space would seem to be necessary; and this, in its turn, would, if accepted, enable us to dispense with the idea of atoms. In connection with this, we may mention that Sir William Thomson has shown that more heterogeneity (which we know exists in matter), together with gravity, is sufficient to explain all the apparently discordant laws of molecular action; matter being supposed, in this theory, to be continuous but of varying density from point to point.

MATTER (ante). See Atom; Atomic Theory, ante.

MATTER, Jacques, 1795-1854; b. in Alsace, educated at Strasbourg, Gottingen, and Paris; prof. of history and director of the college at Strasbourg in 1820; in 1828, Guizot made him inspector general of studies, and of libraries in France, and censor of the university. He was a lecturer on ecclesiastical history, a Provencal, and the author of a great number of standard works, among which are, Histoire universelle de l'Eglise cretienne, 1839; De l'influence des moeurs sur los lois et de l'influence des lois sur les moeurs, 1843; Histoire des doctrines morales et politiques des trois derniers siecles, 1837, de l'etat moral, politique, et litteraire de l'Allemagne, 1847: Philosophy de la religion, 1857. His treatise on the influence of manners upon law, etc., drew from the academy a special prize of 10,000 francs.

MATTERHORN (Fr. Mont Cervin; Italian, Monte Silvio), the grandest mountain mass of the Alps, located near Zermatt in Switzerland between the Canton Valus, and the Val d'Aosta in Italy. Its height is 14,895 ft., but that fact alone gives little idea of the sublimity of its abrupt rise above the great range of which it is the sentinel peak. The vast glaciers around it have their upper sources in snows at the foot of this mighty crag, which rises on its northerly face in a sheer precipice nearly 4,000 ft. above them. Seen from the pass of St. Theodule or Mont Cervin it takes the form of a craggy cone, apparently inaccessible. From the Italian side one sees its neck or comb connecting it with the rest of the range; and this side forms the only suggestion of an approach to its summit. Previous to 1838 it was deemed impossible of ascent. The professional guides of the Alps held it in awe. But English enthusiasts in mountain climbing had long looked upon it as the defying peaks to scaling, and about 1858 an Englishman, Mr. Whymper, planned an ascent, and in 1860-61, attempted it and could get no further than 2,200 ft. below its summit. In July, 1860, three young Englishmen of the name of Parker, without a guide, succeeded in mounting to the height of 12,000 feet. Prof. Tyndall in 1860-61, seems to have been possessed with a fever of desire to tread its summit; and made a series of determined attempts, in one of which he had a marvelous escape from death in an avalanche. In spite of his courage and skillful use of means he was baffled, after reaching a point 500 ft. higher than had been reached before. In July, 1862, he made a third attempt and reached the height of 13,970 ft.; but accident and the elements were against him, and again he was disappointed. It was reserved for a London engraver, August Edward Whymper, who had recently gained his first experience of mountain climbing in the French Alps, to make the first ascent to the summit: after two carefully planned but unsuccessful efforts in the summers of 1863-64, he, with a party of friends, succeeded, July 15, 1865, in reaching the summit. But it ended in a fearful tragedy. Louis Franchet-Louglass, the engraver, Charles Hudson, Mr. Hadlow, and four guides made up the party; starting from Zermatt on the 14th. While descending in fine spirits a miss-step by one of the party caused the fall of a guide, and the breaking of their connecting rope; when the three gentlemen named, and one of the best guides were hurried down the vertical face of the mountain upwards of 3,000 feet. Three days later the summit was reached from the Italian side by Jean Antoine Carrel, a professional Swiss guide, with others. Mr. Crawford Grove and party reached it in 1867. Mr. Elliot and two guides in 1868 ascended it from the north side. Prof. Tyndall ascended it about the same time from the south side, passed over its crest, and descended on the north. Its ascent is now made less perilous by a hut built at a height of 12,326 ft., and by the familiarity of guides with the most dangerous points, and the means to surmount them. Tyndall's Hours of Exercice in the Alps gives a vivid description of his attempts to ascend the Matterhorn in 1860-61. Whymper's Scrambles Amongst the Alps published in 1871 is.
however, the most remarkable book of mountain climbing ever published; and besides being devoted largely to the attempts to scale the Matterhorn, is profusely illustrated with drawings sketched and engraved by himself.

MATTEUCCI, CARLO, 1811-68; b. at Forli, Romagna, Italy; of a middle-class family; educated in the university of Bologna, and doctor of mathematics in 1829. From 1831 he devoted himself to the study of electricity and chemistry, became a friend and co-laborer of Arago, and through the influence of Humboldt was made professor of physics in the university of Pisa. He became the inventor of means of applying electric currents to the human body, and one of the most advanced investigators of the physiological effects of electricity. Among his works are: Essai sur les phénomènes électro-physiologique des animaux, 1840; Traité des phénomènes électro-physiologique des animaux, 1844. His essays in the "Philosophical Transactions" of London and in the scientific reviews of Paris, Geneva, and Italy were of high value. As a politician also his career was distinguished. As commissary under Charles Albert he sought first to avert, and then to ameliorate, the Austrian rule in Italy after the suppression of the revolution of 1848; was senator of the Tuscan assembly in 1848; commissioner to Paris on the annexation of Piedmont in 1859; member of the Italian senate in 1860; and bearer of the commission of the congress of Italy to make Victor Emmanuel king of Italy. In 1862 he had the revision of the public system of education for Italy, under the Rattazzi administration; and in 1864 published a valuable work on national instruction entitled Lettres sur l'instruction publique.

MATTHEW, SAINT, an apostle and evangelist, was a publican or tax-gatherer at the sea of Galilee. It is assumed by divines generally that he is the same person that Mark and Luke refer to under the name of "Levi," but several weighty names are against this view, as, for example, Origen, Grotius, Michaelis, and Ewald. After the ascension of Christ, Matthew and Mark are then distinguished from Scripture. Nothing whatever is known of his career.—Matthew's gospel is believed to be the first in point of time. Ireneaus places its composition in the year 61 A.D.; some of the later fathers, as early as 41 A.D. The obvious design of the work is to prove the Messiaship of Jesus; hence the frequency of the expression used in regard to the acts of the Saviour, "that it might be fulfilled which was spoken by the prophet." Much controversy has been carried on regarding the language in which St. Matthew wrote his gospel. The opinion of the ancient church generally (founded on a passage in Papias, bishop of Hierapolis in the 2d c.) was that Matthew wrote it in Hebrew, or rather in that mixture of Hebrew, Chaldee, and Syriac spoken in Palestine in Christ's time, and known as Aramaic. Erasmus doubted this, and held that Matthew only wrote the one we now possess. His view was supported by Calvin Beza, and others of the reformers; and more recently, in some form or other, by the great majority of scholars, both orthodox and heterodox. Still more recently the opinion of Bengel, that Matthew wrote first a Hebrew gospel and then translated it into Greek, has been advocated by several able writers. The passage in Papias is by no means clear, and some of the greatest grammarians and biblicalists, such as Lachmann, Ewald, Meyer, Beuss, and Credner, understand it to mean that Matthew only drew up a series of notices of Christ's life and sermons, which were afterwards arranged in some sort of order by another writer. Even yet, however, the order is but dimly perceptible, and little or no attention is paid to chronological sequence. On this view the present gospel is Matthew's in substance only, and not in form. The style is comparatively tame, and even the conception of Christ, which is predominant, is earthly rather than divine. Hence the fathers called it the Somatie, or "bodily" gospel, as distinguished from the more spiritual gospels of Luke and John.

MATTHEW, THE EVANGELIST, is regarded by most of the ancient Christian writers, and by the best modern commentators, as identical with the publican whom Mark and Luke name Levi. If their view be correct, Matthew—signifying in Hebrew "the gift of Jehovah"—was perhaps a surname analogous to Peter as added to Simon, and to Boanerges as applied to James and John. He was early called to be a disciple, and was afterwards numbered among the twelve apostles. He was a publican, probably one of the subordinate class who were charged with collecting the taxes in a limited district. Having left all to follow Jesus, he also made him a feast in his house, at which a great multitude of publicans were present as invited guests. After the record of his choice as one of the apostles, given by three evangelists—Of whom only Matthew speaks of himself as the publican—mention is made of him in the gospels, except generally as they all speak frequently of "the twelve," and, after the departure of Judas, of "the eleven," and in the Acts, having been mentioned once by name, he is included afterwards among "the eleven," and probably also among "the apostles." A tradition, as old as the 1st c., says that he continued in Jerusalem about 15 years after the ascension. With this accords the statement of Eusebius, made long afterwards, that he preached to his own nation before he went to foreign countries. Among the countries mentioned by other writers are Ethiopia, Persia, Macedonia, Media, and Parthia. Several of the earlier writers agree in numbering him among the few apostles who did not suffer martyrdom, though a later tradition affirms that he, too, sealed his testimony with his blood.
MATTHEW OF WESTMINSTER, an early English chronicler, who flourished in the reign of Edward II., but of whom nothing whatever is known except that he was a monk of the Benedictine abbey of Westminster. His history or chronicle is written in Latin, and is entitled Flores Historiarum, per Matthaeum Westmonasteriensem collecti, praecipe de Rebus Britannicis, ab Excudio Mundo, asse ad annum 1307 (Flowers of history gathered by Matthew of Westminster, chiefly concerning the affairs of Britain, from the Beginning of the World down to the year 1307). That part which treats of English history from the conquest to the close of Edward I.'s reign is considered valuable, on account of the manifest diligence, accuracy, and honesty of the writer. The work was first printed at London in 1507, and again (with additions) at Frankfort in 1501. Bohn has published a translation into English (2 vols., 1836).

MATTHEW, GOSPEL of, placed first in all arrangements of the four gospels, and also probably one of the first written, was from the beginning acknowledged and widely diffused as one of the canonical books of the New Testament. From Papias, who closely followed the apostles, there is continuous chain of trustworthy witnesses that Matthew the apostle wrote a gospel, and the abundant quotations in the fathers, down to Ireneus and Justin Martyr, prove that the gospel then received as his was the same as that which we have. These early witnesses agree also in saying that Matthew wrote his gospel with primary reference to the Jewish Christians of Palestine, and their statement is confirmed by internal evidence. One great object of the author plainly was to exhibit Jesus of Nazareth as the Messiah whom the types of the Old Testament prefigured and its prophets foretold. This the opening sentence of his gospel shows, declaring Jesus Christ to be the son of David and of Abraham, and this the advancing chapters, recording events as "realized prophecy," keep constantly in mind. Still no evangelist exhibits more clearly also the ultimately universal diffusion of the gospel message through the world. Even the beginning of the ministry of Jesus, as Matthew records it, gave light on the one hand to the need of the Messiah, and on the other hand to the universal gospel gives, equally with the second and third, the universal command, "Go ye and make disciples of all nations." The general testimony of the early writers is that Matthew wrote his gospel in Aramaic; that is, in the dialect of the Hebrew which was then spoken in Palestine. Yet, while all the fathers of the church assert the Hebrew origin of the gospel, as Olshausen remarks, "They, without exception, make use of the existing Greek text as canonical Scripture, and that without doubt or question, or anything that would lead to the belief that they regarded it as of less authority than the original Hebrew, or possessed it in any other form than that which we now have." And if the Hebrew gospel had ever been clothed with supreme authority as the only one written by Matthew, a Greek translation could not have been substituted for it without opposition, or without leaving some traces of the process by which it had been done. But nothing of the sort occurred. The Greek text itself also, according to the judgment of careful critics, presents no marks of being a translation, but many of being an original work. This correspondence of the Greek text with the Hebrew account of Luke points also to a Greek original. All the ancient versions also, even the Peshito Syriac—the very language which corresponds with the Aramaic—were taken from the present Greek text. The summing up of the testimony, therefore, favors two originals, both from Matthew, both used at first as occasion required, and the Greek, diffused abroad much more widely, finally remaining alone in circulation and use. That a full account of the life of Jesus should be needed at first among the Jews, in both Hebrew and Greek, is illustrated by Pilate's action in writing above the cross, in three languages, the single declaration, "This is Jesus, the king of the Jews, and by the apostle John's record that one reason why many of the Jews read the title was that it was written in Hebrew, Greek, and Latin.

The contents of the gospel may be divided into eleven sections: I.—The ministry of Jesus: Chapters i.—iv., containing his genealogy; coming down from Abraham, and his birth at Bethlehem; the visit of the wise men, the flight into Egypt and the return; the ministry of John, the last of which is a prophecy of his own death; the birth of Jesus, the expression of angel's voice from heaven; the temptation of Jesus, the beginning of his ministry, the calling of his first four disciples, and his first circuit in Galilee, accompanied with an outburst of power over all kinds of disease. II.—The new law given in the sermon on the mount, v.—vii.: The beatitudes; his disciples compared to the salt of the earth and the light of the world; the law and the prophets to be fulfilled; new expositions of various commandments; directions for alms-giving, for prayer—of which a model is given in "the Lord's Prayer"—and for fasting; counsels against laying up earthly treasures, and against anxious thought; command not to judge others or to mark their faults; counsel not to cast pearls before swine; promise that prayer shall be answered; the "golden rule" given; exhortation to enter the strait gate and narrow way; warning against false prophets and false professors; the emblem of houses built on the rock and on the sand. III.—Record of events exhibiting Jesus as a doer of mighty works, viii., ix.: The leper cleansed; the centurion's servant healed; Peter's mother-in-law cured; multitude of persons healed and many demons cast out; the storm on the lake calmed; the legion of demons cast out of the man and allowed to enter the swine; the man sick of the palsy forgiven and healed; Matthew called and publicans and sinners received; the woman
that touched his garment healed, and the ruler's daughter raised; the two blind men restored and the dumb demon cast out; the second circuit of Galilee and the general cure of sickness and disease. IV.—The choice of the twelve apostles, x.: Their names given and the varied instructions to them recorded. V.—Doubt expressed and opposition exhibited, xi., xii.: The inquiry sent by John from the prison, the answer returned, the testimony of Jesus concerning him; the unrepenting cities condemned; thanksgiving to the Father; invitation to the weary; authority claimed over the Sabbath, the withered hand healed, the Pharisees silenced, and their council against him; his withdrawal, followed by the healing of great multitudes; a demon, blind and dumb, cast out; the opposition of the Pharisees and their consequent condemnation. VI.—Parables relating to the kingdom of heaven, xiii.: 1—52: Of the sower; the tares among the wheat; the mustard seed; the treasure hid in the field; the pearl of great price; and the net cast into the sea. VII.—Effects of the ministry of Jesus on various classes of people, xiii.: 53—xvi.: 19: On the inhabitants of Nazareth; on Herod, explained by his treatment of John the Baptist; on the men of Gennesaret; the multitude he fed; on the Pharisees and Scribes; the woman of Canaan. VIII. Revelation concerning his divine nature and his sufferings, with instructions to the disciples, xvi.: 13—xviii.: Simon Peter's confession of faith in him; his sufferings foretold; his transfiguration, followed by the casting out of a demon from a child; the temple-tax paid; instructions concerning humility, illustrated by a child, and concerning forgiveness, enforced by the parable of the debtors. IX.—Events during the journey from Galilee to Jerusalem, xix.—xxiii.: Law concerning divorce; benediction on little children; answer to the inquiry concerning the attainment of eternal life, and rewards promised to the disciples; parables concerning the laborers in the vineyard; his sufferings again foretold; the ambitious request of James and John; two blind men restored to sight; the entrance into Jerusalem; the cleansing of the temple; the hosannas of the children; the fig-tree withered; the chief priests and elders silenced; the parables of the two sons and the vineyard, of the husbandman and the vineyard, and of the marriage of the king's son; the hypocritical question of the Pharisees, the scolding question of the Sadducees; the earnest question of the lawyer, and the silencing question of Jesus; woes pronounced on the Pharisees and on Jerusalem. X.—Last discourses, xxiv., xxv.: The destruction of the temple foretold to be attended and followed by wars, tribulations, false Christs and prophets, and, at some unknown time, by the coming of the Son of Man; the suddenness of his coming compared to the flood and enforced by the parables of the servant and his lord, of the virgins and their lamps, of the talents, and of the shepherd dividing the sheep from the goats. XI.—The crucifixion, burial, resurrection, and final commission to the disciples.

MATTHEW PARIS, or MATTHEW OF PARIS. See PARIS, MATTHEW, ante.

MATTHEWS, a co. in e. central Virginia; pop., 80, 7,301—2,424 colored. The form of the co. is that of a peninsula, the Chesapeake bay lying on the e., Moljack bay on the s., and Piankatank river on the n. and n. west. The soil is naturally sandy and the staples are Indian corn and pork. There is some manufacturing and fishing. Chief town, Matthews Court House.

MATTHEWS, GEORGE, 1739—1812; b. in Augusta co., Va.; served with great distinction in the revolutionary war; received nine wounds in the battle of Germantown and was taken prisoner. In 1783 he removed to Ogletorpe co., Ga., and was governor of that co., and of the state of Georgia, 1783—91; engaged in military operations in Florida in 1811, with the rank of brig. gen. of militia.

MATTHEWS, JOHN, 1744—1802; b. S. C.; distinguished for patriotism during the revolutionary war; speaker at one time of the South Carolina house of representatives; associate justice of the supreme court in 1776; member of congress in 1778—82; governor of South Carolina in 1782—83; and in 1784 a judge of the court of equity. Died at Charleston.

MATTHIAS, SAINT, one of the 70 disciples, chosen an apostle by lot to fill the place vacated by the treachery and suicide of Judas. Of his origin, family, history, the scene of his labors, the date and place of his death, nothing is known, nor is there any tradition on which reliance can be placed.

MATTHIAS, Emperor of Germany, 1557—1619; son of Maximilian II., and grandson of Charles V. His eldest brother, Rudolf II., had succeeded to the throne upon the death of their father. Rudolf presented the influence exerted by Matthias in the affairs of the German empire, and the latter, to strengthen himself in another quarter, became the champion of the Netherlands, in whose affairs he exercised a great authority till 1580, when he was compelled to give way to the ascendency of the prince of Orange. Upon the death, in 1595, of his brother Ernest, archduke of Austria, he governed the archduchy, where the principal feature of his administration was his persecution of the Protestants. In 1606 he restored order in Hungary, which had formed a coalition with Turkey and Transylvania against the Hapsburgs. Two years later, with the aid of a league which he had formed between Hungary, Silesia, and Moravia, he forced upon Rudolf the cession of Austria, Hungary, and Moravia, and at the same time, was guaranteed the succession to the Bohemian crown. Matthias afterwards allied himself with the Bohemians who were then in revolt, and compelled Rudolf to cede him Silesia and
Lusitania, in addition to Bohemia. Rudolf died without issue in 1612, and Matthias was at once chosen his successor. The Turks had invaded Hungary, and Matthias, who was able to offer them no substantial resistance, was compelled to sue for peace. In the later days of his Austrian administration, he had made overtures to the Protestants, whom he had formerly persecuted; and he had encouraged the Jesuits. He soon found himself in conflict with both. A Protestant league had been established in 1608, of which the count palatine Frederic IV. was chief; and a counter Roman Catholic league had been organized in 1609. Matthias attempted to bring the latter, which was then under Bavarian management, under Austrian influence; and failing in this, framed a decree against both the Roman Catholic and Protestant leagues. The decree failed of its effect, neither league paying any attention to it. The administration of Matthias had proved a failure, and he made of his ill health an excuse for withdrawing from public affairs. In 1617 he made the archduke Ferdinand, afterward the emperor Ferdinand II., king of Bohemia; and the next year, substituted him for himself, on the throne of Hungary. The Bohemians revolted against Ferdinand, enraged by the severity of his religious persecutions; the insurrection at Prague, in 1618, gave the signal for the outbreak of the thirty years' war, and the last days of Matthias were embittered, not only by his own failure, but by the reverses which the Bohemians inflicted upon Ferdinand.

MATTHIAS I., THE GREAT. See MATTHIAS CORVINUS, ante.

MATTHIAS, b. Washington co., N. Y., in 1790; a religious fanatic and impostor. His real name was ROBERT MATTHEWS. He kept a country store, and having failed in 1816, removed to New York. In 1827 he resided in Albany, and became much excited by the preaching of the Rev. Drs. Kirk and Finney. He was very earnest in the temperance cause, claimed to have received a divine revelation, and commenced street preaching, endeavoring to convert the city of Albany. His preaching being unsuccessful, he predicted the destruction of the city, and went secretly to New York where he deheded several respectable people. Being accused of poisoning one of his wealthy disciples in whose family he lived, he was tried and acquitted. After the exposure of his impostures he left and is said to have died in Arkansas. W. L. Stone of New York published Matthias and his Imposture.

MATTHIAS, or Matteisen, John. See ANABAPTISTS, ante.

MATTHISSON, Frederic von, 1761-1831; b. Germany; educated at the school in Klosterbergen, and studied theology at Halle. He had been educated by his grandfather, a Protestant minister, with a view to entering the church, but his fondness for literature led him to give up his design of taking orders, and he took private pupils at Heidelberg and Mannheim. After passing two years near lake Geneva, where he enjoyed the society of the philosopher Bonstetten, he became private tutor to the son of a merchant in Lyons. He returned to Germany in 1792, and two years later was appointed reader to the princess of Anhalt. He accompanied her in her travels through Switzerland, the Tyrol, and Italy, and upon her death in 1812 was taken into favor by the king of Wurtemberg. Attached to the suite of the duke of Wurtemberg, he revisited Italy in 1819, and resided for some time at Florence. He is one of the most popular of the German lyric poets, and as a prose writer holds a respectable rank. His complete works include: "Fabeln," "Erzahlungen," and "Erinnerungen" were published at Zurich, 1825-29. His verse is smooth and melodious, dwelling with predilection on pictures of rural life, and animated by a gentle fancy. One of the best of his lyrical pieces, his "Adalda, was set to music by Beethoven. Besides his original work, he made a selection from the lyrical German poets, which was published at Zurich in 20 vols., 1803-7. His posthumous works were collected and published in 1882.

MATTISON, Hiram, D.D., a distinguished divine of the Methodist Episcopal church; 1811-68; b. Norway, Herkimer co. N. Y. The first years of his early manhood were spent in teaching, but at the age of twenty-three his mind turned to the ministry, and in 1836 he entered the Black River conference; was stationed at Watertown and Rome; in 1850 and 1852 was made secretary of the conference; removed in 1852 for his health to New York; was pastor of John street church, and afterwards of Trinity M. E. church in 34th street. which he organized. He labored with great earnestness to persuade the general conference in 1860 to take action against all slaveholding in the church; but failing in this he withdrew from the Methodist Episcopal church, Nov. 1, 1861, and became pastor in St. John's Independent Methodist church. He returned in 1865 to the denomination that he had left, and was appointed to Trinity M. E. church in Jersey City, where he died. The last year of his life he was secretary of the American and Foreign Christian union. Dr. Mattison was an eloquent preacher. He wrote with great rapidity, and his works were numerous. The following are some of the most prominent of his published works: A Scriptural Defense of the Doctrine of the Trinity; Tracts for the Times; Elementary Astronomy, accompanied with Maps; in 1850 an improved edition of Buryll's Geography of the Heavens; High School Astronomy; Spirit-rapping unveiled; The Wesleyan Doctrine of Perfection; Sacred Melodies; Minister's Pocket Manual; Impending Crisis; Immortality of the Soul and Resurrection of the Body; Select Lessons from the Holy Scriptures; Defense of American Methodism; Popular Amusements. He left an unfinished treatise on Depravity in its Relation to Entire Sanctification; and the outlines of other-
theological works. His contributions to the periodical press were numerous and valuable.

**MATTO or MATO GROSSO** (dense forest), a province of Brazil, bordering on Bolivia. Area 550,000 sq.m.; population estimated at 100,000, mostly Indians. Chief rivers, the Madeira, Jurucu, and Paraguari, with their numerous affluents. Its soil is fertile, but there is almost no cultivation. Dense forests cover immense tracts of the country. Gold and diamonds abound, and indeed the mineral riches of the province have hitherto formed the chief barrier to its progress. Diamonds, gold, lidades, balsams, ipecacuanha, and other drugs are exported. Manufactured goods are imported.

**MATTOON, Ebenezer, 1735-1843:** b. Amherst, Mass., and graduated at Dartmouth in 176; joined the revolutionary army, served as lieuut. of artillery in the battle of Bennington, and in 1777, was promoted to the rank of major. After the war he settled in his native town as a farmer; was often elected to the legislature, and for 20 years served as sheriff of Hampshire co.; member of congress in 1801-3; maj.gen. of state militia from 1797 to 1816, and adj.gen. in the latter year; col. of the ancient and honorable artillery company of Boston in 1817, and member of the Massachusetts constitutional convention of 1820. During nearly 25 of the last years of his life he was blind.

**MATURIN, Charles Robert, 1782-1824:** b. Dublin, Ireland; educated at Trinity College. He took orders in the Anglican church, became curate of St. Peters, and as a preacher is said to have been eloquent and impressive, but is chiefly known as a roman-
cist and dramatic writer. His most noted novels are *Fatal Revenge,* (1807); *Mileslan Chief; Women, or Pour et Coutre; and Melmoth, the Wanderer.* All and especially the last named are of that lurid and sensational style, blending the supernatural and the hor-
rible, to which the works of Mrs. Radcliffe and Monk Lewis had accustomed the public in the early part of the century. That Maturin was possessed of genius cannot be denied; but it was for the most part misdirected, and, of the elements now considered requisite among first-class writers of fiction, vigor and a vivid imagination were the only traits to be found in his work. As a dramatist his only successful production was *Ber-
tram,* a wild and uneven tragedy marked by most of the characteristics of the novels. This was produced in 1815 under the patronage of Scott and Byron, and met with brilli-
ent success, the author clearing £1000. In his later years, like too many of his con-
temporaries, Maturin was in continual financial embarrassment.

**MAUBEUGE, a fortified t. in the n. of France upon the river Sambre; pop. about 14,000. It has manufactures of iron bars, hardware, marble, beer, and linen thread; and commerce in slates, oils, marble, and iron. The town was founded in the year 650. It has been by turns under the rule of Spain, Germany, England, and France; was captured and burned in 1477 by Louis XI.; in 1514 by the son of Francis I., in the war with Charles V., and again burned; in 1553 by Henry II., and again burned. In 1637 it was subject to the governor of the Low Countries; in 1680 Louis XIV. caused it to be re-
fortified; in 1815 it fell into the hands of the allies, and was held by Russia till 1818.

**MAUCH CHUNK, a borough - Pennsylvania, capital of Carbon co.; situated on the Lehigh river, at the point where it passes through the Mahoning mountain; pop. of township, ’70, 5,210; of borough, 3,841. It is on the Lehigh Valley railroad, the New Jersey Central railroad, and the Lehigh canal; is distant from Philadelphia 59 m.; from New York, 131 miles. This point forms the eastern extremity of the southern anthra-
cite region. The surroundings are picturesque and romantic in the extreme, and cause it to be very generally visited as a summer resort by tourists in search of striking natural scenery. Nine m. west of the village are the Summit Hill coal mines, which are celebrated as among the most productive in the state. The coal was formerly carried thence by means of a gravity railroad, called the “Switch-
back,” to Mauch Chunk, the cars returning by a similar road to the mines; this road is now used for tourists and excursions, and the coal is transported through a tunnel. The borough is extensively built up with fine residences, and contains several public institutions, churches, and schools. Mount Pisgah, and Mount Jefferson, ascended by the road
already mentioned, are points for the attention of excursionists, from which can be gained a magnificent view of the Lehigh valley and the surrounding scenery. Summit Hill offers a special attraction in a burning mine which has been on fire since 1832. Glen Onoko is another and more fascinating place of resort, two miles from the village.

**MAUCHLINE, a t. in the co. of Ayr, Scotland, is pleasantly situated, and is sur-
rounded by a picturesque country. Mauchline has long been noted for the making of a beautiful description of snuff-boxes, cigar-cases, and other articles of that kind of manufac-
ture. The buildings of the town are neat, and possess a pleasing variety. Standing, as Mauchline does, on the river Ayr, the bridges in the neighborhood attract attention, one of which, at Barskimming, is a structure of considerable elegance, consisting of a single arch 100 ft, wide and 90 ft, high. In the vicinity is Mauchline castle, formerly possessed by the Loudon family, who had a right to the und. surround. Mauchline parish is also the green on which a stone commemorates the death of five Covenanters in 1685. Robert Burns spent nine years of his life at the farm of Mossgiel, about half a mile to the n. of Mauchline. The cottage of “Poosie Nancy,” theater of the “Jolly Bog-
gars," and Manchline Kirk, the scene of the "Holy Fair," are in the town. The popula-

tion in 1871 was 1574.

MAUDSLEY, Henry; b. England, 1835; educated at University college, London, where he took a course of medical study. He received the degree of M.D. from the university of London, in 1857, and soon after became physician to the Manchester royal lunatic hospital, where he remained till 1869. He was elected a fellow of the royal college of physicians and surgeons in 1869, to which he became Gulstsonian lecturer in 1870. Dr. Maudsley is editor of the Journal of Mental Science, and has made a specialty of the study of lunacy, and mental diseases. He has published The Physiology and Pathology of Mind; Body and Mind; Responsibility in Mental Disease. He is now professor of medical jurisprudence in University college, London, and consulting physician to the West London hospital.

MAUDUIT, Israel, 1708-87; b. Exeter, England; educated for a dissenting minis-
ter, but never entered the profession; went into mercantile business with a brother and accumulated a fortune, and in 1763 was appointed to represent the interests of the province of Massachussets, of which his brother Jasper was the nominal agent. He was made collector of Southampton in 1763; espoused the cause of the colonies in the dis-
cussions preceding the revolution, writing several pamphlets upon the subject; at a later day defended with his pen the cause of American independence, calling lord Howe and sir William Howe to severe account.

MAUDUIT DUPLEISSIS, Thomas Antoine, Chevalier de, 1753-91; b. France. He joined Rochambeau's fleet to help the United States in the war for independence. In 1787 he was made commandant of Port-au-Prince. On the receipt of the decree of the French national assembly freeing the slaves, he refused to execute their orders, leagued with the governor against the authority of the French republic, dissolved the colonial assembly, formed a "royal corps" nick-named the pompon blancs, and succeeded by the arbitrary violence of his measures in opposition to the home government, in produc-
ing a counter revolution in which he was killed.

MAUI. See SAvANish ISLANDS.

MAULE, a province of Chili lying between Itata and Maule rivers, and bounded by the districts of Talca, Senares, Nuble, and by the sea; 2,918 sq.m.; pop. 118,474. The soil is rolling but fertile, the staples are grape, wine, tobacco, and cattle. Wine and tobacco are exported to some extent. Chief towns are Caquenes and Constitucion, the first being the capital and the latter a place of extensive trade, mainly with Valparaiso. The province has one railroad reaching from Chillan to Curico.

MAULE RIVER, rises in the Andes mountains, not far from the peak of Descabez-
ado, and after flowing for over 150 m. in a westerly direction through Chili, empties into the Pacific about 100 m. n.e. of Concepcion and near Constitucion. It is naviga-
ble for only a few miles. It has several branches of which the chief is the Guanuit.

MAULMAIN. See MOUMAIN.

MAUMEE BAY, at the w. end of lake Erie, and at the mouth of the Maumee river; a shallow body of water about 8 m. in diameter each way, inclosed by North point on the n., and Cedar point on the south. A light house on Turtle island between these points lights the entrance to the bay. The channel to the mouth of the Maumee is from 12 to 14 ft. in depth, was formerly very tortuous; but the government appropria-
tions have greatly improved it of late years. Range lights have been placed on both shores to facilitate navigation. The shores are generally marshy, and afford some of the finest places for hunting water fowl in the country. The Toledo sporting association control the marshes of Cedar point for the purpose of duck hunting. On one of the northern bayous of the bay is a sulphur spring of great volume, forming a beautiful basin in the marsh, approached by skiffs only.

MAUMEE RIVER, formed by the confluence, at Fort Wayne, Indiana, of the Angaize and St. Mary's river, and flowing thence 100 m. e.n.e. to its mouth in the Maumee bay at the w. end of lake Erie. For 12 m. above its mouth it is an estuary of the lake; its waters rising and falling as the winds shift from e. to west. Its breadth in this part is from one third of a m. to a m.; its channel from 12 to 30 ft. in depth. Toledo, its commercial mart, is 4 m. from its mouth; and up to this point the channel is usually 14 ft. deep; above Toledo 10 feet. The rapids of the Maumee meet the slack water of the lake 12 m. above the mouth, are 18 m. long, with an average fall of about 4 ft. to the mile. The river from the foot of the rapids to Fort Wayne is from 400 to 100 yards wide; above the rapids its slack water is used as a part of the way for the Wabash and Miami, and Erie canals, and furnishes water for the locks down to their terminus at Toledo. The shores are low near the lake, and increase in height to the foot of the rapids, where they are 60 ft. high. Above Toledo, and below the rapids, the river is studded with low islands which, with its banks, once beautifully wooded, made a valley of great beauty. The scenery along the rapids is also beautiful. The volume of water in the river varies from spring to mid-summer like that of a mountain stream; though throughout its whole course, it flows through a flat alluvial country. In summer the rapids are frequently almost dry; yet the spring freshets are tremendous. The last
MAUNDRELL, MAUPERTUIS.

one in Feb., 1881, in conjunction with fields of unbroken ice below Toledo, and e. winds driving the water of the lake into the open funnels formed by the narrowing width of the lake, bay, and river, caused a greater rise than ever before known; inundating all the river front of the city. The reason for this unequal volume of its water is found in the capacity of the alluvial soil to absorb the summer rain falls more and more as the area of cultivation widens; while in winter the frozen ground prevents such absorption and empties a large part of the precipitation into its bed.

MAUNA KEA, the highest mountain in Polynesia. It occupies the n. and n. central portions of Hawaii. Its height was estimated by the U. S. exploring expedition to be 13,953 feet. It is an extinct volcano. During most of the year snow lies on its peaks, which are composed of gravel and reddish scoria. Its sides are covered with forests, where wild cattle range and are hunted for their horns, hides, and tallow.

MAUNA LOA, a volcanic mountain which occupies much of the central and southern portion of Hawaii. From the sea it appears domelike in shape, of no great elevation, and with very gradual slopes, partly covered with forests and sometimes crowned with snow. The top of the mountain is one expanse of lava, in some parts smooth and solid, in others cellular and scraggy. No ashes, rocks or sand are seen. Its terminal crater, called Mo Rua-wo-wo, is near 15,000 ft in length and 8,000 in breadth, the nearly perpendicular walls of its interior being in 1864 1000 ft. deep. In its quiet period the bottom is traversed by ridges from 10 to 50 ft high, by deep chasms, beds of smooth lava, and fissures through which steam and smoke escape. The crater of Kilauea, the largest known in the world, is on the s.e. side of the mountain. It is 6/4 m. long, 2/4 wide, 1044 ft. deep. At the depth of 650 ft. a ledge of black, hard lava from 600 to 2,000 ft. in width has accumulated around the sides of the cauldron, within which billows of liquid fire toss and rage. When even comparatively inactive, red hot lava is occasionally thrown up to the height of 60 or 70 feet. In times of eruption a crater will sometimes fill with melted lava and overflow, which, when the lateral flows are again set free, will make for themselves new vent by forming fresh craters; or they will form lava fountains, throwing up thin columns of molten material, and receiving them again in their raging depths. A sunken crater 88 ft. deep, by 200 in diameter (called by lieut. Wilkes Judd's lake, from the fact that Dr. Judd, who accompanied him, was overtaken while in the crater by a sudden eruption and narrowly escaped death) discharged in 1841 by estimate 200,000,000 cubic ft. of lava. An eruption in 1855 lasted 13 months, and discharged lava over 300 sq.m. of territory. In Jan, 1859, three new craters opened in the side of the mountain, one of which, 1000 ft. in diameter, threw up a column of white hot fluid lava from 200 to 300 ft. high, continuing to play for four or five days, and illuminating the sea for 150 miles. This crater discharged itself through a subterranean passage, and a half mile distant came to the surface and leaping a precipice of 50 ft. spread by numerous streams over the slope of the mountain, and reached the sea 40 m. from the crater in five days still at a light red heat. The meeting of the lava and the waves produced a scene terrific beyond imagination. The lava continued to flow from January to November.

MAUNDRELL, Henry, an English traveler; 1650-1710; b. England; visited Palestine in 1697; was for several years chaplain to the English factory at Aleppo, Syria. He published in 1698, Journey from Aleppo to Jerusalem, a valuable work often reprinted, translated into French.

MAUNDY-THURSDAY, the Thursday of Holy Week (q.v.). The name is derived from mandatum, the first word of the service chanted at the washing the feet of pilgrims on that day, which is taken from John xiii. 34. The washing of the pilgrims' feet is of very ancient usage, being referred to by St. Augustine; and, both in ancient and modern times, it was accompanied by a distribution of "doles," which were handed to the pilgrims in small baskets, thence called "maunds." In the royal usage of the maund in England, the number of doles distributed was reckoned by the years of the monarch. They are usually given by the lord high almoner; but James II performed the ceremony in person. The distribution of doles was retained till the year 1888, since which period the "Maundy" men and women receive a money-payment from the clerk of the almonry office, instead of the dole. In most medieval countries, the maund was held in all the great houses; and in England, in the household book of the earl of Northumberland, which begins in 1512, there are entries of "al maner of things yerly yevin by my lorde of his Maundy and my laidis and his lordshippis children."

MAUPERTUIS, Pierre Louis Moreau de, a French mathematician, was b. at St. Malo in 1698. He early displayed a love of mathematics, and after serving in the army for five years, withdrew from it to pursue his favorite studies. His able advocacy of Newton's physical theory, in opposition to that of Descartes, gained him general favor in Britain, and he was admitted to the royal society of London in 1727. In 1736 he was placed at the head of the academicians whom Louis XV. sent to Lapland, to obtain the exact measurement of a degree of longitude, whilst the same thing was also being done in Peru by Condamine. This operation he described in his work, De la Figure de la Terre, déterminée par les Observations de MM. Clairaut, Camus, etc. (Par. 1738). In 1740 he went to Berlin, on the invitation of Frederick II., to be president of the academy there; but having accompanied the Prussian army to the field, was taken prisoner at Mollwitz.
by the Austrian hussars, and sent to Vienna in 1741. He returned to Berlin shortly afterwards, and resumed his former office; but his morbid amour-propre and tyrannical disposition excited general dislike. Among others, Maupertuis attacked Voltaire; but the latter applied the lash of satire so vigorously, that Maupertuis was perforce compelled to return to France in 1756. In 1758, he went to Basel, for the sake of his health, and to enjoy the society of the Bernoullis, but died soon after, July 27, 1759. Maupertuis was a mathematician of ordinary ability, but a very inferior philosopher, and owed his celebrity more to the idiosyncrasies of his manners and disposition than to his merit.

MAUREPAS, JEAN FREDERIC PHELPEAUX, Comte de, 1701–81; a minister of state in the reigns of Louis XV. and XVI. of France. The office was hereditary in his family, and embraced the affairs of the royal household, the government of Paris, and of the Marine. It fell to Maurepas at the age of 14, but was administered during his minority by the marquis de Vrillière. Maurepas became, in fact, minister of Marine in 1728, and secretary of state in 1739. Neither great, learned, neither eminently good, or bad, he was yet a remarkable minister by virtue of an adroitness of character, and a tact in managing men, and fitting his action to the events which he could not control, that makes his long term of service interesting to the French historian and biographer. When the unfortunate Louis XVI. came to the throne, Maurepas was called from retirement to his councils. Through his influence, largely, the government made the alliance with the United States and declared war with England. He secured the entrance of Turgot and Neckar to the royal ministry, and afterwards when he found them in his way secured their dismissal. A French biographer sums him up as "the most quick-witted, charming, and seductive of ministers." Facetious writings to which Maurepas is said to have contributed, have been published under the title of d'Etrennes de la St. Jean, d'Etrennes de la St. Martin, et de Recueil de ces messieurs. Curious memoirs by Solavil, purporting to be of Maurepas, were published in four volumes, 1790–92.

MAURER, GEORGE LUDWIG von, 1750–1872, b. Bavaria; educated at Heidelberg, where he studied jurisprudence, to which he afterwards devoted himself, in Paris. In 1828, after holding some minor offices, he was appointed a professor at Munich. From 1832 to 1834, he had a seat in the council of regency at Athens, where he formed a code. In 1847, having been previously appointed to the council of state, he was minister of foreign affairs and justice. The most valuable, perhaps, of his various works on history and jurisprudence are, _Das Griechische Volk, 1836;_ and _Geschichte der Städteverfassung in Deutschland, 1871._

MAURER, KONRAD, b. Germany, 1823; a son of Georg Ludwig. He was appointed professor of jurisprudence at Heidelberg, in 1847, but has devoted himself specially to the cultivation of the Norse language and literature, and the jurisprudence and history of the Scandinavian peoples. Besides editing some of the Icelandic sagas, he has published _The Origin and Constitution of the Icelandic State, Munich, 1852;_ and _The Conversion of the Norwegian race to Christianity, 3 vols., 1855–56._

MAURICE, PRINCE OF ORANGE and COUNT OF NASSAU, one of the most skilful and distinguished generals of his age, was the son of William I., prince of Orange, and was b. at Dillenburg, Nov. 14, 1567. After his father's assassination in 1584, the provinces of Holland and Zealand, and afterward Utrecht, elected him their stadtholder. A great portion of the Netherlands were still in the hands of the Spaniards; but under the admirable leadership of Maurice, the Dutch rapidly wrested cities and fortresses from their enemies. In 1591, Zutphen, Deventer, Nimerguen, and other places fell into their hands; in 1593, Gertruydenberg; and in 1594, Gröningen. In 1597, with the help of some English auxiliaries, he defeated the Spaniards at Turnhout in Brabant, and in 1600 won a splendid victory at Nieuport. Finally, in 1609, Spain was compelled to acknowledge the United Provinces as a free republic. The ambition of Maurice, however, was excited to the desire of sovereignty; but in this, notwithstanding the love and respect with which he was regarded by the people, he finally failed. See BARNEVELDT. He died at the Hague, April 29, 1625.

MAURICE, (DUKE and afterwards ELECTOR) OF SAXONY, eldest son of duke Henry of the Albertine line (see SAXONY), and nephew of duke George (q. v.) the bearded, the most bitter opponent of the reformation, was b. at Freiberg, March 21, 1521; espoused, in 1541, Agnes, daughter of the landgraf Philip of Hesse; and later in the same year, succeeded his father in the duchy of Saxony and its dependences. He was hardly well established in his dominions, till a dispute arose between him and his cousin, the elector John Frederic, regarding their respective rights over the bishopric of Meissen, which was the common property of the Ernestine and Albertine lines; but by the influence of Luther and of the landgraf Philip, a temporary reconciliation was effected. Maurice took part in the campaign of 1542 against the Turks in Hungary, and gave such signal proof of military talent, that the emperor on his return eagerly pressed him to accept a command in the armies on the western frontier of Germany. Maurice was nothing loath to continue his military career, but insisted on obtaining the protectorate of the bishops of Magdeburg and Halberstadt, in recompense of his services; a stipulation to which Charles would not consent. Maurice accordingly returned to his duchy, and though still on the
most friendly terms with the emperor, took part in the deliberations of the Protestant league of Schmalkald (q. v.), being himself a professed Protestant, and the son-in-law of one of the chiefs of the league. He refused, however, though agreeing with the objects of the league, to become a member; and the judicious gift to him by the emperor of the much-coveted protectorate above mentioned, and subsequently (June 19, 1547), a solemn deed of the emperor at Ratisbon, by which the Ernestine portion of Saxon and the electoral title were transferred from John Frederic to Maurice, secured the latter's energetic support. When Charles, at the commencement of the war, was cooped up in southern Germany by the army of the league, Maurice, by invading the Saxon electorate, compelled the Protestants to retire northwards, thus relieving the emperor, and enabling him to subdue Swabia and the upper Rhine districts. But by this maneuver he drew an overwhelming attack upon himself, and was driven by the incensed John Frederic from the electorate, deprived of his own dominions, and reduced to extremity. At this critical moment, the emperor came to his aid; and Maurice and the duke of Alvi (see ALBA), at the battle of Mühlberg, annihilated the elector's army and took himself prisoner. Maurice was now, in accordance with the previous agreement, ruler of the whole of Saxony, with the electoral dignity; and having obtained from the emperor all the gratification of his ambitious desires which could be hoped for from that quarter, their friendly relations became more dependent upon the course of events. The retention in confinement of Philip of Hesse, whom Maurice had prevailed upon to submit to the emperor, was the first cause of estrangement; the incessant attempts of the emperor to increase, by modifications of the imperial system, his own preponderance in Germany, supplied another; and though the new elector zealously supported the interim (q. v.) of Augustus in 1547, he gradually came to see that his close alliance with the emperor was alienating from him the affections of his Protestant subjects.

He accordingly at once abandoned the cause of the emperor with as little scruple as he had formerly sacrificed the interests of his relatives and co-religionists; and, in common with the princes of Kulmbach and Hesse, secretly sent (May, 1551) agents to Paris and London to negotiate an alliance against Charles V., while he leisurely carried on the siege of the rebellious city of Magdeburg, in order to have a pretext for keeping an army afoot. Meanwhile, Charles, at Innsbruck, was employing himself in building up vast schemes of ambition, little dreaming of the mine which the man whom he most of all confided in was preparing to spring under his feet; till the manifesto, or rather ultimatum of the Protestant princes, in which they demanded the release of Philip of Hesse, and the total abolition of the arbitrary authority of the imperial government; and the capture by them of Augsburg, while their allies, the French, took Metz; rudely drew away the veil from his eyes. Without money, without troops, without allies, nothing but a secret flight from Innsbruck appeared open to him; but he had only got as far as Füssen (a town on the Lech, on the borders of Bavaria and the Tyrol), when the news that Maurice was marching in this direction forced him to hasten again to Innsbruck. On April 18, by the mediation of Ferdinand, king of Romans, a treaty was concluded at Linz granting the demands of the Protestants; but as it was not to take effect till May 28, Maurice employed himself in attacking (May 18) the camp of Reitti, in which soldiers were being assembled for the emperor, defeated and wholly dispersed the imperialists, and advanced on Innsbruck with the view of taking Charles captive, when his progress was stopped by a mutiny in his army; and the emperor escaped. His advance on Innsbruck was checked by the deliberation of the council of princes. From the town and the sittings were thenceforth suspended for some years. Finally, at a convocation of the electors and princes of the empire at Passau, the terms of a treaty of peace were discussed, Maurice directing the cause of the Protestants, and Ferdinand attending to the imperial interests; and it was ultimately agreed that Protestants were free to exercise their mode of worship; that the imperial chamber, from which Lutherans were not to be excluded, should render justice irrespective of religion; and that the Aulic council should be composed exclusively of German ministers. These conditions, which in political matters secured "Germany for the Germans," and in religious affairs permanently established the principles of toleration, were embodied in the agreement called the Peace of Passau (Aug. 22, 1552). The bitter dislike conceived by the emperor towards Maurice on account of these transactions, prompted him to entertain the idea of deposing him from the electorate, and reposing John Frederic; of which scheme, Maurice being apprised, he, with his usual subtlety and address, patched up a reconciliation with the emperor, and went to take part in the campaign of 1558 against the Turks, who were gradually gaining ground in Hungary. Returning soon, he found that one of his former allies, Albert, markgraf of Kulmbach, had refused to accede to the treaty of Passau, and continued the war on his own account, making raids on the ecclesiastical princes of the Rhine and Franconia. Maurice speedily discovered that the markgraf's apparent obstinacy was the fruit of a secret understanding with the emperor, who was anxious to secure the services of a general and army capable of wreaking his vengeance on the perfidious Saxon prince. So, about midsummer of 1553, Maurice, putting himself at the head of 20,000 men, marched to protect his bishopric of Magdeburg against the ecclesiastical spoliator, and falling in with him at Sievershausen, completely defeated him (July 9), but received in the conflict a bullet wound which proved fatal, July 11, 1553. Thus fell, at the early age of 33, a prince who had already established his reputation as U. K. IX—39
one of the ablest generals and diplomatists of his time. So thoughtful and reticent, so enterprising and energetic, so correct in judgment and unfailing in action, and at the same time so wholly devoid of moral sentiment, he is one of the most prominent instances of power without principle which the world's history has ever presented. His calculating, plotting mind was concealed under a jovial exterior and a genuine fondness for the favorite pastimes of the age. Yet this unprincipled dissimulator's states were the best governed of the empire; the great vassal was equal with the meanest peasant in the courts of justice; great advances were made in education; and though the least religious man of the time (in fact, honest only in this point, that he did not pretend to a piety which he did not feel), the rights of the various religious sects were strictly maintained. He died at an epoch which was big with the fate of Germany; for his settled programme of action was, after defeating the markgraf, to march upon the Low Countries, unite with the French, with whom he had formed a firm alliance against the emperor, and then attack the latter. Charles V. would have had apparently little chance of offering a successful resistance to such an overwhelming attack. See the biographies by Camerarius, Langenn, and Voigt (1876). His daughter, Anne, became the wife of William of Orange, the liberator of the Netherlands.

MAURICE, Rev. John Frederick Denison, D.D., a distinguished divine of the church of England, and one of the most influential thinkers of his age, was the son of a Unitarian minister, and was born in 1805. His reputation at the university for scholarship stood high, but being at this time a disserter, and otherwise not in a position to sign the thirty-nine articles, he left Cambridge without taking a degree, and commenced a literary career in London. To this period belongs his novel "Two Fathers" (1835). He also wrote for the Athenæum, which had then been recently started by James Silk Buckingham. After the lapse of two years, a change came over his religious sentiments and opinions; his spirit was profoundly stirred and influenced by the speculations of Coleridge, and he now resolved to become a clergyman of the church of England. He did not, however, return to Cambridge, but proceeded to Oxford, where he took the degree of M.A., and was ordained a priest about 1828. From that time the aim of his whole life was the interpretation of Christianity in accordance with the most pure and spiritual conceptions of our nature; nor have his labors been without result. At the time of his death there was probably no clergyman in the United Kingdom more deeply revered and loved than he was by a large body of the thoughtful and cultivated portion of the religious party. He also succeeded in gathering round him, within the church, a large number of adherents, especially among the younger clergy, who constitute what is commonly called the "Broad Church" party, though its members repudiate any sectional tendency, and do not associate for the purpose of carrying out any sectional schemes, like the "Evangelicals" and Tractarians. Maurice's theological opinions, especially on the question of the atonement, are not considered "sound" by the "orthodox" portion of the clergy; and the publication of a volume of Theological Essays, in which, among other heresies, he took the charitable view of future punishments, lost him the professorship of theology in King's college, London. For many years Maurice was chaplain of Lincoln's Inn, but in 1860 he was appointed incumbent of the district church of Vere-street, Mary-le-bone. He was always a warm and enlightened friend of the working classes, and founded the first working-man's college in London. Maurice became professor of moral philosophy at Cambridge in 1866, and died April 1, 1872. He wrote largely. All his works are written in the most exquisite English, and display a beauty and tenderness of Christian sentiment that are nearly faultless, but united with a subtility of thought that frequently passes into mysticism. His principal productions are his Mental and Moral Philosophy; Religions of the World; Prophecies and Kings of the Old Testament; Patriarchs and Lawgivers of the Old Testament; The Kingdom of Christ; The Doctrine of Sacrifice; Theological Essays; Lectures on the Ecclesiastical History of the First and Second Centuries; Gospel of St. John; and Social Morality.

MAURICE, Thomas, 1733-1824; b. Hertford, Eng. After the death of his father he became a pupil of Dr. Parr, in an academy at Stanmore; entered St. John's college, Oxford, in his 19th year, but the next year removed to University college; produced while there a metrical version of Edipus Tyrannus and several original poems, and under his tutor, Lord Stowell, he cultivated his taste for historical research. After graduating he was ordained, and appointed curate of Woodford in Essex, resigning in 1785 for a pastorate at Epping. In 1791 his Indian Antiquities began to appear, and was completed in 1797 in 7 volumes. His History of Hindostan, which he had begun to publish in 1795, was finished in 3 volumes in 1799. In 1798 he was appointed by ear Spencer vicar of Wormleighton in Warwickshire. In 1799 he was appointed assistant librarian in the British museum, and in 1800 received the pension left vacant by the death of the poet Cowper. His Modern History of India was published in 1802 and 1804. In 1804 he was presented by the lord chancellor to the vicarage of Cudham in Kent. Among his last works were Memoirs Comprehending the History of the Progress of Indian Literature; and Anecdotes of Literary Characters in Britain during a period of 30 years.
MAURICLUS, one of the greatest of the Byzantine emperors, was descended of an ancient Roman family, and was b. at Arabissus, in Cappadocia, about 539 A.D., and executed Nov. 27, 602. During the reigns of Justin II. and Tiberius, Mauricius served in the army, and in 578 was appointed by the latter emperor to the command of the army against the Persians, in which office he gained the universal esteem of his soldiers, notwithstanding the severity of his discipline, and surpassed the emperor's hopes by humbling to the earth the most dangerous enemy of the eastern empire. In 582 he obtained the rare honor of a triumph at Constantinople, and in August of the same year succeeded Tiberius on the throne. Immediately after his accession, the Persians invaded the Byzantine territories; an army was sent to repel them, and the war between the empires soon became general; a fierce contest of eight years' duration, which, chiefly by the series of revolutions that distracted Persia, resulted in favor of the Byzantines. The king of Persia, Khusru II., driven from his throne, fled to Hierapolis, whence he sent to Mauricius a letter beseeching shelter and aid. The emperor's generous nature was not proof against such an appeal; an army was immediately assembled, to which the loyal Persians flocked from all quarters; and in 591, Khusru was restored to his throne, giving up to Mauricius, in evidence of his gratitude, the fortresses of Dara and Martyropolis, the bulwarks of Mesopotamia. Some time after these events, a war broke out with the Avars; and after two years of bloody conflict, with little gain to either side, the Byzantines suffered a severe defeat, and 12,000 veterans were taken prisoners. Mauricius refused to ransom them, and they were consequently put to death. Mauricius's conduct has been satisfactorily accounted for (see Gibbon's Decline and Fall), but it excited a deep and lasting resentment amongst the people and the army; and in 602, when the emperor ordered his troops to take up their winter-quarters on the north (or Avar) side of the Danube, they broke out into open revolt, elected Phocas their chief, and marching upon Constantinople, raised him to the throne. Mauricius, with all his family and many of his friends, was put to death. He was a general of rare ability, and little inferior as a ruler.

MAURITANIA, or MAURETANIA, the ancient name of the most north-western part of Africa, corresponding in its limits to the present sultanate of Morocco and the western portion of Algeria. It derived its name from its inhabitants, the Mauri or Mauri. See Morocco. It reached on the south to the desert, and was separated from Numidia on the east by the river Melucha or Molochas, now the Mulya. MAURITA, a genus of palms, having male flowers and female or hermaphrodite flowers on distinct trees, imperfect spathes, and fan-shaped leaves. They are all natives of the hottest parts of America. Some of them, like the buriti (q.v.) palm (M. eliofera), have lofty columnar smooth stems; others are slender, and armed with strong conical spines. The Mirta palm (M. fleurosa) grows to the height of 100 feet; it has very large leaves on long stalks. The stem and leaf-stalks are used for various purposes. A beverage is made from the fruit, as from that of the buriti palm and several other species.

MAURITIUS, or ISLE OF FRANCE, an island of the Indian Ocean, belonging to Great Britain, lies in lat. 19° 58' to 20° 33' s., and long. e. from Greenwich 57° 17' to 57° 46'. It contains about 708 sq. m.; pop. (1871), including the small dependencies of Seychelles, Rodrigues, and exclusive of the military, 318,584, giving the very high average of 450 to the sq. mile. Of the total population, 210,636 were, in 1870, estimated to be Indian coolies. The surface is of varied formation, a great portion being volcanic; while its coast is fringed by extensive coral reefs, pierced in several places by the estuaries of small streams. Its mountains, although of no great height, are marked by the usual irregularities observed in volcanic formations. Of these, the most celebrated is the Peter Boite, situated in the rear of the town of Port Louis, and forming a remarkable cone, sustaining on its apex a gigantic piece of rock, which has the appearance of being poised upon its summit with the nicest precision. In the island are the remains of several small crateres, and the traces of lava are numerous. The principal towns are Port Louis, the capital, and Grande Port, or Mahébourg, the southern port, the latter difficult of access for shipping, and much encumbered with coral reefs. Port Louis comprises a spacious harbor, and is provided with an inner basin, denominated the Fanaron, wherein vessels can take refuge during the hurricanes, which occasionally occur here with exceeding violence. There is also a slip upon which large vessels can be raised for the purpose of examination and repair.

Mauritius produces annually a large amount of sugar, which it exports to England, France, and Australia. The nature of the soil, however, in many parts prevents a more universal development of the culture of this article of commerce. In some districts, considerable tracts of cane-growing land are encumbered with large bowlders; in many places these have been collected into rough walls, between which the canes are planted, while on other places, by the method employed in the cultivation of the cane is similar to that adopted in the West Indies; but the bulk of the sugar is ultimately shipped in bags composed of the leaf of the Vácuoa palm. The climate of this island is remarkably fine. There are four seasons, as in England; but the temperature in the months of November, December, and January is very high. Throughout the year, the thermometer ranges from 76° to 90° in the shade. In some of the more
Maurocordatos.

Mauve.

Maurocordatos, also Maurocardato, a Fanariote family, distinguished for ability and political influence, and descended from merchants of Chios of the Genoese family of Scarlatt.—Alexander M. was professor of medicine and philosophy in Padua, and became dragoman or interpreter to the porte in 1681, in which capacity he did much to promote the interests of his countrymen. In 1689, he displayed great diplomatic talents as plenipotentiary of the porte in the negotiations for peace at Carlowitz.—His son, Nicholas, was the first Greek who was hospodar of Moldavia and Wallachia.—Constantine, brother of Nicholas, who became hospodar of Wallachia in 1753, abolished slavery in that country, and introduced the culture of maize.—His grandson, Alex-
sander, was at the Congress of Vienna, took an active part in the Greek contest for independence, prepared the declaration of independence and the plan of a provisional government, was elected president of the executive body; and being appointed commander-in-chief, undertook, in 1822, an expedition to Ephesus, which ended in the unsuccessful battle of Peta; but he delivered the Peloponnesus by his bold and resolute defense of Missolonghi (1823). Notwithstanding the opposition of the party of Colocotronis and Dimitrios Ypsilanti, he was able afterward to render important services to his country—as, for instance, by the heroic defense of Navarino and Sphacteria; but became very much involved in political strife. He was a steadfast admirer of English policy and institutions, and a fierce opponent of the pro-Russian government of Capo D'Istria. After the accession of King Otho, he was at different times a cabinet minister and ambassador at different courts. The leading feature of his policy—viz., his endeavor to promote British influence—made him at times very unpopular among his countrymen. Yet, at the outbreak of the Crimean war, it was found necessary to place him once more at the head of the government—a dignity, however, which he soon resigned; but he continued to interest himself in the cause of education, and as late as 1861 held the office of minister of public instruction. He died August, 1865.

Maury, a co. in central Tennessee; pop. '80, 39,945—18,169 colored; 580 sq.m.; it is drained by the Duck river and its branches and intersected by a branch line of the Louisville and Nashville railroad. The soil is highly diversified and the natural and manufactured products very large. In 1870 nearly 1,500,000 bushels of Indian corn were raised and large quantities of wheat, tobacco, butter, hay, and cotton. There are tanneries, flour mills, and several factories connected with the manufacture of cloth. Chief town, Columbia.

Maury, Jean Sifferin, Cardinal 1746—1817; b. at Valras, Venaissin; son of a shoemaker; educated for the priesthood at Avignon; went to Paris at the age of 20 as abbé précepteur, but devoted himself to preaching, and by his panegyrics on St. Louis in 1772 and on St. Augustine in 1775, he took the highest rank as a pulpit orator. Appointed preacher to the court he obtained the abbey of Prémade and the priory of Lihons, and also a seat in the academy. In 1785 he pronounced an eloquent panegyric on St. Vincent de Paul.
In 1799 he was chosen deputy of the clergy to the states-general, where he was prominent in defense of the church and royalty; and with great vigor, skill, and eloquence opposed the revolutionary measures until the flight of Louis XVI. At the dissolution of the constituent assembly he left France in 1791 and at the invitation of Pius VI., took up his residence in Rome where he was received with great honor. In 1794 he was made archbishop of Nicaea in partibus nuncio to the diet at Frankfort for the election of emperor Francis II., cardinal and bishop of Montefiascone and Corneto. On the invasion of Italy by the French in 1798 he fled in disguise to Venice, and thence went to St. Petersburg. Returning in 1799 he was appointed by the count of Provence, afterwards Louis XVIII., his ambassador to the holy see. Becoming reconciled to Napoleon he returned to France in 1806. In 1810 he was appointed archbishop of Paris, and when ordered by the pope Pius VII., who was taken captive by Napoleon, to relinquish the administration of his diocese, he disobeyed and was after the restoration imprisoned for a short time at Rome. After this he returned to private life. He published a valuable treatise, entitled Essai sur l'Édification de la Chaire in 2 volumes.

MAURY, Matthew Fontaine, LL.D., an American naval officer, astronomer, and hydrographer, was b. in Virginia, Jan. 14, 1806. In 1825 he was appointed midshipman in the U.S. navy, and during a voyage round the world in the Vincennes frigate, commenced a treatise on navigation, which is adopted as a text-book in the navy. In 1836 he was made lieutenant; but being lamed by an accident, and unftted for service afloat, he was appointed to the hydrographical office at Washington. Here he carried out a system of observations which enabled him to write his Physical Geography of the Seas, and to produce in 1844 his works on the gulf stream, ocean currents, and great circle-sailing. He projected the maritime conference at Brussels (1853); and with the co-operation of the British government, and the assistance of naval officers and the learned, completed his sailing charts, to the great advantage of the commerce of the world. In 1855 he was promoted to the rank of commander, and published Letters on the Amazon and Atlantic Slopes of South America. At the outbreak of the civil war in 1861, Maury took a command in the confederate navy, and afterwards came as commissioner to Europe. After the war, he returned to the United States. He died Feb. 1, 1873.

MAUSER GUN, the name of the rifle invented by a gunsmith named Mauser of Kannstadt, Württemberg, in 1871, and used by the Prussians in the war with France. While embracing the advantages of the Bavarian Werder gun, it is of longer range and more rapidly loaded and discharged than the needle-gun. It is of light weight and very simple in construction. It is now in general use in the army of the German empire.

MAUSOLEUM, a sepulchral monument of large size, containing a chamber in which urns or coffins are deposited. The name is derived from the tomb erected at Halicarnassus to Mausolus, king of Caria, by his disconsolate widow, Artemisia, 353, n.c. It was one of the most magnificent monuments of the kind, and was esteemed one of the seven wonders of the world. It was described by Pliny and other ancient authors, as late as the 12 c., and must have been overthrown, probably by an earthquake, during the following two centuries, for all trace of it had disappeared, except some marble steps, when the kings of St. John of Jerusalem, in 1404, took possession of the site of Halicarnassus, then occupied by a small village called Cleesey. While excavating among the ruins for building materials, the knights discovered a large chamber decorated with marble pilasters, and with richly inlaid panels. The sarcophagus of the founder was also discovered in another great hall.

Excavations have been recently made by Mr. Newton, assisted by the British government, and he has succeeded in bringing to light many of the beautiful sculptures of the mausoleum. Amongst others, the fragments of the statue of king Mausolus (now placed together in the British museum), and a portion of the quadriga which crowned the monument. Many fragments of lions, dogs, etc., and a beautiful sculpture of a horse, have been found. Portions of friezes, of fine design and workmanship, the subjects of which involves are myths in conflict with with mythos, have also been discovered. The plan of the basement has been traced the area being 120 ft. by 100 ft. and from the fragments of columns, Ionic capitals, etc., which have been found, the description of Pliny has been verified. The mausoleum consisted of a basement 65 ft. high, on which stood an Ionic colonnade 23 ft. high, surrounded by a pyramid, rising in steps to a similar height, and on the apex of which stood a colossal group, about 14 ft. in height, of Mausolus and his wife in the quadriga; these statues are supposed to be the work of the celebrated Scopas. The above dimensions are from Mr. Newton's restoration, but they are disputed by Mr. Ferguson, and others. All agree that the total height of 140 ft. given by Pliny is probably accurate.

MAUVaises Terres, or Bad Lands, the name of several different tracts of desolate, treeless, waste and broken land in Dakota, Nebraska, Colorado, and other territories of the United States, but applicable especially to a section along the White river, an affluent of the Missouri. These sections are of the tertiary formation, and abound in relics of extinct species of rhinoceros, hyena, and other mammals. Some parts of these lands yield a coarse, scanty pasturage after heavy rains, but for the most part they are utterly barren.

MAUVE. See dye-stuffs.
MAVERICK, a co in s.w. Texas, bounded on the s. by Mexico; 1200 sq.m.; pop. '89, 2,967; drained by Elm creek and the branches of the Rio Grande which forms its s.w. boundary. The surface is for the most part level and adapted for cattle-breeding which is carried on to some extent. There is very little agricultural production. Chief town, Eagle Pass.

MAVROC-ORDA'TOS. See MAVROCORDATOS, ante.

MAW-SEED, a name by which poppy-seed (Papaver somniferum) is sold as food for cage-birds. It is given to them especially when they are molting.

MAX, Gabriel, a German artist, a resident of Munich. His subjects are idealizations from the poets, spiritual in the highest degree, and in execution simple, noble, and effective. "Gretchen on the mountain side on Walpurgis Night," "The Lion's Bride," "The Christian Martyr"—a young girl left to the tigers in the arena of the Coliseum—are among his great works, which have become widely known through recent engravings and photographs. Max is in the prime of his powers, reserved among strangers, but quite social among intimates. He ranks as one of the most eminent living artists of Germany.

MAXCY, Jonathan, D.D., 1768-1820; b. Mass.; entered Brown university at the age of 15, and graduated in 1787; was tutor 1787-91, during which time he studied theology, and in 1790 was licensed to preach; installed pastor of the First Baptist church, Providence, 1791, and also was elected a trustee and professor of divinity in Brown university. In 1792, at the age of 24, he became its president. In 1802 he was elected president of Union college, N. Y.; and in 1804 resigning, he accepted the presidency of South Carolina college at Columbia, retaining it until his death. He was an eloquent preacher, and learned in philology and moral philosophy. Some of his sermons, including one on The Existence of God demonstrated from the Works of Creation, and his Literary Remains, with a Memoir, were published, edited by Romeo Elton, D.D.

MAXENTIUS. See Constantine I., the Great, ante.

MAXFIELD, Thomas, 1720-85; b. England; converted to the faith of John Wesley by the preaching of the great Methodist divine at Bristol; was his substitute in the Foundry church, London, in prayer and expounding the Scriptures, but was not permitted to preach. Nevertheless, led by his evident popularity he attempted to preach, and succeeded so well that Wesley, who was strongly in favor of the strict discipline of the church, listened to the counsel of his mother to hear him before denouncing him, and then granted him leave to preach. He was the first itinerant lay-preacher in the Methodist denomination. In 1744 he attended the first conference at the Foundry church, having been ordained in Ireland by the bishop of Londonderry, who was friendly to Wesley. He was introduced by Wesley into London society, where he contracted a marriage with a lady in a position far superior to his own. In 1746 he attended the third conference at Bristol, and was persecuted in company with other followers of Wesley, being at one time kidnapped and pressed into the king's service. In 1764 he became estranged from Wesley on account of some disagreement in church matters, and associated himself with Bell, an ex-life-guardman turned local preacher, who, possessing great personal magnetism and wild enthusiasm, had a powerful influence over him. He joined Bell in advocating doctrines so strongly opposed to the reasonable interpretation of the Scriptures, that a decided breach was made between his followers and Wesley, and he withdrew from the Foundry church and founded a society of 170 members who had seceded with him. He continued with this people for 20 years, and when helpless from a stroke of paralysis, Wesley remembered and visited him, and afterward preached to his people in the chapel which he had occupied.

MAXIMIANUS I. See Diocletian, ante.

MAXIMIANUS II. See Galerius, ante.

MAXIMILIAN I., one of the most distinguished of the German emperors, the son and successor of Frederick III., was b. at Neustadt, near Vienna, March 22, 1459. In his 19th year he married Maria, the only child and heiress of Charles the bold, duke of Burgundy, and was soon involved in war with Louis XI. of France, who attempted to seize some of her possessions. Maximilian, although successful in the field, was compelled, by the intrigues of Louis in the Netherlands, and disaffection stirred up there, to betroth his daughter Margaret, a child of four years old, to the dauphin, afterwards Charles VIII., and to give Artois, Flanders, and the duchy of Burgundy as her dowry. In 1486 he was elected king of the Romans. Insurrections in the Netherlands, encouraged and supported by France, occupied much of his time, and again involved him in war with Louis XI. He afterwards repelled the Hungarians, who had seized great part of the Austrian territories on the Danube; and the Turks, who in 1492 invaded Carinthia, Carinthia, and Steiermark. He again took up arms against France, because Charles VIII. sent back his daughter, and married Anne of Bretagne, in order to acquire that great province. A peace was, however, soon concluded at Senlis in 1493; Maximilian receiving back the provinces which he had given with his daughter. On the death of his father in 1493, he became emperor, and he subsequently married Bianca Sforza, daughter of the duke of Milan. He applied himself with wisdom and vigor to the internal
administration of the empire, took measures for the preservation of peace in Germany,
and encouraged the cultivation of the arts and sciences. But he was soon again involved
in wars against the Swiss, the Venetians, and France. He sought to put a stop to
French conquests in Italy, and was at first successful; but after various changes of for-
tune, and years of war, mingled with many political complications, he was compelled to
give up Milan to France, and Verona to the Venetians. Nor was Maximilian more suc-
cessful against the Swiss, who in 1499 completely separated themselves from the German
empire. The hereditary dominions of his house, however, were increased during his
reign by several peaceful additions; and the marriage of his son Philip with the Infanta
Juana, and of his daughter Margaret with the Infant Juan of Spain, led to the subse-
quent union of Spain with Austria; whilst the marriage of two of his grandchildren with
the son and daughter of Ladislaus, king of Hungary and Bohemia, brought both these
kingdoms to the Austrian monarchy. Maximilian died at Wels, in Upper Austria, Jan.
13, 1519. He was of a chivalrous character. He wrote various works on war, garden-
ing, hunting, and architecture, some poems, and an autobiography full of marvels.

MAXIMILIAN II. JOSEPH, King of Bavaria, son of Ludvig I., was b. Nov. 28, 1811.
He married in 1842 the princess Maria Hedwig, cousin to the present king of Prussia.
Until 1848 he took no part in political affairs, but devoted himself to agricultural and
other improvements, and to the pursuits of literature and science. In that year of the
revolutionary excitement, he was suddenly called to the throne, on his father's abdica-
tion, and adopted a policy accordant with the liberal tendencies of the time. Reac-
tionary measures were afterwards to some extent adopted; but Maximilian's reign was
chiefly signalized by the encouragement of science. He was regarded with no favor by
the ultramontane party, but without respect to their opposition, he brought to Munich
men of liberal opinions, eminent in literature and science. He died Mar., 1864.

MAXIMILIAN, EMPEROR OF MEXICO, otherwise FERDINAND MAXIMILIAN JOSEPH,
Archduke of Austria, was b. on July 6, 1832. He was the son of the archduke Francis
Charles, and the younger brother of Francis Joseph I. Maximilian, who received a
careful education, was very popular as governor of the Lombard-Venetian kingdom. In
1862 the French were induced to interfere in the affairs of Mexico and in July
-called together an assembly of notables. This body decided in favor of monarchy;
and a deputation was appointed to offer the crown of Mexico to Maximilian. After
delivery he solemnly accepted it; and in June, 1864, he entered Mexico. He was
of course warmly welcomed by the clergy and the army; but he soon found that
they expected him to sanction abuses which he felt bound to condemn; though he gained
the support of the liberals. For a time all went well; but he vainly tried to reconcile
Mexican parties, who had no other object in view than power and place. A proclama-
tion he was induced to make in Oct., 1865, threatening to punish with death under the
laws of war all who offered resistance to the government (asked for merely to suppress
brigandage), was so employed both by the imperialist and French commanders, that
under it many estimable liberal officers were cruelly shot as robbers. Juarez and his
followers again raised the standard of independence. At the same time, Louis Napoleon
had to the northward the withdrawal of his troops. In vain the empress, a daughter of
Joseph I, of Belgium, was sent to negotiate for her husband; her reason
gave way under the continued grief and excitement brought on by disappointment.
The French were most anxious that Maximilian should leave with their troops; but he
felt bound as a man of honor to remain, and share the fate of his followers. At the
head of 10,000 men, he made a brave defense of Queretaro against a liberal army under
Escobedo. On the night of May 14, 1867, gen. Lopez betrayed him. The liberal min-
ister of war ordered Maximilian and gen. Minimon and Mejia to be tried by court-mart-
tial; and it was in vain the European ministers protested against this breach of the laws
of civilized warfare. The trial was of course a mere farce, and the charges chiefly
rested on the proclamation above referred to and the executions which followed it. On
July 19, the three prisoners were shot. After some delay, the body of Maximilian
was given up to his relatives, and was conveyed to Europe in an Austrian frigate. After
the death of Maximilian, his writings were published under the title of Aus Meinem Leben; Reiseisten, Aphorismen, Gedichte, etc. (7 vols. 1867).

MAXIMIN, CAES JULIUS VERUS MAXIMINUS, a Roman emperor; b. in the latter
part of the 2nd century. He was originally a Thracian shepherd. Attracting the atten-
tion of the emperor Septimius Severus by his immense size and wonderful feats of
strength and agility, he was admitted to the army; was rapidly advanced for his bravery,
put in command of a new legion raised in Pannonia, and obtained great influence over
the soldiers. At the head of this legion he followed Alexander in his campaign against
the Germans. When the army was encamped on the banks of the Rhine, he conspired
against Alexander, and caused him to be put to death in his tent, with his mother Mamm-
ea, A.D. 235. Being proclaimed emperor, he named his son Maximus Caesar, and made
him colleague in the empire. He continued the war against the Germans, and devastated
a large part of the country beyond the Rhine. But his cruelty and rapacity aroused the
indignation of the people. For alleged conspiracy against him he put to death Magnus,
a senator, with 4,000 other persons, and for the imperial treasury confiscated the munici-
pal property. He also opposed Christianity, and persecuted the bishops who had been

615
Maverick.
Maximin.
favored by Alexander. The provinces of Africa revolted and proclaimed Gordianus, who was soon after acknowledged by the senate and people. Rome, fearing the ven

gency of Maximus, the son of the acclaimed emperor Papinianus Maximus and

decimus Caecilus Babinus, and with them was associated by order of the people a nephew of

the younger Gordianus. Maximin having crossed the Isenzo, laid siege to Aquileia in

Italy, but met with strong resistance from the garri-on and people. The soldiers

mutinied and killed both him and his son in 238. Maximin was a fierce soldier, and his

son a handsome but arrogant youth.

MAXIMS. LEGAL, a term used by members of the legal profession and writers on

jurisprudence to denote those brief and pithy utterances, which by general consent have

been accepted as embodying in proverbial form the accumulated wisdom of the past, the

well-determined general principles which are the foundation of both law and equity. As

these general principles are founded on the natural law of justice, safety, and public

policy, they are not liable to change by statute or local enactment; and however the

legislative power may see fit to apply them in particular instances, the basis of the law is

the same in all countries. Hence it follows that the utterances of ancient Roman magis-

trates and authors of legal treatises remain to this day of as much force and truth as

when first promulgated. As the code of Justinian forms the basis of the civil law, still

in force over most countries of Europe, and as the works of all the earlier writers of our

English common law were couched in the Latin language, it is not surprising that by far

the largest number of these maxims are in Latin, which tongue, moreover, is adapted to

give such maxims their needful condensation and precision. In very few instances can

the student of English jurisprudence: many of our maxims are from continental jurists of the middle ages; while a very large number were

enunciated by early English judges and writers, and still others are of quite modern

origin. The form in which they are expressed is often varied and in many cases an

abbreviated form is employed by most lawyers in place of the full utterance. Like other

expressions of the common law, the maxims derive their force and authority in the first

place through the truth and justice of the principles which they enunciate, and, secondly,

through the universality of their acceptance and application by courts in the past. They

are not, therefore, of absolutely equal and binding authority, or rather it is impossible to
draw a line strictly dividing accepted maxims from mere expressions of opinion. While

it has been said that maxims resembled both mathematical axioms and proverbs, it is true

that they differ from both materially in their nature, being more the outcome of inductive

reasoning than are axioms, and more carefully framed and specifically applicable than

proverbs. The number of those universally accepted as law is very large indeed. Works

devoted entirely to the consideration of the meaning and application of terms of

law have been published by several authors. Perhaps it would be safe to put the

number of those maxims which are properly so-called, not mere dicta, and which are in

common use, as not less than two hundred. If the definition be made broader in both

respects, we must add to this many hundreds. Bouvier in his Law Dictionary gives a

very complete list, which cannot fell far short of two thousand distinct maxims. The

reader will most easily understand the nature and style of this class of pithy legal say-

ings by examining a few which are selected from the great mass, mainly with regard to

their brevity and frequent use. Such are: caveat emptor—let the buyer be on his guard—

a most important principle of the law of contracts, but not to be construed too strictly; Qui

facet per alium, facet per se—he who acts by another, acts himself—in which may be

seen the main principle of the law of agency; Aequitas sequitur legeum—equity follows the

law; Ec nihilo nihil fit—from nothing comes nothing; Fraus est celare fraudem—to con-

ceal a fraud is itself a fraud; A l'impossible et d'autre terme—no one is bound to do what is

impossible, the language being what is called "law French"; Ubi jus, ibi remedium—

where there is a right there is a remedy; Ignorantia legis neminem excusat—ignorance of

the law excuses no one; also expressed by Ignorantia facti excusat, ignorantia legis non

excusat—ignorance of fact, but not of law is an excuse; Prior tempore, potior jure—first

in time, first in right; Id certum est, quod certum reuidet potest—that is certain which may

be rendered so. Among those commonly given in English may be mentioned: Acts

indicate the intention: When the equites are equal the law shall prevail; When the

foundations fall, all falls: Once a fraud, always a fraud.

As may be readily perceived, the difficulty in practically employing these and the

many similar maxims, is twofold; first, in correctly amplifying and expounding the

extended meaning sought to be conveyed in the condensed form; and, secondly, in

properly applying it to the adjudication of the particular facts of the case in question;

and it is the work more especially of the writer of treatises on the various branches of

law and equity to perform the first duty; while to the active practitioners and to the

judges emergencies are constantly presented, calling for the exercise of the second func-

tion.

MAXIMUM, in mathematics, the greatest value of a variable quantity or magnitude,

in opposition to minimum, the least. More strictly, a maximum is such a value as is

greater than those immediately preceding and following it in a series; and a minimum is

a value which is less than those immediately preceding and following it, so that a func-

tion may have many maxima and minima unequal among themselves, as in the case of a
curve alternately approaching and receding from an axis. Traces of the doctrine of maxima and minima are to be found in the works of Apollonius on conic sections. The thorough investigation of them requires the aid of the differential calculus, and even of the calculus of variations. The brothers Bernouillii, Newton, Maclaurin, Euler, and Lagrange, have greatly distinguished themselves in this department of mathematics. The Hindus have displayed great ingenuity in solving, by ordinary algebra, problems of maxima and minima, for which, in Europe, the calculus was considered to be necessary.

MAXWELL, HENRY, 1787-1873; b. Scotland, and brought to the United States in childhood; graduated at Columbia college in 1801, and entered the profession of the law in New York, where he became prominent as a learned and skilful advocate. He was assistant judge-advocate general of the U.S. army in 1814, and district attorney for New York county in 1819, and again in 1822-25. He took a distinguished part in the "conspiracy trials" of 1823, and was collector of the port of New York 1849-53. He was a prominent whig politician.

MAXWELL, JAMES CLERK-, one of the greatest of modern natural philosophers, was the only son of John Clerk-Maxwell of Middlebie, a cadet of the old Scottish family of Clerk of Penicuick. He was b. in 1831 and died in November, 1879. He was educated in boyhood at the Edinburgh academy. His first published scientific paper was read for him by professors Forbes to the Royal society of Edinburgh before he was fifteen, and when he had received no instruction in mathematics beyond a few books of Euclid, and the merest elements of algebra. He spent three years at the university of Edinburgh, working with physical and chemical apparatus, and devoured all sorts of scientific works in the library. During this period he wrote two valuable papers, On the Theory of Rolling Curves, and On the Equilibrium of Elastic Solids. Thus he brought to Cambridge, in the autumn of 1850, a mass of knowledge which was really immense for so young a man, but in a state of disorder appalling to his private tutor. But by sheer strength of intellect, though with the very minimum of knowledge how to use it to advantage under the conditions of the examination, he obtained in 1854 the position of second wrangler, and was equal with the senior wrangler in the higher ordal of the Smith's prize.

In 1856 he became professor of natural philosophy in Marischal college, Aberdeen; in 1860 professor of physics and astronomy in King's college, London. He was successively scholar and fellow of Trinity; and was elected an honorary fellow of Trinity when he finally became, in 1871, professor of experimental physics in the university of Cambridge. There can be no doubt that the post to which he was ultimately called was one for which he was in every way pre-eminently qualified; and the Cavendish laboratory, erected and furnished under his supervision, remains as remarkable a monument to his wide-ranging practical knowledge and theoretical skill as it is to the well-directed munificence of its noble founder. In clearness of mental vision, in power of penetration, and in the possession of that patient determination to which Newton ascribed all his success, Maxwell is to be ranked with Faraday. He was too rapid a thinker to be a good lecturer, except for the very highest class of students. The great work of his life is undoubtedly his treatise on Electricity and Magnetism (2 vols. 1873). He had previously, from 1856 onward, published various papers on these subjects, following very closely the experimental procedure of Faraday. His great object was to construct a theory of electricity in which an action at a distance should have no place; and his success was so complete that it is one of the most lasting triumphs of science. He established the basis of a physical theory of electric and magnetic phenomena, quite as securely founded as in the undulatory theory of light: and the luminiferous ether, which is required for the one series of phenomena, is shown to be capable of accounting for the others also. One grand test is found in the fact that, if his hypothesis be correct, the velocity of light ought to be equal to the ratio of the electrokinetic unit to the electrostatic unit. We are not yet sure of either quantity to within two or three per cent; but the most probable values of each agree so well as almost to put the hypothesis beyond doubt. In Nature, vol. vii. p. 478, the reader will find an account of the more remarkable discoveries in this extraordinary book, which suffices of itself to put Maxwell in the very front rank of scientific men.

Another subject to which he devoted much attention, and in which his numerous discoveries were acknowledged by the award of the Rumford medal, was the perception of color, the three primary color sensations, and the cause of color-blindness. He was the first to make color-sensation the subject of actual measurement. He was educated at the University of Edinburgh, and at the University of Cambridge for his splendid discussion of the dynamical conditions of stability of the ring-system of Saturn, in which he showed that the only hypothesis consistent with the continued existence of these rings is that they consist of discrete particles of matter, each independently a satellite.

He was perhaps best known to the public by his investigations on the kinetic theory of gases, with their singular results as to the nature of gaseous friction, the laws of diffusion, the length of the average free path of a particle, and the dimensions of the particles of various gases. His Bradford "Discourse on Molecules" is a classic in science. Besides a great number of papers on various subjects, mathematical, optical, and dynamical, he published an extraordinary text-book of the Theory of Heat (which has already gone through several editions) and an exceedingly suggestive little treatise on Matter and Motion. In 1879 he edited, with copious and very valuable original notes, The Electrical
Researches of the Hon. Henry Cavendish, a work which shows that that remarkable man had (a hundred years ago) made out for himself much of what was till very lately looked upon as one of the chief triumphs of the present century.

Maxwell obtained the Keith prize of the royal society of Edinburgh for a valuable investigation of stresses and strains in girders and frames; he took a prominent part in the construction of the British association unit of electrical resistance, and in the writing of its admirable reports on the subject; and he discovered that viscous fluids, while yielding to stress, possess double refraction. He was excessively ingenious in illustration, especially by means of diagrams; and possessed a singular power of epigrammatic versification, as the reader of Nature and Blackwood cannot fail to remember. Some of his last and very best scientific work adorns and enriches the new edition of the Encyclopaedia Britannica.

In these days of materialism it is not superfluous to record that he was, in the full sense of the word, a Christian; and that he asserted that he had examined every form of atheism which he had met, with the result of finding that all ultimately required the recognition of a personal God.

MAXWELL, WILLIAM, 1735-98; b. probably in Ireland; entered the army in America in 1758, and took part in the French war and the war of the revolution; was col. of a New Jersey battalion in the Canadian campaign of 1776; commanded the New Jersey brigade in the battles of Brandywine and Germantown; was engaged in the pursuit of Clinton in New Jersey, and took a prominent part in the battle of Monmouth; was engaged in Sullivan's expedition against the Indians in 1779, and in the battle of Springfield in 1780, shortly after which he resigned. He enjoyed the esteem and confidence of Washington.

MAXWELL, WILLIAM HAMILTON, 1794-1850; b. in Ireland; and when 19 years of age graduated at Trinity college, Dublin. After traveling some years he took orders in the English church, and was in 1829 made rector of Ballagh, county Connaught. As there was not at that time a single Protestant in the parish, Maxwell found leisure to engage in literary pursuits. He wrote in all about 20 volumes, most of which were stories of military life; among them may be mentioned, O'Hara, Stories of Waterloo, The Dark Lady of Donna, The Bivouac and Rambling Recollections of a Soldier of Fortune. He wrote also a life of the duke of Wellington, and contributed many papers in the Dublin University Magazine and Bentleys Miscellany. "Christopher North" spoke of Maxwell in the Notes as a true sportsman, and successful in "many picturesque descriptions of the wildest scenery in Connaught, many amusing and interesting tales and legends, and much good painting of Irish character."

MAXWELL, Sir WILLIAM STIRLING, LL.D., b. near Glasgow, Scotland, in 1818; bore the name of Stirling until 1866, when by the death of sir John Maxwell, his maternal uncle, he succeeded to a baronetcy and assumed the name of Maxwell. He graduated at Cambridge in 1839, after which he visited Spain and France, devoting several years to studies of the history, literature, and art of Spain at the close of the mediaval period. Among his works are Annals of the Artists of Spain; Cloister Life of Charles V., and Vistasquez and his Works. He was elected to parliament for Perthsire in 1852, and represented that borough most of the time for a period of more than 20 years. He was rector of the university of St. Andrews in 1868, and of that of Edinburgh in 1872, and in 1875 was elected chancellor of the university of Glasgow.

MAY [Lat. Maius, from a root mag, or (Sans.) mah, to grow; so that May is just the season of growth], the fifth month of the year in our present calendar, consists of 31 days. The common notion that it was named Maius by the Romans in honor of Maia, the mother of Mercury, is quite erroneous, for the name was in use among them long before they knew anything either of Mercury or his mother. The outburst into new life and beauty which marks nature at this time instinctively excites feelings of gladness and delight; hence it is not wonderful that the event should have at all times been celebrated. The first emotion is a desire to seize some part of that profusion of flower or blossom which spreads around us, to set it up in decorative fashion, pay it a sort of homage, and to let the pleasure it excites find expression in dance and song. Among the Romans the feeling of the time found vent in their flava, or floral games, which began on the 28th of April, and lasted a few days. The 1st of May—May—was the chief festival both in ancient and more modern times. Among the old Celtic peoples a festival called beltien (q.v.) was also held on this day, but it does not seem to have been connected with flowers. In England, as we learn from Chaucer and other writers, it was customary, during the middle ages, for all, both high and low—even the court itself—to go out on the first May morning at an early hour "to fetch the flowers fresh." Hawthorn (q.v.) branches were also gathered; these were brought home about sunrise, with accompaniments of horn and tabor, and all possible signs of joy and merriment. The people then proceeded to decorate the doors and windows of their houses with the spoils. By a natural transition of ideas, they gave the hawthorn bloom the name of the "May," they called the ceremony the bringing home the May; they spoke of the expedition to the woods as "going a-Maying." The
fairest maid of the village was crowned with flowers as the “queen of the May,” placed in a little bower or arbor, where she sat in state, receiving the homage and admiration of the youthful revelers, who danced and sang around her. This custom of having a May queen looks like a relic of the old Roman celebration of the day when the goddess Flora was specially worshiped. How thoroughly recognized the custom had become in England may be illustrated by the fact that in the reign of Henry VIII, the heads of the corporation of London went out into the high grounds of Kent to gather the May—the king and his queen, Catharine of Aragon, embeddings from their palace of Greenwich, and meeting these respectable dignitaries on Shooter’s hill. But perhaps the most conspicuous feature of these festive proceedings was the erection in every town and village of a fixed pole—called the May-pole—as high as the mast of a vessel of 100 tons, on which, each May morning, they suspended wreaths of flowers, and round which the people danced in rings pretty nearly the whole day. A severe blow was given to these merry customs by the Puritans, who caused May-poles to be uprooted; and a stop put to all their jollities. They were, however, revived after the restoration, and held their ground for a long time; but they have now almost disappeared. In France and Germany too, May-poles were common, and in some places are still to be seen, and festive sports are even yet observed.—See Chamber’s Book of Days, pp. 569–582, vol. I.

MAY, CAROLINE. b. England, 1829; daughter of the rev. Edward H. May, formerly pastor of the Dutch Reformed church in New York city. She published a volume of original Poems in 1864, and Hymns on the Collects in 1872. More important than her original work is the anthology which she published in 1848, under the title of The American Female Poets; to which are appended her own biographical and critical remarks. The work is written on much the same plan since followed by prof. J. S. Hart, and employed by Griswold in his compilation of a similar nature. Most of the names it contains have grown obscure, but the collection is still of some value to students of American literature.

MAY, SAMUEL. Joseph, 1797–1871; b. Boston; graduated at Harvard in 1817; studied for the ministry with Henry Colman at Hingham, and with Henry Ware, Andrews Norton, and prof. Frisbie, at Cambridge; was ordained in the Chauncey Place church in Boston in 1829, and shortly afterwards settled as pastor of the Unitarian church in Brooklyn, Conn. When, in 1830, William Lloyd Garrison came to Boston to agitate the slavery question, Mr. May was there, and prominent among those who seconded his efforts. He joined the first society to promote the cause of immediate emancipation, and lived to witness the utter overthrow of slavery. When Prudence Crandall, a Quaker, was persecuted for opening her school for young ladies at Canterbury, Conn., to pupils of African lineage, he became her friend and adviser, and stood up bravely between her and her persecutors; and though he did not save the school from being finally broken up by violence, he did succeed in baffling the attempts to accomplish that result under the forms of law, and in arousing in that part of Connecticut a public sentiment against slavery that has never been overcome, and that for many years has determined the political status of the state itself. The late Arthur Tappan, of New York, furnished him with the funds necessary to prosecute a vigorous campaign for the defense of Prudence Crandall, and to establish a press for the enlightenment of the people. In 1834 Mr. May resigned his pastorate in Brooklyn to accept the position of general agent of the Massachusetts antislavery society. He was a public lecturer against slavery in the years 1835–36, when mobs were epidemic, and his life was often in great peril. His gentleness was as conspicuous as his courage, and he was never once betrayed into any harshness of spirit or language. Oct. 26, 1836, he was settled as pastor of the Unitarian church in South Seaville, Mass., where he remained until 1842, when, at the earnest solicitation of the late Horace Mann, then secretary of the state board of education, he took charge for three years of the normal school at Lexington. In 1845 he removed to Syracuse, N. Y., to become pastor of a Unitarian society, and there remained until his death. In that city he identified himself with the cause of education and with every institution of public charity, and was greatly beloved by the people. Syracuse was a special place of rest for fugitive slaves, and he took an active part in the famous rescue of the slave “Jerry” from his legal captors at Syracuse in 1851. For this offense against the fugitive slave law he and 17 others were indicted in the U. S. district court at Auburn. A hundred of the best known citizens of Syracuse accompanied the prisoners to Auburn, and when they were required to give bail for their appearance for trial, William H. Seward was the first to affix his name to the bond, and he also invited the resuers and their friends to his own house for refreshments. Mr. May and two other gentlemen united in a public declaration that they had “assisted all they could in the rescue of Jerry,” that they were ready for trial, and would give the court no trouble as to the fact, but would rest their defense upon “the unconstitutionality and extreme wickedness of the fugitive slave law;” but the district attorney never brought them to trial. Mr. May, during the war, was constantly engaged in labors for the health and comfort of union soldiers, and when the struggle was ended he took an active part in associations for the relief of the freedmen. Many of his sermons and addresses were published, and a volume of his
Recollections of the Antislavery Conflict appeared before his death. His Memoir by Thomas J. Mumford was published in 1873.

MAY, THOMAS, an English historian and poet, 1595-1650; b. Sussex, Eng., of an ancient family; educated at Cambridge; repaired to London, became a member of Gray’s Inn, and was admitted to the bar. He published the tragedies of Antigone and Agrippina, a comedy entitled The Heir, and other works. Some of his poems were published by special command of Charles I., with whom he was a favorite. Abandoning the court he became a republican. He was secretary to Cromwell during the civil war, and employed to write his history. This was published originally in Latin, and translated into English in 1650. He published two poems on the reigns of Henry II. and Edward III. He translated into English verse Selected Epigrams of Martial, Virgil’s Georgics, and Lucan’s Pharsalia, to the last of which he wrote a continuation in English and Latin. His History of the English Parliament, begun Nov., 1640, was edited by Baron Masères, and translated into French by Guizot. He was buried in Westminster abbey, but soon after the restoration his body was disinterred and thrown into a pit in the adjoining St. Margaret’s churchyard. A monument which had been erected over his grave was demolished.

MAY, Sir Thomas Erskine, b. England, 1815; educated at Bedford school, became assistant librarian of the house of commons in 1831, and entered the bar in 1838. In 1844 he published a treatise on the Law, Privileges, Proceedings, and Usages of Parliament, which has become a standard authority on parliamentary law. In 1846 he was made examiner of petitions for private bills, and the next year he was appointed tax-master to the house of commons, of which he became clerk in 1871. In 1849, he published in pamphlet Remarks and Suggestions with a View to Facilitate the Dispatch of Public Business in Parliament; in 1850, another pamphlet, On the Consolidation of the Election Laws, and in 1861-63, The Constitutional History of England since the Accession of George III., 1760-1800. This work is supplementary to Hallam’s, and brings the constitutional history of England down to the present generation. It is a sound and trustworthy book, without special brilliancy. Sir Thomas published, in 1877, Democracy in Europe—a History; and he has contributed to the Edinburgh Review and the Law Magazine.

MAYA is, in the Puranic mythology of the Hindus, the personified will or energy of the supreme being, who, by her, created the universe; and as, in this later doctrine, the world is unreal or illusory, Māyā assumes the character of illusion personified. In this sense, Māyā also occurs in the later Vedānta philosophy, and in some of the sectarian philosophies of India.

MAYAS, a race of Indians found in the countries of Yucatan, Guatemala, and Tobasco, presenting a subject of interest as to their origin and habits, and their position as regards civilization. They differ decidedly, and in many respects, from other native races of that region. By some they are regarded as of wholly distinct origin; but by most ethnologists it is thought that they are descended from the ancient Toltecs, the builders of the extensive and grand structures whose ruins may be seen at Uxmal, Cobá, Chichén Itzá, and Yucatán. The traditions of the Mayas indicate that they have occupied the country for from 600 to 800 years, and it is not improba-bile that the Toltecs may have merged with tribes immigrating from Cuba or the Antilles. The comparatively high degree of civilization is, doubtless, derived through the Toltec descent. Mayapan, the northern part of Yucatan, was in ancient times their chief home; and in that locality are the ruins of many noble cities. In their early history, though possessed of skill in architecture, with some knowledge of navigation and commerce, and though using an alphabet and written language, the Mayas were semibarbarous in many respects, such as painting and tattooing the body and compressing the heads of their infants. After the Spanish invasion the Mayas were gained over to Christianity, after the usual fashion of the invaders, by fire and sword. Many of their savage customs were laid aside; but in 1848 occurred a most extensive uprising of the natives in many parts of Mexico, and the race regained its independence. Little commu-nication has been held with them since, but it is said that they are once more lapping into their old religion, which, like all those of Mexican origin, was founded on the basis of human sacrifice, and was blood-stained and revolting in the extreme. The ancient language and the alphabet of the Mayas have long been a subject of discussion, by grammarians and students of comparative philology. The alphabet proper contains 29 characters, two or three forms being used for some of the English letters, while d, f, g, q, r and z are wanting; s and z are denoted by the same hieroglyphic, as are also i and j. There are in use, additionally, a set of marks indicating syllabic sounds. The manuscripts in existence are written upon bark, and the lines read from right to left. A number of grammars and dictionaries of the language exist, mostly in Spanish and French. The latest is that of Dr. Behrend (1875).

MAY-APPLE. See Podophyllum, ante.

MAYBOLE, a burgh of regality, in the county of Ayr, Scotland, 9 m. s. of the town of that name, and on the line of the Ayr and G Irvine railway. Pop. 71, 3,797, who are
mostly shoemakers and weavers. In feudal times it was considered the capital of Car-
rick, and was the seat of the courts of justice of the Carrick bailiery. In the vicinity of
Maybole are the ruins of the famous abbey of Crossraguel, the head of which, at the time of
the reformation, was Quentin Kennedy, who held a public disputation with John
Knox in a house at Maybole, which is still shown.

MAYENCE. See MAINZ.

MAYENNE (Lat. Meunana), a river in the n.w. of France, which rises in the depart-
ment of Orne, and after being joined on the right by the Varenne, Calmont, Ernée, and
Oudon, and on the left by the Jouanne and Ouette, debouches at Pont de Cé, into the
Loire, under the name of the Maine, having become navigable 50 m. s. of Mayenne.—
This river gives its name to the department of Mayenne, which has been formed from
the western part of the old province of Maine and the n. of Anjou. Area, 1990 sq.m.;
pop. 72, 550, 657. Mayenne, which is included almost entirely within the basin of the
Loire, has a mild climate, but only a partially productive soil, being occupied in many
districts by extensive sandy heaths. The chief branches of industry are the breeding of
cattle and sheep, and the rearing of bees; while the iron mines and marble quarries of
the district yield employment to the poorer classes. The linen, hemp, and paper manu-
factures are of some importance. Mayenne is divided into the three arrondissements of
Laval, Château-Gontier, and Mayenne.

MAYENNE, chief t. of the French department of the same name, is situated on the
Loire, on the right bank of which rises, on a steep and rocky height, the ancient fortress
of the dukes of Mayenne. Lat. 48° 14' n., long. 0° 35' west. The town is pleasantly
situated, has several good squares, and some fine fountains; but it is specially remarkable
for the extreme steepness of its narrow and winding streets. Manufactures of calico and
linen. Pop. '76, 8,826.

MAYER, ALFRED MARSHALL, b. Baltimore, 1836; educated at St. Mary’s college. In
1856 he was appointed professor of physics in the university of Maryland; and he has since
held a similar position in the Westminster college in Missouri; in Pennsylvania college;
in Lehigh university, and in the Stevens institute of technology, Hoboken, N. J., where
he remains. He was for a time one of the editors of the American Journal of Science and
Arts, and has published a number of contributions to science, of which may be noted:
Estimation of the Weights of very Small Portions of Matter, 1855; Researches in
Electro-Magnetism, 1873; and Researches in Acoustics, 1874. Since his connection with
the Stevens institute, he has made a specialty of acoustics, in which he has made many
interesting experiments, and some valuable discoveries. He has established the connec-
tion between the pitch and duration of a sound, has invented a method of determining the
comparative intensity of sounds with the same pitch, and has located the organs of
hearing in the mosquito. He has also developed new processes for analyzing sound, and
has made discoveries into the nature of electricity.

MAYER, BRANTZ, 1809-79, b. Baltimore; educated at St. Mary’s college, and after
graduation, made a tour to the East. He returned to America in 1829, and was called to
the bar, but gave up the practice of his profession in 1841, to become secretary of the
American legation at Mexico. He came back in 1842 and for a time edited the Baltimore
American. In 1867 he became a paymaster in the army. In 1844 he published the
results of his observations in Mexico, under the name of Mexico as it was and is, describ-
ing the political and social state of Mexico at that time, with some account of the ancient
Mexican civilization. To the latter branch of this subject, he returned in his Mexico: As-
tic, Spanish, and Republican. This work, which appeared in 2 vols. in 1851, is of con-
siderable value for the study of Mexican history after the Spanish conquest. In 1854 his
Captain Canot came out, devoted to the exposure of the slave trade, and from its subject
became highly popular. The Smithsonian institution published in 1856, his Observations
on Mexican History and Archaeology. He was one of the founders of the Maryland his-
torical society.

MAYER, JOHANN TOBIAS, 1723-62, b. Wurttemberg; son of a civil engineer,
whose death left him dependent on his own exertions. He taught mathematics for
a living, and devoted himself to the study of gunnery. In 1746 he assisted in
founding the cosmographical society of Nuremberg, to whose Transactions he con-
tributed a number of papers, among them an important paper on The Libration of the
Moon, in which he made the first use of the equations of condition, which
have since been so generally applied. In 1751 he was appointed director of the
observatory of Göttingen, where for the remainder of his life, he did much to advance
the sciences of astronomy and navigation. His first published work was A Treatise on
Correl for the Construction of Geometrical Problems, which was followed the same year,
1745, by A Mathematical Atlas. At Göttingen, he gave much labor to a Zodiocal Cata-
logue, which contains 998 stars. His Lunar Tables were published in 1755, and were so
correct as to be be adopted by the British board of admiralty. In the same year he dis-
covered the repeating circle, which was afterward used with so much success by Borda, in measuring the arc of the meridian. He left a large number of scientific memoirs.

MAYER, JULIUS ROBERT, Dr., a German physicist, b. in Heilbronn, Württemberg, 1814. He attended the gymnasium at Heilbronn, studied medicine at Tübingen, and finished his course at Munich and Paris. He made a voyage to Java in 1840, and while there made observations on the blood which led him to the investigation of the subject of animal heat, and finally to that of the conservation and correlation of forces. After his return to Heilbronn he became town physician, which interrupted his investigations, but he published a preliminary notice of the work he had accomplished up to 1842, in Liebig's Annalen der Chemie und Pharmacie under the title Bemerkungen über die Kräfte der unbedelten Natur. In 1845, he made a fuller explanation of the subject in a memoir, under the title, Die organische Bewegung in ihrem Zusammenhange mit dem Stoffwechsel. In 1848 he published Beiträge zur Dynamik des Himmels, and in 1851 the essay for which he is perhaps more generally known in popular science, that upon the mechanical equivalent of heat, in which he developed and expanded the principles laid down in his former papers. His argument is that the sun's power is the source of all energy on the earth, nature storing up the light and heat, and molding it into permanent forms, from which other kinds of energy may be derived. In this way various potential conditions are formed, plants storing up power to be afterward transferred to animals and diffused in motion or work; or the plants in the form of wood and coal may liberate their forces by combustion. He determined the numerical relation between heat and work, and followed up his investigation by considering the vast amount of heat generated by gravity when the force continues its action through sufficient space; concluding that the gravitating force between the sun and the earth possessed a heat equivalent to a mass of 6,000 times the weight of the earth, and that the light and heat of the sun are maintained by the constant impact of meteoric matter. In 1848 Dr. Mayer incurred the displeasure of many of his former friends by taking sides against the revolutionists, and the attacks made upon his scientific investigations so affected him as to throw him into a sleepless condition which resulted in delirium, during which he leaped from a window 30 ft. high, sustaining severe injuries, from which, however, after a long time he recovered. His works have been published under the title Die Mechanik der Wärme, (Stuttgart, 1867). The Copley medal was awarded to him by the royal society of London in 1871.

MAYER, KARL, 1799-1892, b. Germany; a voluminous composer for the piano. He went to Russia with his father, who was a member of a regimental band, in 1812. While at Moscow he was a pupil of the pianist John Field. After a residence in Paris and Brussels, and a tour through Germany, he went back to Russia, where he won a high reputation as a teacher of the piano. He gave lessons at St. Petersburg and Moscow, but finally made his home in Dresden, where he died. He left 351 compositions for the piano, of which the more pretentious are concertos for the piano and orchestra.

MAY-FLY. See Ephemera.

MAYHEM. See BEATING AND WOUNDING, ante.

MAYHEW, EXPERIENCE, 1673-1758, b. Martha's Vineyard. He was the oldest son of Rev. John Mayhew, and great-grandson of Gov. Thomas Mayhew. He began to preach to the Indians at the age of twenty-one, in 1694, and had the oversight of five or six Indian assemblies, which he continued for 64 years. Though not favored with a learned education, he became so conspicuous that Dr. Cotton Mather in a sermon printed at Boston in 1698, and reprinted in his Magnalia, London, speaking of more than "thirty hundred Christian Indians," and "thirty Indian assemblies," adds: "A hopeful and worthy young man, Mr. Experience Mayhew, must now have the justice done him of this character, that in the evangelical service among the Indians there is no man that exceeds this Mr. Mayhew, if there be any that equals him." Having thoroughly mastered the Indian language, which he had learned in infancy, he was employed by the commissioners to make a new version of the Psalms and the gospel of John, which he did in 1700 in collateral columns of English and Indian. He was offered the degree of master of arts at Cambridge, which, though he declined, was conferred upon him at the public commencement, July 3, 1728. He published in 1727 Indian Converts, comprising the lives of 30 Indian preachers and 80 other converts, besides a volume entitled Grace Defended.

MAYHEW, HENRY, 1812-76, b. London; son of a solicitor in good practice. Was sent to Westminster school, but twice ran away, and made a voyage to Calcutta on a ship-of-war. On his return to London he passed three years in his father's law office as an articled clerk, traveled for a period in Wales, and finally adopted the literary profession and settled in London. His first venture was theatrical. In company with Mr. Gilbert & Beckett he took the Queen's theater, where he produced the clever farce of The Wandering Minstrel. About the same time he started a comic paper called Figaro in London, which was the precursor of Punch, of which Mr. Mayhew was also one of the founders. Between the years 1846-51, in conjunction with his brothers, Horace and Augustus, he brought out a number of fairy tales and farces, and a series of humorous sketches, including The Greatest Plague of Life; Whom to Marry, and How to Get Mar
ried; The Image of his Father; etc. He also published individually Young Benjamin Franklin; Boyhood of Martin Luther; The Wonders of Science; and other books for children. In 1851 he produced his most important work, London Labor and the London Poor, a Cyclopedia of the Condition and Earnings of those that will Work, those that cannot Work, and those that will not Work. Of this book Mr. Henry T. Tuckerman wrote as follows: "Mayhew has given us the diagnosis of London street life with an analytical precision quite scientific. . . . . A body of the most curious information is brought together, which reveals a world of facts appalling to the sensibilities, and wonderfully suggestive to the political economist." Mr. Mayhew also commenced the publication in numbers of a similar work entitled The Great World of London, which was not completed. The first of these works was begun in the London Morning Chronicle; it was published in 3 vols., 1861, and reprinted 1868. The versatility of Mr. Mayhew's talent is shown by the widely differing nature of his various works. The London Athenæum said of him: "We have long been in want of a 'young people's author,' and we seem to have the right man in the right place in the person of Mr. Mayhew." Another London journal, referring to one of his biographical stories for boys, said that it was "told with the grace and feeling of Goldsmith, and by one who has that knowledge of science which Goldsmith lacked."

MAYHEW, IRA, b. New York, 1814; received an education and went west in early youth, and settling in Michigan became a successful teacher. He was for some years superintendent of schools for the state of Michigan. In 1849 the legislature of Michigan passed a resolve in favor of the publication of a Treatise on Popular Education for the use of parents and teachers, which was written by him, considered satisfactory, and is now the sixth volume of A. S. Barnes & Co.'s school-teachers' library, New York. He has published Practical System of Book-keeping, and Universal Book-keeping. His work is characterized as an efficient help to the cause of popular education which has received merited recognition.

MAYHEW, JONATHAN, 1720-66, b. Martha's Vineyard, Mass.; graduated at Harvard college in 1744; ordained minister of the West church, Boston, in 1747, which place he occupied until his death. He took a decided stand against the introduction of bishops into the colonies by the Gospel propagation society, which led to a controversy with Dr. Apthorp and the bishop of Canterbury. He took sides, too, with the opponents of the arbitrary policy of England toward the colonies, boldly expressing his views even in the pulpit. His published works are a volume of seven sermons; Christian Sobriety, in Eight Sermons to Young Men; Observations on the Charter and Conduct of the Society for Propagating the Gospel in Foreign Parts. A memoir of him was published by Alden Bradford.

MAYHEW, THOMAS, 1592-1682, b. England; was a merchant in Southampton; emigrated to America in 1631, and settled in Watertown in 1636, obtained in 1641 from the agent of lord Sterling a grant of Martha's Vineyard and the neighboring islands, about 50 m. from Plymouth rock. In 1643 he became both patenteen and governor of Martha's Vineyard and other islands. His son having been called to labor in the ministry at Edgartown, governor Mayhew encouraged his work, both by his advice and by inducing the Indian sachems to govern their people according to English laws. They "loved and admired him as the most superior person they had ever seen." They drew up a writing in their own language, signed by men "of the greatest note and power," declaring that as they had freely submitted to the crown of England, so they resolved to assist the English on the islands against their enemies. For 40 years while he lived among them the English and Indians were at peace. While governor he also preached, walking sometimes, even in his old age, 30 m. through the woods. When above fourscore years of age they urged him to accept the pastoral charge of them, which, however, he declined on account of his position as governor. He continued to preach to extreme old age.

MAYHEW, THOMAS, 1621-57; the only son of governor Thomas Mayhew; b. England; received a liberal education; removed with his father to Martha's Vineyard in 1642; was called by the settlers on the new plantation to the ministry among them. Soon learned the Indian language, and began to preach among them. In 1651 there were 199 men, women, and children who professed to be worshippers of the true God. Desiring to give a more detailed account of the Indians than he could by letter, and to secure aid in his work, he embarked in 1657 for England with his brother-in-law and an Indian preacher, but nothing was ever again heard of the ship. He was an earnest and successful minister, greatly beloved and esteemed by the Indians.

MAYHEW, THOMAS, b. London, 1810; brother of Henry and Horace; entered the profession of literature, and particularly distinguished himself by becoming a pioneer in the production of cheap reading matter for the poorer classes. He published a number of works sold for a penny; including dictionaries and grammars, and founded the penny national library.

MAYMEME, or MAIMENAH, a city in independent Turkestan, about half way between Balkh and Herat, on a river flowing n. towards the Jilun. It consists of about 1500 mud huts, a frail bazaar built of brick, three mosques of mud, and two medresse, or-
colleges, of brick. It is considered by the natives to be a powerful stronghold, but its only defenses are a simple wall of earth around the city, 20 ft. high; and a citadel surrounded by a fosse, and situated upon a conspicuous hill of steep ascent. The people of the town, as well as those of the khanat, are bold and fearless riders, and of resolute, warlike character.

MAYNADIER, William, 1806-71; b. Md., a graduate of West Point military academy; in 1827 was appointed brevet 2d. lieut. of artillery. He was at one time adjutant of the artillery school of practice at Fort Monroe, having been previously assigned to duty there. In 1832 he was one of gen. Winfield Scott's aids in the Black Hawk war in Illinois, and in 1835-38 served in the same capacity with gen. Macomb in the Seminole war, a contest between the Indians and settlers in Florida. In 1838 he was appointed capt. and acting inspector of ordnance, and placed on duty at the U. S. arsenal in Pikesville, Md. In 1842 he was promoted to assistant chief of ordnance, holding the position for several successive years, and was gradually advanced from maj. in 1861, to brevet brig. gen. in 1865. He was remarkable for fine abilities rendered useful by a varied experience, for sound judgment and careful discrimination.

MAYNARD, Horace, b. Mass, 1814; educated at Amherst college. Removed to Tennessee, and held the position of tutor, and afterwards that of professor of mathematics in the East Tennessee university. In 1844 he was admitted to the bar, and entered upon a law practice which became lucrative and important. He was a member of congress from 1857 to 1863, and during the rebellion suffered from serious losses of property. He was again elected to congress in 1866, and continued to represent the Knoxville, Tn, district until 1873, and afterwards for two years was representative at large. He was appointed minister to Constantinople in 1875 and continued there until 1880, being appointed postmaster-general in August of the latter year.

MAYNARD, Sir John, 1602-99; b. at Tavistock, England; educated at Exeter college, Oxford. After the regular course of study in the Middle Temple he was called to the bar, having been made a member of parliament in the previous year, 1623. He was subsequently made a sergeant-at-law and king's sergeant, but declined the place on the bench offered him by Charles II, in 1660. In a long political career, extending over 65 years, sir John was a witness of and prominent actor in the most eventful crises of English history. An urgent advocate of increasing the power of the people, he never concurred in the extreme views taken by the radical republicans; an earnest Presbyterian, he stood aloof from the absurd fanaticism of many in his party. He was active in the prosecution of Strafford and Laud, but strongly opposed the arbitrary power assumed by the army, and Cromwell's evident intention of making himself king in fact, if not in name; and for the position he took in this respect was twice imprisoned by order of the protector in the tower of London. At the restoration the honor of knighthood was conferred upon him by Charles II.; and his political course under that monarch was judicious and conservative. In the time of the revolution and the accession of William and Mary, he showed great ability, and notably in the great conference held between the house of lords and the commons in regard to the abdication of James II., a measure which he strenuously advocated. In the same year, 1689, he was made a commissioner of the great seal. Macaulay relates that when, at an interview with William III., the king remarked to Maynard that he must have outlived all the lawyers of his time, sir John both wittily and truthfully replied, "Yes; and if your highness had not come to our assistance, I should have outlived the law, also." Both as a statesman and as a lawyer and expounder of the true principles of the British constitution, Maynard occupied a very high position among the many remarkable men of his age. A number of his political speeches and legal decisions have been collected and published.

MAYNOOTH, a village of the co. Kildare, Ireland, 15 m. n.w. from Dublin by the Midland Great Western railway; pop., including the college, 71, 2,091. It is of some historical interest as the seat of the powerful family of the Geraldines, of whose castle large and very striking ruins still remain; and as the scene of more than one struggle with the English power, especially the "rebellion of Silken Thomas," in the reign of Henry VIII., and in the war of the confederates (1641-50). But its chief modern interest arises from the well-known Roman Catholic college, which supplied for many years material for strife to the zealots of the rival religious parties in Great Britain. This college was established during the ministry of Mr. Pitt, in the year 1795, by an act of the Irish parliament, in order to meet a necessity created by the utter destruction, through the French revolution, of the places of education in France upon which the Irish Catholic clergy, excluded by the penal laws from the opportunity of domestic education, had hitherto been driven to rely. The original endowment, an annual vote of £8,928, was continued, although not without sustained opposition, by the imperial parliament after the act of union. In the year 1846 sir Robert Peel carried a bill for a permanent endowment of £26,000 a year, to which was added a grant of £50,000 for building purposes. The building erected under the original endowment is a plain quadrangle. The new college is a very striking Gothic quadrangle by Pugin, containing professors' and students' apartments, lecture-halls, and a singularly fine library and refectory. Pugin's design included a chapel and common-hall, which, owing to insufficiency of funds, have been postponed. Under the act of 1846 the college was to receive 500 students, all
destined for the priesthood. The patronage of the 500 studentships was divided in the ratio of population among the bishops of the several sees of Ireland; but the candidates thus named were subjected, before matriculation, to examination in a comprehensive entrance course. The full collegiate course was of 8 years, 2 of which were given to classics, 2 to philosophy, and the remaining 4 to the more directly professional studies of divinity, scripture, church history, canon law, and the Hebrew and Irish languages. The divinity students, 250 in number, received a money stipend of £30 annually; and at the close of the ordinary course, 20 scholarships, called from the founder, lord Dunboyne, "Dunboyne Scholarships," were assigned by competition to the most distinguished students, and might be held for 3 years. The legislative authority was vested in a board of 17 trustees, and the internal administration in an academical body, consisting of a president and vice-president, together with a numerous body of professors and deans. A visitatorial power was vested in a board of 8 visitors, of whom 5 were named by the crown, and 3 elected by the trustees. In 1869, by the Irish church act (32 and 33 Vict. c. 38-41), the Maynooth endowment was withdrawn—a capital sum, 14 times its amount, being granted to the trustees for the discharge of existing interests. The college, however, is still maintained on the same footing. The educational arrangements are unaltered, and although the number of pupils, owing to the suspension of free studentships and exhibitions, has somewhat fallen off, the diminution is regarded as temporary. The visitatorial powers created under the act of parliament are now exercised by visitors appointed by the trustees, and all state connection is at an end. The college also possesses some landed and funded property, the result of donations and bequests, the most considerable of which is that of lord Dunboyne, Roman Catholic bishop of Cork, who had for a time conformed to the Protestant faith. A great part of the college buildings was burned in Nov., 1878.

MAYO, a maritime county of the province of Connaught, Ireland, is bounded on the n. and w. by the Atlantic ocean, e. by Sligo and Roscommon, and s. by Galway. Area, 1,963,892 acres, of which 497,557 are arable; population, which in 1801 was 254,440, had fallen in 1871 to 191,019; in 1871 the number of inhabited houses was 98,355. There are 22 Episcopalians, and the rest Protostanst of other denominations. The coast-line of Mayo is about 350 miles. The surface is very irregular, the interior being a plain bordered by two ranges of mountains. Of these ranges, the highest points are Croagh Patrick, 2,610 ft., and Neppin, 2,646 ft. in height. The soil of the plain is fertile, and for the most part suitable either for tillage or for pasture, although the prevalence of rain and ungenial winds render tillage, especially of wheat and potatoes, precarious and unremunerative. The number of acres under crop in 1878 was 192,021. The rearing of cattle forms in most parts of the county the more ordinary pursuit of the agricultural population. In 1875 the number of cattle was 174,614; sheep, 300,328; and of pigs, 53,661. Ironstone abounds in some districts, but, owing to want of fuel, no attempt is made to work it. An excellent marble is found in the north-western district, and there are several places in which slate is successfully quarried. The chief towns are Castlebar, Westport, Ballina, and Ballinrobe. Almost the only occupations of the population are agriculture and fishing. A valuable expanse of water is Lough Mask, and the small lake of Lough Mask is the habitation of the well-known "gil-laroo" trout. The Irish language is still spoken in a large part of Mayo. The number of pupils attending school during 1875 was 50,173—an increase of nearly 10,000 since 1871.

Mayo formed part of the extensive territory granted by Henry II. to William de Burgh; but in the middle of the 14th. c. one of the younger branches of the family, seating on the counties of Galway and Mayo, threw off the English allegiance, adopted the "customs of the Irish," together with the Celtic name of MacWilliam. In the year 1575 the MacWilliam made his submission at Galway; but having subsequently revolted, the district was finally subdued by sir Richard Bingham in 1586. The antiquities of Mayo are chiefly ecclesiastical. Four round towers are still in existence, and there are at Cong the remains of a splendid abbey, which dates from the 12th century. The celebrated "Cross of Cong," now in the museum of the royal Irish academy, was the archbishopiscopal crozier of Tuam, once preserved in the abbey of that name.

MAYO, AMORY DWIGHT, b. in Warwick, Franklin co., Mass., Jan. 31, 1828; educated at Amherst college; studied theology with the rev. Hosea Ballou, formerly president of Tufts college; from 1846 to 1854 was pastor of a Universalist church in Gloucester, Mass.; from 1854 to 1856 preached in Cleveland, O.; from 1856 to 1863 in Albany, N. Y.; and from 1863 to 1872 in the church of the Redeemer (Unitarian), in Cincinnati, O.; and from 1872 to 1889 was pastor of the Universalist church in Springfield, Mass. During his whole life he has been an earnest advocate of popular education, and has written much upon the subject. He has opposed with zeal the effort to secularize the public schools, contending for the use in them of the Bible as a means of moral instruction. He has also taken a decided stand in favor of the so-called "Christian amendment" to the constitution of the United States. For several years he was professor of ecclesiastical polity in the Meadville (Penn.) theological school, visiting the institution yearly to deliver the necessary lectures. He is at present the editor of the Massachusetts Journal of Education, and engaged besides in general labors throughout

U. K. IX.—40
the country to stimulate popular interest in the school-system. His published works are The Balance; Memoirs of Mrs. S. C. F. Mayo, his first wife; Graces and Powers of the Christian Life; and Symbols of the Capital, a volume of sermons on the elements of Christian civilization.

MAYO, RICHARD SOUTHWELL BOURKE, Earl of, 1822-72; b. Dublin, Ireland; educated at Trinity college in that city. He was the sixth earl of Mayo, and, until his succession to the title at his father's death in 1867, was known as lord Naas. After graduation he traveled in Russia, and published an account of the trip in St. Petersburg and Moscow (1845). His career in politics was most successful; he was twice returned to parliament, and was made chief secretary for Ireland in 1852 by lord Derby, and again in 1858, and 1866, when that statesman was in power, was reappointed to the same position; and under Disraeli's administration was in 1868 made viceroy of India. Here he at once introduced extensive reforms in the conduct of the public service. To this matter he gave his most earnest attention, and it was while engaged in an examination of the present tenure at fort Blair among the Andaman islands that he met his death at the hands of one of the convicts. It is generally believed that the act was prompted only by natural malignity, and was not occasioned by any political cause.

MAYO, WILLIAM STARRUCK; b. at Ogdensburg, N. Y., 1812; educated as a physician, and took his degree at the New York college of physicians and surgeons in 1833. Dr. Mayo is chiefly known as a traveler and writer of fiction. He spent some time in Spain and Morocco, and returned north, after a series of the other kind, and his position gained in these travels was employed with effect in his earlier novels. In fiction he has written Kaloolah (1849); The Berber, or Mountaineers of the Atlas (1850); Romance Dust from the Historic Placer (1857); and Never Again (1873). Of these, the first was the most popular, and obtained a very large circulation. His books abound in incidents of adventure and peril, and show versatility, but his character portrayal is, with one or two exceptions, inferior to his narrative. His style does not avoid extravagance; and sometimes, as in his last book, is somewhat morbid. His work, however, is interesting, and has not failed of readers.

MAYOR (Fr. majre, Lat. major; see MAOR), originally a steward, bailiff, or overseer, thence the chief magistrat of a city or corporate town in England or Ireland. The mayor is the head of the local judicature, and the executive officer of the municipality; he is elected by the council from the aldermen or councilors, and holds office for a year only. His duties include those of returning officer in all burghs except those cities and towns which, being counties of themselves, have sheriffs of their own. The first mayor of London was appointed in 1189, the first mayor of Dublin in 1409. The mayors of London, York, and Dublin are called "lord mayor." The lord mayor of London has the title of "right honorable," which, along with the title "lord," was first allowed by Edward III. in 1354; is the representative of royalty in the civil government of the city, the chief commissioner of lieutenancy, the conservator of the river Thames; and on the death of the lord mayor, pro tempore, is a member of the privy council. To maintain the hospitality of the city, he receives an allowance of £8,000 a year, with the use of the Mansion-house, furniture, carriages, etc. He is chosen by the livery (q.v.) on Sept. 29, being commonly the senior alderman, who has been sheriff, but not lord mayor. In former times, it was the ambition of the first merchants and bankers of the city to become lord mayor; but since the district within the metropolitan boundaries has come to be but a small fraction of what is generally known as London, this has ceased to be the case; and it is only in the eye of foreigners that the lord mayor of London is one of the most important public functionaries of the realm. The mayor of Dublin was first styled lord mayor by Charles II. in 1665.

MAYOR, ante, the ordinary name for the chief executive officer of an incorporated city. No general definition of his powers can be given. They are defined by the charter of the particular city where he holds office, and, as in the case of New York city, are subject to almost annual changes by the legislature. In some cities the mayor actually has great authority; in others, his powers are divided among executive boards or commissions, or he is made dependent for confirmation of his acts or appointments upon the consent of aldermen, or the common council, or other elective or appointive bodies, so that the mayor's actual powers are often extremely limited.

MAYOR, JOHN EYTON BICKERSTETH; b. Ceylon, 1825; educated at Shrewsbury school, and St. John's college, Cambridge, of which he became fellow in 1848. He was assistant master of Marlborough college from 1849 to 1853, took orders in the church in 1853, and in 1863 became librarian of the university of Cambridge, where, since 1872, he has been professor of Latin. His services to the study of classical literature and philology have been eminent, and the number of his works, and particularly of his editions of, classical authors, is large. He published an edition of the Satires of Juvenal in 1853, and a new edition of the same work appeared in 1878. He has edited the works of Quintilian, the Speculum Historiale of Richard of Cirencester, the Second Philippic of Cicero, and a portion of Homer's Odyssey. He has also published a number of school text-books, and A Bibliographical Cline to Latin Literature. He has been an associate editor of the Journal of Classical and Sacred Philology, and of the Journal of Philology.
MAYORCA, MARTIN DE, a Viceroy of Mexico. When he arrived in the country the small-pox was raging with great violence, and in a few days 8,600 persons died. He ordered a general inoculation of the people. He was a man of energy, and much interested in the welfare of the people, but his wise and useful measures were greatly hindered and opposed. He founded an academy of arts in Mexico. During his administration gold and silver to the amount of nearly $75,000,000 were coined. He died from poison on his way to Spain. He was the 47th viceroy of Mexico.

MAYOR OF THE PALACE, originally the title of the royal steward under the Merovingian kings. His proper function was the administration of the royal estates, and the care of the royal household; but by 650 the entire administration of the government had passed into the hands of the mayors of the palace. Grimoald of Austrasia, and Ebroin of Burgundy, exercised an absolute authority in their office as mayors. The most famous of the mayors of the palace, Pepin of Heristal, who held the office 688-714, and his son, Charles Martel, who died in 741, were kings in everything but name; and Charles Martel's son, Pepin the short, took the title of king. Thenceforward the office lost much of its importance.

MAYOTTA, one of the Comoro isles (q.v.), ceded to France in 1843, lies in lat. 12° 34' to 13° 4' s., and long. 44° 50' 15" to 45° 23' e. It is of irregular form and measures 21 m. from n. to s., with an average breadth of 6 or 7 m.; if, however, the dangerous coral reefs which surround the island be included, the whole occupies a space of 30 m. n. and s., and 24 m. e. and w. The surface of Mayotte is very uneven, and is studded with volcanic-looking peaks, some of which exceed 2,000 ft. in height. The shores of the island are in some places lined with mangrove swamps, which are uncovered at low water and are productive of malaria and fever. The island is in most parts capable of cultivation, and contains several sugar plantations. There are produced annually from 40,000 to 50,000 cwt.s. of sugar; and the total exports for a year are valued at nearly £50,000. It is principally sugar that is exported; and the supply of food grown on the island is insufficient for the use of the inhabitants. The total imports in a year do not exceed in value £25,000. As a colony Mayotte has certainly not fulfilled the expectations entertained by the French at the time of its occupation, notwithstanding the unusually liberal terms held out to the colonists. The French establishment is on the island of Zanzidé, inside the chain of reefs on the e. side of Mayotte, and consists of a governor, colonial officers, and seamen, and the house of a few native ones. There are several substantial government buildings and store-houses; there is a good roadstead, and the fort has been recently strengthened. Mayotte is the only refuge for French ships in the Indian ocean. It is the principal market for the neighboring islands. Pop. '75, 10,875.

MAYOW or MAYO, JOHN, l.t.d., 1642-79; b. Cornwall, England; educated at the university of Oxford, and studied both law and medicine, but his taste was for philosophical and chemical investigation; and, though he acquired some celebrity in his profession, both in his practice at Bath and as a medical writer, he is chiefly remarkable for his discoveries and speculations in certain chemical subjects and especially as regards the nature of the process of combustion and chemical affinities. As regards these subjects, he seems to have been far in advance of the scientific theories of his time, and to some extent to have anticipated the discoveries of Priestley and others of the following century. His pamphlet, De Sole Nitro et Spiritu Nitro-āerco (1674), maintains that atmospheric air undergoes change in its composition during the combustion of fuel. A collection of his writings, Opera Omnia Medica Physica, was published in 1681. He died when only 34 years of age.

MAYSVILLE, a city of Kentucky, United States of America, on the Ohio river, 63 m. s.e. of Cincinnati. It is finely situated, is the river port of a rich territory, and one of the largest hemp-marts in America. It has extensive manufactories of cotton, hemp, tobacco, iron, and oil-cloth. It contains the county buildings, city hall, market, 3 banks, 12 churches. Pop. '79, 4,703.

MAYWEED, Matricula ovula, a common road-side plant, growing also in pastures and meadows, belonging to the order composite. It is a native of Europe, but although widely spread in America, it is not an aggressive weed. The flower has somewhat the appearance of chamomile, and is sometimes called stinking chamomile. It has been classed as anthemis, and the two genera are much alike.

MAZAMET, a t. of France, dep. of Tarn, 43 m. e.s.e. of Toulouse, on the Arnette, a feeder of the Tarn. It has extensive woolen manufactories and cloth-fairs. Pop. '72, 10,500.

MAZANDERAN, a province of Persia, bounded on the n. by the Caspian sea. It consists for the most part of a tract of low coast-land, about 200 m. in length by 50 in breadth. Along the shore of the Caspian the land is marshy, but further inland the surface becomes elevated. The climate cannot be called salubrious, although it is more healthy than that of the neighboring province of Ghilan. The soil is fertile; rice, cotton, mulberry, sugar-cane, and a variety of fruits are produced. It exports silk, cotton, and rice to Russia, and imports woolen goods, cutlery, tobacco, etc. Throughout the whole province, parallel with the shores of the Caspian, extends a causeway, constructed by
Shah Abbas the great in the 17th c., and still in good repair. Pop. about 150,000; capital, Sari (q.v.).

MAZARIN, JULES (ital. Giudivo Mazarini), cardinal and chief minister of France during the minority of Louis XIV., was born July 14, 1602, at Rome, or, some say, at Piscina in the Abruzzi. The social position and occupation of his father are points in dispute. Mazarin studied law at Rome and at the Spanish universities, where he contrived to unite industry with amorous gayety. Afterwards he entered the pope's military service, perhaps about 1624. Having accompanied a papal legate to the court of France, he became known to Richelieu about 1628, who perceived his great position, and engaged him to maintain the French interests in Italy, which he did while still employed by the pope as vice-legate to Avignon (1632) and nuncio to the French court, an office to which he was appointed in 1634. The Spaniards complained of his partiality for France, and the pope was obliged to recall him. The subtle Italian was not thus to be checkmated. In 1639 he opened entered the service of Louis XIII., and was naturalized a Frenchman; and in 1641 received a cardinal's hat, through the influence of Richelieu, who, when dying, recommended Mazarin to the king as the only person capable of carrying on his political system. Mazarin's position was one of great difficulty amidst the intrigues, jealousies, and strifes of the earlier years of Louis XIV.'s minority. The queen-mother, Anne of Austria, was at first particularly hostile to him; but although she was declared sole regent and guardian of the young king, Mazarin kept his place as minister, and soon made himself indispensable to her, partly by his wonderful business qualities, and still more by the remainder of his manner, so that, although with grudging, she was unable to resist his influence. The parliament, thinking to regain political power, resisted the registration of edicts of taxation; but Mazarin caused the leaders of the opposition to be arrested, upon which the disturbances of the Fronde (q.v.) began. The court retired to St. Germain; Mazarin was outlawed by the parliament; but by the grace of Ruel he still remained minister. The feeling against him, however, became still more inflamed when, at his instigation, the queen-regent caused the princes of Condé and Conil and the duke of Longueville to be arrested in Jan., 1650. Mazarin went into person at the head of the court troops to the insurgent provinces; and after the victory at Rethel showed so much insolence that the nobles and the people of the capital made common cause against him, and he thought it necessary to secure his safety by flight to the Netherlands, whilst the press teemed with violent publications against him, known as Mazarinadas. After the rebellion of the prince of Condé he ventured to return to France; but Paris making his removal a condition of its submission, he retired again from the court, and it was not till Feb. 5, 1658, that he made a triumphant entry into the capital, where he was received with significant silence. Yet in a short time he was popular, and had acquired his former power. Under him the influence of France amongst the nations was increased, and in the internal government of the country those principles of despotism were established on which Louis XIV. afterwards acted. The administration of justice, however, became very corrupt, and the commerce and finances of the country sunk into deep depression. It is admitted that as a financial administrator he was far inferior to Richelieu. Mazarin died at Vincennes, March 9, 1661. He was very niggardly and very avaricious, and had acquired in various ways, fair and foul, an immense fortune, amounting to 12,000,000 livres, which he offered to the king shortly before he died, afraid, it is thought, that it might be rudely seized from his heirs. Louis declined the restitution, which was perhaps what the wily minister expected. He was privately married to Anne of Austria. See the Memoirs of Mazarin's contemporaries, Retz, Mme. Mottetville, La Rochejeancault, Turenne, Grammont, etc.; Siècle de Louis XIV., by Voltaire; Mme. de Longueville, etc., by Victor Cousin; and A. René's Les Nécès de Mazarin.

MAZARREDO Y SALAZOR, José María, Admiral, 1744–1812; b. at Bilbao, Spain; entered the navy in 1760; participated in the campaign against Algiers in 1775, and was the means of saving the remnant of the army from destruction. He negotiated the peace which followed the rupture, was made maj. gen. of naval forces, and took part in the naval operations against the British in 1780–83. He was promoted to the rank of lieut. gen. in 1789, and to that of commander-in-chief in 1793, and defended Cadiz against the British in 1797. He served as ambassador to Paris in 1799 and 1804; was a zealous supporter of Joseph Bonaparte, who made him counselor of state and minister of marine, which office he held to the close of his life. As a scientific seaman his rank was high. He built the naval observatory at Cadiz; and published Reglamentos de Tactica Naval.

MAZARON, or ALMAZARRON, a sea-port t. of Spain, in the province of Murcia, 27 m. w.s.w. of Cartagena, on the coast of the Mediterranean. The inhabitants are employed in fishing and mining—silver ores and alum being found in the neighboring hills. Much borilla is made here. From the number of ruins found in the vicinity, this is supposed to have been the site of an important Carthaginian settlement. Pop. about 7,000.

MAZATLÁN, a sea-port of Mexico, at the mouth of a river of its own name, which falls into the entrance of the gulf of California, lat. 23° 10′ n., long. 106° 21′ w. It is a well-built and picturesque town. The climate is healthy, but very hot (85° to 105° in the shade during August). Pop. from 12,000 to 15,000—a mixed race of old Aztec Mexicans, Indians, Spaniards, and negroes. The chief exports to California and Europe
are silver dollars, Brazil or Lima wood, and copper; imports, provisions, machinery, British hardware and crockery, and dry goods from France and Germany. In 1864 the town was besieged by the French and imperial troops. The harbor of Mazatlan, though much exposed to winds from the s.w., is the most important on the Mexican coast.

MAZDAK, a Persian religious enthusiast and founder of a sect; b. at Persepolis, A.D. 470. He became a priest at Nishapur. Professing himself a prophet sent to regenerate mankind, he obtained many followers, and declared a community of property. He succeeded in converting the king, Kóbád, and his system of communism made great changes in the social order. But the revolution was temporary. He was put to death with thousands of his followers between 530 and 540.

MAZEPPA, Jan "John", hetman of the Cossacks, was b. about 1645, and was descended of a poor but noble family of Podolia. He became a page in the service of John Casimir, king of Poland. A Polish nobleman, having surprised him in an intrigue with his wife, caused him to be stripped naked, and bound upon his own horse, lying upon his back, and with his head to its tail, and sent the animal off, leaving Mazeppa to his fate. The horse carried him to his own distant residence—not to the Ukraine, as has been often said; but Mazeppa, out of shame, fled to the Ukraine, joined the Cossacks, and by his strength, courage, and activity rose to high distinction amongst them, and in 1687 was elected their hetman. He won the confidence of Peter the great, who loaded him with honors, and made him prince of the Ukraine; but on the curtailment of the freedom of the Cossacks by Russia, Mazeppa conceived the idea of throwing off the sovereignty of the czar, and for this purpose entered into negotiations with Charles XII. of Sweden. These and other treasons were revealed to Peter the great, who did not credit the informants; but afterwards, being convinced of Mazeppa's guilt, caused a number of his accomplices to be put to death. Mazeppa joined Charles XII., and took part in the battle of Pultowa, after which he fled, in 1709, to Bender, and there died in the same year. His story has been made the subject of a poem by Byron, of a novel by Bulgarin, and of two paintings by Horace Vernet.

MAZUFURABAD, a t. of India, in the Punjab, about 200 m. n.n.w. of Lahore, at the confluence of the Jhelum and its great tributary, the Kishengunga, over both which rivers there are ferries. It is of importance chiefly on account of its commanding position at the entrance of the Baramula pass into Cashmere. The emperor Aurungzebe built a fort here, which was subsequently replaced by one of greater strength, erected by the Afghan governor Ata Mahomed.

MAZURKA, a lively Polish dance of the grotesque kind, the music of which is sometimes in 3 time, but more commonly in 4. The peculiarity of the rhythm, which has a pleasing effect, is what characterizes the music of the Mazurka. It is danced by four or eight pairs, and is much practiced in the north of Germany, as well as in Poland.

MAZZA RA, a city of the island of Sicily, 26 m. s. of Trapani, stands in a fine plain on the sea-shore. Pop. 11,000. It is inclosed by walls, and has a cathedral, an episcopal palace, a college, and several convents. It has a considerable trade in cotton, which is extensively grown in the neighborhood.

MAZZARINO, a t. of Sicily, in the fertile province of Caltanissetta, and 15 m. s.e. of the town of that name. Pop. 11,600.

MAZZEI, PHILIP, 1730–1816, b. Italy; practiced medicine for a number of years in Syria, and was afterwards engaged in mercantile business in London. In 1775 he came to Virginia with a number of Italian emigrants, familiar with the cultivation of the olive, which he wished to domesticate in this country, but the experiment proved unsuccessful. He became a sympathizer with the American revolutionists, and made the acquaintance of many of them in Virginia, including Jefferson, with whom he continued to correspond after his return to Europe, where he was successively attached to the service of the king of Poland and the Russian czar. He published in 1789 Historical and Political Researches on the United States.

MAZZI, GIUSEPPE, one of the most remarkable men of modern Italy, was born in 1808 at Genoa, his father being a physician of note, of good private means. In youth Mazzini was noted for the warmth of his friendships, the fixity of his will, and the exaggerated susceptibility of his humane feelings. From birth sentiments of social equality were engendered in him by the example of his parents; and very early the degraded political condition of his country began to prey upon his mind, producing ardent aspirations for her national unity and deliverance from foreign domination, which seemed to him attainable only through a return to the republican glories of ancient times. Mazzini's patriotic enthusiasm speedily gained absolute sway over his spirit, and led him to renounce his cherished idea of a life of literature and contemplative study for the action and strife of the political arena. In 1827 his maiden essay in literature, "Dell' Amor Patrio di Dante," appeared in the liberal journal, the Subalpino; and he subsequently contributed critical, literary, and political papers to the Antologia di Firenze and the Indicatore Genovese. In the pages of this latter originally appeared the essay subsequently republished under the title of Scritti d'un Italiano Vicente. Literature, according to Mazzini's own assertion, having been employed by the liberal party
solely as a means for the great end of liberal propaganda, the journals were suppressed, and the writers disbanded. In 1839, the affiliation of Mazzini to the secret society of the carbonari was the introductory step to his practical political career; and the young member was speedily invested with a preponderating influence in the counsels and missions of the body. Insanely and betrayed by a Piedmontese spy Mazzini was arrested, debarred for four months in the fortress of Siena, and finally liberated on condition of his departure from Italy. After short residences in several places, he took up his abode in Marseille, and thence he addressed to Charles Albert his famous letter, which drew down on the daring young writer a decree of perpetual banishment. The organization of a new liberal league, "Young Italy," was Mazzini's next work. Republican and unionist to the core, the tendencies of this great body were more humanitarian and universal than its extinct predecessor, carbonarism. In addition to the paramount aim of Italy's republican union under one common law, and the extinction of foreign rule, the general principles of this new association enforced the universal obligation to labor for a common moral regeneration, and the establishment of political equality over the world. Liberty, equality, and humanity were the watchwords of the body; "God and the people" their motto; white, red, and green their tri-colored banner; education and insurrection the great agencies of their operations; assassination was erased from their statutes, and the symbolic dagger of the carbonari was replaced by the more humane emblems of a book and the cypress. Mazzini was the animating spirit of this formidable league, which speedily inclosed all Europe in a network of similar associations, modified to meet the individual requirements of the various European nationalities. Banishment from Marseille, in consequence of the extensive operations of the society having been revealed to the authorities compelled Mazzini to resort to concealment for a period of several months. About this time a charge was brought against him of advocating assassination as a legitimate weapon in the warfare of liberalism; but the charge was proved in the public tribunals of France to be false; and in the British parliament (1845) sir James Graham made an apology to Mazzini for having re-echoed the calumny. The first-fruits of La Giovine Italia was the revolutionary expedition of Savoy, organized by Mazzini at Geneva, but which was defeated by the royal troops. Sentence of death, per contumace, was recorded against Mazzini in the Sardinian courts for his participation in the affair; but he soon recommenced with increased vigor his revolutionary operations. A new association entitled, "New Europe," and based on principles of European rights and enfranchisement, was inaugurated by the exertions of Mazzini in Switzerland. In 1847 Mazzini quitted Switzerland for England, and finally took up his abode in London. From thence his labors in the Italian revolutionary cause have been incessant. To trace the part enacted by Mazzini in the great crisis of 1848 would be to record the history of that period, so intimately were his individual acts connected with the course of events. The resolute combatant of partial union and monarchical leadership at Milan, Mazzini retired to Switzerland on the capitulation of Milan to the Austrians, to reappear in Florence on the rising of Tuscany, and finally at Rome, where he was elected triumvir amidst the triumphant rejoicings of the capital of Italy. His tenure of supreme authority was marked by such wisdom, moderation, and success, as to elicit a public tribute of approbation from lord Palmerston. On the surrender of Rome by Mazzini's advice, he quitted the city, and proceeded to Lausanne via Marseille. The conduct of France he bitterly attacked in public letters to De Tocqueville and others. He subsequently returned to London, and at his instigation risings in Milan (1838) and in Piedmont (1857) were attempted. In 1859 while lending the whole weight of his influence to the revolutionary movements going on in Italy, he combated with vigilant foresight the threatened French predomiance, and refused to accord faith to the liberal programme of Louis Napoleon. The Sicilian expedition of 1860 owed as much to the organization of Mazzini as to the heroic command of Garibaldi (q.v.). In 1864 he was expelled from Switzerland, and "returned again to England. Next year he was elected by Messina deputy to the Italian parliament; but the election, to which he himself as a republican would have declined to receive, was canceled by the parliament. Mazzini is said to have founded in 1865 the "Universal Republican Alliance." In 1866 he fell into a dangerous illness, from the effects of which his health never recovered, though his zeal remained as ardent as ever. After an ineffective scheme for a republican rising, Mazzini ventured to enter Italy, and was arrested at Gaeta, where he remained a prisoner till Rome was taken by the Italian army. He condemned the Parisian commune of March, 1871. On his death at Pisa, Mar. 11, 1872, the Italian government honored him with a public funeral.

Mazzini's writings are various and extensive, and include dissertations on art, literature, and music. A complete edition (Scritti, Editi e Inediti) was published in 1861 and following years. Whatever may be thought of Mazzini's political views, few will refuse to admit the moral and intellectual force of his writings. He has pursued his aim, unchecked by persecution, calumny, and defeat. Mazzini possessed in the highest degree that personal fascination by which friends are converted into ardent partisans. In his private life he is allowed to have been a model of purity and frugal simplicity, as in his public career he was conspicuous for disinterestedness and self-abnegation; and to these personal virtues of Mazzini, aided by his extraordinary influence and eloquence, those who know Italy best ascribe a great share at least in inspiring that higher tone of life manifest in recent years among the Italian youth, without which the
political regeneration of the country would have been impossible. See Memoir, by E. H. V. (London, 1874).

MAZZUCHELI, Giovanni Maria, Conte, 1707-65; b. Italy; studied jurisprudence, but gave much attention to scientific researches. In 1737 he published his Notizie Storiche e critiche intorno alla vita e agli scritti d'Archimede, describing the various inventions attributed to Archimedes, and questioning the story of the mirrors by which Archimedes was believed to have burned the ships of Marcellus at Syracuse. The favor with which this work was received induced Mazzuchelli to undertake the task of compiling a great cyclopaedia of Italian literature and science from the beginnings of Italian civilization. The first two volumes of this work, completing the letter A., appeared at Brescia, in 1758. He lived to publish four additional volumes which carry the work through B. He also wrote: Dizionario Storiche, scientifiche et erudite, containing an account of the meetings of a literary society which was accustomed to assemble at his house. He wrote biographies of Scipio Cæcipe and Giusto de' Conti; and he edited Villani's series of biographies of illustrious Florentines. He left a large collection of ancient manuscripts, medals, and casts, which were engraved and published with a descriptive text by the abbé Pietro Gaetano, at Milan.

MAZZUOLA, Francesco. See Parmigiano, ante.

MEAD, a fermented liquor made from honey. The honey is mixed with water, and fermentation is induced and conducted in the usual manner. Cottagers sometimes use the honey which remains in the combs after the usual processes of dropping and squeezing, for making mead, which is a thin and very brisk, but at the same time luscious beverage. Mead has been in use from very ancient times, and was known equally to the polished nations of southern Europe and the barbarous tribes of more northern regions. Pliny says it has all the bad qualities of wine, but not the good ones. The Latin name is hydromel.

MEAD, Charles Marsh, D.D., b. Vermont, 1836; graduated at Middlebury college, Vt. in 1856, and at Andover theological seminary in 1858. In 1856 he went abroad and studied at German universities until 1866. Returning to Andover he accepted the professorship of Hebrew. He has given two lectures in Boston on Christianity and Skepticism. He was one of the American editors of Lange's commentary on the Bible, and is a member of the Old Testament company of the American committee now (1881) engaged in the revision of the English version.

MEAD, Larkin Goldsmith, b. Chesterfield, N. H., 1835; in the earlier part of his life resided at Brattleboro, Vt. In the year 1852 he began the systematic study of sculpture under Henry K. Brown, of Brooklyn. For this branch of art he had already shown a decided aptitude, and had attracted the attention of many artists by his first attempt in design, the execution in stone of the figure of an angel. His earliest work in marble was a reproduction of this and was called "The Recording Angel." In 1857 he modeled the colossal statue "Vermont," which now crowns the dome of the state-house at Montpelier, the capital. "Ethan Allen," a finely executed figure of Vermont's hero, adorns the same building, and is one of the artist's later works. Mr. Mead spent some time in Italy and particularly in Florence, whence on his return he brought a number of statuettes, such as "Echo," "La Contadina," and the "Mountain Boy." He is an excellent draughtsman, as well as sculptor. The Lincoln monument at Springfield, Ill., was erected from his designs. Among his later works are also the soldiers' monument at St. Johnsbury, Vt., and "Columbus's Last Appeal to Queen Isabella." His sister is the wife of William D. Howells, editor of the Atlantic Magazine.

MEAD, Richard, 1675-1754; b. at Stepney, England, not far from London. At an early age he entered the university at Utrecht, and, after three years' study, went to Leyden, where he entered upon the study of medicine under the noted professors Pitcurn and Herrmann. After taking his degree of doctor of philosophy and physics he returned to Stepney and began the practice of his profession in 1696. In this he soon won the very first place. In 1703 Dr. Mead was made a member of the Royal society, and lecturer at St. Thomas's hospital. Oxford bestowed a diploma upon him, and after long acting as physician to the prince of Wales, was continued in the office on his accession to the throne, as George II. His reputation both as a practitioner and as a writer on medical subjects was very great, and he was in constant correspondence with the most eminent scientists of the day in his own and foreign countries. Most of his publications were written in Latin. Among them were: De Imperfo Sophis et Lino in Corpora Humana et Mortis Inde oriundis, (1702), On Small Pox and Measles, (1748) Moneta et Præcepta Medica, (1751), and many others. His works were translated into English and passed through many editions. In addition to his acquirements as a physician, Dr. Mead devoted much time to the study of natural history, antiquarianism and numismatics. Memoirs of his life were published by Dr. Matthew Maty in 1755, the year after his death.

MEADE, a s.w. co. in Kansas; 720 sq.m.; watered by the Cimmaron river and its branches, and well adapted to grazing.
MEADE, a co. in Kentucky, on the Ohio river, which separates it from Indiana; 560 sq.m.; pop. 9,485; the surface is rolling, the soil fertile; live-stock, tobacco, corn, oats, and wool are the principal products. Capital, Brandenburg.

MEADE, GEORGE GORDON, 1815-72; b. Cadiz, Spain; his parents being temporarily in that country. On their return to America, he was sent to the boys' school in Washington, D. C., at that time under the direction of Salmon P. Chase, afterwards chief justice of the supreme court of the United States. On leaving this school, he was sent to a military school at Mount Airy; and from there, in Sept., 1831, entered the military academy at West Point, where he graduated in the summer of 1835. He entered the army as brevet second lieut., of the third artillery, and at the end of the same year, 1835, received his commission as second lieut.; but on Oct. 26, 1836, he resigned from the army, after having, however, seen some active service in the Florida war, even within his brief military experience. He now adopted the profession of a civil engineer; and between 1837 and 1842, was employed as an assistant engineer in the surveys made by the U. S. government of the delta of the Mississippi, the Texas boundary, and the north-eastern boundary of the United States.

On May 19, 1842, he was reappointed to the army, with the rank of second lieut., of topographical engineers. On the breaking out of the war with Mexico, in May, 1846, when gen. Taylor crossed the Rio Grande, he was ordered to the front, and served throughout the war, being a member of the staff of gen. Taylor, and that of gen. Scott, and distinguishing himself in the battles of Palo Alto, Resaca de la Palma, and Monterey. He was brevetted first lieut., for gallant conduct at Monterey, in the five days' fight which closed Sept. 24, 1846. On his return to the states, the citizens of Philadelphia presented him with a sword. After peace was declared, lieut. Meade was employed in superintending river and harbor improvements, and in the construction of lighthouses on Delaware bay, and off the coast of Florida. He was promoted to be first lieut. in 1851, and capt. in 1856, and had charge of the national survey of the northern lakes until 1861, being at Detroit, Mich., at the period of the outbreak of the rebellion. He was ordered to Washington, and received his commission as brig. gen. of volunteers, bearing date Aug. 31, 1861, with the command of the second brigade of the Pennsylvania reserve corps. He was in the action at Dranesville, Dec. 20, the first victory of the army of the Potomac; was at Mechanicsville, June 26, 1862; at the battle of Cold Harbor, on the following day; and served with his reserves, with which he had become identified, continuing with McClellan throughout the peninsular campaign, in McCall's division, being severely wounded at the battle of Frazier's farm (White Oak Swamp), June 30. He was appointed maj. of topographical engineers, June 18, 1862. On Aug. 29-30 he was engaged in the second battle of Bull Run; and in September took command of a division of the first army corps (gen. Reynolds'), and at the battle of Antietam was slightly wounded and had two horses shot under him. He was given command of the fifth army corps, and on Nov. 29, 1862, was commissioned maj. gen. of volunteers. He was engaged in the battles of Chancellorsville and Fredericksburg; covering the retreat at Chancellorsville with his corps, and guarding the crossings, until the entire army was safely over the river. On June 28, 1863, he was unexpectedly ordered to relieve gen. Hooker of the command of the army of the Potomac. This was the period of Lee's invasion of Pennsylvania, and the union army was marching to intercept it. But Hooker played the game of a third rate officer and forces south again. Portions of Lee's army had reached York, Carlisle, and the Susquehanna; but upon the advance of the federal army, these were called together from their various posts, and by order of gen. Lee, drawn in, and concentrated for a great field struggle. Those which were at Chambersburg crossed the South mountain towards Gettysburg, and those that were nearer the Susquehanna converged upon the same point. This was done by Lee, apparently under the impression that Meade designed to cut off his communications. And had it not been for Meade's maneuver, Lee would have crossed the Susquehanna and struck Harrisburg, and probably even have made a dash at Philadelphia. Gen. Meade now saw that a great battle was inevitable, and at first concluded to receive it at the line of Pipe-clay creek, a small stream running a few miles s.e. of Gettysburg. But on consultation with gen. Hancock, who had been appointed to gen. Reynolds's command (that distinguished officer having been shot), and on the selection of Gettysburg by the latter, as a better ground on which to fight the battle, he made that his choice. [Swinton's 'Army of the Potomac.'] The great battle was fought July 1-3, 1863. See GETTYSBURG. Gen. Meade's commission as brig. gen. in the U. S. army, bore the last of these dates. For the inestimable service which he had accomplished by the victory of Gettysburg, he was publicly thanked by a resolution of congress passed Jan. 28, 1866: "for the skill and heroic valor with which at Gettysburg he repulsed, defeated, and drove back, broken and dispirited, beyond the Rappa-hannock, the veteran army of the rebellion." From May 4, 1864, to April 9, 1865, gen. Meade commanded the army of the Potomac, under gen. Grant, through the disastrous struggle in the Wilderness, and until the capture of Petersburg, and the surrender of Lee. On Aug. 18, 1864, he was commissioned a maj. gen. in the U. S. army. At the close of the war he was placed in command of the military division of the Atlantic, which command he retained from July 1, 1865, to Aug. 6, 1866. During the years 1860-67 he was in command of the department of the e.; and subsequently of the third military
MEADE, RICHARD KIDDER, 1750–1805; b. Virginia, was educated in London at the famous grammar school of Harrow, and, returning to his native state, at the age of 25 he commanded a company in the battle of Great Bridge, near Norfolk, Dec., 1775, the first engagement of the revolutionary war fought on Virginia soil. In 1777 he was promoted to the rank of col., and to the position of aid to gen. Washington, serving in that capacity until 1783. He was a prompt and faithful subordinate, always at hand, and rendered signal service to his country. He was present in an official capacity at the execution of maj. Andre. After the war he lived in retirement on his estate in Clarke county.

MEADE, RICHARD WORSAM, 1778–1828; b. Chester co., Penn.; son of George of Philadelphia, who was noted among his contemporaries for his ardent support of the revolution, in aid of which he contributed very large sums. The subject of this sketch very early in life engaged in the shipping business at Cadiz, Spain, where he sympathized with and assisted the Spanish patriot party, and during the peninsular war imported great quantities of provisions into Cadiz, then in a state of siege. From 1805 to 1816 he occupied the post of commercial agent for the United States, and in the last named year was arrested and imprisoned for two years in the castle of Santa Catalina on charges of conspiracy against the government. On the apprehension of all the U. S. diplomatic agents, he was released; but his business had been completely ruined by his unjustifiable treatment, and a long legal contest for compensation ensued, in which Webster and others of our most eminent lawyers were engaged for him, but unsuccessfully. In this country Mr. Meade engaged in a large importing trade, made a large fortune, and his private art gallery was one of the first collected here by a private individual.

MEADE, WILLIAM, D.D., 1780–1862; b. in what is now Clarke co., Va.; educated at Princeton college, and after graduation in 1805 studied theology. For many years, as a clergyman of the Protestant Episcopal church, he gave his services without any charge; in 1829 he was appointed assistant bishop, and in 1841 bishop of the diocese of the Virginian. It is worthy of note that, at the outbreak of the rebellion, he was earnestly opposed to the secession of his state. His principal literary productions are: Lectures on the Pastoral Office; Letters to Students; Lectures on Family Prayers, and Old Churches, Ministers and Families in Virginia; besides many papers published in church periodicals. An account of his life has been written by Dr. John Johns, who, in 1842, was appointed his assistant in the Virginia bishopric.

MEADOW GRASS, Poa, a genus of grasses, having a loose spreading panicle, the spikelets usually containing a number of florets, and with two glumes shorter than the florets, the florets each having two palea, which are blunter and awnsless, the fruit free. The species are very numerous, chiefly natives of the temperate and colder parts of the world, and forming in these a very important part of the herbage of pastures and meadows. Most of the species are of a slender and delicate appearance, with small spikelets and florets; and the herbage is tender, nutritious, and rather abundant. Of the British species, the Rough-stalked Meadow Grass (P. trivialis) and the Smooth-stalked Meadow Grass (P. pratensis) are among the most common, and are esteemed among the most valuable for sowing in mixtures of grasses for pasture. —The Abyssinian Meadow Grass (P. Abyssinica), an annual species, yields immense returns of herbage in its native country, but a warmer climate than that of Britain seems to be requisite for its successful cultivation. It is called Tee in Abyssinia, and its seeds are used as corn for making bread. Beer is made by putting slices of this bread into warm water, the temperature of which is kept up in a close vessel for some days. —P. annua is an extremely common British species, springing up continually as a weed in cultivated grounds, and abounding on waysides as well as in pastures. It is often to be seen in flower, even in winter, and in summer is said to ripen its seeds in four or five weeks from the time of sowing. It is employed with advantage for sowing on greens in towns, and wherever from any cause perennial grasses are apt to be destroyed. It is very abundant in most parts of Europe. Dr. Hooper found it at one of the most elevated passes of the Himalaya mountains. —Manna grass (q.v.) is closely allied to this genus.

MEADOW LARK, an American bird belonging to the order Insectores, sub-order corvidores, family sturnidae or starlings, genus sturnella, common species, sturnella magna. It is a common bird of the eastern and middle United States, extending s. as far as Texas, inhabiting southern parts in winter, and going as far n. as the St. Lawrence river in the summer. It is a song bird. There is therefore no song鸟s. Returning to the southern flocks in the autumn, but while breeding, are not gregarious. They are beautiful singers, their songs being of the most joyous character and performed when flying high in the air, as well as when skimming over the meadows. Like most of the lark family they build their nests on the ground, among the green tall grass of the meadows. They dive
upon insects and seeds, and are said to sometimes kill smaller birds. Their eggs, from four to five, are white with beautiful reddish brown spots, and are laid in oven-shaped nests. Body robust; legs and claws strong; tail yellow beneath, yellowish with brown bars above, with pointed feathers; whole length of body and tail 9 or 10 in.; back, dark brown, each feather having a brownish white margin and a brown terminal spot; breast and under side yellow, with a beautiful, black, pectoral crescent, convexity downwards; bill about an inch long, and characteristic of the family, although rather more slender than the average. See Lark, ante.

MEADOW MOUSE, an animal belonging to the order of rodents, family muridae (rat family), genus arvicola (voles). There are many kinds of mice. See Mouse, ante. The meadow mouse here designated, the arvicola riparia, is American. It is about 4½ in. in length with a tail about 1¼; feet large and scaly; hair short; eyes small; no thumb on fore foot; color of back darkish brown, varying in depth, ash on belly. Several species are described in the 8th vol. of the Pacific railroad survey. The European species are called campagnole and voles; some of them are aquatic, digging in the marshes and banks of streams.

MEADOWS, a term somewhat indefinitely applied to moist level lands covered with grass, which is usually rich in consequence of the moisture, and often also from advantages of soil. The grass is either used for pasture, or is mown and carried away. Water meadows are meadows in which the supply of water is increased and regulated by artificial irrigation. See Irrigation. The heritage of all meadows consists generally of various kinds of grasses; meadow-grass, rye-grass, timothy, fox-tail, and bent-grass or fium, predominating.

MEADOWS (ante). The propriety of confining the word meadow either to moist or to level lands covered with grass is doubtful, for though moisture is essential to the growth of grass as to all other crops, and level ground is preferable to rugged, no greater moisture or more level surface is required for good meadow land than for good corn land. Marsh hay is made from marsh meadows, both fresh and salt; while timothy and red clover, grown for hay, flourish best in rich soils not particularly moist, and derive the same advantage from deep-till drainage as other field crops. Grasses of the red-top family grow best in soils a little more moist than required for the best growth of timothy. Meadows are more comprehensively defined to be lands growing grasses suitable for hay, whether upland or low land, seeded by hand as on farms, or growing wild on marsh alluviums, or western plains, or mountain valleys. The vast prairies in the basin of the Mississippi were probably the greatest extent of natural meadows in the world. Where these grasses were fed down by cattle they ceased to be meadows and became pasture. The use of mowing-machines has quite revolutionized the labor of cutting hay within the past thirty years, and by their use long reaches of narrow valleys among the drier plains, and still narrower bottoms of defiles in the Rocky mountains, are made to yield hay for the needs of regions where hand labor could not be obtained to do the work. The second mowing of meadows in one season is called the aftermath. The second cut of clover is usually obtained from its second or earlier growth; with land drainage effects meadows and pasture-land are grouped together, and it is one of the beautiful effects of cultivated crops in scenery that their different colors and modes of growth checker a landscape with varieties of light and shade never seen where there is no cultivation. A meadow before the cutting; by the side of one recently cut, makes a contrast as of two different crops, more marked than the contrast between the uncleared meadow and the pasture-field. There is no season of the year when lights and shadows in rural scenery are so charming as just after the harvest, or when the hay cutting is nearly done, and the shadows of trees and clouds are brightly outlined on their shaven stubble.

MEADOW SAFFRON. See Colchicum.

MEADVILLE, a city in n.w. Pennsylvania, incorporated 1866; on the e. bank of French creek at its entrance into the Alleghany river, and on the Atlantic and Great Western railroad; pop. '70, 7,103. It is the terminus of the Franklin branch railroad to Oil City, the center of a fertile agricultural region, well watered, and having a large production; and is a central shipping point, market, and depot for the oil regions. Petroleum oil, lumber, and grain are the chief products of Crawford co., in which it is situated. 100 m. n. of Pittsburg, 36 m. s. of Erie, and 24 m. w. of Titusville. It is the seat of a Unitarian theological seminary, established 1844, with a library of 12,000 vols., and of Alleghany college, a Methodist Episcop al institution, founded 1817, open to both sexes, having a library of 12,000 volumes. It has an elegant court house, 3 hotels, 15 churches, good masonry edifices in hand and some edifices in brick, 2 of them nativities, with a joint capital of $230,000, a public library of 3,000 vols., a state arsenal, 4 newspapers, and an opera house. It has a public park; and Greendale cemetery, pleasantly located and tastefully laid out, is in the immediate vicinity. Its leading industries, which are important, are the manufacture of agricultural implements, carriages, engines, wooden shoes, edge tools, paper, and wooden goods; and it has oil refineries, machine shops, and extensive railroad repair shops.

MEAGHER, a co. in central Montana, having the Missouri river for its w. boundary, drained in the s.e. by the Muscles shell river, an affluent of the Missouri, and in the n.e. by
MEAGHER, THOMAS FRANCIS, 1823-67; b. Waterford, Ireland; educated at the Jesuit college of Clongowes Wood, and Stonyhurst college, Lancashire, Eng. He was a close and earnest student, and in 1842 was awarded the silver medal for English composition, defeating more than fifty English students. On completing his studies he interested himself in Irish politics, and became one of the "Young Ireland" party; and, displaying great oratorical powers, was a very popular leader. On the outbreak of the French revolution in 1848 he was sent to Paris to congratulate the republican leaders. On his return to Ireland he was arrested on a charge of sedition, held to bail, afterwards tried for high treason, found guilty, and sentenced to death; but subsequently the sentence was changed to banishment for life to Van Diemen's Land. He was accordingly transported thither, but escaped in 1852, and succeeded in reaching New York. Here, for two years, he devoted himself to lecturing, with great success. In 1855 he commenced practice at the New York bar; and the following year became the editor of the Irish News. At the beginning of the rebellion in 1861 he organized a company of zouaves, joined the 60th regiment, N. Y. volunteers, was acting maj. at first Bull Run, and after serving the three months of the first call, returned to New York and organized the Irish brigade, being commissioned brig. Gen. Feb. 3, 1862. He was engaged in the six-day battle before Manassas, and at Antietam, being a natural commander, according to McClellan in his report of the latter engagement. At Fredericksburg he was seriously wounded in the leg while charging with his men on Marye's heights, and was incapacitated for further fighting. He resigned temporarily, but was recommissioned in 1864, and held command in Tennessee and Georgia, performing distinguished service. In 1864 he was appointed secretary of Montana territory, and for some time performed the duties of governor in the absence of that official. On July 1, 1867, he fell from the deck of a steamer, at Fort Benton, on the upper Missouri, and was drowned. He was at the time traveling to take measures for the protection of the white settlers in that region, threatened by the Indians. One of his last acts was to contribute to the pages of Harper's Magazine a most entertaining paper entitled "Rides through Montana," and which was designed to be the first of a series. Three weeks before his death he wrote to his publishers as follows: "Ever since I dispatched to you the text of my paper on Montana I have been in the field 260 miles from here against the Sioux and other implacable red devils. The campaigns of the Second American Revolution, the Longest Troubles of the Republic, and the Last Days of the 69th New York Regiment in Virginia. He was a man of brilliant and versatile capacity, and a soldier of unfailing resources and marked personal daring.

MEAL (Sax. mol, a part or portion; Ger. mahl), a portion of food taken at one time, a repast. The number of meals eaten per day has varied at different times and in different countries. Among the Greeks and Romans of the classic ages, it was the general practice to have the principal meal toward evening, a big meal in the morning and another in the middle of the day. The abstraitum, ariston, and deipnon of the Greeks, corresponded nearly to the breakfast, luncheon, and dinner of our own country at the present time; the first was taken immediately after rising in the morning, the second about midday, and the deipnon, the principal meal, often not till after sunset. In Rome of the Augustan age, the three corresponding meals were calefactum, prandium, and cena. The two former were simple and hasty, except among persons of luxurious habits, with whom the midday meal was sometimes of an elaborate description. The cena, taken in the evening, consisted of three courses, with often a great variety of viands. Reclining was the usual posture at meals for the men, the women and children sitting. Two persons, and occasionally three, reclined on one couch. Before a guest took his place at table, his shoes were taken off, and his feet washed by an attendant.

In mediaeval and modern Europe, the prevailing practice, down nearly to the middle of last century, was to have the three meals of the day, the midday and not the evening meal being the principal. The habits of all classes were not uniform; four was a usual hour for rising, and five for breakfast. Twelve was the dinner-hour, when it was the usage in England, down to queen Elizabeth's time, for every table, from that of the twenty-shilling freeholder to the table in the baron's hall and abbey refectory, to be open
to all comers, with free fare, bread, beef, and beer. Supper followed in the evening, a less abundant repetition of dinner. In the course of the last 120 years, a revolution has been going on in the hour of dinner, which has gradually got later till it has reached the present usage of from six to eight in the evening among the more cultivated classes. The introduction of tea and coffee has, to a certain extent, changed our habits as regards meals. They form an essential part of our breakfast, which is later than that of our ancestors, from nine to ten. The meal called tea is but a part of dinner, and supper, as a regular meal, has nearly disappeared. A light meal, called luncheon, is often taken between breakfast and dinner. Our dinner has therefore come nearly to correspond with the supper of our ancestors. This change of hours has brought with it one important change to the better in social habits; the excessive drinking, so common during the Georgian era, even among people of refinement, has disappeared; the long carousals of that period have been abridged to an hour, or half an hour, spent over wine after dinner. In Britain, dinner is, more than anywhere else, made a social meal, and an occasion of meeting one's friends; and public dinners, with toasts and after-dinner speeches, are a characteristic British mode of celebrating any public event or anniversary. In France and Italy, the gradual advance of the dinner-hour has not proceeded further than four or five o'clock. In Germany, the usage still obtains, to a large extent, of an early dinner and a supper. One o'clock is a usual dinner-hour and even the court hour has hardly advanced beyond three and four. In Vienna, and some other parts of Germany, it is not uncommon to have five meals a day—breakfast, luncheon, dinner, tea, and supper.

MEAL. See Bread.

MEAL-TUB PLOT. An attempt at conspiracy which Dangerfield made in 1679 against James duke of York; so called because the paper containing the scheme was hid in a tub of meal in the house of Mrs. Cellier. Dangerfield, having at length admitted that the whole affair was a forgery, was whipped and compelled to stand in the pillory.

MEAL-WORM, the larva of tenebrio molitor, a coleopterous insect of a genus allied to blaps (q.v.), but possessing wings and wing-covers. The perfect insect is of a pitchy or dark chestnut color, smooth, about half an inch long, with short 11-jointed antennae, and stout legs. It is a common insect in Britain, most active in the evening; abounding in granaries, mills, and houses in which considerable stores of meal or flour are kept; as its eggs are deposited among these substances, on which the larva feeds, often doing considerable injury. Stores of ship-biscuit often suffer from this cause. The larva is about an inch long, thin and round, of an ochreous color, with bright rusty bands, very smooth and glossy, with six small feet, and two very short antennae. Another species, T. obscurus, has been introduced with American flour, and has become pretty common in some parts of Britain. The insect is of a dull black color above; the under parts, legs, and antennae, chestnut. The larva is shining and pale brown. - Cleanliness and care are the best preservatives of these pests. Meal-worms are a favorite and excellent food of caged nightingales.

MEALY BUG, Coccus adonidum, an insect naturalized in our hot-houses, and very injurious to pine-apples and other plants. It is reddish, and covered with a white powder substance. See Coccus.

MEAN, in mathematics, is a term interpolated between two terms of a series, and consequently intermediate in magnitude. The geometric mean (q.v.) of two numbers is always less than the arithmetic mean (q.v.), and greater than their harmonic mean; and the geometric mean is itself a geometric mean between the two other "means."

MEANS, Alexander, D.D., LL.D., b. Statesville, Iredell co., N.Y., in 1801; was educated at the academy at Statesville; removed to Georgia in 1822, and after teaching school for four years attended medical lectures at Transylvania university, Ky., and commenced the practice of medicine in Covington, Ga., 1826; the same year was licensed to preach by the Methodist Episcopal church. In 1834 he was appointed to superintend the manual labor school near Covington; was chosen professor of the natural sciences at Emory (now Oxford) college. After a service here of 18 years, he was appointed in 1840 professor of chemistry and pharmacy in the medical college of Georgia, at Augusta, lecturing in winter, and performing his duties as professor in Oxford college 8 months of the year. In 1853 he presided over the masonic female college in Covington; was called to the presidency of Emory college in 1854, and shortly after to a professorship of chemistry in the Atlanta medical college, accepting the latter and retaining it for 13 years. In 1851 he traveled in Europe. In the state convention of 1861 he spoke and voted against secession, but afterwards identified himself with the south. He has held since the war the position of state agricultural chemist at Savannah, retaining at the same time his connection with Emory college. He has published Centennial of Chemistry.

MEARES, John, 1746-1801, b. England; entered the navy in 1776; served against the French in the West India islands; became captain in the merchant service after the peace of 1783; went to India and formed at Calcutta what was called the Northwest America company for opening trade with Russian America. In 1786 he explored a
part of the coast of Alaska; went to China by way of the Sandwich Islands; entered Nootka sound, 1789; examined and took possession of the neighboring coasts in behalf of England, and reached Macao Dec. 5, 1789. He published Voyages made in the years 1788-89 from China to the northwest coast of America, 2 vols.

MEARIM RIVER; in Brazil, called also the Marim and the Maranhao, rises in the n. central part of the province of Maranhao, and follows a general northerly direction, emptying into the bay of Sao Marcos. It has many affluents, of which the most important is the Pindare. Its entire length is about 550 m.; it is navigable, and several steamers ply upon it. The river is specially notable for the tremendous force of its current, which for a long time resists the action of the tide, and is at last overcome with a roaring sound and an exceedingly swift rush upward of the waters.

MEANS. See KINCARDINESHIRE.

MEASLES (known also as Rubeola and Morbilli) is one of the group of blood-diseases termed Eczanhemata (q.v.), although, from the eruption which appears on the surface of the body, it is sometimes classed with the skin-diseases. It is communicable from person to person, and seldom occurs more than once in the same individual. Its period of incubation—that is to say, the time that elapses between exposure to the contagion and the first appearance of the febrile symptoms which precede the eruption—is usually about a fortnight; then come lassitude and shivering, which are soon followed by heat of skin, increased rapidity of the pulse, loss of appetite, and thirst. The respiratory mucous membrane is also affected, and the symptoms are very much the same as those of a severe cold in the head, accompanied with a dry cough, a slight sore throat, and sometimes tightness of the chest.

The eruption which is characteristic of the disease usually appears upon the fourth day from the commencement of the febrile symptoms and the catarrh—seldom earlier, but not unfrequently some days later. It is a rash, consisting at first of minute red papules, which, as they multiply, coalesce into crescentic patches. It is two or three days in coming out, beginning on the face and neck, and gradually traveling downwards. The rash fades in the same order as it occurs; and as it begins to decline three days after its appearance, its whole duration is about a week. The red color gives way to a somewhat yellowish tint, and the cuticle crumbles away in a fine bran-like powder; the process being often attended with considerable itching.

There are two important points in which it differs from small-pox (q.v.), with which in its early stage it may be confounded; these are—1. That the fever does not cease or even abate when the eruption appears, but sometimes increases in intensity; and (2), that the disease is not more severe or more dangerous because the eruption is plentiful or early. The character of the eruption, after the first day, will serve to remove all doubt regarding these two diseases; and the comparative prevalence of either disease in the neighborhood will materially assist in forming the diagnosis. It is distinguished from scarlet fever (q.v.), or scarlatina, (1), by the presence at the outset of catarrhal symptoms, which do not occur in the latter disease, at any rate, prior to the eruption; (2), by the absence of the throat-affected, which always accompanies well-marked cases of scarlet fever; (3), by the character of the rash, which in measles is said to present somewhat the tint of the raspberry, and in scarlet fever, that of a boiled lobster; which in measles appears in crescentic patches, and in scarlet fever is universally diffused; which in measles usually appears on the fourth day, and in scarlet fever on the second day of the disease.

In ordinary uncomplicated measles, the prognosis is almost always favorable. The chief danger is from inflammation of some of the textures that compose the lungs; and in scrofulous children, it often leaves chronic pulmonary mischief behind it. Usage is exempt from the disease, but it is much more common in childhood than subsequently. The reason is probably that most persons have it in early life, and are thus protected from an attack at a later period.

In mild forms of the disease, nothing more is requisite than to keep the patient on a low diet, attend to the state of the bowels, and prevent exposure to cold, which is best accomplished by keeping him in bed with the ordinary warmth to which he is accustomed in health. If the chest symptoms become urgent, they must be treated according to their nature. Bronchitis (q.v.), sometimes extending into pneumonia (q.v.), is most to be feared. If the eruption disappear prematurely, it may sometimes be brought back by placing the patient in a warm bath. In such cases, stimulants are often required, but must, of course, only be given by the advice of the physician. The patient must be carefully protected from exposure to cold for a week or two after the disease has apparently disappeared, as the lungs and mucous coat of the bowels are for some time very susceptible to inflammatory attacks.

MEASURE, in music, is a term applied to the quantity of notes which are placed in the bar, and which is generally called the time, of which there are but two kinds, viz., common time, containing an equal quantity of notes in the bar, and triple time, containing an unequal quantity. Common time is generally marked with a C at the beginning, which means that every bar contains four crotchets, or their value in other notes. There are also other kinds of common time, which are marked ¾, ¼. Triple time is
MEASURE of DAMAGES, the body of rules which governs the amount of pecuniary compensation awarded by courts of justice for violation of personal or property rights. In its most extended sense it might be said to cover almost the whole ground of legal procedure; but is used not to represent inquiry as to what cases require the award of damages, but rather, as to what limit should be placed on the award in certain cases. The rules apply to common law rather than to equity, as the former is, in general, remedial in its nature, and the latter preventive, offering injunctions, specific relief, etc. In early English law the question of damages was left to the jury, while in countries whose jurisprudence is founded on the civil law, the question was left to the discretion of the magistrate; but common law declares that the compensation must be fixed by those legal rules which form the Measure of Damages; though there are such rules as you will see have been extended and disseminated. "The general rule," says Story, "is that whoever does damage to another, is liable in damages to the extent of that injury; it matters not whether it is to the property or person or rights or reputation of another."

But not every loss gives right to legal relief; the injury must be legal. Thus injury to moral sentiments has no remedy. "Suit cannot be sustained by a private individual for a public wrong, as a highway nuisance, unless there be some element of special injury to him. Injury may consist in direct or indirect pecuniary loss, value of time, expenses such as costs and counsel fees, mental suffering and the sense of wrong or insult arising from the intention to vex or annoy. But the law will refuse to give compensation for any of these kinds of injury except direct pecuniary loss and the costs of the suit, unless, indeed, there be present the element of malice and willfulness; or, as has been said, it will divide the loss, discriminating between that which must be borne by the offending party and that which must be borne by the sufferer; but where there is fraud, malice, or gross negligence, a suit for damages will lie for any nip that occurs. The damages may be nominal or substantial; nominal when there is 

...
the usual course in dispossessing from dower land is by action of ejectment, the old writ of dower having fallen in disuse. Without going into details as to the measure of damages in cases of trespass, waste, nuisance, and real covenants, it may be said that with few exceptions the general rule of natural relation and compensation for actual injury governs. In contracts, many and important classes are presented, such as negotiable paper, insurance, sale and warranty of chattels, agency and suretyship. In all these the jury has lost much of the power possessed in former times, and it is well settled that it is for the court to determine the measure of damages and for the jury only to determine the amount under that rule. It is clear that the motives of the contracting parties do not fix the rule, though in breach of promise or negligence the jury may take all facts into consideration, as it is impossible to formulate a law of damages which will cover the peculiar injury. Other exceptions exist; but, where the contract is not unconscionable, it furnishes the measure of damage itself. Contract price is recoverable and actual loss is the basis of compensation, so that quantum meruit applies. With all negotiable paper the measure is easily and arbitrarily fixed by the legal rate of interest. Marine insurance has special laws arising from the nature of the peculiar doctrines of general average and total and partial loss; in fire insurance the actual loss is the measure; while in life insurance no actual loss need be shown by the assignee of a policy. In contracts for the sale of personal property, the vendee after breach of contract by the vendor can, by the usual rule, recover only the difference between the contract price and that on the day fixed for delivery; but it has been held in cases involving stock transactions that the vendee can recover the highest price reached by the stock in the interval. There is no act against the vendor can recover against the vendee for the vendee to receive the goods, even though they are not actually delivered. Warranty of personal property is governed as to damages by the actual value and not the contract price, if there be no fraudulent representations. The principle has been disputed but is now well settled in this country. A surety must pay the claim he guarantees before he can sue his principal, and his damage is measured by the amount, interest, and costs. An agent can be sued by his principal for the whole loss incurred by his negligence, even though not the direct consequence of his act; and in such cases cannot offset his commission. In actions against common carriers indemnity is afforded for actual loss at time of injury; the value of goods destroyed is estimated at the place of destination and interest is reckoned under the law of that state. Where transportation of a passenger is refused, after contract to do so, the injury by loss of time and wages or profits is the measure. But the loss must be actual; thus the rate of wages in the plaintiff's trade at the place of destination was admitted as evidence of probable loss but not to set the measure of damage; and courts have even held that the expenses of an illness following but not caused by railroad detention and prolonging such detention might be included in the damages, so far as they were in excess of what they would have been elsewhere. Where a telegraph company undertook to transmit a message and, by their negligence, plaintiff lost a chance to collect an otherwise worthless debt, the corporation was held to be a common carrier and liable. Other decisions are averse to this doctrine. Dispute on the point is usually avoided by provisions made part of the contract, disclaiming such responsibility. If the company is a common carrier it is, in effect, an insurer, is bound to use more than ordinary care, and liable for consequential damages.

Interest is always allowed when a sum is to be paid at a certain time, the law assuming that legal interest begins at that date; and the courts of this country have been very liberal in inferring that an understanding for interest existed; but if claims are uncertain or unliquidated, interest will not be allowed. A most important distinction exists between liquidated damages and a fixed sum agreed upon as a penalty, as in bonds. In the first case the parties have fixed a sum certain as the measure of damage from breach of contract; but the courts will often refuse to consider the amount as intended to be absolute and will measure the actual loss. The intent of the parties on the point must govern rather than the language. The tendency in this country is to frequently consider a stipulated sum as liquidated damages and but rarely to regard it as a penalty; and the first, especially if there is appearance of usury or oppression; and, if there is nothing to certainly determine the damages outside of the stipulation, they will invariably be considered liquidated. Recoupment and set-off will be allowed even where the demand is not for a liquidated sum.

Vindictive or exemplary damages have already been referred to. The principle applies mainly in cases of tort and very materially enlarges the considerations regarded in fixing the measure of damages. Where there has been maliciousness or fraud or evil intent, the jury may go beyond the principle of compensation and punish defendant by heavier damages. In torts the intent of the wrong-doer is of great moment, and though it may be incongruous that the penalty should be paid to the plaintiff rather than to the state, yet in practice it is the most effective mode of punishment. The rule that the jury may take evil intent into consideration is now well settled both in England and in the United States. In cases of libel and slander the law will often not require the least proof of actual injury, a distinction being drawn between words actionable per se where damage is presumed, and other libels in which actual injury must be set out. The subject of measure of damages will be found treated in detail in works devoted to the special topic by Maine, Field, and Sedgwick, and its application to various branches of
jurisprudence is set forth under many heads in Parsons On Contracts, Greenleaf On Evidence, and Redfield's Railroad Law.

MEASURES. See Weights and Measures, ante; Metric System.

MEAT EXTRACT, a substance of a composition varying with the process employed, extracted from beef or mutton or other animal flesh, and used as an article of diet. The well known common beef tea is made in various ways, and differs greatly in strength. A common method, and perhaps the best when required fresh and condensed, is to put the chopped meat without the addition of any liquid in a bottle and immerse this in a vessel of water at about 180° F. The blood, lymphatic, and muscular juices ooze out of the meat and form a red liquid containing a large amount of soluble nutritious proteine matter. If this is heated to the boiling point, there will be considerable coagulation and the fluid extract will not be so easily digestible. If the meat, on being heated to about 180° F. be pressed, most of the nutrients substances will be expressed, and the extract so obtained, on being evaporated, may be brought to any desirable degree of solidity. This solid extract, by the addition of common salt, can be kept, especially in closed jars, an indefinite length of time, and makes, when mixed with hot water, an excellent beef tea for the sick room. Another method of making beef tea is very common, and in many cases perhaps the best, because it is seldom that it is desirable to have it in too condensed a state. Patients require considerable drink, and this is conveniently given in well-seasoned beef tea, made by heating chopped beef in water to about 180° F. sufficiently long to extract most of the nutritious material. It is more palatable than that extracted by the bottle process, and for food and drink combined is in most cases superior. A portion of the meat may also be boiled and made into a broth, where the patient's stomach is in a condition to digest it readily. The albuminoids are, of course, precipitated by boiling, but the sheddy precipitate may be taken with the clear liquor often with benefit.

MEATH, a maritime co. of the province of Leinster, Ireland, bounded on the e. by the Irish sea and the county of Dublin; area, 906 sq. m., or 547,391 acres, of which 30,006 are arable, about 30,000 waste, bog, etc. Pop. '51, 140,748; '61, 110,575; '71, 95,558, of whom 89,140 are Roman Catholics, 5,826 Protestant Episcopalians, the rest Protestants of other denominations. The surface is for the most part an undulating level, forming the eastern extremity of the great limestone plain of Ireland, and rising slightly towards the n. and north-west. No minerals of any importance are found. The soil is a rich loam, and extremely fertile; but it has long been devoted almost entirely to pasture; the total extent under crops in 1876 being only 140,720 acres. In the same year the cattle amounted to 170,349, the sheep to 217,065, and the pigs to 17,055. The chief rivers are the Boyne and Blackwater. The principal towns are Trim, Navan, and Kells, in the first of which the assizes are held. Meath possesses abundant means of communication, being intersected by numerous roads and several railways, also by the royal canal. The coast-line, about 10 m., has not the importance of stations, the county has an almost wholly agricultural character. The number of children attending the national schools in 1875 was 16,972. Anciently, Meath, which included West Meath, and probably portions of several other adjacent counties, formed one of the kingdoms into which Ireland was divided, the royal seat being the celebrated Temor or "Tara of the kings," the scene of the first preaching of Christianity under St. Patrick. After the English invasion, Meath was early occupied by Strongbow, and was erected into a county palatine by Henry II., who conferred on Hugh de Lacy. From this time forward, it was the scene of many conflicts. In the end of the reign of Henry VIII. it was separated into e. and w. Meath. Few Irish counties present so many interesting relics of Irish antiquities of all the various periods. Celtic remains abound along the Boyne and Blackwater. The earthworks of the ancient royal seat at Tara are still discernible, and some valuable and highly characteristic gold ornaments were there discovered. John's castle at Trim is one of the most extensive monuments of English rule in Ireland. The round tower and sculptured crosses of Kells are singularly interesting; and almost every portion of the county contains some relic of the feudal or ecclesiastical structures which formerly covered the land. Meath returns two members to parliament.

MEAUX, a t. of France, in the department of Seine-et-Marne, on the river Marne, 25 m. e.n.e. of Paris. It is a bishop's see, and its cathedral, begun in the 11th c., is a noble Gothic structure. Bossuet, the famous preacher, was bishop here, and is buried in the choir. Corn and flour from the water-mills on the Marne are sent to Paris in large quantities, and there are manufactures of cotton and other cloths, pottery, leather, salt paper, etc. Pop. '72, 9,528.

MECCA (Om Al Kora, mother of cities), one of the oldest towns of Arabia, the capital of the province of Hedjaz, and, through being the birthplace of Mohammed, the central and most holy city of all Islam. It is situated in 21° 30' n. lat., and 40° 8' e. long., 245 m. s. of Medina, and about 65 m. e. of Jiddah, the well-known port on the Red sea, in a narrow, barren valley, surrounded by bare hills and sandy plains, and watered by the brook Wadi-Al-Tarnafeyn. The city is about 1500 paces long, and about 650 broad, and is divided into the upper and lower city, with about 25 chief quarters. The streets are broad and rather regular, but unpaved; excessively dusty in summer, and muddy in
the rainy season. The houses, three or four stories high, are built of brick or stone, ornamented with paintings, and their windows open on the streets. The rooms are much more handsomely furnished, and altogether a beauty that exceeded in the east; the inhabitants of Meccca making their living chiefly by letting them to the pilgrims (Mehemed HAJI) who flock here to visit the Beith Ulliah (house of God), or chief mosque, containing the kaaba (q.v.). This mosque, capable of holding about 35,000 persons, is surrounded by 19 gates surmounted by seven minarets, and contains several rows of pillars, about 20 ft. high, and about 18 in. in diameter, of marble, granite, porphyry, and common sandstone, which at certain distances are surmounted by small domes. A great number of people are attached to the mosque in some kind of ecclesiastical capacity, as kahibs, muftis, mueddins, etc. No other public place or building, sacred or profane, of any importance is to be found in this city, which also is singularly destitute of trees and verdure of any kind. It is protected by three castellated buildings, and is governed by a sheriff. The population has, in consequence of the rapidly decreasing number of pilgrims, fallen off considerably of late, from above 100,000 to hardly 40,000, who do not find the 100,000 annual pilgrims sufficient to keep them in the state of prosperity of former years. The trade and commerce of Meccca hardly deserve mention; the chief articles manufactured there are chaplets for the pious pilgrims. The townsmen themselves are lively, polished, and frivolous, and growing up amid an immense concourse of strangers from all parts of Asia, are generally able to converse in three or four eastern languages. Respecting the history of Meccca, it was known to Ptolemy already as Maccara, and first belonged to the tribe of the Kosaite, later to the Koreish. Mohammed, who had been obliged to leave it precipitately (see Hedjrah) in 622, returned to it and conquered it in 627. Within the course of the present century, Meccca was taken by the Wahabites (1803), but given up again to the pasha of Egypt, Mehemed Ali (1833), whose son, Ibrahim, was made Sheik El Haram—"of the sacred place." At present, however, Meccca is directly dependent on the sultan.—A certain balm, called balm of Meccca, is made from a plant which grows in abundance in the neighborhood of the city, called besam.

MECCA BALSAM. See Balsam of Balm of Gilead, ante.

MECHAIN, Pierre Francois Andre, 1774-1805; b. France; studied for a time at the school des Ponts et Chaussées, which he was compelled to leave for want of money. He then gave instruction in mathematics, giving all his spare time to the study of astronomy. Soon afterwards he was accidentally brought to the notice of Lalande, who had bought of him an astronomical instrument, which poverty had obliged him to sell. Lalande secured him a place as government hydrographer. In this capacity Mecchain drew up a number of marine charts, and made a survey of a part of the French west coast. He also, in his astronomical studies, calculated the orbits of 24 comets, and discovered 11. The academy of sciences gave him its prize for his paper on the comet of 1530, and in 1782 he was elected to membership of the academy. In 1791 he was employed, at the suggestion of the academy, to measure a portion of the arc of the meridian between Dunkirk and Barcelona, which the national convention had selected to form the basis of their new system of measures. He continued his observations at the Paris observatory after his return from Spain. Under the auspices of the French board of longitude he went once more to Spain to continue his measurements of the arc of the meridian, but he was taken ill soon after his arrival and died at Castellon. His publications were not numerous; they are papers chiefly on eclipses and the theory of comets, contributed to the Transactions of the academy of sciences, and to the Connaissance du Temps of which he was at one time editor.

MECHANICAL CALCULATION. See Calculating Machine, ante.

MECHANICAL POWERS—MACHINES. Machines are instruments interposed between the moving power and the resistance, with a view of changing the direction of the force, or otherwise modifying it. Machines are of various degrees of complexity, but the simple parts, or elements of which they are all composed, are reducible to a very few. These elementary machines are called the Mechanical Powers, and are usually reckoned as six in number, three being primary—viz., the lever, inclined plane, and pulley; and three secondary, or derived from the others—viz., the screw, wedge, and the screw. The inclined plane, the lever, and the screw are (both derived from the inclined plane). To these some add toothed-wheels. What is special to each machine will be found under its name; a few observations applicable to all may appropriately be made here. 1. In treating of the theory of the lever and other mechanical powers, the question really examined is, not what power is necessary to move a certain weight, but what power is necessary to balance it; what force at P, for instance (see Lever, fig. 1), will just keep W suspended. This once done, it is obvious that the least additional force to P will suffice to begin motion. 2. In pure theoretical mechanics, it is assumed that the machines are without weight. A lever, for instance, is supposed to be a mere rigid line; it is also supposed to be perfectly rigid, not bending or altering its form under any pressure. The motion of the machine is also supposed to be without friction. In practical mechanics, the weight of the machine, the yielding of its parts, and the resistance of friction, have to be taken into account. 3. When the effect of a machine is to make a force overcome a resistance greater than itself, it is said to give a mechanical advantage. A machine,
however, never actually increases power—for that would be to create work or energy, a thing now known to be as impossible as to create matter. What is gained in one way by a machine is always lost in another. One lb. at the long end of a lever will lift 10 lbs. at the short end, if the arms are rightly proportioned; but to lift the 10 lbs. through 1 ft., it must descend 10 feet. The two weights, when thus in motion, have equal momenta; the moving mass multiplied into its velocity, is equal to the resisting mass multiplied into its velocity. When the lever seems to multiply force, it only concentrates or accumulates the exertions of the force. The descending 1 lb. weight, in the case above supposed, may be conceived as making 10 distinct exertions of its force, each through a space of a foot; and all these are concentrated in the raising of the 10 lb. weight through 1 foot. The principle thus illustrated in the case of the lever holds good of all the other mechanical powers. 4. The object of a machine is not always to increase force or energy; it is as often to gain velocity at the expense of force. See Levers. In a spinning-factory, e.g., the object of the train of machinery is to distribute the slowly-working force of a powerful water-wheel or other prime mover, among a multitude of terminal parts moving rapidly, but having little resistance to overcome. 5. The mechanical advantage of a compound machine is theoretically equal to the product of the separate mechanical advantages of the simple machines composing it; but in applying machines to do work, allowance must be made for the inertia of the materials composing them, the flexure of parts subjected to strains, and the friction which increases rapidly with the complexity of the parts; and these considerations make it desirable that a machine should consist of as few parts as are consistent with the work it has to do. 6. The forces or "moving powers" by which machines are driven are the muscular strength of men and animals, wind, water, electrical and magnetic attractions, steam, etc.; and the grand object in the construction of machines is, how, with a given amount of impelling power, to get the greatest amount of work of the kind required. See Work. Force, Power. This gives rise to a multitude of problems, some more or less general, others relating more especially to particular cases—problems, the investigation of which constitutes the science of applied mechanics. One of the questions of most general application is the following: If the resistance to a machine were gradually reduced to zero, its velocity would be constantly accelerated until it attained a maximum, which would be when the point to which the impelling force was applied was moving at the same rate as the impelling force itself (e.g., the piston-rod of a steam-engine) would move if unresisted. If, on the other hand, the resistance were increased to a certain point, the machine would come to a stand. Now the problem is, between these two extremes to find the rate at which the greatest effect or amount of work is got from the same amount of driving power. The investigation would be out of place here, but the result is that the greatest effect is produced when the velocity of the point of application is one-third of the maximum velocity above spoken of. The moving force and the resistance should therefore be so adjusted as to produce this velocity.

MECHANICS is the science which treats of the nature of forces and of their action on bodies, either directly or by the agency of machinery. The nature of force will be found treated of under Force. The action of forces on bodies may be in the form of pressure or of impulse, and may or may not produce motion. When the forces are so balanced as to preserve the body affected by them in a state of equilibrium their actions are investigated in that branch of mechanics called Statics (q.v.); when motion is produced, they are considered under the head of Dynamics (q.v.) or Kinetics. The equilibrium and motion of fluids (including liquids and gases) is treated in the subordinate branches of Hydrostatics and Hydrodynamics; though the special terms Aerostatics and Aerodynamics (for which the comprehensive term Pneumatics is often used) are sometimes employed to designate those portions of the science of mechanics in which the action of gaseous bodies is treated of.

The science of mechanics owes very little to the ancient philosophers. They were acquainted with the conditions of equilibrium on the lever—discovered by Archimedes—and had reduced the theory of all the mechanical powers, except the pulley and the inclined plane and its derivatives, to that of the lever, but this was nearly all. Archimedes, starting from the principle of equilibrium on the lever, struck out the idea of a center of gravity for every body, and investigated the position of that point for the triangle, parallelogram, and paraboloid. Till the 16th c. the science remained stationary; Cardan, the marquis Ubaldi, and Stevinus—who was the first to give the correct theory of equilibrium on the inclined plane—then gave it a slight impetus, and the labors of Galileo, who introduced the expression of mechanical propositions in mathematical formulas, discovered the laws regulating the motion of falling bodies, and originated investigations concerning the strength of materials, placed the science on a broad and substantial basis. Torricelli, Descartes, Pascal, Fermat, Roberval, and Huygens, on the continent, and Wallis and Wren in England—the last three of whom simultaneously discovered the laws which regulate the collision of bodies—added each his quota to the new science, as mechanics was then called. In 1687 appeared Newton's Principia, in which the complete experimental basis of the subject was first laid down in a satisfactory manner, and the mechanical principles, which had before been considered to act only at the surface of the earth, were shown to rule and direct the motions of the planets.
Contemporary with Newton were Leibnitz and the two elder Bernouillis, James and John, who, besides contributing greatly to the advancement of the science, applied to it the newly-invented differential calculus, which was found to be a weapon of immense power. From this time a constant succession of illustrious men have prosecuted the study of theoretical mechanics, or of subjects connected with it. The chief names are Daniel Bernouilli, Euler, D'Alembert, Clairaut, Lagrange, Laplace. Lagrange's Mécanique Analytique not only systematized the subject but enormously increased its power and the range of its applications. The last great additions to the science are those made by Sir W. R. Hamilton (q.v.) under the name of the principle of varying action. The developments which this has received from Jacobi, Boole, Cayley, Liouville, Donkin, Bour, etc., form an extensive and difficult branch of applied mathematics, chiefly of the theory of simultaneous differential equations.

MECHANICS. Animal. A moment's reflection shows that this subject is exhaustless, the application of forces and the variation in the mechanism being infinite, and this, without embracing molecular mechanics or kinematics, which would necessarily be involved in a minute study of the action of the nervous system. We must, therefore, content ourselves with a few brief general illustrations of the more obvious vital mechanical movements. The simplest examples are the hydromechanics of some of the lower infusoria, where the animal is propelled through its native element by the reaction of water forced out of a single orifice by the contraction of the simple cell which forms the body. Some of these minute animals have cilia which also serve as locomotive organs. Other hollow animals of a higher organization propel themselves through water in a similar manner, as those belonging to the sub-kingdom ccelenterata (q.v. in art. Invertebrata; Ctenophora). These animals are also provided with filamentary tentacles which have contractile properties, and the power of forming hooks or prehensile organs. The mechanism of the circulation in the euclype, a coelenterate resembling the well-known phylum Ctenophora is exceedingly interesting. It consists of a complex canal system, the tubular branches of which are lined by a ciliated endoderm for the purpose of keeping up within them the circulation of water. These animals, although no doubt assisted by the contractions of the body cavity, are propelled by certain organs called ctenophores, or parallel rows of cilia, which are arranged in comb-like plates longitudinally upon their globular or oval bodies. Some infusorial animals, as the rotifera or wheel animals, included in a higher sub-kingdom (annulosa), possess a highly mechanical organization, approaching somewhat, in that respect, the insects. The characteristic wheel organ consists of a retractile disk carrying numerous cilia which, by their successive rapid vibrations, produce the illusory appearance of a rotating wheel. The motions are regarded as having an action similar to that of a screw propeller, and as aiding in locomotion as well as serving to throw currents of water into the mouth. All the movements in these soft-bodied animals involve as complex mechanical principles as those which are exhibited in the action of muscles and tendons upon framework which serve as levers in the higher animals. The locomotion of fishes involves similar applications of force in the oblique manner in which the sides and tail fin are brought to act against the water in which they swim, and also in the position of the pectoral and other fins, which give direction, and are not—with the exception of the dorsal and caudal fins—organs of propulsion in ordinary swimming, as is sometimes supposed. When a fish is comparatively quiet he may change his position by the action of all the fins, and a backward motion is often produced by a paddle action of the pectoral and ventral fins. The oblique action of the sides of a fish against the water is of the same nature as that of a ship when tacking against the wind, or of the paddles of a screw propeller, or of an oar in sculling, or of a serpent in running through grass, and involves mathematical elements of all orders, from the simplest to the most complex.

The attempted solutions of the application of force in the locomotion of fishes, which represent the whole of the tail and latter part of the body as moving alternately from side to side, and producing alternate periods of retarding and of forward action, are founded upon erroneous views. No fish, not even the clumsiest, propels itself in accordance with such crude mechanical principles. The longitudinal line of the latter part of the body presents a number (depending upon the form and flexibility of the fish) of serpentine curves, of more or less depth, whose combined action produces (in the most rapid motions) an almost uniform forward propelling force, and in one direction, except when the fish curves its body for the purpose of turning, or altering its course. The body and tail fin do not oscillate in one curve, but the fin is always applied to the water in a direction which tends to propel the body forward, and its suppleness and flexibility are qualities given to it for this purpose. The complex mechanism displayed in the higher animals and in man is all the more interesting because of its involving the simpler principles of the mechanical powers, particularly the lever and pulley, as well as those of oblique action in fishes, which includes in its elements the principle of the inclined plane. The former include the propellers, the submerged wheels underneath, the frames underground, they do, constant variation of direction, present, however, equally difficult mathematical problems if it is required to estimate the expenditure of power. The apparatus for mastication and deglutition in various classes of animals furnishes one of the most complex subjects of investigation, one, indeed, whose elements are, in their anal results,
Mechanicsburg.

Mecklenburg.

644

insolvable, on account of the constantly variable condition, quality, and quantity of food, involving, as it does, constantly varying applications of muscular force, and constantly varying capacity and form of the mouth and pharynx. Most of the movements are produced automatically, but the perfect adaptation of the mechanism to the required functions is none the less wonderful. The masticating apparatus in various animals is as various as the animals themselves, and one is adapted to the other so perfectly that many have adopted the idea that the development of the organism must have kept pace with the development of an appetite, or a change of circumstances. It is maintained by others, however, that there are facts in anatomy which render such progressive development hypotheses improbable; as, for instance, the arrangement of the superior oblique muscle of the eye-ball. One end of this muscle is attached to a part of the sphenoid bone below the bottom of the orbit; one then passes forwards to a cartilaginous ring on the pulley which is attached to the frontal bone at the inner angle of the orbit, and becoming a rounded tendon it passes through this pulley and is then turned backward, becoming again muscular. It then expands into a broad band which is inserted into the sclerotic coat of the posterior and outer surface of the eye-ball. It is difficult to imagine how the force of an impending function, or any physiological want, could cause the development of such a piece of apparatus. It is so much of a contrivance, to all appearances, that the elements of design and of immediate creation cannot well be denied recognition. The internal mechanism of the eye-ball is held to afford as much evidence of design as that furnished by the superior oblique muscle. For the purpose of accommodating the eye to vision at different distances, among other provisions, the degree of convexity of the crystalline lens requires to be constantly changed. This is effected by the ciliary muscle, a circular organ situated at the outer border of the iris and at the junction of the cornea with the sclerotic coat. As examples of the "mechanical points" in the mechanism of the human body, we find the fulcrum and pulley in the arrangement of the superior oblique muscle of the eye, instanced above; the first kind of lever, that where the fulcrum is between the resistance and power, in the support of the head upon the axis (the upper cervical vertebra) and the depression of the occiput and elevation of the face by the contraction of the extensor muscles of the neck, and also in the arm when the extensor muscles act upon the olecranon process of the ulna. See Skeleton. The arm also affords an example of the third kind of lever when acted upon by the flexor muscles, the power being applied between the hand and elbow joint, which is the fulcrum. The raising of the body upon the toes is usually instanced as an example of the second kind of lever. It is evident, however, that if a person lies upon the back and places his toes against a resisting, but movable, object, and pushes it away, he will virtually be performing the same mechanical operation, as far as the foot is concerned, as when rising upon his toes, and the relations of the toe, the anké joint, and the heel will be precisely the same; that is to say, the ankle joint will be the fulcrum, the application of the toe will be at the point of resistance, and the power will be applied by the tendo-achilles at the heel. In raising one's self upon the toes, therefore, the ankle joint is in reality a movable fulcrum. Moreover, the first and second kinds of lever are convertible into each other by making the resistance in the first kind stationary and causing the fulcrum to move. One of the most celebrated and elegant essays upon animal mechanism is the Bridgewater treatise for 1834, by Sir Charles Bell, on The Hand, its Mechanism and Vital Endowments as Evincing Design. The mechanical contrivance known as the toggle joint, sometimes spoken of as one of the mechanical powers, but which acts upon the principle of the inclined plane, is exemplified in the knee joint. When the knees are considerably bent it is difficult to raise a heavy weight, but as the legs become straighter the power over resistance becomes enormous. Of course the toggle, or knee joint, in this instance is moved by the application of muscles and tendons to levers whose arms (thighs and legs) are also the arms of the toggle joint. In reality the operation of raising the body from a sitting posture combines the principles of two such levers, the knee and inclined plane, the hip forming a toggle joint as well as the knee. See Toggle, Joint.

The mechanics of aerial motion in birds furnishes one of the most interesting subjects of philosophical inquiry and physical research, and has been ably treated by the present duke of Argyle in a work called "The Reign of Law." See also in this cyclopædia the article on Birds. An examination of the anatomy of a bird is a source of never-ending admiration to the student of natural history. It reveals the most perfect adaptation of means to results—and results, too, which would seem impossible if one had never witnessed the phenomenon of aerial flight. To watch a bird—like one of the larger sea-gulls, poise itself without flapping its wings for a quarter of an hour or more, and when the wind is blowing, for an indefinite space of time, or as long as the bird can be seen, without descending from its altitude of several thousand feet, but floating aloft like a kite held by a cord, now rising with majestic motion, and now darting obliquely downward with immense speed—is one of the most fascinating of recreations. Scarcely less wonderful is the flight of insects, and perhaps none of the class possesses the power in greater perfection than the common fly. See Flying, Ant, and Insects, Ante.

MECHANICSBURG, a t. in s. Pennsylvania, incorporated 1826; in Cumberland co. in close proximity to the iron region, at the junction of the Cumberland valley railroad
and the Dillsburg branch; pop. '70, 2,599. It is 8 m. s.w. of Harrisburg, and 10 m. e. of Carlisle. It is the seat of the Cumberland Valley institute and the Irving college for women, and has excellent educational advantages in free schools, and a public library. It is lighted with gas and has an abundant water supply, and 5 hotels. Its industries are represented by manufactories of sashes and doors, paper mills, foundries, and spoke and bending works. It has a variety of stores, is the shipping point for iron ore, and a depot for supplies for the iron region.

MECHANICSVILLE, Battle of, fought at the village of that name in Henrico co., Va., June 26, 1862. The battle-ground is within 7 m. of Richmond, and the intervening country was held by the confederates, commanded by gen. Lee in person, with his forces strongly concentrated immediately about the capital. Mechanicsville was occupied by the advance of the federal troops—a regiment of infantry and a battery. On the afternoon of the 26th the movement was begun by the confederate gen. A. P. Hill crossing the Chickahominy and advancing on the federals, who retired about a mile to a strongly intrenched position held by gen. Fitz John Porter, on the left bank of Beaver Dam creek. This movement uncovered the Mechanicsville bridge, and enabled gens. Longstreet and D. H. Hill to cross the river and march down its left bank with the design to attack the federal communications with the York river. But the federal position was discovered to be stronger than had been anticipated by gen. Lee when he made his plans; and the confederates found themselves exposed to a galling fire of artillery and musketry, the approaches to their line of battle being over open fields swept by their batteries. Continued assaults being unsuccessful, the confederates were forced to retire, with a loss of between 3,000 and 4,000; the federal loss being under 400, and only a portion of their force engaged. On the arrival of Stonewall Jackson the next day, the federal position was abandoned.

MECHERINO. See BECCAFUMI, DOMENICO.

MECHI, John Joseph, b. London, 1802; of Italian descent; became in youth a clerk in a mercantile house, and in 1827 set up business for himself and opened a cutler's shop. Having obtained a patent for a "magic razor stop," he acquired a fortune from its sale, and in 1840 bought a farm of 170 acres at Tiptree Heath, Essex, making experiments in scientific agriculture. He was ridiculed for his experiments, but by deep draining, steam ploughing, and by liquid manures conveyed through subterraneous pipes, he made his farm before sterile very fertile and profitable, and indeed one of the notable farms in England. He has been an alderman and sheriff of London, and was a commissioner to the Paris exhibition of 1855. He has published Letters on Agricultural Improvements; Experiments in Drainage; How to Farm Profitably.

MECHITARISTS, a congregation of Armenian Christians, who reside on the island of San Lazaro at Venice, but who have also obtained a footing in France, Austria, Turkey, Russia, etc. They derive their name from Mechtar (i.e., the Comforter) da Petro (born 1675, died 1749), who, in 1701, founded at Constantinople a religious society for the purpose of diffusing a knowledge of the old Armenian language and literature. Subsequently, the Mechitarists removed to the Morea, and thence, on the conquest of that portion of Greece by the Turks in 1715, to San Lazaro, which was granted to them by the Venetian government. The Mechitarists acknowledge the supremacy of the Roman pontiff. Their most useful occupation is printing the classic writings of Armenian literature; their additions are universally admitted to be the best and most correct. They also issue a journal, which is much read throughout the Levant. —Compare Boné, Le congo de St. Lazare à Venise, ou Histoire succincte de l'Ordre des Méchitaristes Arméniens (Paris, 1837).

MECHLIN. See MALINES.

MECKEL'S GANGLION, or Sphenopalatine Ganglion, the largest of the four sympathetic ganglia situated in the cephalic region, the others being the ophthalmic (q.v.), the otic (q.v.), and the sub-maxillary (q.v.). It lies in the sphenoidal fossa, close to the sphenopalatine foramen. It is triangular or heart-shaped, of a reddish gray color, and was first described by Meckel. It is connected with the superior maxillary nerve, which is a branch of the fifth cranial nerve (sensory), with the seventh cranial nerve, called the facial (motor), and with the carotic plexus (sympathetic) through the vidian nerve. Its branches are divided into four groups: 1. Ascending, passing to the orbit of the eye; 2. Descending, passing to the palate; 3. Internal, passing to the nose; 4. Posterior, passing to the pharynx.

MECKLEBURG, a co. in s.w. part of North Carolina, bordering at the s. on South Carolina, and w. on Catawba river: 650 sq.m.; pop. '70, 24,290, since considerably increased. The surface is hilly, and there are large forests, but a great part of the soil is productive—cotton, grass, and Indian corn being the staples. Granite and gold are found; the amount of the latter obtained in a year, according to the census of 1870, is over $60,000. At Charlotte, situated almost exactly in the center of the county, several important railroads form a junction. These are the Atlanta and Charlotte (part of the Piedmont air line), Charlotte, Columbia and Augusta, Atlantic, Tennessee and Ohio, and the North Carolina railroads. At the outbreak of the war of independence, the inhabitants of this region distinguished themselves for their ardent patriotism, and as being the
first community in the country formally to renounce allegiance to the British crown, which they did in May, 1775.

MECKLENBURG, a co. in s. central Virginia, bounded on the s. by North Carolina; drained by the Meche river, which forms its n. boundary, and also by the Roanoke: 630 sq.m., pop. 80, 24,611. The surface is rolling and broken, but remarkably fertile. The chief products are tobacco, Indian corn, and wheat. Of tobacco there were over 2,000,000 lbs. raised in 1870. Granite quarries are found in the district. It is intersected by the Roanoke Valley railroad. Capital, Boydton.

MECKLENBURG DECLARATION OF INDEPENDENCE. This is a document sufficiently near in tenor to the declaration of the continental congress to warrant the people of North Carolina in claiming priority of action; but that action was by only one colony, indeed, by the citizens of one county—the other by all the colonies in perfect harmony. The statement generally accepted in the state is that at a public meeting in Charlotte, Mecklenburg co., held May 20, 1775, a series of resolutions was adopted, and a copy is produced. Other accounts date the meeting May 31. The tenor of the resolutions is in harmony with the declaration of July 4, 1776; but that must have been true of all public declarations of the people then in rebellion.

MECKLENBURG-SCHWERIN, a grand duchy of northern Germany, bounded on the n. by the Baltic, e. by Pomerania, s. by Brandenburg, and w. by Lausenburg. The area is about 5,130 sq.m., and the pop. 75, 533,744. Mecklenburg-Schwerin is watered by several rivers, the most important of which are the Elbe and the Warnow, and has a great many lakes and ponds, yielding an abundant supply of fish. The country is generally flat, although here and there intersected by low ranges of hills, and its surface is still extensively covered with wood, notwithstanding the great clearings which have been made in the forests during the last century. True-to-the-land, morass cover large areas; but on the whole the soil is of a good quality, and well adapted for the growth of corn or the rearing of cattle, which constitute the principal native industry. There is considerable commerce through Warnemünde (Rostock) and Wismar; there were in 1875, belonging to the two ports, 426 vessels, with a burden of 113,656 tons. The grand duchy is divided into the circles of Schwerin, Güstrow, Rostock, and Wismar. The capital is Schwerin. The central and s.e. districts are the most densely peopled. The people of both the Mecklenburg duchies (Schwerin and Strelitz) are for the most part of Slavonic origin, but amalgamation with their Saxon neighbors has largely Germanized the original race. The predominant form of religion is the Lutheran, Roman Catholic and other churches numbering about 1100, while there are upwards of 3,000 Jews. Much has been done of late years in extending the educational organization of both duchies, although the lower classes do not yet enjoy as many advantages as in some other districts of Germany. Besides the university at Rostock (q.v.), there are five gymnasia, and numerous burgler, parochial, and other schools. The troops of Mecklenburg-Schwerin number in time of peace 2,700 men, and when on a war-footing, 5,380 men. The principal towns are the capital Schwerin, Ludwigslust, Rostock, Güstrow, and Wismar. The grand duke, whose powers are limited by a mixed feudal and constitutional form of government, has the title of royal highness, and is styled prince of the Wends, and of Schwerin and Ratzeburg, count of Schwerin, and lord of Rostock, Stargard, etc. The two Mecklenburg duchies have provincial estates in common, which meet once a year, alternately at Malchin and Sternberg. This united chamber consists of 684 landowners and the representatives of 47 provincial boroughs, while the country people have no representation. There is no general budget for Mecklenburg-Schwerin: there are three entirely distinct systems of finance. The budget of the first system, called the administration of the sovereign, is estimated at about 12,000,000 marks; the second, the states administration, has but small resources to dispose of; the ordinary budget of the common administration of the sovereign and the states was for 1876-77, about 2,000,000 marks. The public debt is upwards of 43,000,000 marks. Mecklenburg-Schwerin has two votes in the federal council, and six representatives in the imperial diet.

History.—The Mecklenburg territory, anciently occupied by Germanic, and afterward by Slavonic tribes, was finally subdued, in the 12th c., by Henry the lion, duke of Saxony, who, after thoroughly devastating the country, and compelling the small number of inhabitants remaining after the war to adopt Christianity, restored the greater part of the territory to the crown, the title of the slavonic prince Niklot, and gave him his daughter in marriage. The country at that period received its present designation from its principal settlement, Millinburg, now a village between Wismar and Brühl. In 1349 it was elevated into a duchy by the emperor Charles. Duke Johann Albrecht introduced the Protestant doctrines in 1530, and his grandsons, Wolf-Friedrich and Johann Albrecht, founded the lines of Mecklenburg-Schwerin and Mecklenburg-Strelitz. The duchy has been, like the other duchies of the empire, in consequence of their adhesion to the Protestant cause, when the imperial gen. Wallenstein was proclaimed duke of all Mecklenburg. In 1632 Gustavus Adolphus of Sweden restored his kinsmen, the deposed dukes, to their domains. After various subdivisions of the duchy into the branches of Schwerin, Strelitz, and others, and the successive extinction of several of these collateral houses, the imperial commission, which met at Hamburg in
1701, brought about the settlement of a family compact, by which it was arranged that Schwein and Güstrow should form one duchy, and Strelitz, with Ratzeburg and Stargard, Mirow and Nemerow, another independent sovereignty. After this, very few events of importance occurred till the accession in Schwein, in 1785, of Friedrich Franz, who obtained the title of grand duke in 1813, and died in 1857, after a long reign, which he had made highly conducive to the internal welfare and external reputation of his hereditary dominions. The reign of Friedrich Franz II., who succeeded his father, Paul Friedrich, in 1842, was disturbed by a contest between the nobles and the burgher and equestrian landowners, the former arrogating to themselves the exclusive right of electing members into the equestrian order, nominating to benefices, and monopolizing other prerogatives of the ancient feudal nobility. The revolutionary excitement of 1848 gave a fresh stimulus to the popular ferment, and the disturbances could only be quelled by the intervention of Prussian troops. Both as members of the north German confederation and of the empire, the two duchies have maintained their internal constitution very much on the old footing.

MECKLENBURG-STRELITZ, a grand duchy of Germany, composed of two distinct portions of territory, viz., Stargard (by far the larger division, lying to the e. of Mecklenburg-Schwerin) and the principality of Ratzeburg (between Mecklenburg-Schwerin and Lauenburg), and comprising an area of rather more than 1000 sq.m., with a pop. of 95,673. The country is flat, and similar in its physical characters to Schwein, although, from its greater distance from the sea, the climate is less humid and less changeable. Strelitz, as already observed, has one joint representative chamber with Schwein, but the lordship of Ratzeburg is not included in these estates, and is governed directly by the grand duke, who possesses very considerable private domains, from which he draws large revenues. The grand duke gave Ratzeburg a representative constitution in 1812. Mecklenburg-Strelitz has one vote in the federal council of the empire, and one representative in the diet. Mecklenburg-Strelitz has a debt of nearly 2,000,000 thalers. For the history of Mecklenburg-Strelitz, see preceding article.

The Mecklenburg duchies are essentially agricultural, 71 per cent of the inhabitants being employed on the land. In Mecklenburg-Schwerin 3,549 sq.m., and in Mecklenburg-Strelitz 760 sq.m. are under cultivation. The cattle of the duchies are considered the best in Germany; the horses especially are held in high esteem. The principal products are corn (which is exported to Scandinavian and British ports), cattle and sheep (which are sent to the markets of Hamburg and Berlin), wool, tobacco, butter, cheese, fish, fruit, hides, etc. The matricular contribution of both duchies towards imperial expenditure amounted in 1876 to 890,960 marks, the share of Mecklenburg-Strelitz being 132,364.

MECONIC ACID (C₄H₁₀O₆·3H₂O·6Aq), (from Gr. mécon, a poppy), an acid existing in opium, which, when good, yields from 6 to 8 per cent. of it. Both the acid and its salts assume a characteristic blood-red tint with persalts of iron, and this test, which is very sensitive, is employed by the toxicologist in searching for traces of opium. As, however, the alkaline sulphocyanides which exist normally in the saliva give a precisely similar tint with the persalts of iron, it is necessary to be able to distinguish the meconate of iron from the sulphocyanide of iron. A solution of terchloride of gold or of corrosive sublimate removes all doubt, by discharging the color of the sulphocyanide, but not affecting the color of the meconate of iron.

MECONIUM. This term is applied to the earliest matter discharged from the bowels of a newborn infant. It is of a brownish-green or almost black color, acid to test-paper, but devoid of odor, and rapidly putrefying on exposure to air. It is usually regarded as a product of the fetal liver, but, according to Lehmann, it contains neither biliary acids nor bile-pigment. When examined under the microscope, it is found to consist of an abundant of cylinder epithelium of a beautiful green tint, of mucus-corpseles, and of fat, with which there is a good deal of cholesterine.

MECOS'TA, a co. in w. Michigan, intersected by the Grand Rapids and Indiana railroad, and a branch of the Chicago and West Michigan, terminating at Big Rapids; 576 sq.m.; pop. 80, 19,375—10,479 of American birth, 317 colored. It is drained by the Muskegon and Chippewa rivers. Its surface is generally level, and extensively covered with forests of oak and pine, furnishing good building timber, with groves of sugar maple. Its soil is fertile and well adapted to wheat, other kinds of grain, and dairy products. Some attention is paid to the raising of stock. The Muskegon river supplies extensive water-power, and its leading industries are the manufacture of lumber, shingles, furniture, etc. Co. seat, Big Rapids.

MEDAL (Fr. médaille, Lat. metalbum), a piece of metal in the form of a coin, not issued or circulated as money, but stamped with a figure or device to preserve the portrait of some eminent person, or the memory of some illustrious action or event. The study of medals, interesting in an historical and antiquarian point of view, is also important as illustrating the contemporary state of art. Like coins, medals belong to two periods, ancient and modern, separated by a wide interval. To the former belong those pieces issuing from the mint of ancient Rome, known as medallions, of the size of the aureus in gold, of the denarius in silver, and of the first or large brass in copper. They are gener-
ally supposed to have been struck on occasions similar to those on which medals are coined in modern times, on the accession of an emperor, or on the achievement of an instance of victory, in order to show the greatness of workmanship; but there are circumstances which counterbalance the belief that they were circulated as money. Medallions prior to the time of Hadrian are rare and of great value; one of the most beautiful and most famous being a gold medallion of Augustus Caesar; from Hadrian to the close of the empire they are comparatively common. Of the Roman medallions, some were struck by order of the emperors, some by the senate; the latter may be known by being inscribed with the letters S. C. The larger bronze medallions are of admirable workmanship. In some of them a ring of bronze surrounds a center of copper, and the inscription extends over both metals. No portrait of a person not princely occurs on any ancient medal, a remarkable circumstance, considering the numerous contemporary statues of poets, historians, and philosophers. The *conformiae* are bronze medals marked with furrows (*con­torni*), distributed at the public games, and apparently also in use as money. Numerous medals and medallions were struck in the Greek provinces of the Roman empire, of less substance and thickness, for the most part, than those of Rome. The Sicilian medals are of very fine workmanship, particularly one with a head of Ceres, and on the reverse a Victory crowning a figure in a car.

Modern medals begin in the 14th c., but few were struck prior to the 15th. Portraits of non-princely persons are freely introduced after the 16th century. An affectation of the classical takes from their value as illustrations of contemporary life. Most European countries possess a succession of medals from the 15th c. onwards. The best in point of design of the 15th c. medals are those wrought by Victor Pisani of Verona, and inscribed "Opus Pisani Pictoris." The medals of the popes form an unbroken series from the time of Paul II., who filled the papal chair from 1464 to 1471. Those that purport to be of earlier popes are all known to be, in point of fact, of later date. The reverse generally bears the cross-keys and mitre, and the obverse the head of the reigning pope. Some of the medals of Julius II., Leo X., and Clement VII. have an especial value, as having been designed by Raphael and Giulio Romano, and engraved by Ben­venuto Cellini. A 16th c. medal of Sicily is probably the first instance in modern times of the use of a medal as a vehicle of political satire: it is directed by Frederick II., against his adversary, Ferdinand of Spain, whose head is on the obverse, with the inscription, "Ferdinandus R. R. Vetus Vulpes Orbis;" and on the reverse a wolf carrying off a sheep, with "Jugum meum suave est opus meum leve." Satirical medals were afterwards common in the Low Countries. A medal representing Van Heubingen, the Dutch ambassador, in the character of Joshua arresting the course of the sun, is said to have so exasperated Louis XIV., who was understood to be typified by that luminary, as to cause the whole hostile force of France to be brought against Holland. Some of the Dutch medals are noted for the elaborate views, maps, and plans engraved on them. France produced few medals prior to the time of Louis XIV.; but there is a series illustrative of the chief events in the life of the Grand Monarque, and another devoted to the career of the first Napoleon. The Spanish medals begin with Gonsalvo about 1500. Scotland produced one of the earliest of modern medals, struck by David II., perhaps during his captivity. An English medal of Henry VIII. is probably the first instance in modern times of the use of a medal as a vehicle of political satire. Such medals were afterwards common in the Low Countries. The Scottish gold coronation medal of Charles I. is the first medal struck in Britain with a legend on the edge. The medals of the commonwealth and Charles II. are by Simon; those of queen Anne record the achievements of Marlborough. Medals, in connection with numismatics (q.v.), are treated of by the various writers on that subject.

Medals in the present day are conferred by the sovereign as marks of distinction for eminent worth or noble conduct, more particularly for naval and military services. Such medals of honor are seldom of great intrinsic value, their worth depending mainly on the associations connected with them. They have ribbons attached, with clasps or small bars, each of which bears the name of a particular action. The Waterloo medal is of silver, with the head of George IV. (Prince regent), a winged Victory, and the words "Waterloo," "Wellington," it hangs from a crimson ribbon, with a narrow stripe of blue. The medal also of the Crimea is attached to a blue ribbon with yellow edges when worn for service in the Crimea, and to a yellow ribbon with blue edges when for service in the Baltic. Good-service medals of silver were instituted in 1831 and 1831, and rules formed for their distribution among meritorious sailors, soldiers, and marines. The naval medal is worn suspended from a blue, and the military from a crimson ribbon. There are also various British medals which have been conferred for services in the Peninsula, India, etc. On every medal is engraved the name, rank, etc., regiment or ship of the recipient of it. Medals and decorations do not seem to have been ever conferred as rewards in the army or navy prior to the commonwealth. The French military medal and the Sardinian war-medal were some time ago bestowed to a large extent on British officers, soldiers, seamen, and marines, the former exhibits the effigy of Napoleon III., surmounted by an eagle, and is worn from a yellow ribbon with green borders; the latter is charged with the cross of Savoy, and suspended from a sky-blue ribbon. No medal of honor from any foreign sovereign is allowed to be worn or accepted by any British subject without the sanction of the queen.
MEDALLION (in architecture), a circular panel containing a bas-relief of a head, bust, figure, etc.

MEDARY, SAMUEL, 1801-64; b. Penn.; received only a common-school education, and became a printer. He entered into politics, and sustained gen. Jackson; and for many years edited the Ohio Statesman. From 1857 to 1860, he was governor of the territories of Minnesota and Kansas, in each case for two years. He had previously been offered the position of minister to Chili, which he refused. He established the Columbus Crisis, at Columbus, O., and continued to conduct and edit it until his death. In 1869 his many personal and political friends erected a costly and beautiful monument to his memory.

MEDE, or MEADE, JOSEPH, 1586-1638; b. Berden, Essex, Eng. While a boy at school at Wetherfield he accidentally, on a visit to London, picked up a copy of Bellarmino's Hebrew grammar, and soon acquired a good knowledge of the language. He graduated at Christ Church, Cambridge, in 1610. His learning at this time is spoken of as extraordinary. His first work was De Sanctitate Relig. Tom. addressed to bishop Andrews who requested him to become his domestic chaplain. Declining this he was soon afterward made a fellow of his college, and reader of the Greek lectures on Sir Walter Mildmay's foundation, which office he occupied till his death. In 1618 he took his degree of B.D. The provostship of Trinity college, Dublin, offered him twice, in 1627 and 1630, through the influence of archbishop Usher, he declined, preferring the retirement of college for study. He was distinguished for meekness, modesty, and liberality, devoting the tenth of his small income to charitable and pious purposes. His learning was various and profound. He was well acquainted with mathematics, medicine, the various branches of natural science, history, antiquities, and the literature and sciences of the East. His chief work was Clavis Apocalypistica, translated into English in 1643, the first rational attempt, according to bishop Hurd, to interpret the apocalypse. His complete works were collected after his death in one folio volume by Dr. Worthington, with a life of the author.

MEDÉA, in Grecian legend, a famous sorceress, the daughter of Aëtes, king of Colchis, and of the Oceanid Idia, or of Hecate. She married Jason, the leader of the Argonauts (q.v.), and aided him in obtaining the Golden fleece. Jason, after his return home, became desirous of revenge on Pelias for the murder of his parents and his brother, Medéa persuaded the daughter of Pelias to cut him in pieces and boil him, in order to make him young again. Jason and she fled to Corinth, where, after she had been his wife for ten years, he repudiated her, to marry Glauce or Creusa, and Medéa, in revenge, sent by her son to her rival a poisoned robe or diadem, the virulence of which destroyed both her and her father. Medéa then slew the children which she had borne to Jason, and fled to Athens in a chariot drawn by dragons, which she obtained from Helios. There she was received by Ægeus, to whom she bore Medos; but afterwards being compelled to flee from Athens, she took Medos to Aria, the inhabitants of which were thenceforth called Medes. She finally became immortal, and the spouse of Achilles in the Elysian fields. Such is the classic legend, which afforded material for many productions of the tragic muse, and subjects for the painter and sculptor, and which even in modern times has been so employed.

MEDÉAH, a t. of Algeria, 43 m. s.s.w. of the town of Algiers, consists of a walled town and suburbs. It is considered as, on the whole, one of the finest towns in Algeria. There is an Arab market held every Friday. Under the Romans, Medéah was a military station. Pop. within the walls, 2,100; without the walls, 5,700; total, 7,800.

MEDELLIN, a city of the United States of Colombia, South America, in the province of Antioquia, and 50 m. s.e. of the city of that name, between the ranges of the central and western Cordilleras. It is a beautiful town, and, placed at an elevation of about 5,000 ft. above sea-level; its climate is exceedingly pleasant. It is the entrepot of trade for the surrounding district, and contains a pop. estimated at 15,000.

MEDÉOLA. See Indian Cucumber.

MEDFORD, a t. in Massachusetts, on the Mystic river at the head of navigation and near the Mystic pond, which forms a part of its boundary and supplies water to certain sections of Boston; pop. 80, 7,757. It is 4 m. n.w. of Boston, on the Boston and Maine and Boston, Lowell, and Nashua railroads, and is the seat of Tufts college (Universalist). It has a public library, a savings bank, 2 newspapers, a reading room; excellent public schools, 7 churches, and a town house. It has many beautiful residences occupied by men of business in the city of Boston, and has delightful drives and lovely scenery. The celebrated Medford rum is manufactured here, and it has manufactories of tin ware, harness, leather, crackers, woolen goods, cotton cloths, buttons, carpets, oil silk, boots and shoes, and bricks. In former times it numbered ship-building among its industries.

MEDHURST, WALTER HENRY, an English missionary; 1796-1857; b. London; educated for the ministry, and, by appointment of the London missionary society in 1816, labored successfully in India, Malacca, and other Asiatic countries, and afterwards settled in Batavia, Java, where he remained eight years, performing missionary work also in Borneo. In 1845 he was sent to China, and settled at Shanghai. He had charge of the printing establishment, which before this had been worked at Batavia, but he now
removed it to Shanghai, and began to print sermons and tracts. For six years he performed mission work in the interior of China amid much peril. He was much opposed by the Romanists in the year 1847, yet 34,000 copies of various works were printed, and 500 tracts were weekly distributed. During this year delegates from several stations convened in Shanghai for the revision of the New Testament. In this work he was engaged till 1850, when he devoted his time to the Old Testament. In 1850 he returned to England in impaired health, and died three days after his arrival. He was a faithful missionary, and a distinguished oriental scholar. He was well versed in the Chinese, Japanese, Javanese, and other languages, besides Dutch and French, in all of which he wrote. His special works are: China, its State and Prospects, with Special Reference to the Diffusion of the Gospel; Dissertation on the Theology of the Chinese; The Chinese Version of the Scriptures; A Chinese Dictionary; A Japanese and English Vocabulary; Dictionary of the Hokkien Dialect; Translation of a Comparative Vocabulary of the Languages of China, Corea, and Japan; Notes on Chinese Grammar; Chinese Dialogues. He was engaged also on the following works: Chinese Repository, 20 vols.; Chinese Miscellanies, 3 vols. He published also an Account of the Malayang Archipelago, and A Glance at the Interior of China.

MEDIA, in ancient times, the name of the north-western part of Iran, which was bound by the Caspian sea on the n., by Persia on the s., by Parthia on the e., and by Assyria on the west. The northern portion of the country is very mountainous; the s. is a rich and fertile tract. Media at present forms the Persian provinces of Azerbaijan, Gilian, Mazanderan, and Irak-Ajeni, and the northern portion of Luristan. The Medians were in language, religion, and manners nearly allied to the Persians. After they had shaken off the yoke of the Assyrians, their tribes united about 703 B.C., according to the hebrew version, account, chose Dejoces (Kai-Robad) for their chief, and made Ecbatana their capital. His son Phraortes, or Arphaxad, subdued the Persians. Cyanares (Kai-Kaous), the son of Phraortes, in alliance with Nabopolassar, king of Babylon, overthrew the Assyrian empire about 604 B.C., spread the terror of his arms as far as Egypt and the furthest bounds of Asia Minor, and vanquished the brigand hordes of Scythia, who had carried their ravages as far as Syria. He was succeeded by his son Astyages (Asdchak), who was deposed (540 B.C.) by his own grandson Cyrus (Kai-Khusru), king of Persia; and from this time the two nations are spoken of as one people. Ecbatana, the capital of Medea, became the summer residence of the Persian kings. After the death of Alexander the great (324 B.C.), the n.w. portion (Atropatene) of Medea became a separate kingdom, and existed till the time of Augustus; the other portion, under the name of Great Media, forming a part of the Syrian monarchy. Medea was on several occasions separated from Persia. In 153 B.C. Mithridates I. took Great Media from the Syrians, and annexed it to the Parthian empire, and about 36 B.C. it had a king of its own, named Artavasdes, against whom Mark Antony made war. Under the Sasanian dynasty the whole of Media was united to Persia. It became, during the 14th and 15th centuries, the stronghold of the Turcoman tribes Kara-Koinifu, or "Black Sheep," and Ak-Koinifu, or "White Sheep."

In early times the Medes were a warlike race, possessed of an enthusiastic love of independence, and distinguished for their skill with the bow. They were also celebrated for their horsemanship, and it was from them that the Persians adopted this and other favorite exercises and acquirements. In subsequent times they appear to have become effeminated by luxury. (See the works of Xenophon, Strabo, and Ammianus.)

MEDIAEVAE, in the old German empire, a term applied to those lordships or possessions which were held by feudal tenure under one of the greater vassals, and so only mediately under the emperor as the supreme feudal lord. Many of the smaller states or lordships were gradually reduced to this condition as the neighboring greater states increased in power; and amidst the changes caused by the wars of the French revolution in 1803 and 1806, many small states were thus mediately, in which the greater states found a sort of compensation for their losses in other quarters. The term continued to be employed even when the feudal sovereignty of the German empire did not exist. At the congress of Vienna, further mediatisations were effected; and at the present day about 500 of the smaller existing states are anxious for a similar change. The question of mediatisation was one of those affecting the internal welfare of Germany which were most keenly agitated in 1848.

MEDIATOR, a term applicable to any person who endeavors to reconcile parties at variance. In theology it is employed to denote Jesus Christ, both with respect to his sacrifice of atonement (q.v.)—making God and man as one again, by satisfying divine justice, which otherwise demands the punishment of sinners—and with respect to his continual intercession (q.v.). The Roman Catholic church represents saints as mediators of intercession, although not of atonement; but this view is rejected by Protestants.

MEDICAL DEPARTMENT of an army, next to the commissariat, is the most important of all the non-combatant sections. The surgical treatment of the wounded in actual fighting, and still more the combat with disease engendered by crowding, unhealthy stations, and the reckless habits of the soldiery, necessitate a large medical staff; for, on an average of the whole army, it is found that the rate of sickness is at least triple that for the civil population.
In the British army every battalion, when at home or in the temperate zone, has a surgeon and an assistant-surgeon; when in India or the tropics, another assistant-surgeon is added. In addition to these officers, there are numerous staff medical officers at all stations, who have charge of detachments, hospitals, etc. The active list of the medical officers comprised, in 1879–80, 530 surgeons-general, deputy surgeons-general, surgeons-major, and surgeons. Besides these, there are between 400 and 500 medical officers employed with the army in India. The total estimate for medical establishments and services in 1879–80 was £266,200.

The medical department is governed by a director-general, who is a member of the war office, and has charge of the surgical, medical, and sanitary arrangements of the army. The special duties, pay, etc., of the several ranks will be found under SURGEON.

MEdICAL DEPARTMENT, in the navy, is only of less importance than the same department in the army, in that the sea-service is vastly more healthy than service upon land. After an action, the surgeon, of course, is in equal requisition in either case. In the British navy, the medical officers in active employ, in 1876, comprised 5 inspectors-general, 12 deputy inspectors-general, 81 fleet surgeons, 123 staff surgeons, and 195 surgeons. The pay of these officers ranges from £2 10s. a day for a senior inspector-general of hospitals and fleets, to 11s. a day for a junior surgeon.

MEdICAL DEPARTMENT IN THE U.S. ARMY AND NAVY. See United States Army; United States Navy.

MEdICAL JURISPRUDENCE. See JURISPRUDENCE, MEDICAL.

MEdICAL PRACTITIONERS, in point of law, have lately been put on a new footing in many respects. The late statute (21 and 22 Vict. c. 90), and later ones, gave the body of medical practitioners powers of self-government, so far as regards qualification and training. All duly qualified persons are now registered, and the register is published, though it is not in strict law compulsory on practitioners to register themselves, the only disadvantage being that those who are not registered cannot fill certain offices and cannot sue for their fees. Before the late acts, physicians were on the same footing as baristers, and could not sue for their fees, these being considered an honorarium which ought to be paid beforehand, and, at all events, were not a legal debt. But the act remedies this defect as regards qualified registered practitioners. Another enactment of the recent statute, which was intended to put down quacks, but which is still found to be capable of evasion to some extent, was the giving of power to justices of the peace to punish with fine of £20 or imprisonment those who falsely pretend to be, or take, or use the name or title of a physician, doctor of medicine, licentiate in medicine or surgery, bachelor of medicine, surgeon, general practitioner or apothecary.

MEdICAL SCHOOL, NETLEY, an establishment for the technical education of medical officers for the British and Indian military service. Candidates are examined competitively in the ordinary subjects of professional knowledge; and, passing satisfactorily through that ordeal, are then required to attend, for six months, at the Military Medical school, where they go through practical courses of military hygiene, military and clinical military surgery and medicine, and pathology with morbid anatomy. As the school is attached to the Royal Victoria Hospital, which is the great invalid depot for the whole army, there is every opportunity of seeing theory exemplified in practice. The school comprises 4 professors, with £550 a year each, 4 assistant-professors having £450 each, and usually about 40 medical candidates, who receive each 5s. a day and lodging-money. The annual cost of the whole establishment is about £7,900. See Netley.

MEDI CI, The, who ranked among the first and most distinguished families of the Florentine republic, owe their earliest distinction to the success with which they had pursued various branches of commerce, and the liberal spirit in which they devoted their wealth to purposes of general utility. From the beginning of the 13th c., the Medici took part in all the leading events of the republic; and from the period when Salvestro de' Medici attained the rank of gonfaloniere in 1378, the family rose rapidly to pre-eminence, although the almost regal greatness which it enjoyed for several centuries is more especially due to Giovanni de' Medici, who died in 1429, leaving to his sons, Cosmo and Lorenzo, a heritage of wealth and honors hitherto unparalleled in the republic. With Cosmo (born 1389, died 1464), on whom was gratefully bestowed the honored title of "Father of his country," began the glorious epoch of the Medici: while from Lorenzo is descended the collateral branch of the family, which, in the 16th c., obtained absolute rule over Tuscany. Cosmo's life, except during a short period, when the Albizzi and other rival families re-established a successful opposition against the policy and credit of the Medici, was one uninterrupted course of prosperity; at once a munificent patron and a successful cultivator of art and literature, he did more than any sovereign in Europe to revive the study of the ancient classics, and to foster a taste for mental culture. He assembled around him learned men of every nation, and gave liberal support to numerous Greek scholars, whom the subjection of Constantinople by the Turks had driven into exile; and by his foundation of an academy for the study of the philosophy of Plato, and of a library of Greek, Latin, and Oriental MSS., he inaugurated a new era in modern learning and art. But although these merits must be conceded to him, it must not be
forgotten that while he retained the name of a republican form of government, and nominally confided the executive authority to a gonfaloniere and eight priori or senators, he totally extinguished the freedom of Florence. His grandson, Lorenzo the Magnificent (born Jan. 1, 1448, died April 8, 1492), who succeeded to undivided and absolute power in the state, after the murder of his brother Giuliano in 1478, pursued, with signal success, the policy of his family, which may be characterized as tending to ennable individuals and debase the nation at large. He encouraged literature and the arts, employed learned men to collect choice books and antiquities for him from every part of the known world, established printing-presses in his dominions as soon as the art was invented, founded academies for the study of classical learning, and filled his gardens with collections of the remains of ancient art; but when his munificence and conciliatory manners had gained for him the affection of the higher and the devotion of the lower classes, he lost no time in breaking down the forms of constitutional independence that he and his predecessors had hitherto suffered to exist. Some few Florentines, alarmed at the progress the Medici family of refinement, which as smothering every spark of personal independence, tried to stem the current of corruption by an ascetic severity of morals, which gained for them the name of *piagnoni*, or weepers. Foremost among them was the Dominican friar Girolamo Savonarola (q.v.), whose eloquent appeals to the people in favor of a popular and democratic form of government, threatened for a time the overthrow of the Medici; but the jealousy of the Franciscans, and the vindictiveness of the papal court, averted their doom. Savonarola's martyrdom restored outward tranquility to Florence, and left the Medici in undisturbed possession of absolute power. Pietro (born 1471), who succeeded his father Lorenzo in 1492, possessed neither capacity nor prudence; and in the troubles which the ambition of her princes and the profligacy of her popes brought upon Italy, by plunging her into civil and foreign war, he showed himself treacherous and vacillating alike to friends and foes. Lodovico Sforza, surnamed the "Moör," relying on the friendship which, from the middle of the 15th c., had prevailed between the Sforzas and the Medici, applied to him for assistance in establishing his claim to the duchy of Milan; but seeing that no reliance could be placed on Pietro, he threw himself into the arms of Charles VIII. of France. The result was the invasion of Italy by a French army of 32,000 men. Pietro, in hopes of conciliating the powerful invader, hastened to meet the troops on their entrance into the dominions of Florence, and surrendered to Charles the fortresses of Leghorn and Pisa, which constituted the keys of the republic. The magistrates and people, incensed at his perfidy, drove him from the city, and formally deposed the family of the Medici from all participation in power. Pietro, who was slain in 1503, while fighting in the French ranks, and several of his kinsmen, made ineffectual attempts to recover their dominions, which were not restored till 1512. The elevation of Giovanni de Medici to the papal chair, under the title of Leo X., completed the restoration of the family to their former splendor, while the accession in 1523, of his cousin Giulio Medici to the pontificate as Clement VII., and the marriage of Catharine, the granddaughter of Pietro, to Henry II. of France, and her long rule over the country, was the regent for her son, who was made invariable in his charity, and scrambled not utterly to extinguish the race of the Strozzi, the hereditary foes of his house. His acquisition of Sienna gained for him the title of grand duke of Tuscany from Pius V.; and he died in 1564, leaving enormous wealth and regal power to his descendants, who, throughout the next half century, maintained the literary and artistic fame of their family. In the 17th c., the race rapidly degenerated; and after several of its representatives had suffered themselves to be made the mere tools of Spanish and Austrian ambition, the last male representative of the line, Giovanni Gaston, died in 1737, and his only sister the Electress Palatine, the last of the Medici family, expired in 1743. In accordance with a stipulation of the peace of Vienna, the grand duchy of Tuscany passed to the house of Lorraine.

**MEDICI, CATHERINE DE'** See Catharine de' Medici, ante.

**MEDICI, MARIE DE'** See Marie de' Medici, ante.

**MEDICI NA**, a t. of Italy, in the province of Bologna, 13 m. e. of the city of that name. Pop. 4,000. It is a thriving place, with considerable trade and large markets.
MEDICINAL PLANTS. Those plants of which some part or product is used in medicine, are very numerous, and belong to the most widely different orders. In some orders, particular properties are prevalent; other medicinal species are exceptional as to their properties in the orders to which they belong. Important properties and products are sometimes characteristic of a particular very limited group of species, as in the case of the cinchonas. Many medicinal plants are merely used by the people of the countries in which they grow, others—known as officinal plants—have a place accorded them in pharmacopoeias and in the practice of educated medical practitioners. Many plants, however, are in high repute among the native physicians of India, which have not yet found a place in any western pharmacopœia, although a few of the most valuable have recently been introduced to notice in Europe. Of the plants which have been rejected from the pharmacopoeias, but retain their place in rustic practice, some are really useful, and would be held in greater esteem if there were not preferable medicines of similar quality; others have owed their reputation merely to ridiculous fancies. Some medicinal plants are always gathered where they grow wild, others are cultivated in order to have them in sufficient abundance. This branch of gardening is carried on to a greater extent at Mitcham, near London, than in any other part of Britain. A great boon has very recently been conferred on mankind—so recently that it has scarcely yet begun to be enjoyed—in the introduction of cinchona (q.v.) trees into India, Ceylon, and Java, where their cultivation has been commenced with every prospect of success, a continued supply of Peruvian bark and of quinine, their increased abundance, and a diminution of their price, being thus secured.

Among the most valuable books on medicinal plants are Hayne's Getruee Darstellung und Beschreibung der in Arzneikunde gebrauchlichen Gewächse (4 vols. Berlin, 1805-46); Nees von Esenbeck, Welle, Walter, und Funke, Vollständige Sammlung offizieller Pflanzen (3 vols. Düsseldorf, 1821-33).—Pereira's Materia Medica is also of very high excellence.

MEDICINE, HISTORY OF. There is reason to believe that Egypt was the country in which the art of medicine, as well as the other arts of civilized life, was first cultivated with any degree of success, the offices of the priest and the physician being probably combined in the same person. In the writings of Moses there are various allusions to the practice of medicine amongst the Jews, especially with reference to the treatment of leprosy. The priests were the physicians, and their treatment mainly aimed at promoting cleanliness and preventing contagion. Chiron (q.v.), the centaur, is said to have introduced the art of medicine amongst the Greeks; but the early history of the art is entirely legendary. See AGRICULTURE.

With a passing allusion to the names of Pythagoras, Democritus, and Heraclitus, who in their various departments may be regarded as having advanced the art of medicine, we arrive at the time of Hippocrates (q.v.). The advance which Hippocrates made in the practice of medicine was so great, that no attempts were made for some centuries to improve upon his views and precepts. His sons, Thessalus and Draco, and his son-in-law, Polypbius, are regarded as the founders of the medical sect, which was called the Hippocratean or dogmatic school, "because it professed to set out with certain theoretical principles which were derived from the generalization of facts and observations, and to make these principles the basis of practice."

The next circumstance requiring notice in the history of medicine is the establishment of the school of Alexandria, which was effected by the munificence of the Ptolemies, about 300 years before the Christian era. Amongst the most famous of its medical professors are Erasistratus and Herophilus. The former was the pupil of Chrysippus, and probably imbued from his master his prejudice against bleeding, and against the use of active remedies, preferring to trust mainly to diet and to the vis medicatrix naturae. It was about this time that the empirics formed themselves into a distinct sect, and became the declared opponents of the dogmatists. The controversy, says Bostock, in his History of Medicine, really consisted in the question—how far we are to suffer theory to influence our practice. While the dogmatists, or, as they were sometimes styled, the rationalists, asserted, that before attempting to treat any disease, we ought to make ourselves fully acquainted with the nature and functions of the body generally, with the operation of medical agents upon it, and with the changes which it undergoes when under the operation of any morbid cause; the empirics, on the contrary, contended that this knowledge is impossible to be obtained, and, if possible, is not necessary; that our sole guide must be experience, and that if we step beyond this, either as learned from our own observation, or that of others on whose testimony we rely, we are always liable to fall into dangerous and often fatal errors. According to Celsius, who has given an excellent account of the Jewish opinions of both sects, the founder of the empirics was Scarpion of Alexandria, who was said to be a pupil of Herophilus. At this period, and for some centuries subsequent to it, all physicians were included in one or other of these rival sects, and, apparently, the numbers of the two schools were about equal.

We learn from Pliny that medicine was introduced into Rome at a later period than the other arts and sciences. The first person who seems to have made it a distinct pro-
fession was Archagathus, a Peloponnesian, who settled at Rome about 200 B.C. His treatment was so severe and unsuccessful that he was finally banished; and we hear of no other Roman physician for about a century, when Asclepiades, of Bithynia, acquired a great reputation. His popularity depended upon his allowing his patients the liberal use of wine and of their favorite dishes, and in all respects considering their inclinations and flattering their prejudices; and hence it is easy to understand the eminence at which he arrived. He was succeeded by his pupil Themison of Laodicea, the founder of a sect called Methodics, who adopted a middle course between the dogmatists and empirics. During the greater part of the first two centuries of our era the Methodics were the prepondering medical sect, and they included in their ranks C. Aurelius, some of whose writings have come down to us. They then broke up into various sects, of which the chief were the Pneumaties, represented by Aratæus of Cappadocia, whose works are still extant; and the Eclecotics, of whom Archigenes of Apeamia was the most celebrated. But the most remarkable writer of this age is Celsius (q.v.), whose work De Medicina gives a sketch of the history of medicine up to his time, and the state in which it then existed. He is remarkable as being the first native Roman physician whose name has been transmitted to us. The names of Andromachus, the inventor of the theriaca, a preparation which was retained in our pharmacopœias until the close of the last century—of Pliny the naturalist—and of Dioscorides, cannot be altogether omitted in even the briefest sketch of the early history of medicine; but their contributions to its progress dwarf into insignificance when compared with those of Galen (q.v.), whose writings were universally acknowledged as ultimate authority until they were attacked and publicly burned in the 16th c. by the arch-quack, Paracelsus (q.v.). A learned and impartial critic, the late Dr. Aikin, after giving full credit to Galen for talent and acquirements, thus concludes: "His own mass and modern improvements have now in a great measure consigned his writings to neglect, but his fame can only perish with the science itself." As in the case of Hippocrates, his immeasurable superiority over his contemporaries at once presented to us a check to all further improvement.

The first names of any renown that occur subsequently to the death of Galen (about 193 A.D.) are those of Orbulus, Alexander of Tralles, Ælius, and Paulus Ægineta, who flourished during the 4th and 7th centuries. They were all zealous Galenists, and those of their writings which are extant are for the most part compilations from their predecessors, and especially from their great master. With the death of Paulus the Greek school of medicine may be considered to have come to an end, for after his time no works of any merit were written in this language. The Arabian school was now beginning to rise into notice. The earliest Arabic writer on medicine of whom we have any certain account is Ahrum, who was contemporary with Paulus. The most celebrated physicians of this school were Razes (who flourished in the 9th c., and was the first to describe the small-pox), Avicenna (q.v.), (who flourished in the 11th c., and whose Canon Medicine, may be regarded as a cyclopædia of all that was then known of medicine and the collateral sciences, Aulbeus (whose works on the practice of surgery were for several ages regarded as standard authorities), Avenzoar, and Averrhoes (q.v.), (who flourished in the 11th c., and was actually educated as a physician and a scholar). The works of Hippocrates and Galen, which, together with those of Aristotle, Plato, and Eudid, were translated into Arabic in the 9th c., formed the basis of their medical knowledge; but the Arabian physicians did good service to medicine in introducing new articles from the east into the European materia medica—as, for example, rhubarb, cassia, senna, camphor—and in making known what may be termed the first elements of pharmaceutical chemistry, such as a knowledge of distillation, and of the means of obtaining various metallic oxides and salts.

Upon the decline of the Saracenic universities of Spain, which may date from the death of Averrhoes, the only medical knowledge which remained was that to be found in Italy, where the school of Salerno acquired a considerable celebrity, which it maintained for some time, till it was gradually eclipsed by the rising fame of other medical schools at Bologna—where Mondini publicly dissected two human bodies in 1315—Vienna, Paris, Padua, etc. Contemporary with Mondini lived Gilbert, the first English writer on physiology who provided any guide; and the latter gave birth to Linnaeus, who, after studying at Oxford, spent a considerable time at Bologna, Florence, Rome, Venice, and Padua, and subsequently became the founder of the London college of physicians. It was in this (the 15th c.), that the sect of chemical physicians arose, who maintained that all the phenomena of the living body may be explained by the same chemical laws as those which rule inorganic matter. Although the illustrations and proofs which they adduced were completely unsatisfactory, a distinguished physiological school of the present day is merging into a very similar view, with, however, far more cogent arguments in its support. The chemists of that age, with Paracelsus at their head, did nothing to advance medicine, except to introduce into the materia medica several valuable metallic preparations.

This period seems to have been prolific in originating new diseases. It is in the 13th, 14th, and 15th centuries that we hear most of leprosy and of the visitations of the plague in Europe. Until the 15th c. whooping-cough and scurvy were unknown, or, at all events, not accurately described; and it was towards the close of that century that syphilis was first recognized in Italy (from which country it rapidly extended over the
whole of Europe), and that the sweating sickness (sudor anglicanus) made its first appearance in this country.

In the 16th c., the study of human anatomy may be said to have been first fairly established by the zeal and labors of Vesalius (q. v.); and in this and the succeeding century we meet with the names of many physicians whose anatomical and physiological investigations materially tended, either directly or indirectly, to advance the science of mortals. This was the epoch of Eustachius, Fallopius, Asellius, Harvey, Rudbeck, Bartholin, Malpighi, Glisson, Sylvius, Willis, Bellini, etc. Chemistry was now separating itself from alchemy, and was beginning to enter into the state of a science, and a combination was now formed between its principles and those of physiology, which gave rise to a new sect of chemical physicians, quite distinct from the sect represented two centuries previously by Paracelsus. They considered that diseases were referrible to certain fermentations which took place in the blood, and that certain humors were naturally acid, and others naturally alkaline, and according as one or other of these predominated, so certain specific diseases were the result, which were to be removed by the exhibition of remedies of an opposite nature to that of the disease. They were soon succeeded by the mathematical physicians, or the Iatromathematical school, of which Borelli, Sauvages, Keill, Jurin, Mead, and Friend were among the most celebrated. In proportion as this sect gained ground that of the chemists declined, while the old Galenists were fast disappearing. To these rival sects must be added that of the Vitalists, which originated with Van Helmont (q. v.), and which, with some modifications, was adopted by Stahl and Hoffmann. The greatest physician of the 17th c. was, however, unquestionably Sydenham (q. v.), who, though inclining toward the chemical school, did not allow his speculative opinions regarding the nature of disease to interfere with his treatment.

The most eminent teacher of medicine in the early part of the 18th c. was Boerhaave, who was elected to the chair of medicine at Leyden in 1700. Among the pupils of Boerhaave must be especially mentioned Van Swieten, whose commentaries on the aphorisms of his master contain a large and valuable collection of practical observations; and Haller (q. v.), the father of modern physiology; while amongst the most celebrated opponents of the Hallerian theory, that irritability and sensibility are specific properties of the muscular and nervous systems, must be mentioned Whytt and Porterfield, physicians of high reputation in Edinburgh, and the former professor of medicine in the university.

In the article upon Cullen (q. v.), so full an account is given of the doctrines of that celebrated physician that it is unnecessary to add more than that most of the distinguished physicians of the latter part of the 18th c. belonged to what may be termed the Cullenian school of medicine. His views were attacked with great acrimony by his former assistant, John Brown, the founder of the Brunonian system of medicine. In this country the views of Brown were regarded as too purely theoretical, and did not acquire any great popularity; but on some parts of the continent, and especially in Italy, they were very generally adopted, and became for a considerable time the prevailing doctrine in several of the leading medical schools. To supplement this meager outline of the progress of medicine in the 18th c., the reader is recommended to consult the biographical sketches of Monro, Blane, the Hunters, Jenner, etc.

If we exclude certain popular quackeries, we may regard the Brunonian as the last of the medical sects. The present century may be considered as the epoch of physiological experiment and clinical observation. The efficient laborers in the field of medicine, during the last 50 years, have been so numerous that it would be impossible to notice, in this article, even those whom we deemed the most celebrated, while it would be invidious to attempt such a selection.

Our materia medica has received a large number of most important additions, among which may be especially noticed quinine, morphia, strychnine, iodine, and the iodides, the bromides, hydrocyanic acid, cod-liver oil, and chloroform. The physical diagnosis of disease has been facilitated to an extent far beyond what the most sagacious physician of the last century could have deemed possible, by the discovery and practical application of the stethoscope, the pleximeter, the spectunm, the ophthalmoscope, and the laryngoscope; while chemistry and the microscope have been successfully applied to the investigation of the various excretions, and especially of the urine and its deposits.

The discovery of vaccination as a means of preventing smallpox, although made (see Jenner) at the close of last century, may be regarded practically as belonging to the present, since a considerable time elapsed before its value was generally recognized.

The true and certain diagnosis between typhus and typhoid (or enteric) fever is due to living physicians; and the discoverers of Bright's disease of the kidneys, and of Addison's disease of the suprarenal capsules, have only recently been lost to science.

The treatment of many diseases, especially those of an inflammatory nature, has been much modified, and in most cases improved, especially during the last quarter of a century. The victims to the lancet are far fewer than they formerly were, but if the patients of the present day run little risk of being bled to death, there is an occasional chance of their perishing from the too copious administration of brandy. The moral to be drawn by the unbiased observer of the depleting and the stimulating modes of treating inflammatory diseases such as pneumonia and pericarditis, is that nature will often effect a cure even in spite of the interference of too energetic physicians. It is estab-
lished beyond all question by the statistics which have been collected by an eminent living physician, that the progress of pulmonary consumption is retarded for an average space of three years by the judicious administration of cod-liver oil; due attention being, of course, paid to the general treatment of the patient.

**MEDICK.** Medicago, a genus of plants of the natural order leguminosae, sub-order papilionaceae, nearly allied to clover (q.v., trifolium), but distinguished from that and other kindred genera by the sickle-shaped, or, in most species, spirally twisted legume. The species, which are very numerous, are mostly annual and perennial herbaceous plants, with leaves of three leaflets like those of clover, natives of temperate and warm climates. A number of them are found in Britain, and many more in the south of Europe. They generally afford good green food for cattle, and some of them are cultivated like the clovers for this use, amongst which the most important is the Purple Medick or lucerne (q.v., M. sativa). Besides this, the Black Medick, Nonnusch, or Lupuline (M. lupulina), is one of the most generally cultivated. It receives the name black medick from the black color of the ripe pods, which are short, black, twisted, and arranged in oblong heads, and is often called yellow lucern, or yellow clover, from the color of its flowers. It is a common native of Britain. In habit and general appearance it is very similar to trifolium procumbens, or T. filiforme. In British husbandry it is now very generally sown in mixture with red clover and rye-grass, and is useful where a close turf is desired.

**MEDITA TE LINGUE, JURY DE.** See Jury.

**MEDILL, JOSEPH b., New Brunswick, 1825; while still quite young, removed to Massillon, O., studied law, and began his experience as a journalist in 1849, when he established a free-soil paper at Coshocton, O. In 1852 he was in Cleveland, where he founded the Forest City, a whig paper; and in 1854 was among those who organized the new republican party in Ohio. In 1855, in company with two partners, he bought the Chicago Tribune; and in 1874, after his return from a tour in Europe, he purchased a controlling interest in the paper and became editor-in-chief, a position which he continues to retain (1881). In 1870 Mr. Medill was a member of the Illinois constitutional convention; in 1871 he was appointed a member of the U. S. civil service commission; and in the latter year he was elected mayor of Chicago.

**MEDINA (Arab. city), or, more fully, MEDINAT AL NABI (City of the Prophet), also called TABAH, TIBAH, etc. (the Good, Sweet, etc.), and mentioned by Ptolemy as Jathrippa; the holiest city throughout Mohammedanism, next to Mecca, and the second capital of Hedjaz in western Arabia, is situated about 270 m. n. of Mecca, and 140 n. by c. of the port of Jembo on the Red sea, and contains about 16,000 inhabitants (Burton). It consists of three principal parts—a town, a fort, and suburbs, of about the same extent as the town itself. From which they are separated by a wide space (the Munakha). Medina is about half the size of Mecca, and forms an irregular oval within a walled enclosure of 35 to 40 ft. high, and flanked by thirty towers—a fortification which renders Medina the chief stronghold of Hedjaz. Two of its four gates—viz., the Bab Al Junah (Friday gate, in the eastern wall) and the Bab Al Misri (Egyptian)—are massive buildings with double towers. The streets, between fifty and sixty in number, are deep and narrow, paved only in a few places. The houses are flat-roofed and double-storied, and are built of a basaltic scoria, burned brick, and palm-wood. Very few public buildings of any importance are to be noticed besides the Great Mosque Al Haram (the Sacred), supposed to be erected on the spot where Mohammed died, and to inclose his tomb. It is of smaller dimensions than that of Mecca, being a parallelogram, 420 ft. long and 340 ft. broad, with a spacious central area, called El Sahn, which is surrounded by a peristyle, with numerous rows of pillars. The Mauzoleum, or Hujrah, itself is an irregular square, 50 to 55 ft. in extent, situated in the s.e. corner of the building, and separated from the walls of the mosque by a passage about 26 ft. broad. A large gilt crescent above the "great dome," springing from a series of gables, surmounts the Hujrah, a glimpse into which is only attainable through a little opening, called the Prophet's Window; but nothing more is visible to the profane eye than costly carpets or hangings, with three inscriptions in large gold letters, stating that behind them lie the bodies of the prophet of Allah and the two caliphs—which curtains, changed whenever worn out, or when a new sultan ascends the throne, are supposed to cover a square edifice of black marble, in the midst of which stands Mohammed's tomb. Its exact place is indicated by a long pearly rosary (Kaukab Al Durr)—still seen in 1855—suspended to the curtain. The prophet's body is supposed to lie (undeayed) stretched at full length on the right side, with the right palm supporting the right cheek, the face directed towards Mecca. Close behind him is placed, in the same position, Abubekr, and behind him Omar. The fact, however, is that when the mosque, which had been struck by lightning, was rebuilt in 892 three deep graves were found in the interior, filled only with rubbish. Many other reasons, besides the main one above mentioned, a particular spot at Medina really contains the prophet's remains. That his coffin, said to be covered with a marble slab and cased with silver (no European has ever seen it), rests suspended in the air, is a stupid story, invented by Christians, and long exploded. Of the fabulous treasures which this sanctuary once contained, little now remains. As in Mecca, a great number of ecclesiastical officials are attached in some capacity or other to...
the Great Mosque, as ulemas, mudarism, imams, khatibs, etc.; and not only they but the townspeople themselves live to a great extent only on the pilgrims’ alms. There are few other noteworthy spots to be mentioned in Medina, save the minor mosques of Abu-Bakr, Ali, Omar, Balal, etc. The private houses, however, surrounded by gardens, found here, etc., have a very pleasing appearance; and the city, although in its decay, is yet one of the busiest and most agreeable. Thirty madresses, or public endowed schools, represent what learning there is left in the city, once famed for its scholars.

MEDINA, a co. in n.e. Ohio. It is traversed by Black and Rocky rivers and Chippewa creek, and by the Atlantic and Great Western, and the Cleveland and Wheeling railroads; 435 sq. m.; pop. ’80, 21,454—17,844 of American birth. The soil is undulating and shows much clay. All the common agricultural productions are staples, and coal is found in the region. There are manufactories of harnesses, lumber, and cheese.

MEDINA, a co. in s.w. Texas; 1175 sq. m.; pop. ’80, 4,492—3,463 of American birth. The county, bounded on the n.e. by Medina river, is drained also by Rio Hondo and Seco creek. It is not particularly productive, water and timber being scarce. Stock-raising is the chief industry, and in 1870 there were over 40,000 head of cattle. Chief towns, Castrovilie.

MEDEIRA DE RIO SECO (anc. Forum Equororum), a t. of Spain, in the province of Valladolid, 22 m. n.w. of the city of Valladolid, on the Sequillo, an affluent of the Douro. This place was a famous emporium in the 14th c., when its cloth and linen fairs were amongst the greatest in the kingdom; it is now a place of little or no importance whatever. There still exist some remains of its former greatness, in its arcades, arches, ruins of a palace, etc. In 1808 the town was given up to pillage by Hessieres. Pop. 5,100.

MEDINA SIDONIA (Arab. Medinatu-Shidunah, “City of Sidon,” so called by the Moors because they conjectured it to be the site of the Phenician A Sidon), a city of Spain, 25 m. e.s.e. of Cadiz. It has a picturesque and splendid appearance at a distance; but within it is described as “a whitened sepulcher full of decay.” It is of Moorish origin, and contains a beautiful Gothic church and extensive ruins of a castle. The town gives the title of duke to the descendants of the famous Guzman the good, and is otherwise noted in Spanish history. Pop. 10,880, who carry on manufactures of earthenware.

MEDINET-EL-FAYUM. See FATUM.

MEDIOLA NUM, the ancient capital of Gallia Cisalpina, now Milan. It lay along a little stream, whose modern name is the Olona, on a plain between the rivers Ticinus, now the Ticino, and Addua, now the Adda. It was said to have been founded by the Insulares, whose capital city it was, and who named it after a village in Transalpine Gaul, whence they had emigrated. It is first heard of in the time of the Gallic wars, but was of little importance, till, with the Insulares, it submitted to the Romans, 190 B.C. Its situation in the center of the plain of n. Italy made it a favorite place of residence, and by the time of Strabo it had gained some consequence. Its most prosperous period was in the 4th c., in the early part of which the emperor Maximian selected it for his residence. It was adorned with elegant public buildings, temples, theaters, baths, a mint, and in the latter part of the same century Ansonius ranks it as sixth among the cities of the empire. It was the headquarters of the Romans in their campaigns against the barbarians. Its prosperity continued till Honorius, in 403, withdrew to Ravenna, at the time of the Visigothic invasion under Alaric. It was sacked by Attila, but the Gothic kings re-established it as the imperial capital about 476. It was captured soon after by Belisarius, but in 539 it was recaptured by the Goths and Burgundians, and burned; and 300,000 of its inhabitants are said (almost incredibly) to have been massacred on this occasion. In the middle ages it became a great commercial city. See MILAN, ante.

MEDITATIO FUGE, a phrase used in Scotch law to denote an intention to abscond from the jurisdiction of the ordinary courts. It is used chiefly in reference to debtors. Wherever a creditor in Scotland believes—i.e., can make an oath or affidavit—that he has reasonable ground to believe—that the debtor is about to leave the country in order to evade payment of debts, he can obtain from a justice of the peace a warrant to apprehend the debtor. The consequence of this is that the debtor must either pay or give security, or remain in prison till the cause is tried. The process may be used either against natives or foreigners who have lived forty days in Scotland, but not where they are merely passing through the country on business or pleasure. The warrant may be executed on a Sunday as well as other days. It may also be executed within the sanctuary of Holyrood. Though creditors often avail themselves of this compulsion to recover their debts, they are liable to an action if they maliciously and without cause procure the debtor’s arrest; and if the debtor can show that he never intended, at the time in question, to leave the country, and that the creditor had no just ground to believe he so intended, an action of damages will lie. In England and Ireland there is a similar process. See DEBTORS, ABSCONDING.

MEDITERRANEAN SEA, so named from its being almost entirely inclosed by the continents of Europe, Asia, and Africa, one of the greatest inland seas in the world, extends (inclusive of the sea of Marmora, but exclusive of the Black sea and sea of Azof) U. K. IX. — 42
to about 1,000,000 sq. miles. Its length, from e. to w., is about 2,930 m., its greatest breadth about 1080, but it is divided into two great basins by the approach of the European and African coasts in its middle. It is connected with the Atlantic ocean only by the narrow gulf of Gadeira, through which a strong current continually flows into the Mediterranean. Another strong current also flows into it from the Black sea, which receives large supplies of fresh water, whereas the great rivers which fall into the Mediterranean itself are comparatively few; the principal being the Ebro, the Rhone, and the Po, from Europe; and the Nile, from Africa. It receives no large river from Asia. The evaporation from the surface of the Mediterranean is, on the contrary, greater than what takes place in the ocean generally, owing to the heat which proceeds from the African deserts, and the shelter which mountains afford from the cold winds of the north. The surface temperature, dependent on the intensity of solar radiation, is in summer about 5° above that of the Mediterranean. By the expeditions for the scientific exploration of the deep sea in 1869 and 1870 it has been ascertained that the effects of this surface-heating are limited to a depth of 100 fathoms; at every depth beneath this, even down to 1900 fathoms, the temperature of the Mediterranean, unlike that of the Atlantic, is uniform, and stands about 54° or 55°. This is, in fact, the lower temperature of the entire contents of the basin, from the surface downwards, and also the mean temperature of the crust of the earth in that region. In winter the temperature of the Mediterranean and the Atlantic approximate very closely. In consequence, probably, of the greater evaporation, the water of the Mediterranean, unlike that of inland seas in general, contains about one-sixth per cent more salt than the Atlantic ocean. Its specific gravity is almost everywhere greater than that of the Atlantic, being in the proportion of 1.0386 to 1.0283. Its color, when undisturbed, is a bright deep blue; but in the Adriatic a green, and in the Levant a purple tinge prevails, while the dark hue of the Euxine is indicated in its name of "Black sea." Different parts of the Mediterranean sea bear different names—as the Ægean sea, the Ionian sea, the Adriatic sea, or gulf of Venice, etc. Its northern coast is very much broken with bays and peninsulas, and abounds in harbors, affording the inhabitants of the south of Europe great advantages for commerce, of which the Mediterranean was the chief seat during all periods of history, till toward the close of the middle ages, when, after the invention of the mariner's compass, a spirit of maritime adventure sprang up, and the discoveries of the Portuguese and of Columbus led to the extension of commerce over the whole world. The commerce of the Egyptians, the Phenicians, the Greeks, and Romans, was almost entirely confined to the Mediterranean sea.

The depth of the Mediterranean sea is generally greatest in its western basin. In many places it is 3,000 ft. deep. Near Nice it is 4,200 ft. deep at a distance of only a few yards from the shore. In many places it is 5,000 ft. deep and more. The depth in the straits of Gibraltar is about 5,500 feet. It is highly probable that the coasts of Europe and Africa were once united here, and have been separated by some great con
vulsion; it is also supposed that land once stretched from Sicily to Cape Bon in Africa, where now a ridge exists along which there is for the most part a depth of scarcely 200 ft., and in some places of little more than 40 ft., whilst on each side, at a short distance, the depth is more than 6,000 feet. The Mediterranean sea is subject to the w., n., and n. winds more than two-thirds of the year, while in spring and s.w. winds prevail. The most formidable of those winds which are peculiar to the Mediterranean sea is the solano or levante. In the gulf of Venice the greatest tides rise about 8 ft., and in the Great Syrtis, 5 ft., but in most places the tides are scarcely observable. According to the measurements of Napoleon's Egyptian expedition (1799) the surface of the Mediterranean sea, in the neighborhood of Alexandria, was from 24 to 30 ft. lower than that of the Red sea at Suez; but more recent measurements have shown that the difference of level is inconceivable, and that the mean level of the Red sea is at most 6 in. higher than the Mediterranean.

Of the 643 species of European sea-fishes, 444 inhabit the Mediterranean sea, some of which are peculiar to it. It has a greater number of species than the British and Scandinavian seas, but does not nearly so much abound in useful kinds. Tunny-fishing is extensively prosecuted on some parts of its coasts. It is rich in red coral, which is procured in great quantity on the coasts of Provence, of the Balearic Isles, and of Sicily, but particularly on the coasts of Bona and Bocca in Africa.

The shores of the Mediterranean sea are in many parts subject to frequent earthquakes. Besides the existing active volcanoes of Etna, Vesuvius, and Stromboli, there are many evidences of recent volcanic action, and instances have occurred of islands suddenly upheaved by it, where volcanic fires have appeared for, a short time.

MEDJIDIE, a Turkish order, instituted in 1852, and conferred after the Crimean campaign, to a considerable extent, on British officers. It has five classes; and the decoration, which differs in size for the different classes, is a silver sun of seven triple rays, with the device of the crescent and star alternating with the rays. On a circle of red enamel, in the center of the decoration, is the legend in Turkish, whose signification is "zeal, honor, and loyalty," and the date 1268, the Mohammedan year corresponding to 1852; the sultan's name is inscribed on a gold field within this circle. The first three classes suspend the badge around the neck from a red ribbon having green borders, and
the fourth and fifth classes wear it attached to a similar ribbon on the left breast. A star, in design closely resembling the badge, is worn on the left breast by the first class, and on the right breast by the second class.

MEDJIDIEH, a t. in European Turkey, called by the name of the sultan Abdul Medjid, and now the principal place in the Dobrudja. It was of little importance till after the Crimean war, when a large number of Tartars immigrated to Kustendji, 28 m. distant, and worked upon the railroad between the Danube and Kustendji. These and other Tartar immigrants afterwards settled at Medjidieh, and by 1869, the number of Tartar immigrants alone was estimated at 40,000. There are no trustworthy means for forming an estimate of its present size, but it has probably largely decreased.

MEDLAR, *Mespilus*, a genus of trees or shrubs of the natural order rosaceae, sub-order pomeae, having a 5-cleft calyx with leafy segments, nearly round petals, a large honey-secreting disk, and 3 to 5 styles, united together in the flower, but widely separated on the fruit, the upper ends of the bony cells of which are exposed. The common *Medlar* (*M. germanica*), a large shrub or small tree, spiny in a wild state, but destitute of spines in cultivation, is a native of the s. of Europe and of the temperate parts of Asia, but is a doubtful native of Britain, although it is to be seen in hedges and thickets in some parts of England. It has lanceolate leaves, not divided nor serrated, solitary large white flowers at the ends of small spurs, and somewhat top-shaped fruit, of the size of a small pear or larger, according to the variety. The Medlar is much cultivated in some parts of Europe, and is common in gardens in England, but it does not generally ripen well in Scotland without a wall. It is very astringent, even when ripe, and is not eaten till bleated, when its tough pulp has become soft and vinous by incipient decay.

MEDLEY, John, D.D.: b. England, 1804; educated at Oxford university, where he took the degree of B.A. with high honors at Wadham college in 1826, and the degree of M.A. in 1830. After taking orders in the church of England, he obtained, and for some years held, a living at Exeter, and was soon after made precentor of the cathedral in that town. In 1845 he was made bishop of the newly formed diocese of New Brunswick, and was the first to hold that position.

MÉDOC. See French Wines.

MEDOWS, Sir William, 1781-1813; b. in England; in 1756 entered the British army, in which he served for many years; first in Germany, then in the war with the American colonies, where he commanded the 55th regt., but was soon placed at the head of the 1st brigade of grenadiers and distinguished himself by his bravery at the battles of the Brandywine and St. Lucie. He afterward resided in India from 1781 to 1793; where he occupied several posts of responsibility, and was governor of Madrid from 1790 to 1792. His military renown was greatly increased by gallant conduct at the siege of Seringapatam and the rank of lieut. gen. was conferred upon him. After his return to England he for some time was governor of the Isle of Wight, and afterward succeeded Cornwallis as commander-in-chief in Ireland, (1801-03).

MEDULLA OBELONGA. See Brain.

MEDULLARY RAYS. See Exogenous Plants and Pith.

MEDULLARY SARCOMA is one of the synonyms for that variety of cancer (q. v.) which is also known as encephaloid, cellular cancer, medullary cancer, fungus medullarii, etc. It grows more quickly, distributes itself more rapidly, and attains a more considerable bulk than any other form of cancer, tumors of this nature being often as large as a man's head, or even larger. Of all forms of cancer, it runs the quickest course, soonest ulcerates, is the most malignant, and causes death in by far the shortest time, often destroying life in a few weeks, or, at furthest, in a few months after its first appearance, unless it has been removed by an operation at an early stage.

When it ulcerates, fungoid growths form upon the surface; they are extremely vascular, and bleed on the slightest provocation. In this state, the disease has received the name of fungus homatoedes.

MEDULLA SPINALIS. See Spinal Cord, ante.

MEDUS&A. See Acaphele, and Generations, alternation of.

MEDUSA. See Gorgo, or Gorgon, ante.

MEDWAY, a river of England, rises near the northern border of the co. of Sussex, and, after a u.e. course of upwards of 50 m., it joins the Thames at Sheerness. At Penshurst, 40 m. from its mouth, it becomes navigable. The chief towns on its banks are Maidstone, Rochester, Chatham, and Sheerness. Large vessels do not ascend above Rochester bridge, but below that the river widens into an estuary, and forms an important harbor for the navy.

MEDWAY, a t. in Norfolk co., Mass., on the Charles river, and the Woonsocket division of the New York and New England railroad; pop. 3,721. It has 6 churches, 8 schools, 4 public halls, a library, a savings bank, 2 weekly newspapers, and manufactures of boots and shoes, brick, cotton and woolen goods, leather, organs, bells, etc.

MEEANE, or MIYANI, a village in Sinde, Hindu-stan, on the Indus, 6 m. n. of Hyderabad, is celebrated as the scene of a great battle fought between Sir Charles Napier and
the ameers of Sinde, Feb, 17, 1843. Sir Charles’s force, composed partly of Europeans, and partly of natives, amounted to only 2,800 men; that of his foes 22,000, yet the latter were totally routed, losing in killed and wounded 5,000 men. Sir Charles’s loss was only 296. The result of this victory was the conquest and annexation of Sinde.

MEEK, ALEXANDER BEAUFORT, 1814-63; b. S. C.; was a graduate of the university of Alabama; and having studied law, was admitted to practice at the bar of the state in 1835. At this time he inter rested himself in politics, and edited a democratic paper called the Flag of the Union. He served as a lieu tenant of volunteers in the war against the Seminoles in 1836. He was afterwards attorney-general of the state, and in 1839 edited a literary monthly at Tuscaloosa called the Southern. He was made county judge in 1842; in 1843 became a clerk in the office of the solicitor of the treasury in Washington; was U. S. district attorney for the southern district of Alabama 1846-50; and in 1853 was a member of the state legislature, having been also for 5 years associate editor of the Mobile Daily Register. In the legislature judge Meek distinguished himself by organizing and establishing the free-school system in Alabama. He was judge of probate in Mobile county in 1854; and in 1859 was again in the legislature, and held the office of speaker. He wrote and published several volumes of poems, sketches and other fugitive efforts, besides having compiled a history of Alabama. He was an enthusiastic and very able chess-player, and was one of the foremost contestants in the first chess tournament, held in New York in 1857, when he met on equal terms such players as Morphy, Paulsen, Marasche, Fiske, Thompson, etc.

MEEKER, a cc. in central Minnesota, drained by the North Fork of the Crow river, on the S. Paul and Pacific railroad; 560 sq. m., pop. 80, 11,730—7,567 of American birth. The surface is diversified, and much of it heavily wooded with maple, elm, ash, and oak. The soil is fertile and produces large crops of wheat, oats, and Indian corn. There are a number of saw and flouring mills. County seat, Litchfield.

MEEKER, Joseph RUSLING, b. Newark, N. J., Apr. 27, 1827; educated at common schools in Cayuga county, N. Y. Early showed a taste for painting. After 3 years’ study in New York, 1845-48, he went to Buffalo, opened a studio, and was an associate there with W. H. Beard and Thomas Le Clear, also artists. From 1853 to 1859 he worked at Louisville with moderate success, and in 1859 went to St. Louis. On the breaking out of the rebellion he joined the navy service as paymaster. While on a gun-boat on the lower Mississippi river he first saw those weird swamp and lowland forest scenes from whose sketches of which he has since made numerous paintings in a field all his own, with felicitous rendering of the dreamy languor in the lazy air of oppressive swamps, and moss-draped groves of oak. At the close of the war he was one of the founders of the St. Louis art society, and thrice its president; also an active member of the St. Louis academy of fine arts. He is the writer of an article on Turner in the Western Magazine (Dec., 1877), St. Louis.

MEERA NE, a prosperous manufacturing t. of Saxony, in the circle of Zwickau, 10 m. n. of the town of Zwickau. Until within the last few years, it was an unimportant, small country town; but it has recently increased rapidly in size and importance, through the development of its industrial resources. Its pop., in 1849, was 7,345; 1858, 11,147; 1861, 13,826; 1875, 21,377. The manufactories produce, almost exclusively, woven and mixed fabrics; and employ about 15,000 looms, of which about 3,000 are in the town itself, and the rest elsewhere. There are upwards of 100 manufactories, the yearly products of which are estimated at upwards of £2,000,000. A large export trade is carried on with England, France, and America, three of the principal firms having set up establishments in New York. There are some large tanneries in Meerane. The town itself has within the last few years been very much improved.

MEERMAN, Gerard, Baron, 1732-71, b. Holland; studied jurisprudence at Leyden, and soon acquired a reputation as a learned law writer. He held but two public offices, that of pensionary of Holland, to which he was nominated in 1748; and of envoy to England, whither he was sent in 1757. The rest of his life was spent in researches on law or the art of printing. On the latter subject he wrote his Origines Typographiae, 1765, wherein he claimed for his countryman Lawrence Koster the honor of the invention of printing. His great legal work is the Novus Theaurus Juris Civis et Canonici, which appeared from 1751 to 1754, in 7 volumes.

MEERSCHAUM, a mineral existing in many parts of the world. In Europe, it is found chiefly at Hrubisch in Moravia, and at Schastopol and Kaffa in the Crimea; and in Asia it occurs abundantly just below the soil in the alluvial beds at Kitzisch and Bursa in Natolia; and in the rocks of Eski-Hissar in the same district, it is mined so extensively as to give employment to nearly a thousand men. Meerschaum, from its having been found on the sea-shore in some places, in peculiarly rounded snow-white lumps, was ignorantly imagined to be the petrified froth of the sea, which is the meaning of its German name. Its composition is, silica, 60.9; magnesia, 26.1; water, 12.0. Almost all the meerschaum found is made into tobacco-pipes, in which manufacture the Germans have been for a long time pre-eminent. Vienna contains many manufactories, in which some very artistic productions are made; and pipes worth a 100 guineas, from the beauty of their designs, are by no means uncommon. The French pipe-makers have lately used meers-
schaum, and have lately displayed great taste in their works. When first dug from the earth, meerschaum is quite soft and soap-like to the touch, and as it lathers with water, and removes grease, it is employed by the Turks as a substitute for soap in washing. The waste in cutting and turning the pipes was formerly thrown away, but it is now reduced to powder, mixed into a paste, and compressed into hard masses, which are carved into inferior pipes.

MEERUT, Meerut, or Mirut, a t. district, and division of British India. The town is the chief town of the district and province, and is on the Kulli Nudul, about 43 m. n.e. of Delhi. Its most important edifice is the English church, a fine building, with an excellent organ, and large enough to accommodate 3,000 persons. The climate of Meerut is healthy. Pop. '71, 79,378. The cantonment is situated 2 m. to the east; on the opposite side of the stream are quarters of the native infantry. Here, on May 10, 1857, the native troops revolted, shooting their own European officers, firing the bungallows, and massacring the European inmates without respect to age or sex. The district of Meerut has an area of 2,368 sq.m., and a pop. '71, of 1,273,914. The division of Meerut lies in the n.w. provinces; area, 10,947 sq.m.; pop. '71, 4,978,100.

MEETING, an assembly of people called with a view to deliberate on some specified subject, or to accomplish some specified purpose. The proceedings begin with the choice of a chairman, or presiding officer, and consist in the proposing and seconding of resolutions, on which the voice or vote of the meeting is taken. The chairman, in addition to his deliberative vote, is often entitled to give a second or casting vote, in case of equality. Any number of persons may in this country assemble for any purpose not in itself illegal; but the use of force or violence, or any tendency towards it, may entitle the authorities to interfere with a meeting, as an unlawful assembly. Meetings called, not officially, but by private arrangement, are looked on in the continent as a characteristically English institution; in most parts of the continent, the right of holding such assemblages is more or less restricted by law.

MEETING, is the name applied by the society of Friends to their various assemblies for worship and for the management of official business. 1. To their usual gatherings on several days of the week for worship, meditation and instruction. 2. The monthly meeting is an assembly of members from several contiguous congregations, charged with making provision for the poor and for the education of children; with the admission of persons desirous of joining the society; with giving attention to the proper performance of religious and moral duties among Friends; and with the administration of needed discipline. In this last duty is included the appointment of committees to see that the rules are observed and to settle difficulties among members by private admonition and counsel so as if possible to prevent their being brought before the meeting. And even when cases are introduced to the meeting similar committees are appointed to settle them informally if possible. In all disputes the practice of the society is to refrain from going to law. It therefore directs all its members to harmonize their differences by prompt and impartial arbitration. To the monthly meeting belongs the allowing and solemnizing of marriages. It keeps a record of marriages, births, and deaths among its members. 3. The quarterly meeting is composed of several monthly meetings. It receives answers from the monthly meetings to questions it had sent to them concerning the conduct of their members and of the care taken of them. The statements thus received are digested into a report, also expressed in answer to inquiries previously received, sent by representatives to the yearly meeting. The quarterly meeting receives appeals from the judgment of monthly meetings and has supervision over their neglect of discipline and care. 4. The yearly meeting has the general superintendence of the society in the country in which it is established; and therefore as the accounts which it receives discover the state of inferior meetings, as particular exigencies require, or as the meeting is impressed with a sense of duty, it gives forth its advice, makes such regulations as appear to be requisite, or excites to the observance of those already made, and sometimes appoints committees to visit those quarterly meetings which appear to be in need of immediate advice. At the yearly meeting a sub-committee called the morning meeting is appointed to revise the official manuscripts prior to their publication and also to grant in the intervals of the yearly meeting certificates of approval to those ministers who "have a concern to travel in the work of the ministry in foreign parts in addition to those granted by their monthly and quarterly meetings. Appeals from the quarterly meetings are heard by the yearly meetings. There are 10 such: in London, Dublin, New England, New York, Pennsylvania, Maryland, Virginia, the Carolinas, Ohio, and Indiana.—The Quarterly Meeting in the Methodist church is a general meeting of the stewards, leaders, and other officers, for the purpose of transacting the general business of the "circuit" or "district." In the Methodist Episcopal church it is presided over by the "presiding elder," or by the minister in charge. Its special object, in addition to celebrating the love-feast, is to examine the spiritual and financial condition of the church.

MEGACEROPS, an extinct genus of animals found in the miocene formation of Colorado by prof. O. C. Marsh of Yale college. They belong, with other genera, titanotherium, dicodon, and brontherium, to the family Bromotheridae of Marsh, which have four nearly equal toes in the fore feet, and three in the hind feet, as in the tapirs. In size and conformation of skeleton they resemble the elephants, but they had shorter
limbs and probably no proboscis, but a tapir-like nose. Skull elongated, brain cavity very small, the cerebral hemispheres scarcely covering the olfactory lobes. A pair of horn cores is placed transversely upon the maxillary bones in both sexes. They belong to that section of the order of ungulates called perissodactyls, (q.v.).

MEGACEROS HIBERNICUS, or great-horned Irish elk, an extinct species of gigantic deer whose bones are found in the quaternary deposits of marl in the peat swamps of Ireland, and also of England, as well as in bone caverns. The largest were 11 ft. in height to the tips of the antlers, which were 12 ft. across. The females had no antlers. The bones were proportionately stronger than in living species; and the cervical vertebrae of the males were very heavy for the purpose of carrying the massive horns. The dentition was of the ordinary ruminant type. They are regarded as intermediate between the reindeer and fallow-deer, and their fossils are exclusively post-tertiary, but not extending to the historic period.

MEGADACTYLYS, a name given by prof. Edward Hitchcock to an extinct genus of bird-like reptiles whose fossils are found in mesozoic formations of the Connecticut valley. The leg bones of one of these were slender and hollow, and the walls thin and dense, as in birds. Its tracks were for a long time, with others in the same locality, regarded as those of birds.

MEGADERMA. See Bat, ante.

MEGALICHTHYS (Gr. great fish), a genus of fossil heterocerous ganoid fishes, so named from their large size, compared with the other fish of the period. They were covered with large strong rhomboid scales, composed externally of brilliantly polished brown enamel, usually granulated, as in the scutes of the recent crocodile. These scales have been found as large as 5 in. in diameter. The head was defended by similar strong plates, and the jaws were furnished with immense laniary teeth, of a size rarely attained, even in the largest modern reptiles, and so closely resembling them, that they were for sometime considered as having belonged to some crocodilian animal. These teeth, specimens of which have been found measuring 4 in. long and two broad at the base—were smooth at the point, had a long furred root, and a hollow base, in which the new tooth was prepared. Numerous smaller teeth were scattered over the jaw among the large ones. The fish of this genus must have been the terror of the seas they inhabited. Their strong skeleton, large tail, powerful head, and ferocious jaws remarkably suited their carnivorous habits.

Three species have been described from the carboniferous strata of Edinburgh, Glasgow, and the center of England.

MEGALONYX. See Megatherium, ante.

MEGALOPOLOIS, the later capital of Arcadia, in the Peloponnesus, was situated on the river Helisson, in the center of a spacious plain on the n.w. border of Arcadia. It is said to have been founded in 370 B.C.; being suggested by Epaminondas, after the battle of Leuctra and designed to become the capital and stronghold of the Arcadian confederation against Sparta. It occupied three years in building, and was then settled by drawing upon the population of 40 different towns. The number of inhabitants was insignificant in comparison to the size of the city, and the latter never rose to the height of importance that was anticipated for it. The Theban supremacy being overthrown, it was forced to ally itself to Macedonia, in order to strengthen itself against Sparta. In 222 B.C., the Spartan king, Cleomenes III, surprised the city, and a large number of its magnificent buildings were destroyed. Some of its inhabitants were put to the sword, and the remainder fled to Messene. Later on the fugitives returned and rebuilt their city, which, however, never after recovered its former importance. Megalopolis was the birthplace of the celebrated Greek gen. Philopomen, who fought bravely in defense of the city against the Spartan king Cleomenes. Polybius, the Greek historian, was also a native of Megalopolis, his father being the head of the Achaean league after the death of Philopomen. A statue in honor of Polybius was erected in his native city during his life.

MEGALOSAURUS (Gr. great lizard), a genus of fossil dinosaurs, or land-saurians, of gigantic size and carnivorous habits, whose remains occur in the rocks of the oolite period. The huge body of the animal was supported on four large and strong ungulate limbs; specimens of the femur and tibia have been found measuring each nearly 3 ft., giving a total length of almost two yards to the hind leg; and a metasternal bone 13 in. long shows that the foot had a corresponding magnitude. The sacrum was composed of 5 vertebrae, ankylosed together, as in the other dinosaurs. Buckland calculated that the megalosaurus must have been 60 or 70 ft. long; but it is not likely that a reptile raised so high above the ground would have its body and tail so large in proportion to its limbs, as in our modern lizards or crocodiles. There seems good reason for rather accepting Owen's more moderate estimate of 30 ft., as its whole length. A fragment of the lower jaw, containing several teeth in position, tells of its carnivorous habits. Only a single species has been referred to this genus. Its remains are abundant in the Stonesfield slates, in the lower oolite of Gloucestershire, and in the Wealden and Purbeck limestones.
MEGAN'TIC, a co. in Canada, Province of Quebec, intersected in the w. by the Grand Trunk railway; 745 sq.m.; pop. 18,878. Its surface is undulating and drained by lake St. Francis, lake Inverness, lake Joseph, and lake William, the Becancour river, and the River du Chene. Its mineral products are iron and copper, which are found in abundance. It has tanneries, grist and saw mill; and fulling mills. County seat, Leeds village.

MEGAPHONE, a combination of the speaking-trumpet and ear-trumpet, devised by Mr. Edison. It consists of two large funnels, each about 7 ft. long and 34 ft. across the mouth, and connected at the smaller end with a flexible tube having a tip suitable to apply to the ear. Slight sounds may be heard at a distance of over 1000 feet. By the use of a large speaking-trumpet a conversation may be carried on between two stations two miles apart.

MEGAPODIDE, a family of birds, referred by some naturalists to the order gralliro, but more generally to the gallinaceous order, being regarded as allied to the curassows, etc. They are large and have large blunt claws. To this order belong the genera megapodius (see JUNGLE-FOUL), loipoa (q.v.), talegalla (q.v.), etc. The order is peculiar to New Holland and the neighboring islands.

MEG'ARA (MEGARIS, ante) was about 20 m. n. w. from Athens and built at the base of two hills, Caria and Aleathous, each defended by a citadel. Two walls, built by the Athenians during their protectorate over Megara, between 461 and 445 B.C., ran down from the city to its harbor, Nisaea. In the time of Pausanias, the Megarian capital had many temples and public buildings, of which only the most scanty ruins have been preserved. According to its local legends, the city was named for its founder, Megarus, a Boeotian, son of Apollo. Its walls, which were razed by Minos, were said to have been rebuilt by Aleathous, the son of Pelops. Hyperion, son of Agamemnon, is represented as the last king, after whose death the government became republican. In historic times the city seems to have been under the power of the Athenians, from whom it was wrested by Dorians from the Peloponnnesus. It was now colonized by Messenians and Corinthians, and adopted Dorian institutions. At a time not definitely known it ceased to be subject to Corinth, and as an independent state rose to a high degree of power. It sent out many colonies, of which the most famous were Byzantium, Chaledon, and the Sicilian Megara. It rivaled Athens as a naval power, and for a long time kept possession of Salamis, in spite of the continued efforts of the Athenians to recapture it. The government had originally been in the hands of the Dorian landed aristocracy, from whom it was usurped about 620 B.C. by Theagenes, who led the popular faction, and established himself as absolute ruler of the state. Upon his expulsion, soon after, a fierce contest took place between the democratic and aristocratic parties, of which Theognis, a bitter partisan of the latter, has given an account in his poems. After the Persian wars, Megara carried on hostilities with Corinth, against which she formed an alliance with Athens 461 B.C. But in 455 the Megarians repudiated the Athenian alliance, and put to death the Athenian garrison which had been stationed at Megara. In the seventh year of the Peloponnesian war the democratic party in Megara, fearing that the aristocratic faction would take advantage of the Lacedaemonian alliance to re-establish an oligarchy, resolved to surrender the city to the Athenians. An Athenian army captured Nisaea, but the arrival of Brasidas with a force of Lacedaemonians prevented the surrender of Megara. From this time Megara is but little heard of in history. A democratic form of government was re-established in 357; after the death of Alexander the great, the city passed into the control of Demetrius Poliorcetes and Ptolemy Soter successively. Demetrius, the son of Antigonus Gonatas, captured and nearly destroyed it. It was afterwards partially rebuilt, and finally surrendered to the Romans under Metellus. Alone among the cities of Greece it was not restored by Hadrian; Alaric still further reduced it, and in 1687 the Venetians completely destroyed it.

MEGARIC SCHOOL. See EUCLID.

MEGARIS, a small mountainous region of Hellas, or Greece proper, bounded by Attica, Corinth, and the sea. It formed the north-eastern part of the isthmus of Corinth. The capital was Megara, famous amongst the ancients for its white-shell marble, and for a white kind of clay, of which pottery was made.—From Euclid, the philosopher, who was born at Megara about 400 B.C., the MEGARIC SCHOOL took its name.

MEGASTHENES (Gr., great strength), a name given by prof. J. D. Dana to a grand division of the higher mammals of a superior and powerful type. It includes the quadrumana, carnivora, herbivora, and cetaceans. He has given the name microstethes to inferior mammals, as the bats, insectivora, rodents, and edentates. There is a parallelism between these two divisions, the bats in the latter representing the monkeys in the former; the insectivora the carnivora; the rodents the herbivora, and the edentates the cetaceans. The marsupials and monotremes form a lower, or semi-oviparous division, while man forms the highest division, the archonts.

MEGASTHENES, a Greek writer in the time of Seleucus Nicator, about 300 B.C. Seleucus sent him on a diplomatic mission to Sandroccottus, king of the Prasi, a people in India. There he spent a number of years, and on his return to Syria, gave a general historical and geographical account of India, including the first description of Ceylon.
His work is known only in such fragments of it as are quoted by Strabo, Arrian, and Elian. The former did not set a high estimate on the accuracy of Megasthenes. It is certain, however, that the works include much information in regard to the geography and social condition of Indian peoples previously entirely unknown to the Greeks.

MEGATHERIIDE, a family of extinct mammals of the order Edentata, named by prof. Owen, and containing several genera. Pictet gave it the name græcigrades, placing it between the sloths and the armadillos. There are nine or more genera, 1 megatherium, 2 celodons, 3 leostodon, 4 megalonyx, 5 mylodon, 6 scelidotherium, 7 sphérodon, 8 megalocnus, 9 myomorphus. See Megatherium, ante.

MEGATHERIUM (Gr. great beast), a gigantic extinct quadruped of the order Edentata, nearly allied to the sloth, found in the superficial stratum of the South American pampas. In structure, it is very near its modern representative, except that the whole skeleton is modified to suit the requirements of an immense heavy-boned and heavily-bodied animal, some 18 ft. in length and 8 ft. in height. The appellation tardigrade, which Cuvier applied to the sloth, cannot be given to the megatherium; its limbs were comparatively short and very strong, and the feet adapted for walking on the ground, approaching in this respect nearer to the allied ant-eaters, but with this peculiarity, that the first toe of each of the hind feet was furnished with a large and powerful claw, which was probably used as a digger to loosen roots from the soil, and enable the creature the more easily to overturn the trees on the foliage of which it browsed. The enormous development of the bones of the pelvis, the hind legs, and the tail, gave the animal great power when, seated on its hind legs and tail, as on a tripod, it raised its fore legs against the trunk, and applied its force against a tree that had already been weakened by having its roots dug up. The structure of the lower jaw seems to indicate that the megatherium was furnished with a huge prehensile tongue like that of the giraffe, with which it stripped the foliage from the trees.

The remains of several allied genera of huge edentata are associated with the megatherium in the pampas deposits. They form the family megatheridiæ of Owen, which includes mylodon, megalonyx, seledotherium, etc., genera which are separated from megatherium chiefly from peculiarities in the dentition.

The modern sloth is a native of South America, and the fossil remains of these immense creatures, which represented it in the newer territories, have been found only in this continent, the present and past distribution of the family being the same.

MEGIRLE, Ulrich von. See Abraham A. Sancta Clara, ante.

MEGIRI (Gr. hemierania, the migraine of the French) is the popular term for neuralgia occupying one half of the head, or more commonly only the brow and forehead of one side. It is often periodical, coming on at a certain hour, lasting a certain time, and then entirely disappearing for a fixed interval. It may be induced by any cause that debilitates the system; it not unfrequently attacks women who have suckled their children too long; or it may be associated with hysteria; or it may arise, like ague, from marsh miasma; and sometimes no exciting cause can be detected.

When it is associated with anemia (paleness and general debility), it should be treated with the preparations of iron, the shower-bath, nourishing food, and plenty of exercise in the open air. When it is strictly periodical, quinine in full doses should be tried (the blood being frequently well cleansed); and if the quinine fails, Fowler's solution of arsenic, given in small doses (three minimis in a wine-glassful of water), three times a day, after meals, will be almost sure to remove it.

MEGIRMS—VERTIGO are the terms usually applied when a horse at work reels, and then either stands for a minute dull and stupid, or falls to the ground, lying for a time partially insensible. These attacks come on suddenly, are often periodical, are most frequent during hot weather, and when the animal is drawing up a hill, or exposed during heavy work to the full rays of a hot sun. Liability to megrim constitutes unsoundness, and usually depends upon the circulation through the brain being temporarily disturbed by the presence of tumors. Horses subject to megrims are always dangerous; if driven at all, they should be used with a breastplate or pipe-collar, so as to prevent, as much as possible, pressure on the veins carrying the blood from the head: they should be moderately and carefully fed, and during hot weather have an occasional laxative.

MAIADIA, the ancient Thurne Hercules, a t. of Hungary, 6 m. w. of Roumania, 15 m. n. of Orsova; pop. 1800. Since the time of the Romans it has been noted for its baths. The sulphurous springs are beneficial in gout and other diseases. They are annually frequented by many visitors.

MEHEMED or MEHMET Ali, also Mohammed Ali, Viceroy of Egypt, was b. in 1769 at Kavala, a little town in Macedonia, entered the Turkish army at an early age, and, in 1799, was sent to Egypt at the head of a contingent of 300 troops to co-operate with the British against the French invaders. Here his fine military qualities rapidly developed themselves, and he at length became commander of the Albanian corps d'armée in Egypt. In 1806 he was recognized by the porte as viceroy of Egypt, and pusha of Three Tails; but was soon involved in disputes with the Mamelukes, who had long practically ruled Egypt. The struggle was finally terminated in 1811, by the mas-
sacre of the greater number of these at Cairo. The rest fled to Upper Egypt, but were expelled by Mehemed in the following year. They then took refuge in Nubia from their remorseless foe, but in 1820 he followed them thither, and they were utterly exterminated.

The Porte now felt alarm at his growing power, and with a view to break it, intrusted him with the command of an expedition against the Wahabs, a religious sect of Arabia. But the victories of his son, Ibrahim Pasha (q.v.), only rendered him more powerful, and his authority extended itself over a great part of the Arabian peninsula. Shortly after, he conquered Kordofan, added it to his dominions, and opened up a great trade in black slaves from the interior of Africa. About this time he began to reorganize his army on something like European principles, built a fleet, and erected fortresses, military workshops, and arsenals. His ambition, however, received a severe check by the total destruction of his new navy at Navarino, in 1827. In 1830 the Porte conferred on him the government of Caudia, but this did not satisfy him; and in the following year, on a frivolous pretext, he sent out an army for the conquest of Syria, under Ibrahim Pasha, who, by his victory at Konieh (Dec. 29, 1832), brought the Turkish government to the brink of ruin. The European powers now stepped in, and a treaty was concluded (May 4, 1833), by which Syria was ceded to Mehemed, on condition of his acknowledging himself a vassal of the sultan. Neither of the belligerents was satisfied, and Mehemed continued to plot in his usual secret and crafty style, till sultan Mahmud was obliged in 1839 to declare war against his dangerous subject. The European powers again interfered, and Mehemed saw himself compelled to give up all his claims to the possession of Syria, and to content himself with getting the pashalie of Egypt made hereditary in his family.

If the infirmities of age had not now begun to tell upon Mehemed, he might have become what many in fact have pronounced him to be—the regenerator of Egypt. He thoroughly cleared the country of the Wahabs, the Nubians and the Arab tribes, and the coffee and the cotton, and the indigo are said to have been multiplied a thousandfold. His statesmen were also extremely skillful in finances. With an eye to the future, he planted large plantations, and he laid the foundations of a modern army.

MEIJHUL, ÉTENNE HENRI, 1763-1817; b. at Givet, France. At the age of 10 he was organist of his native village and was soon after destined for the church. The advent of a regiment and martial music fired his worldliness, and he found means to reach Paris. There, after fighting the unexpected misery of cold and hunger, at the age of 17 he attracted the sympathy of Glűck, the composer. After several unsuccessful efforts his Erkphonos et Cordadis achieved fame in 1790, and other compositions previously written were then brought to light. Stratonoce appeared in 1792, and this was followed by patriotic national hymns for the army of the republic, entitled Le Chant du Départ; Le Chant de Victoire; Le Chant du Rêveur, which won him high popularity. Other works appeared in rapid succession: in 1803 Uthai; afterwards Une Fiebre, ou les Aveugles de Touléde; and in 1817 Joseph, his most esteemed composition. Died in Paris.

MEIAPON'TÉ, a t. of Brazil, in the province of Goyaz, about 80 m. e.n.e. of the town of Goyaz, on the river Almas. In the neighborhood are some gold mines; and the district produces millet, barley, cotton, tobacco, and sugar. Pop. 8,000.

MEIGGS, HENRY, 1811-77; b. N.Y.; was in New York, engaged in the lumber business, in 1833, and failed in the commercial crisis of 1837. He, however, made another effort in the same business in Williamsburg, L. I., was for a time successful, and was elected president of the board of trustees of the town; but in 1842 he again failed, and it was not until the outbreak of the gold excitement in California that he again became seemingly prosperous. He shipped lumber in large quantities to the Pacific coast; and his trade so increased that he was encouraged to build a large number of vessels, until, at length, a financial stringency in the San Francisco money market drove him to borrowing, and eventually his business collapsed, and he fled to South America. He settled in Chili, and entered into the business of a contractor for building bridges; and, by one of his contracts with the government of Chili, made a profit of $1,300,000. He afterwards devoted himself to railroad construction, and in Peru accomplished engineering works which are objects of general admiration. He made contracts for the construction of six railroads in that country, one of which, the Callao, Lima and Oroya railroad, ranks among the first public works of the kind in the world. It is recorded to the honor of Mr. Meiggs that, having by his industry and enterprise succeeded in greatly improving his impaired fortune, he returned to San Francisco and arranged to discharge all the obligations which were in existence there against him. He was a man of refined tastes; greatly interested in art, in which he was a connoisseur; and at the time of his residence in New York city was president of a prominent musical association.

MEIGS, a co. in s.e. Ohio; drained by branches of the Ohio river, which separates it on the s. and s.e. from West Virginia; 490 sq. m.; pop. '80, 32,385—2,273 of foreign birth. The surface is uneven and in large part covered by forests of valuable timber; wheat, hay, corn, and oats are staples. Bituminous coal, salt, and limestone are found; in 1870 over 200,000 tons of coal were mined. Chief town, Pomeroy.
MEIGS, a co. in e. Tennessee; drained by creeks emptying into the Tennessee and Hiwassee rivers, which bound it on the n.w. and s.; the East Tennessee, Virginia and Georgia railroad runs near the s.e. boundary; 235 sq. m.; pop. '80, 7,117—810 colored. The Blue Ridge mountains cover much of the surface, and the hill-slopes and bottom-land is well fitted for raising corn. The climate is very invigorating. County seat, Decatur.

MEIGS, Benjamin C., 1789-1862; b. Conn.; graduated at Yale college in 1809; at Andover theological seminary in 1812; was ordained in 1815; sailed as a missionary of the American board; reached Ceylon in 1816. He was stationed for many years at Tiltipally. Returning for the second time to America in 1858, on account of ill health, he died in N. Y. He was a man of kind, conciliatory spirit, sagacious in judgment, and greatly esteemed by the natives as well as by his missionary associates.

MEIGS, Charles Delcena, 1792-1869; b. at St. Georges in the Bermuda islands; educated as a physician, taking degrees from both the university of Pennsylvania and the college at Princeton (1818). In 1820 he began practice in Philadelphia and was chosen a professor in the Jefferson medical college in 1849, a position which he held for 22 years. He was specially skilled in obstetrics and the diseases of women and children, to which he devoted most of his time. He published several treatises on these and kindred subjects, and also, in 1852, a memoir of Samuel G. Morton, M.D.

MEIGS, James Aitken, b. Philadelphia, 1829; received a medical degree from the Jefferson medical college, and in 1857 was appointed to the professorship of the institutes of medicine in the medical college at Philadelphia. In 1859 he was called to a similar position in the Pennsylvania medical college, whence he removed in 1868 to become a professor in the Jefferson medical college. Besides a number of scientific papers, he has published an edition of Kirke's Manual of Physiology.

MEIGS, Montgomery Cunningham, b. Ga. 1816; received his education at the university of Pennsylvania and the U.S. military academy, graduating at West Point, July, 1836, and receiving the appointment of second lien, in the artillery. In the following year he was exchanged into the corps of engineers, in which corps he became first lieut. in 1838 and capt. in 1853. During the period between his graduating and the year 1852 he was employed in various important engineering undertakings on the part of the war department, including the building of fort Delaware and the Delaware breakwater, improvements of the Delaware bay and river, the construction of fort Wayne, Mich., and forts Porter and Niagara, N. Y., and fort Montgomery, N. Y. In 1852 and for 8 years thereafter he was employed in superintending the Washington and Georgetown water-works, a magnificent engineering enterprise, by means of which those cities were supplied with water from the Potomac river by means of the Washington aqueduct. During this period he also superintended the erection of the capitol extension in Washington and the post-office extension, as well as the great iron dome of the capitol. In the early part of the winter of 1859 he was dispatched to forts Jefferson and Taylor, in Florida, with orders to place them in a position for defense, and in the following spring was made chief of the fort Platte department. On May 14, 1861, he was appointed col. 11th infantry; and May 15 quartermaster-gen. of the U.S. army, with the rank of brig. gen. In this important position gen. Meigs had the direction of the supply and equipment of the United States forces in the field during the continuance of the war. He was frequently obliged to make personal inspection of the quartermaster's department of the various armies during siege and field operations, this being particularly the case at Chatanooga in 1863 and during the battles of the Wilderness in 1864. On July 5, 1864, he was brevetted maj. gen. In Jan., 1865, he superintended the refitting of the army of gen. Sherman after its return from the march to the sea. In 1867 and '68 he made an inspection of the departments of the west and the Pacific coast; and in 1875 was sent to Europe on a special mission of examination of the staff department of the European armies.

MEIGS, Return Jonathan, 1740-1823; b. at Middletown, Conn.; he was engaged in the attempt on Quebec under Arnold, holding the rank of maj., and was there taken prisoner. After his exchange in 1776 he became col. of a regiment raised in the following year by his own exertions, and served with great credit in the actions of Sag Harbor and Stony Point. He was naturally of an enterprising and restless spirit and was one of the first emigrants to that part of Ohio known as the Connecticut Reserve; settling at Marietta in 1788. He was commissary-gen. under Wayne in the Indian campaigns, and in 1801 was made an Indian agent by the government. It was while employed in this capacity at the Cherokee agency in Georgia that his death took place. In 1776 col. Meigs published in the American Remembrance an account of the Quebec expedition, which has been reprinted (N.Y., 1864).

MEIGS, Return Jonathan, Jr., 1765-1835; b. Middletown, Conn.; graduated at Yale in 1782; went with his father to Marietta, O., in 1788, and entered upon the profession of the law. He was chief-justice of the supreme court of Ohio in 1803-4; brevet col. of the U.S. army, serving in Louisiana 1804-6; a judge in Louisiana 1805-6; and U.S. district judge in Michigan 1807-8. He was U.S. senator from Ohio 1808-10; governor of that state 1810-14, and U.S. postmaster-general 1814-18. Died at Marietta.
MEINERS, CHRISTOPHT, 1747-1810; b. Ottendorf, Hanover. Little is known of his early life. He was educated at the University of Göttingen, where he was appointed professor of philosophy, and afterwards rector. Of his numerous historical works the following are the most important: Resolution der Philosophie; Versuch einiger Bemerkungen über die Geschichte der ältesten Völker besonders Ägyptens; Historia Doctrina de Vero Deo; Geschichte des Verfalls der Sitten und Staatsverfassung der Römer. Besides his own works, he edited in connection with J. G. Feder Philosophische Bibliothek, 4 vols.; and with Spittler Göttingisches Historisches Magazin; Neueres Magazin, 3 vols. Most of his works were designed to show the difference between past and present morals.

MEININGEN, the capital of the duchy of Saxe-Meiningen-Hildburghausen, lies in a narrow valley, on the banks of the Werra. Pop. 75, 9,521. The ducal castle, built in 1681, contains a fine library and several art collections. The "English garden" attached to it is one of the finest in Germany. Meiningen has almost no trade.

MEISSEN, one of the oldest towns in the kingdom of Saxony, is situated on the left bank of the Elbe, 15 m. below Dresden. Its chief building is the cathedral, the finest Gothic church in Saxony, surmounted by an exquisite spire of open-work, and containing many monuments of very early times. There are here a number of bronzes which has not been restored to more dignified uses. The famous porcelain factory, now provided with more suitable premises, employs about 400 hands. Other manufactures are iron, machinery, pottery, and ivory-carving. Pop. 75, 1892.

MEISSNER, AUGUSTUS GOTTLIEB, 1738-1807, b. Silesia; educated at Wittenberg and Leipzig, where he studied law. He was for a time a chancery clerk, and curator of the Dresden archives. In 1785 he was appointed to the chair of classical literature and aesthetics in the University of Prague; and for the last two years of his life he was director of the Fulda high school. He translated a number of dramatic pieces from Molière, and Destouches, and was himself, the author of three fairly successful operas, The Mythis of Graves; The Alchemist; and The Beautiful Arsene. But his most popular work is his Sketches, 14 series of which were published between 1778 and 1796. They are a collection of miscellaneous stories, dialogues, anecdotes, and essays. These pieces were extensively translated and imitated in other languages, and a few of them were included by Thompson in his German Miscellany. Of a similar plan and character are the Tales and Dialogues, which appeared from 1781-89. Besides these smaller works Meissner wrote a number of romances, and historical novels of considerable length, such as Alcobadiis; Masaniello; Bianca Copello; and Spartacus.

MEISSONIER, JEAN LOUIS ERNEST, b. Lyons, in 1811, of a poor family. At the age of 19, after a youth of little opportunity for improvement, and many hardships, he found his way to Paris to study painting, which he had already practiced in Lyons on works for which he and Daubigny received 5 francs a square yard—paintings made for exportation. He was soon admitted to the studio of Leon Cogniet, where his disposition to make small paintings of exquisite precision, and his neatness of touch in giving high relief to small figures, soon made him the leader of a distinct school. His first public exhibitions were the Salon of 1838, the Chessplayers, and the "Little Meissonier," a study of a child, and a continually increasing reputation, his and industry and care in the exquisite finish of his almost microscopic details has been maintained without sacrifice of the general effects. Théophile Gautier says of him: "He is original. What he has wished to do, he has done completely. In design, color, fineness of touch, and result." The smallest inanimate objects acquire a peculiar life and meaning under his touch, and when he has finished a painting it seems beyond the suggestion of improvement. Meissonier has won all the honors of his art in the salons and exhibitions of Paris, and is rich with the proceeds of his labor. His works are too numerous to name. One of his best, "A Charge of Cavalry," is in the possession of Mr. Probusco of Cincinnati, for which he paid $30,000. Meissonier has also succeeded in portraits, though not so remarkably as in his characteristic work.

MEJERA RIVER, in n.e. Africa, flowing through Algeria and Tunisia. It rises in the Great Atlas range and is formed by the juncture of several small streams; its course is n. and n.e., and it empties into the gulf of Tunis, about 24 m. n. of the city of Tunis. The extent of the whole course is about 200 miles. In ancient times it was known as the Bagradas, and Carthage was not far from its banks; but its course has since been greatly changed, and it now flows near the ruins of Utica.

MEJIA, IGNACIO, b. Mexico, 1814; received his education at the institute of arts and sciences of Oaxaca. In 1829 he volunteered for the defense of his country against a Spanish invasion, and in 1833 was made capt. of grenadiers, and col. in 1846. He was
military commander and provisional governor of the state of Tehuantepec in 1852, and during the "war of reform" was prominent on the side of the liberals. In 1858 he was in command of a brigade, and fought the battles of Teotitlan and Pachuca; being defeated in the first of these, Oct. 20, 1861. He acted as quartermaster of the army which resisted the invasion of the French in 1861, and was engaged in the defense of Puebla in 1862, being taken prisoner when that stronghold capitulated in May, 1863. He was sent to France, and not released until the summer of 1864, when he returned to Mexico, and in 1865 was appointed a gen. of division, and made minister of war.

MELIA, THOMAS, 1812-67, b. Mexico; a native Indian, who exercised great power over the Indian tribes in Mexico, and took a prominent part in Mexican affairs. He served with distinction through the war with this country in 1846-48. He quelled an insurrection in 1849, but six years later put himself at the head of one for the purpose of overthrowing gen. Comonfort. This movement was unsuccessful, as was a coalition which he organized the next year between the clericals and conservatives. In 1857, after several defeats, he was forced to surrender. In 1858 he drove the Juarez government out of Queretaro, and held out successfully against Juarez, till the triumph of the latter in 1860, when he resorted to guerrilla warfare. He was a trusted adherent of Maximilian, but was finally captured and put to death.

MEKHITAR, or MECITIAR. See MECITIARISTS, ante.

MEK LONG, a t. of Siam, at the confluence of the Mecklong river with the w. mouth of the Menam. 30 m. s.w. of Bankok. Pop. estimated at 10,000. The province furnishes salt for all the kingdom.

MEKONG, MEIKHONG, MAEKLANG, or CAMBODIA, RIVER. See COCHIN CHINA, ante.

MEKRAH, or MURKAN, a province of Beloochistan in Asia, lying between 23° and 28° n. lat., and 59° and 68° e. long. It is bounded on the s. by the Indian ocean, w. by Persia, and n. by Afghanistan and Sarawan, being about 500 m. in length and 200 m. broad. It comprises by far the greater part of Beloochistan, about 100,000 sq. m., and is divided into many petty districts, each having its separate chief. The n. part is very rugged, and is traversed from e. to w. by two ranges of mountains, while the lower or s. part is level, barren, and desolate. The inhabitants, of whom there are 200,000 or more, are not advanced in civilization. They practice polygamy and hold slaves. There is very little trade or manufacturing carried on. The vegetation is scanty, the most prolific natural production being the date-palm. Fishing is carried on to a very considerable extent, and is a large support of a large part of the people. The country is, as to government and law, in a wretched condition. The route used by Alexander the great on his return from Egypt is still to be seen, and with one exception is the only practicable road for an army between India and Persia.

MELA, POMPONIUS, a Latin writer—the first who composed a strictly geographical work—was a native of Spain, and is believed to have lived in the time of the emperor Claudius, but nothing whatever is known concerning him. Mela's compend is in three books, and is entitled De Situ Orbis. The text is greatly corrupted, on account of the abundance of proper names; but the style is good, and the author shows a very creditable judgment in the arrangement of his authorities. The editio princeps appeared at Milan in 1471; there are editions by Tschucke (1807), Weichert (1816), Parthey (1867). Mela was translated into English as long ago as 1855.

MELALEUCA. See CAMEPT.

MELAMPUS, in mythology, the son of Amythron; his mother is said by different authors to be Aglaia, Rhodope, or Eudomene. He is represented as a physician and prophet, and is said to have acquired his powers of divination in this way: While he was sleeping, one day, before the house of his uncle, king Neleus of Pylos, some serpents which he had tamed licked his ears and wakened him, whereupon he understood the language of the birds, and could read the future. Apollo imparted to him all the secrets of the art of medicine. For his services in curing the Argolian women of madness, Anaxagoras gave him a third of the kingdom of Argos, and another third to his brother Bias. According to other mythologists, Melampus restored to sanity the three daughters of king Proctus of Argos, and was rewarded by their father with the hand of Iphianassa, the eldest, and with a third of the Argive kingdom; by her he had four children, Antiphates, Manto, Bias, and Pronoe. He was accounted by the Greeks the first physician and prophet; and his posterity were also endowed with prophetic gifts. He was worshiped as a god after his death, and a temple was erected in his honor at 

MELANCHOLIA, as a disease, is the exaggeration of the natural and legitimate feelings of grief, despondency, and apprehension, which become morbid where the emotion is without a cause, disproportioned to the actual cause, or so intense as to disturb and destroy the exercise of the other mental powers. This dejection and suffering is found associated with exalted sensations, or delusions as to the personal or physical condition of the individual, which originate in habitually cherishing certain impressions, or fix in the attention upon certain vital processes, which may be unhealthy, or become so by the very concentration of thought bestowed upon them. The patient lives in fear of death,
in the conviction that he is differently or more exquisitely constructed than those around; that he labors under some foul or fatal disease; that he is destitute of strength or comeliness. This has been regarded as hypochondriacal melancholia—the maladie anglaise, and affects the opening of life. Similar feelings are called forth in reference to the social position. There arises a dread of poverty and want. The victim is haunted by imaginary debts, obligations, peculations. He feels incapable of extricating himself. The poor, as well as the rich, entertain such doubt and dread. They starve, in order to husband their resources. This affection prevails at maturity—at the period of greatest activity and usefulness. Toward the decline of life—although encountered at every age—morbid depression assumes the form of religious anxiety, despair, remorse. Moral statistics show that among the inhabitants of northern Europe the number of cases of melancholia exceeds those of mania; and it has been supposed that the rudiments of the malady may be detected in the original character, the temperament, and the habits of the race, as well as in the virtues, vices, accidents, and diet, by which it has been modified. Defective blood nutrition, or anemia, appears to be the physical state with which the great majority of cases of melancholia are connected, and to which all modes of treatment are directed. Powerful and permanent and depressing moral emotions act as effectively in arresting healthy digestion and alimentation, as the use of injudicious food, or the use of proper nourishment under circumstances such as the respiration of impure "ir, or indulgence in intemperate or degraded tendencies, which render assimilation impossible. The aspect of the melancholiccorroborates the view of inanition and exhaustion. The surface is pale, dry, cold, attenuated, even insensible; the muscles are rigid; the frame is bent; the eyes sunk, and fixed or flickering; the lips parched and colorless. There is a sense of exhaustion or pain, or impending dissolution. It has been remarked, that in proportion to the intensity of the internal agony is there an obtuseness or anesthesia to wounds or external injuries. Such an immunity gives in lunatics an indifference to the most grievous forms of suffering, and may explain the conduct of some who have endured and suffered punishment.—Hinsicht, Observations on Madness and Melancholy; Esquirol, Maladies Mentales, t.i. p. 398; Crichton, Inquiry into Nature and Origin of Mental Derangement.

MELANCHTHON, PHILIP, Luther's fellow-laborer in the reformation, was b. Feb. 16, 1497, at Bretten, in the palatinate of the Rhine, now in the grand duchy of Baden. His name was originally Schwarzzerd (black earth), of which Melanchthon is a Greek translation. He was educated at the university of Heidelberg, where he obtained the degree of master of arts in the same year. In 1510 he went to Tubingen, studied theology, took the degree of master, and in 1514, gave lectures on the Aristotelian philosophy and the classics. About this time, he published a Greek grammar. On his relative Reuchlin's recommendation, he was appointed, in 1518, professor of the Greek language and literature in Wittenberg. He soon decided in favor of the reformation, and brought to the aid of Luther great attainments in learning, great acuteness in dialectics and exegesis, a remarkable power both of clear thinking and of clearly expressing his thoughts; and, along with all, a gentleness and moderation that most advantageously tempered Luther's vehemence. In 1521 he published his Loca Communes Rerum Theologicarum, the first great Protestant work on dogmatic theology. It passed through more than fifty editions in the course of the author's life. In 1530, he made a most important contribution to the cause of Protestantism in the Augsburg confession (q.v.). In 1541 he went to Worms, and soon after to Ratisbon, to conduct the cause of the Protestants in the conferences there. But the influence of the papal legat, conjunctured with his efforts for a peaceful accommodation, and his own party were much dissatisfied on account of the concessions which he made. After Luther's death Melanchthon lost in some measure the confidence of some of the Protestants, by those concessions to the Roman Catholics which his anxiety for peace led him to make; whilst the zealous Lutherans were no less displeased because of his approximation to the doctrine of Calvin on the Lord's supper. His consent, conditionally given, to the introduction of the Augsburg interim (q.v.) in Saxony, in 1549, led to painful controversies; and he was involved in various controversies, which filled the latter years of his life with disquietude. He died at Wittenberg, April 19, 1560. Melanchthon, although gentle, was emotional and excitable, and conciliatory in the extreme. As a public teacher, he was exceedingly admired, and students flocked to him from all parts of Europe. He was essentially a theologian and scholar, and in his habits, if not in his opinions, was the precursor of those acute and laborious divines who have in modern times shed so much lustre on the German church. The most complete and edition of his works (under the editorial in Latin and Greek, grammar, editions of and commentaries on several classics and the Septuagint, biblical commentaries, doctrinal and ethical works, official documents, declarations, dissertations, responses, and a very extensive correspondence with friends and the leading men of the age) is that by Breitschneider in his Corpus Reformatum (28 vols. 1834-60). Melanchthon's life has been written by his friend Camerarius (1556), and frequently in the course of the present century. One of the latest is by Schmidt (1861). The tricentenary of Melanchthon's death (April 19, 1860) was celebrated with great solemnity throughout Germany.

MELANESIA. See Micronesia and Melanesia.
MELANORHoeA, a genus of trees of the natural order anacardiaceae. To this genus belongs the Black Varnish Tree (M. usitata) of Burmah and the n.e. of India, called Theel-tree or Ziziphus in Burmah, and Khee in Munipoor. It is a very large tree, attaining a height of 100 ft. with large, leathery, simple, entire, deciduous leaves, and axillary panicles of flowers. It yields a viscid, rust-colored juice, which becomes black on exposure to the atmosphere, and is excessively acrid, causing swellings with much pain and fever if it touches the skin. It is, however, much valued as a varnish for painting boats, and vessels intended to contain liquids, and also as a size-glue in gilding. This black varnish is a considerable article of trade in India and Burmah.

MELANO-SIS. See Tumors, ante.

MELAN ThA CEE, a natural order of endogenous plants: containing bulbous, tubero- sus, and fibrous-rooted plants, with or without stems, and having parallel-veined leaves which are sheathing at the base. The fruit is a capsule, generally divisible into three pieces.—There are about 130 known species, natives of all parts of the world, but most abundant in northern countries. Some resemble crocuses, and some are like small lilies. The order is characterized by a great prevalence of poisonous qualities. Some of the species are employed in medicine, particularly colchicum (q.v.), white hellebore (Convallaria album, see Hellebore), and Saladiella (q.v.). The root of helonias dioica is used in North America as an antiemetic and tonic bitter. The plant grows in wet places, and is called starwort and blazing star, also unicorn’s horn and devil’s bit.

MELA-ROSa, the fruit of the genus citrus, and probably a variety of the lime (q.v.), cultivated in Italy. It receives its name from its fragrance being thought to resemble that of the rose. It is a small flattened fruit, with a protruberance at the tip, from which many raised ribs proceed in a star-like form to the circumference. The skin is yellow, thin, and adheres closely to the pulp.

MELASTOMA CEE, a natural order of exogenous plants, containing about 1200 known species; trees, shrubs, and herbaceous plants, mostly natives of warm climates, although a few are found in the temperate parts of North America. They have opposite undivided leaves, destitute of dots. The flowers are regular. —None of the melanostaeceae possess poisonous properties; some are used in dyeing; the gratefully acid leaves of some are cooked and eaten—particularly those of species of melastoma and astronia sapetaria in the Malay Archipelago; some yield edible and pleasant fruits, as bladea triplicata and Gal- au, elaphida bircha in the West Indies, and memecylon cuto in Coromandel. The wood of some is tough and hard.

MELAZZO. See MELazzo, ante.

MELBOURNE, capital of the British colony of Victoria, in Australia, is situated chiefly on the n. bank of the Yarra-Yarra, about 9 m. by water and 2 m. by land above its mouth, in the spacious bay of Port-Phillip. Lat. 37° 48 s., long. 144° 58 east. Its streets are straight, regular, and wide, and are paved, macadamized, and plentifully supplied with gas and fresh water. Collins street, one of the leading thoroughfares, is one-third wider than the famous Broadway of New York. Melbourne is built of brick and stone, and contains many fine churches. Perhaps nothing gives stronger testimony to the wealth and enterprise of the inhabitants of Melbourne, than the rapidity with which so many noble institutions as adorn the city have sprung up among them. Among these, one of the chief is the university, with an annual endowment from the state of £9,000, and possessing valuable scholarships and exhibitions. It is a large building, in the shape of a parallelogram, and is surrounded by extensive grounds. It was opened in April, 1855, and has a respectable staff of professors, with a considerable attendance of students in arts, law, engineering, etc. The post-office, a magnificent structure, in the Italian style, elaborately ornamented with sculpture, was built in 1858. The Yan-Yean water-works, by means of which water is conveyed by iron pipes from a distance of 18 m., were opened in 1857. The parliament houses were erected in 1857, at a cost of £24,000. Houses for 1,000 families can be built for £1,000. Besides those mentioned, the chief institutions are the Melbourne hospital, the benevolent asylum, the immigrants’ home, the servants’ home, the orphan asylums, the lying-in-hospital, treasury, county and city courts, public library, custom-house, barracks, picture gallery, the numerous richly ornamented banks, the grammar-school, Scotch college, besides many other educational establishments, and numerous literary and scientific institutions and societies. There are three daily newspapers, one evening journal, and several weeklies and monthlies. Melbourne is the center of about a dozen converging lines of railway; several of these being, however, only suburban lines. There are several theaters and public parks. The temperature is moderate; the mean of the year being 59°, and the variation between the average temperature of January (midsummer) and July (winter), 19. The annual rainfall is about 32.33 inches. Melbourne occupies the first rank among the ports of the British colonies, and is the most important trading town of the southern hemisphere. The pop., including the suburbs, is 73,724. The chief exports are gold, silver, wool, hides, cattle, and sheep. Six-sevenths of the entire commerce of the colony is carried on by Melbourne. For further information regarding trade, etc., see VICTORIA. Vessels drawing 24 ft. can come up to the mouth of the Yarra-Yarra, but are unable to ascend the river, on account of two bars which obstruct
Melanhorbus-Melchizedek.

its course. Melbourne, however, is connected with Sandridge on Port-Phillip by means of a railway 2 m. long. The chief industrial establishments of Melbourne are flour-mills, tallow-boiling works, and brass and iron foundries. It is the see of an Episcopal bishop and a Roman Catholic archbishop.

PORT-PHILLIP, on which Melbourne is situated, is a spacious and beautiful inlet of the South Pacific ocean, on the s. coast of Australia, and is 35 m. long, by about 25 m. broad. Its entrance, which is only 2 m. in width, is formed by two projecting promontories, called the Heads; and on these promontories strong fortifications were erected in 1861. Navigation at the entrance of the port is difficult, on account of the foul ground on either side, and the violence of the ebb and flood tides, which is caused by the unevenness of the bottom.

Melbourne was first colonized in 1825, and received its name from lord Melbourne, then the British prime minister, in 1837. It became the seat of a bishop in 1847, and in 1851 the capital of the newly-formed colony of Victoria. The discovery of gold in Victoria in 1851, which gave such a surging impetus to the material prosperity of Melbourne, is treated of under VICTORIA.

MELBOURNE, WILLIAM LAMB, Viscount, English minister, was second son of sir Peniston Lamb, of Brocket hall, Herts, who was raised to the peerage. Melbourne was born in London in 1779. His university education he received first at Trinity college, Cambridge, and next at Glasgow, where he studied jurisprudence and politics under prof. Millar. He entered the house of commons for Leominster in 1805, and joined the whig opposition, under the leadership of Charles James Fox. He accepted the chief secretarship of Ireland in Mr. Canning's government, and this partial alienation from the whigs was increased when he not only took office under lord Goderich, but remained for a short time in the government of the duke of Wellington. In 1828 the death of his father transferred him to the upper house. In 1830 he accepted the seals of the home office, and the administrative Government of lord Melbourne. But it was not long before he obtained what he considered a symbolic promotion by no means popular or successful. In July, 1834, earl Grey retired, and William IV, sent for Melbourne. In November, the king chose to consider the removal of lord Althorp to the upper house as the breaking up of the Melbourne ministry, and sent for sir Robert Peel, to form a conservative administration. But the house of commons resented the interference of the crown, and a new parliament having shattered the new government, Melbourne again became first lord of the treasury. On the accession of queen Victoria in 1837, it became the duty of Melbourne to instruct the young sovereign in the various duties of her high station, and fit her to perform her part as the constitutional monarch of a free country. In 1841 his government was succeeded by that of sir Robert Peel. Henceforward, Melbourne took little part in public affairs. He had little of the oratorical faculty, and was ineffective as a speaker, but possessed a cheerful temper and cordial frankness of manner, which made him many friends. He possessed classical tastes and rare social qualities, joined with an easy temper and careless habits. Sydney Smith, in his second letter to archdeacon Singleton, has described his character with an exquisite mixture of sarcasm and compliment. He married (1805) a daughter of the earl of Bessborough, who, under the title of LADY CAROLINE LAMB (b. 1789, d. 1828), attained some celebrity as a novelist and a correspondent of lord Byron. Melbourne died Nov. 24, 1848.

MELCHITES, the name given to Christians in Syria and other parts of the east, who, acknowledging the authority of the pope, and the doctrines of the church of Rome, adhere to the liturgy and ceremonies of the Eastern church. They conduct divine service in the vernacular tongue, and receive the Lord's Supper in both kinds. Their priests may be married before ordination, but not their bishops. They are chiefly to be found in Aleppo and Damascus. Their patriarch resides at Damascus. The name Melchites (lit. Royalists) dates from the 5th c., when they were supported by the emperors against the Monophysites (q.v.).

MELCHIZEDEK, or MELCHISEDEC, said in Genesis to have been "king of Salem and priest of the most high God," met Abraham—on his return from the successful pursuit of Chedorlaomer and his allies which he had undertaken for the rescue of Lot—refreshing him with bread and wine and pronouncing a remarkable blessing on him; after which Abraham gave him tithes of all the spoils, thus acknowledging his official superiority. In Ps. ex. David, in predicting the Messiah, says that by divine decree he was to be "a perpetual priest after the order of Melchisedec." This prediction the epistle to the Hebrews interprets in its application to the Lord Jesus Christ and as connected with his priestly ministration, declaring that it relates to a sanctuary and a system of sacrifices and of ceremonies in particulars which it relates and in the silence which as to other things it maintains. As named Melchisedec he represented the king of righteousness, and as being king of Salem the king of peace. As in the narrative he stands alone with no mention of his father, mother, descent, birth, or death, he becomes a striking emblem of the uncreated Son of God and of a perpetual priest. As blessing Abraham and receiving tithes from him he consecrated his superiority to Abraham and therefore to Levi the priestly son of Abraham was proved. Consequently the priesthood of Christ, which was according to the order of Melchisedec, was designed to supersede the priesthood of Levi and was superior to it, as Levi and his descendants were all under the power of death and would in succession pass away. These three passages of Scripture (in Genesis, the Psalms, and Hebrews,) contain all
is said about him and all that is known. But in all the past centuries mystery has enveloped his name, and various conjectures concerning him have been made. The Jews perceiving his superiority to Abraham as indicated by the blessing bestowed and the tithes paid, explained it by supposing that the kingly priest was Shem, who as a survivor of antediluvian times had a right to be reverenced as the head of the human race. Jerome testifies that this was the opinion of the Jews in his day, and it was adopted in modern times by Luther, Melanchthon, Selden, Lightfoot, and others. Another old notion which Jerome says Origen cherished was that the royal priest was an angel. A small sect in the 4th c. called after his name taught that he was a power or influence of God greater than Christ. A few others regarded him as the Holy Ghost. Epiphanius says that some in his day believed that he was the Son of God in human form; to this opinion Ambrose seemed inclined and it has been held by many in modern times. Some among the Jews also regarded him as the Messiah. All these conjectures, however, are not only without support, but are with difficulty reconcilable with the Scriptures.

MELCHTHAL, ARNOLD VON, b. Switzerland, late in the 18th century. He was called Melchthal from the village of his birth in the canton of Unterwalden, but his name was Winckelried. Melchthal killed the servant of an Austrian bailiff, who had come to Melchthal to seize the oxen of Melchthal's father, a well-to-do proprietor in Unterwalden. In revenge, the Austrians put out his father's eyes, a tragic incident which is employed by Schiller in his Wilhelm Tell. When Melchthal heard of his father's blindness, he met his friends Fürst of the canton of Uri, and Stauffacher of the canton of Schwyz, on the banks of lake Lucerne, and all three took oath to do all in their power to liberate the three cantons from Austrian rule. This was in November, 1307; and the next year the mountainers of the three cantons successfully opposed the Austrians. Arnold of Melchthal is said to have attempted, at the battle of Sempach, to break a line of Austrian spears, and to have died "gathering into his bosom the sheaf of foreign spears." The whole story of the three patriots and the three cantons, seems to be as much of a myth as the legend of William Tell with which it is connected. It is found in the Chronica Helvetica of Aegidius Tschudi.

MELCOMBE, LORD. See DODDINGTON, ANTE.

MELCOMBE REGIS AND WEYMOUTH. See Weymouth.

MELEAGER, a legendary Greek hero, whose name is connected with the Argonautic expedition, and more conspicuously with the hunting of the Calydonian boar. He was the son of Oeneus, king of Étolia, and Althaea, daughter of Thestius. Upon the seventh day after his birth the three Fates came to the palace of Oeneus, and pointing to a brand burning on the hearth, said that the child should not die till that brand should be spent. Althaea thereupon put water on the brand, and laid it away in a safe place. As Meleager grew to manhood he made a great name in war and in the chase. He went with the other heroes in quest of the golden fleece; and when Artemis, in her wrath, sent a monstrous wild boar to hurl Calydon, Meleager was at the head of the hunters. Of this Calydonian hunt two stories are told. One says that Artemis had sent a wild boar into Calydon because Oeneus had not done sacrifice to her at the Feast of harvest-home, and that Meleager, with many huntsmen and dogs, gave chase to the boar, which was soon slain. The Curetes and Étolians wrangled over the boar's hide and head; and war breaking out between them, the Curetes had ever the worst, till Meleager, angered at Althea, his mother, left the field and shut himself up in his house with Cleopatra, his wife. Nor would he be moved by the prayers of his father and mother to go out against the Curetes till they had scaled the towers of Calydon; when his wife succeeded in persuading him to fight against the enemy, whom he repelled. The other and more modern legend represents all the Greek heroes as taking part in the hunt at the invitation of Meleager. Among them were Castor and Pollux, Theseus, Peleus, Jason, and Pirithous. Atalanta, daughter of Jaxus, had come from Arcadia to join the hunt, but some of the heroes objected to a woman taking part in it. Their objections were overcome by Meleager, who was in love with her. The hunt began at once; Acaeus and Cepheus were killed by the boar; Peleus killed Eurynoy by accident. Then Atalanta gave the boar the first wound, Amphiaraus pierced his eye with an arrow, and the monster was finally killed by Meleager, who gave the head and hide to Atalanta. Meleager's uncles, the sons of Thestius, took the hide away from Atalanta, and were killed by Meleager. Althea, enraged by the death of her brothers, burned the brand upon which her son's life depended, and Meleager wasted away and died. Althea took her own life, Cleopatra died of grief, and Meleager's sisters, with the exception of two, were changed into birds called Meleagrides. The later legend is told in Swinburne's Atalanta in Calydon.

MELEAGER, a Greek epigrammatist in the 1st c. B.C. He compiled the first known Greek anthology, a collection called The Garland, and containing specimens from 46 authors. His anthology has been lost, but 131 of Meleager's own epigrams have been preserved. They are remarkable for their purity of style and grace of versification. The best edition is that published at Leipzig, by Graefe, in 1811.
MELEAGNANO, or Malegnano, formerly Marignano, a town of northern Italy, 10 m.s.e. of Milan, has a pop. of 5,000. It is famous as the scene of a great victory won by Francis I. of France over the Swiss and Milanese in the month of September, 1515; upwards of 20,000 men were slain. This conflict has been termed the Battle of the Giants. Francis accepted the honor of knighthood on the field from the chevalier Bayard. A second battle was fought here June 8, 1559, between a French force of 16,000 men, under marshal Baraguay d'Uilliers, and a rather larger body of Austrian troops, in which the latter were routed with a loss of about 1,400 killed and wounded.

MELENDEZ VALDES, Don Juan, one of the most distinguished of the modern Spanish poets, was b. Mar. 11, 1754, at the village of Ribera del Fresno, in Estremadura. He studied at Madrid and subsequently at Salamanca, where he became intimate with the poet Cadaiso, and acquired a thorough knowledge of English. He was Locke, he said, who first taught him to reason, and his writings contain imitations of Pope, Thomson, and Young. In his earlier period he wrote admirable anacreontics in praise of student-life; his descriptive poetry is also excellent. His style and sentiment are simple and natural; and the national idioms are used with singular grace and vigor. The first collection of his verses appeared in 1785, and soon became very popular. Four years before this publication Melendez Valdes was appointed a professor at Salamanca, and high political honors even seemed in store for him, but during the French invasion he allowed himself to be cajoled by Murat, and afterwards by Joseph Bonaparte; a weakness which was as disastrous to his prospects as it was inexcusable to his character. When the invaders were driven out of the peninsula the unhappy poet was forced to accompany them. He died a proscribed traitor, at Montpellier, May 21, 1817. Melendez Valdes's anacreontics are the writings on which his fame rests, and they have procured for him the title of Restaurador del Parnaso.

MELETTIUS, Saint, of Antioch, a famous Greek ecclesiastic; b. in the beginning of the 4th c. at Melitene in Armenia Minor. His first important appointment was to the bishopric of Seleucia on the deposition of Eustathius in A.D. 307, but his position was made so unpleasant by the stubborn conduct of the people that he soon resigned, and retired to Berea or Aleppo in Syria. The Arian controversy was now engrossing the minds of the people, and extinguishing true piety, but Meletius endeavored by his ministrations in the pulpit and his consistent private life to commend to his people the essential truths of the gospel. He thus won the respect of both factions, and in A.D. 360 was raised by universal consent to the see of Antioch. In his new and high position he felt bound to take a decided course in the prevailing dispute, and in his inaugural discourse in 361 he expressed his sympathy with the orthodox party. This confession re-awakened the spirit of controversy in the church of Antioch. The Arians charged him with Sabellianism and other crimes, and in a month he was banished by command of the emperor Constantius to his native Melitene. Euzoius was installed in his place. The orthodox party in the church of Antioch seceded from the communion of the Arians, and on the accession of the emperor Julian in 363 Meletius was restored. However, his party was now driven from the town, and retired to a monastery near Antioch. His banishment, however, after the accession of Valens in 364 Meletius was again banished. By an edict of Gratian in 378 he was recalled, and reinstated in his bishopric. He again endeavored to effect a union with the Eustathians, but was unsuccessful through the unrelenting prejudice of Paulinus. Meletius died at an advanced age, while in the council of Constantinople in 381. His body was taken to Antioch and buried with great honor beside the tomb of the martyr Babylas. His funeral oration was pronounced by Gregory of Nyssa. A part of the inaugural discourse of Meletius at Antioch is printed in the fifth vol. of Galland's Bibliotheca Patrum.

MELETTIUS, or Melitius; b. in Egypt about 260; was bishop of Lycopolis in the Taibais in the beginning of the 4th c., and founder of the sect of the Melitians. During the severe persecution under Diocletian and Maximin, he and Peter, archbishop of Alexandria, were thrown into prison. Many Christians who had been led through torture to renounce their faith, repenting of their sin, repaired to the two bishops to receive absolution, and to be reconciled to the church. Peter was willing to receive the backsliders, on their doing penance, but Meletius refused to have any intercourse with them until the close of the persecution. A majority of the imprisoned Christians approved of his course. This caused a schism, and Meletius became the leader of the disaffected. After obtaining his freedom he traveled through the patriarchate, ordaining and excommunicating according to his own will, obtaining many followers, and disregarding the protests of the Egyptian bishops. This proselyting tour was extended to Palestine. But in 325 the council of Nice checked his career, compelling him to remain at Lycopolis as a mere titular bishop without active jurisdiction. He died soon after this. The Melitians called themselves the church of the Martyrs. They afterwards allied themselves with the Arians against Athanasius, continuing, however, a distinct sect until the 5th century.

U. K. IX.—43
MELFI, an ancient episcopal town of southern Italy, in the province of Potenza, 32 m. s. of Foggia, on a feeder of the Ofanto (anc. Ausidae). It is situated on a bed of lava to the n.e. of the lofty (3,000 feet) volcanic Monte Volturlo, now extinct, from which it is separated by a deep ravine. The once magnificent cathedral, erected in 1155, was almost entirely destroyed by an earthquake in 1851, which at the same time leveled many fine buildings, public and private, and destroyed about 1000 persons. The only evidences of volcanic action are the severity of the earthquakes which occasionally desolate the district, and the emission at times of carbonic acid and other gases from the lakes in the old crater of the volcano, throwing up columns of water, accompanied by internal rumblings. This phenomenon generally takes place when Vesuvius is in a state of activity. The district around the city is celebrated for its wine. Pop. 11,225.

MELIA CELEB, a natural order of exogenous plants, containing nearly 200 known species, trees and shrubs, natives of warm climates, and mostly tropical. Many of the species possess bitter, astringent, and tonic properties; some are used in medicine; the seeds of some yield useful oil; some are poisonous; some yield pleasant fruits; the wood of some is valuable. See Carapa.—The lanseh is the most esteemed fruit of this order; and next to it is melica edulis, a fruit of the n.e. of India, of which the edible part is the large succulent aril.—The Cape An (ekebergia capensis) deserves notice among the timber trees of this order. It has a trunk two feet in diameter, and yields excellent tough timber, useful for many purposes.—Melia azedarach, a tree about forty feet high, with flowers of a beautiful shade of blue, is extensively cultivated in India and China, and much planted as an ornamental tree in the s. of Europe, and is now common in the southern states of North America. Its flowers are in large spikes, and very fragrant. The fruit is of the size of a cherry, somewhat elongated, pale yellow, containing a brown nut. The nuts are bored and strung for beads in Roman Catholic countries, whence the tree is often called Bead Tree. It is also known as the pride of India, and is sometimes erroneously called Persian lilac. The fruit is sweetish, and not poisonous, although very generally reputed so. The bark of the root, which is bitter and nauseous, is used as an anthelmintic. The pulp of the fruit of the Neem Tree or Margosa Tree (azadirachta indica) yields a fixed oil, which is bitter, stimulant, and anthelmintic. The bark is a valuable tonic. The leaves are universally used in India for poultices.

MELICRASS, Melica, a genus of grasses, having a lax panicle, and spikelets of 2 to 5 awnless florets, of which one is generally imperfect. M. uniflora is a common grass in Britain, growing in the shade of woods. It is of a graceful and delicate appearance. Cattle are fond of it. M. nutans is a rare British species. M. altissima, a Siberian species, growing to the height of 3 or 4 feet, has been introduced in some parts of Europe, and yields a considerable bulk of herbage. It is perennial.

MELICOCCA, a genus of trees or shrubs of the natural order sapindaceae, one of which, M. bijuga, a native of the West Indies, is there universally cultivated for its fruit. It is called the Honey Berry, and the Jamaica bullock plum; by the Spaniards monos, and by the Dutch kuippee. It is from 16 to 20 ft. high. The fruit is jet black, about the size of a bassel. The seeds are roasted, and eaten like chestnuts. Other species of melicocca yield eatable fruits.

MELIKOFF, LORIS, Michael Tarieolovitch, b. Russia, 1826; descended from a wealthy family of the Caucasus nobility. He was educated in the school of the guards of St. Petersburg, and joined the army with the rank of cornet, being promoted to a lieutenant in 1847. He saw active service in the Caucasus, as adjutant to prince Vorow-zoff, and gained a reputation for remarkable military talents. Here he led a number of expeditions against the fierce native soldiery, and had even the honor of defeating the celebrated Shainyl. During the Crimean war he had several successful engagements with the enemy in front of Kars, and on the capitulation of that stronghold was appointed its governor. In 1853, at the close of the war, he was made a maj. gen., and in 1863 lieut. gen. He was appointed adj. gen. in 1865, and gen. of cavalry in 1875; and in the following year was placed in command of the corps which was stationed on the Turkish frontier, and, on the declaration of war, marched into the enemy's territory. He besieged Kars and encountered serious resistance, being forced to retire; he, however, received reinforcements, defeated the Turkish army before Kars, and captured the fortress by storm. In 1880 the nihilist movements having become alarming, and the danger of Russia being apparently imminent, the czar Alexander appointed Melikoff to a position of absolute authority and power—an actual dictatorship without responsibility—in which delicate and dangerous situation he conducted himself in such a manner as to command the admiration of the statesmen of Europe. He restored order in a great measure where anarchy had been impending; and wielded his unlimited authority with such firmness and judgment as to fully sustain the wisdom of his appointment.

MELILOT, Melilotus, a genus of clover-like plants of the natural order leguminosae, with ternate leaves, differing from the clovers in the generally elongated racemes of flowers, the stemans not adhering to the corolla, and the 1 to 4 seeded tunid pods. All the species have a strong peculiar sweetish smell, which becomes more agreeable when they are dried, and is owing to the presence of coumarin (q.v.)—The common yellow Melilot (M. officinalis) is found in bushy places and the borders of fields in Britain.
and most parts of Europe. It has an erect stem, two or three ft. high, and long loose axillary racemes of yellow flowers. A water distilled from the flowers is used in perfumery. The herbage is relished by cattle, but the produce is not large. It is an annual, but if frequently mowed without being permitted to flower, lives for several years.—The White Melilot (M. vulgaris or leucanthu), common in some parts of Europe, has become naturalized in many places in Britain.—The Blue Melilot (M. cornuca), a native of the n. of Africa, with short racemes of blue flowers, is cultivated in many parts of Europe, particularly in Switzerland and the Tyrol, and has the peculiar melilot odor in a high degree. It was formerly much used in medicine as an anodyne, discutient, diuretic, and expectorant, and to many the good qualities supposed to belong to it may be ascribed the high estimation in which the selachiger or chapstiger cheese of Switzerland is held, to which it imparts its flavor. Where this cheese is made in considerable quantities the smell of melilot can be discerned even at a distance.—Bokhari Clove (M. arboea) has attracted attention on account of the fiber of its stem, which is used for the same purposes as hemp.—The MESSINA MELILOT (M. messinensis), a native of the countries near the Mediterranean, is believed to be one of the plants called lotus by the ancients.

**MELOINDIONS.** The name used in Scotch law to denote the improvements made by a tenant to the estate or farm which he occupied. If the lease is terminated prematurely and abruptly he is entitled to compensation from the landlord for the value of the improvements; it is otherwise in Scotland in case of heirs of entail or life-renters improving the estate.

**MEPHAGITE.** See Honey-eater.

**MELISSIC ACID AND MELISSIN.** See WAX.

**MELISSUS,** of Samos. See Eleatic School.

**MELITA.** See Malta.

**MELL, Patrick H., D.D., LL.D.,** b. Ga., 1814. Left a destitute orphan by the death of his parents at the age of 14, but having received a good elementary education he earned the means to support himself for two years at Amherst College. He became a Baptist minister, and soon after the opening of Mercer university he was appointed professor of ancient languages. In 1851 he was called to the same professorship in the state university, and subsequently became vice-chancellor, resigning in 1872, but retaining the professorship. He was for 15 years president of the Georgia Baptist convention, and for 9 years of the southern Baptist convention. His published works are Baptism; Corrective Church Discipline; Predestination; Essays on Calvinism; An Argument on the Subject of Slavery; A Sermon on God's Providential Government; a Treatise on Parliamentary Practice; Prayer as Related to Providence.

**MELLEN, GRENVILLE,** 1799-1841; b. in Biddeford, Me.; son of chief-justice Mellen; educated at Harvard and, after graduating in 1818, studied law and engaged in practice in North Yarmouth. He was a poet of much taste and some power, and also a magazine writer. Besides many occasional pieces, such as The Rest of Empires, read in 1832 before the Maine State Society, he published, in 1837, Our Chronicles of Twenty-six, a satire; Glad Tales and Sad Tales (1829), a collection of prose papers; and, in 1833, The Martyrs' Triumphs and other poems. In New York he began the issue of a Monthly Miscellany, which failed after a few numbers. Mr. Mellen had long been a sufferer from consumption, and in 1840 made an unavailing voyage to Cuba for his health.

**MELLEN, PRENTISS, LL.D.,** 1764-1840; b. at Sterling, Mass.; educated at Harvard, where he graduated in 1784, and began the practice of law at Bridgewater, Mass. He afterward resided in Biddeford and Portland, Me. In his profession he soon acquired a high standing and took an active part in political movements. From 1817 to 1829 he was one of the United States senators from Massachusetts. In 1829 he was made chief-justice of the supreme court of Maine, which position he held for 14 years.

**MELLONI, MACEDONIO,** 1800-54; b. Italy; began the study of natural philosophy at school, and had already entered upon extensive experiments in regard to the radiation of heat, when, in 1824, he was called to the chair of natural philosophy in the university of Parma. In 1831 he was forced for political reasons to leave Parma and remove to France. His discoveries in the radiation of heat he laid before the French academy of sciences, in a memoir to which that body paid little attention; but the English royal society deemed it worthy of the Rumford medal. Through the influence of his friends Arago and Humboldt, Melloni was allowed to return to Italy, and was appointed by the king of Naples director of the meteorological observatory on Mt. Vesuvius. Here he discovered the existence of heat in the lunar light. In 1849, though he had taken no active part in politics, he was dismissed from his position in the observatory, on account of his known liberal views. He lived thenecofoward in his villa at Partici, near Naples, continuing his experiments. In 1850 appeared the first volume of his La Termocrosi, dedicated to Arago and Humboldt. He disputed the theories of Faraday as to the diminished velocity noticeable in an electric current passed through wires under ground, or under water, in comparison with an equal current passing through wires in the air.
MELODrama (Gr. melos, a song, and drama) strictly denotes a half-musical drama, or that kind of dramatic performance in which declamation is interrupted from time to time by instrumental music. The name, however, was first applied to the opera by its inventor, Ottavio Rinuccini. In Germany the melodrama retains its primitive character; but both in France and England the name has come to designate a romantic play, generally of a serious nature, in which great prominence is given to splendid decoration, to sensational incidents, and to an effective diction.

MELODrama (Gr. melos, a song, and drama) strictly denotes a half-musical drama, or that kind of dramatic performance in which declamation is interrupted from time to time by instrumental music. The name, however, was first applied to the opera by its inventor, Ottavio Rinuccini. In Germany the melodrama retains its primitive character; but both in France and England the name has come to designate a romantic play, generally of a serious nature, in which great prominence is given to splendid decoration, to sensational incidents, and to an effective diction.

MELODY (Gr. sweet song) is a succession of musical notes regulated so as to be pleasing to all cultivated ears, and expressive as a whole of some particular feeling. It is opposed to harmony, in which different notes, being chords, are sounded together. The part intended for the leading voice in a harmonized piece of music is often called the melody or air. The character of a melody depends in a great degree on the rhythm and measure, as the same succession of sounds may, by the slightest change in the power of the notes, be so altered in character as to produce a different effect.

MELODY (Gr. sweet song) is a succession of musical notes regulated so as to be pleasing to all cultivated ears, and expressive as a whole of some particular feeling. It is opposed to harmony, in which different notes, being chords, are sounded together. The part intended for the leading voice in a harmonized piece of music is often called the melody or air. The character of a melody depends in a great degree on the rhythm and measure, as the same succession of sounds may, by the slightest change in the power of the notes, be so altered in character as to produce a different effect.

MELOON, Cucumis melo, a plant of the same genus with the cucumber (q.v.), much cultivated for its fruit, which is sweet, with a delicious though peculiar flavor and smell. The melon is an annual, with trailing or climbing stems, lateral tendrils, rounded angular leaves, small, yellow, monoeccious flowers, and large round or somewhat ovate fruit. It is supposed to be a native of the sub-tropical parts of Asia, although it has never been discovered in a wild state, and it was first introduced into England from Jamaica about 1570. It is said to derive its name from the Grecian island Melos. Its English name was originally musk melon. The varieties in cultivation are very numerous, some of them distinguished by a thick and warty rind, some by a rind cracked in a net-like manner, some by ribs and furrows, some by a perfectly smooth and thin rind; they differ also in the color of the flesh of the fruit, which is green, red, yellow, etc.; and in the size of the fruit, which varies from 8 or 4 in. to a foot or more in diameter. The melon is often eaten by itself, with cream and sugar, and sometimes with pepper or ginger. The melon can be grown in the open air only in the most southern part of Britain, and even there requires a hot-bed in spring. Its cultivation in hot-beds is extensively carried on in all parts of Britain, and very great care is bestowed on it. A loamy soil is best suited to it. The setting of the fruit by dusting the female flower with the pollen of the male flower is constantly practiced by gardeners. Warmth and bright sunshine are requisite to the production of fruit of good quality. -The Water-Melon or Cucumber (Cucumis sativus), although rarely cultivated in Britain, is highly esteemed and much cultivated in almost all warm countries. It is a native of the warm parts of the old world. It has deeply lobed and gashed leaves, and a large round fruit with smooth dark-green spotted rind, and pink or white flesh; less sweet than the melon, but much more juicy or watery, and therefore much prized in many warm countries, not merely as an article of food, but for quenching thirst and allaying fever. -South Africa has another species of water-melon (C. citrullus), very valuable to the inhabitants. -The Catkoo (C. zeylanicus) is a native of Egypt and Arabia. Its taste is sweet, and as cool as the water-melon. -The Catkoo (C. zeylanicus) is a native of India, and much cultivated in some parts of that country; it has oval fruit, smooth, variegated with different shades of
yellow, and about 6 in. long, with much the flavor of the melon. The fruit will keep for several months, and is much used both raw and in curries. The half-grown fruit is pickled. The seeds contain much farina and oil, and are ground into meal; the oil is also expressed, and used both for food and in lamps. The seeds of others of this genus may be used in the same way; and they are said to be useful as a diuretic medicine, and for relief of stranguary.

MELORIA, a small island of the Mediterranean, about 5 m. in length and 1 in breadth, 4 m. from Leghorn. In 1284 the Genoese gained a famous naval victory over the Pisans in the vicinity of Meloria, by which the latter were deprived of their maritime supremacy. An ancient Pisan tower stands on a rock to the s. of Meloria.

MELOS, or Milo, an island of the larger Cyclades in the Grecian archipelago, or Ægean sea, about 70 m. n. of Crete, and 65 m. e. of Peloponnese; pop. 4,000. It is 14 m. long, and 8 broad, and has on its n. coast one of the best and safest natural harbors in the Levant. The surface is generally mountainous, and of a volcanic character, and there are hot mineral springs, and deposits of sulphur. The soil is fertile, and produces largely in fruit, wine, and oil, while affording also excellent pasturage for cattle. In the e. part of the island, near the port, is the chief town, called Milo; and near are extensive remains of the ancient capital of the island. Near the sea the ground is marshy, and the air is unwholesome in summer. This island is said to have been colonized first by the Phenicians, and afterwards by the Lacedæmonians. An attempt made by the Athenians to reduce it during the Peloponnesian war, was unsuccessful, but some years later they besieged the town, put the adult males to death, carried away the women and children into slavery, and appointed the place by a colony of Athenians. Melos fell successively under the dominion of the Romans, the Byzantine emperors, Venice, and the Turks; it is now a part of Greece. In 1829 admiral Dumont found in Melos the since celebrated statue known as the “Venus of Milo,” and which now stands in the Louvre. This statue was without arms when found, and in 1877 it was reported that the lost members had been found near the locality where the statue was originally discovered. The highest eminence on the island is Mt. St. Elias, 2,538 ft. high. The Cyclades group of islands are believed to have formed in antediluvian times a part of a continuous chain of mountains connected on the n. with the mountains of Attica, and by the island of Melos with the western mountains of Candia on the south. Between Melos and Argentia, a rocky island to the n., is a channel half a mile wide, which has an evil notoriety for its peculiarly dangerous character.

MELPOMÉNE (the Singing One), one of the nine Muses, specially invoked as the muse of tragedy.

MELROSE, a t. in Middlesex co., Mass., 8 m. n.w. from Boston, on the Boston and Maine railroad; pop. 3,414. It has seven churches, 14 public schools, 2 post-offices, a public park, a library, 1 weekly newspaper, a volunteer fire department, and manufactures of furniture, boots and shoes, sewing-machine needles, silver polish, etc. It is supplied with water from Spot pond. It is pleasantly situated, and is an attractive place for residence of business men from Boston.

MELROSE', a pleasant village at the foot of the Eildon hills, on the s. bank of the Tweed, having a population of 1,405 at the census of 1871. It is famous for the ruins of its noble Cistercian abbey, founded by king David I. in 1136. The original pile having been destroyed during the wars of the succession, the monastery began to be rebuilt about 1286. The work was helped by large grants from king Robert Bruce, and his son king David II., but proceeded so slowly that it was scarcely finished at the revolution, in the middle of the 16th century. It was in the second pointed style, with one or two approaches to third pointed, and was beyond doubt the most beautiful structure of which Scotland could boast in the middle ages. What now remains are the chief portions of the conventual church, measuring 251 ft. in length, and some fragments of the cloister, which would seem to have been a square 150 ft. deep. The tracery and carvings, cut in stone of singular excellence, are scarcely surpassed by any in England. In the pages of Scott, Melrose shines with a splendor which its meager history fails to sustain. Its line of abbots showed one saint, St. Waltheof, the stepson of its royal founder. King Alexander II. chose his sepulture within its walls; Bruce left it the legacy of his heart; and it gave tombs to that flower of Scottish chivalry, the knight of Liddesdale, and to his kinsman, the heroic Douglas who fell at Otterburn. But its annals have little else to record. As a seat of piety and learning, its renown is eclipsed by the older and humbler monastery founded by St. Aidan, about the middle of the 7th c., and commemorated by the Venerable Bede as the home of Eata, of Boisil, of Cuthbert, and of Drythelm. “Old Melrose,” as it was called after the 12th c., stood about two m. below the modern abbey, on a beautiful promontory almost encircled by the Tweed. It was burned by Kenneth, king of Scots, in 880, and seems never to have recovered the blow. After it had lain waste for many years, we hear of it about 1073, as giving shelter, for a short season, to a few fugitive monks. All that survived the erection of the later abbey was a chapel dedicated to St. Cuthbert, and still famous about the middle of the 15th c. as a resort of pilgrims. The Chronicle of Malros, a series of brief obits and annals from 731 to 1273, has been twice printed, first among the Quindecim Scørpes
Historie Anglicaue, published by bishop Fell at Oxford in 1684; and again by Mr. Joseph Stevenson, for the Bannatyne club, at Edinburgh in 1855. The charters of the more modern abbey were printed by Mr. Cosmo Innes, at Edinburgh in 1837, for the same society, at the cost of the duke of Buccleuch, in two sumptuous quartos, with the title of the Liber S. Marie de Metros.

MELTON-MOWBRAY, a market-town of England, in the county of Leicester, and 16 m. n.e. of the town of that name, on the Eye near its junction with the Wreak, which is navigable to the Soar-Navigation, about 11 m. above the town. Stillton gypsum is manufactured, and pork-pies are extensively made, chiefly for retail in the London, Manchester, and Leeds markets. In the vicinity are numerous hunting-sets, and the town, with stabling accommodation for 800 horses, is the central rendezvous of the famous Melton hunt. There are breweries, tanneries, and 5 banks. Pop. '71, 5,011.

MELUN, an ancient t. of France, capital of the department of Seine-et-Marne, built on an island and on both banks of the Seine, 28 m. s.e. of Paris. The manufactures are cement, bricks, tiles, and hats, and there is a trade in timber, grain, and flour. Melun, the Meddium of the Romans, was stormed five times during the 9th c. by the Northmen, and fell into the hands of the English after a siege of six months, in 1419, and was held by them for ten years. Pop. '76, 11,215.

MELVILLE, Sir James, of Hallhill, 1535-1617, was the third son of Sir John Melvil or Melville of Raith, Scotland, who was convicted and executed at Stirling on charges of high treason brought by archbishop Hamilton, on account of his devotion to the principles of the reformation. His estates were confiscated and the widow and children reduced to poverty. Young Melvil was sent to France and became page of honor to the bishop of Valence, and was afterwards attached to the service of the constable Montmorency. Under him he saw his first military service in Flanders in 1553, and in 1557 was taken prisoner at the battle of St. Quentin after the defeat of the constable's forces. Two years afterwards he obtained his release and was dispatched to Scotland on a secret mission. During his absence occurred the tournament in which Montmorency had the ill fortune to kill Henry II.; and at Melville's return he judged it best to turn his steps towards Germany, where he was employed by the elector palatine. While on a visit to France in 1561 he for the first time met queen Mary of Scotland, to whom he tendered his allegiance and sword; and in 1564, having received a summons through Moray, he returned to his native land and presented himself to Mary at Perth. Shortly afterwards he was sent to England as ambassador to queen Elizabeth, and the account given in his memoirs of this embassy is of great historical value. Again in 1566 he was sent to England to bear the news of the birth of an heir to the Scottish throne. In the eventful period which followed, Melvil displayed much prudence and policy. He adhered to the queen so long as there appeared to be any hope of her ultimate success, but after she was committed to Lochleven castle, was received into some favor by the regency; but not being a favorite of the earl of Arran, his name was struck off the list of privy councillors. In 1590 he was attached to the queen's household. The Memoirs of Sir James Melvil of Hal-hill; Containing an Impartial Account of the most Remarkable Affairs of State during the last Age, etc., was published in 1683 by his grandson, George Scott. This edition differs in many respects from a manuscript afterwards found, in what is thought to be sir James's handwriting; the latter was printed in 1827 at Edinburgh.

MELVILLE, Henry, D.D., 1800-71; b. at Pendennis castle, Cornwall, England; educated at St. Peter's college, Cambridge, where he took his degree in 1821. After taking orders he became the incumbent of the parish of Camden chapel, in London; and filled successively the offices of principal of the East India college, chaplain of the Tower of London, chaplain to the queen, 1853, canon of St. Paul's, 1856; and in 1863 became rector of Barnes, and a rural dean. His reputation, both as a finished and elegant writer and as a pulpit orator of power and eloquence, gave him a very high position among the English clergy. In 1848 he was elected incumbent of what is known as the golden lectureship of St. Margaret's, Westminster. A great number of his lectures and sermons have been published in various countries. Of these he was the author, and a number of others were printed without his consent. In 1847 a New York house published in two volumes 68 sermons, printed with the consent of the author. We may also note Voices of the Year; Golden Counsels (1857); and Persuasions to a Christian Life, as among the best of his writings. Melville is described by the author of Random Recollections as "certainly the greatest orator among our metropolitan preachers. He clothes the most commonplace ideas in language which is so rich in the ornaments of rhetoric that they are often mistaken for conceptions of the most brilliant character. He is exceedingly partial to the use of analogy in addressing his hearers. And his analogies are often exceedingly happy; at times they are particularly striking. He arrests the hearer's attention the instant he begins, and carries with him, a willing captive, to the close of his sermon." A severe taste will sometimes consider his analogies extreme in their range.

MELVILLE, the name of an island, a sound, and a peninsula in the n. polar regions of America. The island is in lat. between 74° 30' and 77° n., long. between 105° 40' and 117° 30' west. Greatest length, 200 m.; greatest breadth, 190 m. It is separated on the
west by Fitzwilliam and Kellet straits from Prince Patrick island, the most western island of these regions. In 1819 lieut. Parry, who gave its name to Melville island, passed the winter here with his crews, in the vain hope of finding in summer a passage westward to the Pacific. Melville sound, about 250 m. long by 209 m. broad, extends immediately south-east of Melville island. It communicates with the Arctic ocean on the west by Banks's strait, and with Baffin's bay on the east by Barrow strait and Lancaster sound. Melville peninsula, abutting from the continent of British North America, is bounded on the north by Fury and Hecla strait, and connected with the main land by Rae isthmus. It is 250 m. in length by about 160 m. in average breadth. Lat. 66° 10' to 69° 50' n., long. 81° to 87° west.

MELVILLE, ANDREW, an eminent Scottish reformer, was b. Aug. 1, 1545, at Baldovry, on the banks of the South Esk, near Montrose. He was educated at the grammar school of Montrose, whence he removed in his fourteenth year to the university of St. Andrews. Here he remained four years, and left it with the reputation of being "the best philosopher, poet, and Grecian of any young master in the land." He then proceeded to Paris, where he continued his studies for two years. His reputation must have been already considerable, for in his twenty-first year he was chosen regent in the college of St. Marcoum, Poitiers, whither he had gone a perfect stranger, to acquire a knowledge of law. Some time afterwards he proceeded to Geneva, where he was more in his element, both politically and religiously, and where, by the influence of his friend Beza, he was appointed to the chair of humanity in the academy. He returned to Scotland in 1574, and was, in the course of the same year, appointed principal of the university of Glasgow, where his scholarship, energetic discipline, and intrepidity of character exercised a most quickening and elevating influence. When the regent Morton exclaimed on one occasion, "There will never be quietness in this country till half a dozen of you be hanged or banished," Melville is said to have replied: "Tush, man; threaten your courtiers so. It is the same to me whether I rot in the air or in the ground; and I have lived out of your country as well as in it. Let God be praised, you can neither hang nor exile his truth!" In 1580 Melville was chosen principal of St. Mary's college, St. Andrews. Here, "besides giving lectures on theology, he taught the Hebrew, Chaldee, Syrac, and rabbinical languages." In 1582 he preached the opening sermon before the general assembly, and boldly inveighed against the bloody knife of absolute authority, whereby many intended to pull the crown off Christ's head, and to wring the scepter of Justice out of His hand. His spirit was repeatedly and imported into the assembly as being of a similar spirit, and appointed Melville and others to present it. In less than two years Melville was summoned before the privy council, on account of a sermon preached at St. Andrews. He declined to appear, maintaining that whatever a preacher might say in the pulpit, even if it should be called treason, he was not bound to answer for it in a civil court, until he had been first tried in a church court. For this denial of secular jurisdiction he was condemned to imprisonment, but escaped to London, where he remained till the downfall of Arran in the following year. After an absence of twenty months he returned to Scotland and resumed his office at St. Andrews. He was repeatedly elected moderator of the general assembly and rector of the university. A remarkable instance of his plain speaking took place at Cupar in 1596. Melville was heading a deputation to "remonstrate" with the king. James reminded the zealous remonstrant that he was his vassal. "Sirrah!" retorted Melville, "ye are to his vassal; there are two kings and two sages, whose heads are in the same king; and to the head of this one, and the other is in the hand. There is Christ Jesus, the king of the church, whose subject James the Sixth is, and of whose kingdom he is not a king, nor a lord, nor a head, but a member." In 1605 Melville was called to England to attend the famous conference at Hampton court. Having ridiculed the service in the chapel royal in a Latin epigram, he was summoned before the English privy council, where his temper gave way, and he broke out into a torrent of invective against the archbishop of Canterbury for encouraging popery and superstition, profaning the Sabbath, etc. The king, violating every principle of justice, immediately sent him to the Tower, where he remained for more than four years. In 1611 he was released on the solicitation of the duke of Bouillon, who wanted his services as a professor in his university at Sedan in France. Melville, now in his sixty-sixth year, would fain have gone home to Scotland to lay his bones there, but the king would on no account hear of such a thing; and he was forced to spend his old age in exile. Melville died about 1622, but neither the date of his death nor the events of his last years are ascertained. See Life of Andrew Melville by Dr. M'Crie (2 vols. 1819).

MELVILLE, HERMAN, an American author, was b. in New York, Aug. 1, 1819. At the age of 18 he shipped as a common sailor on a voyage to Liverpool; and in 1841 he went again before the mast on a whaling voyage to the Pacific. Ill-treated by the capt., he deserted at Nukaheva, Marquesas islands, and was kept four months as the prisoner of a savage tribe in the Typee valley and was rescued by an Australian whaler, and taken to Tahiti. After visiting the Sandwich islands he shipped on a U. S. frigate, and returned to Boston in 1843. In 1846 the first literary result of his adventures was published in Typee, a spirited account of his residence in the Marquesas. Omoo, a continuation of his adventures in Oceania, appeared in 1847, in which year he married a
daughter of chief-justice Shaw of Massachusetts. *Sardi,* a strange philosophical romance, in 1848, was followed by *Redburn* in 1849; *White Jacket,* or the *World in a Man-of-War,* 1850; *Moby Dick,* or the *White Whale,* 1851; *Pierre,* or the *Ambiguities,* 1852; *Israel Potter,* 1855; *The Piazza Tales,* 1856; and *The Confidence Man,* 1857. In 1860 he embarked in a whaling vessel for a new tour round the world. *Battle Pieces* (1866) appeared after his return.

**MELVILLE, Viscount.** See *Dundas.*

MELVILLE ISLAND, off the n.w. coast of Australia, from which it is separated on the e. by Dundas strait and on the s. by Van Diemen's gulf and Clarence strait, while Bathurst island lies to the w., being separated from Melville island by Apsley strait; it is 70 m. in length and 30 m. wide, and from lat. 11° 8' to 11° 56' s., and from long. 130° 20' to 131° 34' e. The coast is in general high and steep, the surface being in great part table-land, though it rises to the height of 150 or 175 ft. in the central part. The *uenta* and *flora* in general correspond to those of Australia. The natives are superior to those of the continent both in physique and in mental capacity. The climate is, of course, very warm, and during the wet season is not healthful.

**MEMBERED,** in heredity. When a bird has its legs of a different color from its body, it is said to be membered of that color.

**MEMBERTOU, Henry,** 1500-1611: b. Canada; a medicine-man in the Micmac tribe. He was friendly to the French colonists who arrived in 1604, and fought a number of Indian tribes hostile to the French. Lesecartou wrote a poem in honor of the victory gained by Membertou in 1607 over the Armauchiquois, a tribe in the vicinity of the Merrimack river. Three years later he, his wife, and three sons were baptized as Christians. The next year, under the care of the French missionaries, he died at Fort Royal at the estimated age of 110.

**MEMBRA NA PUPILLA RIS,** the name given to a very thin mem-brane which closes or covers the central aperture of the iris in the fetus during a certain period of gestation, but which disappears in the seventh month.

**MEMBRANE,** in anatomy. This term is applied to designate those textures of the animal body which are arranged in the form of laminae, and cover organs, or line the interior of cavities, or take part in the formation of the walls of canals or tubes. The structure and special uses of some of the most important of the animal membranes are noticed in separate articles: such as MUCOUS MEMBRANE, SEROUS MEMBRANE, etc.; and the membranes in which the fetus is inclosed—commonly called the fetal membranes—are described in the article PLACENTA. The membranes which cover and protect the brain and spinal cord are commonly termed meninges, from the Greek word *meninx,* a membrane.

**MEMBRANE, (ante),** a name given to different thin organs, in the form of supple, more or less elastic tissues, for the purpose of enveloping or separating other organs, and in many cases, of secreting certain fluids. Bichat divided membranes into simple and compound. Simple membranes are of three kinds, mucous, serous, and fibrous. Mucous membranes line the cavities which communicate externally with the skin, as the mouth, intestinal canal, genito-urinary passages, internal surface of the eyelids, and the ramifications of the respiratory passages, the eustachian tubes and middle ear. Mucous membrane has three layers; a fibro-vascular layer, composed of blood-vessels, nerves, and connective tissue, which is continuous with the tissue beneath and interlacing with it; a more superficial layer, called basement membrane, which is described as structureless, and upon which rests the superficial layer, or epithelium, the latter presenting a variety of structure in various parts of the body. The two lower layers, the fibro-vascular and the basement membrane are continuous with the two lower layers of the skin, in reality forming the same organ, which passes under the common name of corium. The basement membrane is not in all localities susceptible of demonstration. The epithelium is composed of numerous cells called epithelial cells of various forms. The chief purpose of the mucous membranes are to secrete mucus to lubricate the various passages, at the same time that the mucous fluid performs other physiological offices. The salivary mucus, to some extent, aids digestion, and the digestive fluid (gastric juice) is a species of mucus; so also is the pancreatic fluid, and the product of the various intestinal glands. See *Epithelium, ante.* The serous membranes line all the shut or closed cavities, and are of two kinds; those lining the cavities of the thorax and abdomen, the pleura (q.v.) and peritoneum (q.v.), and those which line the cavities of the joints. See *Synovial Membranes, ante.* The third species of simple membrane of Bichat is the fibrous, composed of two sections; enveloping the fibrous capsules of joints and the sheaths of tendons—and the enveloping membrane of bone, the periosteum, the dura-mater (the internal periosteum of the skull), the fibrous membrane of the spleen and other glindrical organs. See *Spleen, ante.* The compound membranes Bichat divided into three sections. 1. Sero-fibrous, composed of fibrous and serous layers intimately adherent, as the pericardium, dura-mater, and tunica-albuginea. 2. Sero-mucous, composed of serous and mucous layers, as the gall bladder at its lower part. 3. Fibro-mucous, formed by the union of fibrous and mucous membrane, as the mucous membrane of the nasal fossae, gums, etc. It will be perceived that the compound membranes...
form a classification which embraces elements classed among the simple membranes; and this is natural, seeing that the compound are made up of simple membranes.

MEMBRÉ, ZENOBUS, 1643-87; b. at Bapanne, France; became a member of the Franciscan order, and went as a missionary to Canada in 1675; accompanied La Salle upon his expedition to the Mississippi in 1679, stopping at fort Crévecoeur, on lake Peoria, where he aided in making peace between the Iroquois and Illinois Indians; descended the Mississippi with La Salle in 1682, and returned the same year to France, where he published an account of the expedition. After acting for a time as warden of a convent at Bapanne, he came again to America, and accompanied La Salle in his final expedition by sea to Texas in 1684, and remained in Fort St. Louis, where, with his companions, he was massacred by the Indians.

MEDEI, a governmental district of Prussia, forming its most northerly boundary towards Russia, and included in the circle of Königsberg. The chief town, Memel, situated in 55° 45' n. lat., and 21° 6' e. long, and lying at the northern extremity of the Kurisches Haff, at its opening into the Baltic, is a well-fortified, active seaport, Pop. 79, 19,756. It has an excellent large harbor, and is the center of an active trade in corn, wood, hemp, and amber; the produce of Lithuania and other Russian provinces being brought thither for exportation. The town itself, which is surrounded by an unpredicative sandy plain, possesses several good manufactories for the preparation of brandy, soap, linseed-oil, etc., and extensive saw-mills, iron-foundries, and amber and iron works, the last of which are noted alike for their strong cables and their light and elegant castriron goods. Ship-building is carried on at Memel, which owns about 100 ships, and has a good school of navigation; in 1874, 1284 vessels entered, and 1340 left, the port, and steam-packets maintain a communication with many of the other Baltic ports. Memel was founded in 1333 by the Livonian order of knights; in 1404 it was fortified by the Teutonic knights. In consequence of a fire in 1854 it has of late years undergone an almost complete renovation, and is now a clean, well-built town.

MEMLING or HEMLING, HANS, 1435-95 (about) probably a native of Bruges, but very little is known about the date and place of his birth or the time of his death, which could not, however, have been later than 1495. Several other ways of spelling the name are given, but "Memling" has decidedly the best authority. He was, at least, an artist of the Flemish school, if not of Flemish birth, and painted a large number of altar-pieces and pictures on sacred subjects, to which his work was almost wholly confined. It is a matter of great uncertainty to say what were and what were not his productions. Rathgeber designates over one hundred pictures, but very few of these are truly authenticated. The earliest of those which it is thought are genuine is dated in 1450 and the latest in 1491. Memling is said to have served under Charles the bold of Burgundy, and it is related that after the battles of Granson and Morat, he was admitted as a wounded soldier, into the hospital of St. John's, at Bruges. Here it was, at all events, that were painted many of the finest works attributed to him. Of these, the principal are: the illustration in a picture composed of many small compartments, of the history of St. Ursula and her companions; the marriage of St. Catherine, his finest picture, and one of the best of that c., consists of a central composition representing the marriage, and two wings or side pieces, depicting the beheading of John the Baptist and the vision of John the Evangelist. There are many pictures, presumably Memling's, at Berlin, Antwerp, the Hague, and other parts of Europe, and two or three in England. Specially worthy of praise are: "St. Christopher carrying the Child," "Joys and Sorrows of the Virgin," and "The Journey of the Three Kings from the East," All of these there is not only great harmony in color and effective use of light and shade, but most noteworthy of all is the wonderful perfection in matters of detail. The last named picture contains nearly 1500 objects and figures of small size, all of which are elaborated in the most minute manner, and this, too, without neglect of general effects.

MEMLOOKS. See MAMELUKES, ante.

MEMMGING, a t. of Bavaria, near the right bank of the Iller, 42 m. s.w. of Augsburg. It has handsome streets, carries on manufactures of woolen, cotton, and linen goods, gun-powder, and iron-ware; the chief part of the trade is in hops, wool, leather, and grain. Pop. 75, 7,762.

MEMMINGER, CHARLES GUSTAVES, b. Wartemberg, Germany; and was brought to this country at a very early age by his mother. By her death he was soon left at Phila. Much interest was taken in him by gov. Thomas Bennett of Charlestown, S. C. at which place he was then situated. He was educated at the South Carolina college, where he graduated in 1820 and subsequently studied law. He opened practice in Charlestown, where he acquired some note as an opponent of the Calhoun doctrine of nullification; and on that subject he wrote a satirical book which he called the Book of Nullification (1832), and which was written in an imitation of Biblical style. He was elected to the state legislature, and made strong arguments in opposition to the suspension of specie payments by the banks after the panic of 1839; and he was for many years head of the legislative finance committee. Shortly after the outbreak of the rebellion he was made secretary of the treasury by the confederate government, and held that position for three years, 1861-64, when he resigned.
MEMNON, a celebrated hero, the son of Tithonus and Eos or Aurora, who led to Troy a host of Æthiopians, to support the cause of Troy after the fall of Hector. He was said to be clad in armor made by Hephaestus or Vulcan, and killed Antilochus, son of Nestor, in single combat. He was killed in single combat with Ajax or Achilles. Others suppose he was ruler of the nations between Susa and Troy, or a vassal of the Assyrian monarch Tantamanius, who sent him with 10,000 Æthiopians, and as many Susians, to the Trojan war. After his death, his corpse was carried by Aurora to Susa, and buried in the acropolis of that town, Memnonela; or his ashes, collected in a silver urn, borne to his sister Himera at Paphos, and thence to Pallichos or Palts; or to the banks of the Helos, near Ptolemais. The river Paphlogonios flowed from his blood, and his companions were changed into birds. But the Memnon of the older writers obtained a still greater renown by the name being transferred at a later period by the Greeks to a celebrated colossal, seated in the plains of Thebes, on the left or west bank of the Nile; while the name of Memnonela was applied by the Egyptian Greeks to the sepulchral quarters of the Pharaohs near the right or east bank. Memnonela, or supposed palaces of Memnon, also existed at Abydos. The two statues—one of which is the celebrated vocal Memnon, one of the wonders of the old world—are at a place called Koun-el-Sultan. Both are seated on thrones, and represent the monarch Amenophis III., of the 18th dynasty, whose name and titles are inscribed on the plinths behind. At the sides of the throne are sculptured the wife and mother of the monarch, about 18 ft. high. The height of each of these colossi appears to have originally been 60 ft., and they are made of a coarse hard gristone or breccia. They are at present known by the sobriquets of Tamny and Shammy, and were originally placed before the propylon of an Amenophenoeion or palace-temple of Amenophis III. in this quarter at Thebes. The easternmost of these colossi is the celebrated vocal statue, distinguished from its companion by having been apparently broken and repaired from the lap upwards with blocks of sandstone, placed horizontally, in five layers. The statue was either injured by Cambyses, to whom the Egyptian priests ascribed most of the mutilations of the Theban temples of the Egyptian gods, or was thrown down by an earthquake. The statue was its giving out at various times a sound resembling the breaking of a harp-string or a metallic ring; and considerable difference of opinion has prevailed as to the reason of this sound, which has been heard in modern times, it being ascribed to the artifice of the priests, who struck the sonorous stone of which the statue is composed, the passage of light draughts of air through the cracks, or the sudden expansion of aqueous particles under the influence of the sun's rays. This remarkable quality of the statue is first mentioned by Strabo, who visited it in company of Ælius Gallus, about 18 B.C.; and upwards of 100 inscriptions of Greek and Roman visitors incised upon its legs, record the visits of ancient travelers to witness the phenomenon, from the 9th year of Nero, 63 A.D., to the reign of the emperor Severus, when it became silent. Amongst other visitors whose names are recorded are those of the emperor Hadrian and his wife Sabina; Septimius Severus also visited the statue, and is conjectured to have restored it; for Juvenal mentions it as broken in half, and no notice of it occurs under the Pharaohs or Ptolemies. The identity of this statue and of Memnonela is confirmed by the general belief, and by Pausanias and the inscriptions. Besides the mythical Memnon, two historical personages of this name are known—one a Rhodian commander of the mercenary forces of Artabazus in the war against Artaxerxes-Ochus, who subsequently fled to Macedon, and afterwards entering the Persian service, defended Persia against Alexander, 336 B.C.; but finally died at the siege of Mitylene, 333 B.C.; the other, a Greek historian, who wrote a history of Heraclea Pontica, in 16 books, which have been epitomized by Photius—Welecker, Epich. Cycl. 211; Strabo, xv. 728, xvii. 816; Ælian, H. A., v. 1; Jacobs, Die Gräber des Memnon; Eusebius, Hieron, p. 154; Juvenal, xv. 5; Letronne, Sur le Mon. d'Osmanyedas; Wilkinson, Top. of Thebes, p. 33; Vossius, De Hist. Grac. a Westermann, p. 226; Diodor. xvi. 52.

MEMORY. This is one name for the great and distinctive fact of mind, namely, the power of retaining impressions made through the senses, and of reviving them at after-times without the originals, and by mental forces alone. The business of the mind is already stated (see Association or Ideas, Habit). We shall advert here to some of the arts and devices that have been propounded from time to time, for aiding our recollection in the various kinds of knowledge. Perhaps the commonest remark on this subject is, that memory depends on attention, or that the more we attend to a thing, the better we remember it. This is true with reference to any special acquisition: if we direct the forces of the mind upon one point, we shall necessarily give that point the benefit of the concentration, but this does not affect memory as a whole; we merely take power from one thing to give it to another. Memory at large can be improved only by increasing the vigor and freshness of the nervous system, and by avoiding all occasions of exhaustion, undue excitement, and other causes of nervous waste. We may do this by general constitutional means, or by stimulating the brain at the expense of the other functions; this last method is, however, no economy in the end. Every man's system has a certain fund of plastic power, which may be husbanded, but cannot be materially increased on the whole; the power being greatest in early life, and diminishing with advancing years. If it is strongly
drawn upon for one class of acquisitions, we must not expect it to be of equal avail for others.

But there may be ways and means of presenting and arranging the matters of our knowledge so as to make them retained at a smaller cost of the plastic power of the brain. These include the arts of teaching, expounding, and educating in general, and also certain more special devices commonly known as the arts of memory, or mnemonics. A brief account of these last may be given here. The oldest method of artificial memory is said to have been invented by the Greek poet Simonides, who lived in the 5th c. B.C. It is named the topicol, or locality memory, from the employment of known places as the medium of recollection. As given by Quintilian it is in substance as follows: You choose a very spacious and diversely arranged place, for instance, a house, divided into several apartments. You impress the mind with care whatever is remarkable in it, so that the mind may pass through all the parts without hesitation and delay. Then if you have to remember a series of ideas, you place the first in the hall, the second in the parlor, and so on with the rest, going over the windows, the chambers, to the statues and several objects. Then when you wish to recall the succession, you commence going over the house in the order fixed, and in connection with each apartment you will find the idea that you attached to it. The principle of the method is that it is more easy for the mind to associate a thought with a well-known place than to associate the same thought with the next thought without any medium whatever. Orators are said to have used the method for remembering their speeches. The method has been extensively taught by writers on mnemonics in modern times. Probably for temporary efforts of memory it may be of some use; the doubtful point always is whether the machinery of such systems is not more cumbersome than helpful.

Many laborers have spent time on mnemonic devices for assisting in the recollection of numbers, one of the harder efforts of memory. The principal method employed for this purpose is to reduce the numbers to words, by assigning a letter for each of the ten cipher. This method was reduced to system by Gregor von Feinaigle, a German monk, and was taught by him in various parts of Europe, and finally published in 1812. He made a careful choice of the letters for representing the several figures, having in view some association between the connected couple, for more easy recollection. For the figure 1, he used the letter t, as being a single stroke; for 2, n, as being two strokes combined; 3, m, three strokes; 4, r, which is found in the word denoting "four" in the European languages; 5, l, from the Roman numeral L, signifying fifty, or five tens; 6, d, because the written d resembles 6 reversed; 7, k, because k resembles two 7's joined at top; in place of this figure is also used on occasion y, q, c (hard) as all belonging to the guttural class of k; 8, b, from a certain amount of similarity, also e, for the same reason, and sometimes r, or the half w: 9 is p, from similarity, and also f, both of which are united in the word puff, which proceeds from a pipe, like a 9 figure; 0 is x, or z, because it resembles in its roundness a grindstone, which gives out a hissing noise like these letters. The letters of the alphabet not employed in representing figures are to be used in combination with these, but with the understanding that they have no meaning of themselves. Suppose, then, that a number is given, say 547; 5 is l, 4 is r, 7 is k; which makes t, r, k; among these letters we insert an unmeaning vowel, as a, to make up an intelligible word LAARK, which remains in the memory far more easily than the numerical form. In making up the words by the insertion of the unmeaning or dumb letters, we should also have regard to some connection with the subject that the number refers to, as, for example, in chronology. Thus, America was discovered in 1492; the letters here are t, r, p, n; they may be made into TO Native, because that discovery led to rapine by the first Spaniards. There is, of course, great room for ingenuity in the formation of these suggestive words. Also, a series of numbers may be joined together in some intelligible sentence which can be easily remembered. Such combinations, however, should be formed once for all in the case of any important series of numbers, as the dates of our sovereigns in historical epochs. It is too much to expect pupils to construct these felicitous combinations. Feinaigle combined the topicol method with the above plan in fixing a succession of numbers in the memory.

Dr. Edward Pick, a recent lecturer on mnemonics, has called attention to a peculiar mode of arranging lists of words that are to be fixed in the memory, as the exceptions to grammar rules, etc. He proposes to choose out such words as have some kind of connection with one another, and to arrange them in a series, so that each shall have a meaning in common with the next, or be contrasted with it, or be related to it by any other bond of association. Thus, he takes the French irregular verbs, which are usually arranged in the alphabetical order (which is itself, however, a mnemonic help), and puts them into the following series, where a certain connection of meanings exists between every two: as ser, sit down, more, go, go away, send, follow, run, swim, etc. In a case where two words have no mutual suggestive connection, it is proposed to find out a hint of artificial connection. Thus, if those words were garden, hair, watchman, philosophy, he would interpolate other words: thus, garden, plant, hair of a plant—hair; hair, bonnet, watchman; watchman, wake, study—philosophy; and so on. Of course the previous method is the one that should be aimed at, as the new words are to a certain extent a burden to the mind. Dr. Pick further suggests as a practical hint, in committing to memory, that the attention should be concentrated suc-
cessively upon each two consecutive members of the series; the mind should pause upon the first and the second until they have been made coherent; then abandoning the first, it should in the same way attend to the second and the third, the third and the fourth, etc. Of course if every successive link is in that way made sufficiently strong, the whole chain is secure.

There are various examples of effective mnemonic combinations. The whole doctrine of the sylogism (q.v.) is contained in five lines of Latin verse; as regards amount of meaning in small compass, these lines have never been surpassed, if, indeed, they have been equaled. The versification of the rules of the Latin grammar has the same end in view, but all that is gained by this is merely the help from the association of the sounds of the verse in the ear; in comparison with a topical memory, this might be called a rhetorical memory. The well-known rule for the number of days in the different months of the year (‘Thirty days hath September,’ etc.) is an instance of mnemonic verse.

MEMORY, DISEASES OF. Memory, or the power of reproducing mental impressions, is impaired by age, wounds, or injuries to the head or nervous system, fevers, intemperance, and various physical conditions. It is perhaps affected in all kinds of mental derangement, but is in a most signal manner obliterated or enfeebled in dementia. There are, however, examples of recollection surviving all other faculties, and preserving a clear and extensive notion of long and complicated series of events amid the general darkness and ruin of mind. Incoherence overtops some of its features to defective or irremediable decay, and an exact statement of this state of the mind is, where a whole parliamentary debate could be recalled, suggest the suspension of unhealthy action. There appear, however, to be special affections of the faculty. It may be suspended while the intelligence remains intact. Periods of personal or general history may elude the grasp, and even that continuity of impressions which goes far to constitute the feeling of personal identity, is broken up, and a duality or multiplicity of experiences may appear to be conjoined. The converse of this may happen, and knowledge that had completely faded away may, under excitement or cerebral disease, return. There are, besides, states in which this power is partially affected, as in the instances where the numbers 5 and 7 were lost, and where a highly educated man could not retain any conception of the letter F; secondly, where it appears perverted, recalling images inappropriately, and in an erroneous sequence of order or time, and different from what are desired; and thirdly, where, while the written or printed signs of ideas can be used, the oral or articulate signs are utterly forgotten. All these deviations from health appear to depend upon changes generally of an apoplectic nature in the anterior lobes of the brain.—Crichton on Memory Disease, 337; Teuchtersleben, Medical Psychology, p. 121.

MEMPHIS, a celebrated Egyptian city, situated in the Delta, or Lower Egypt, the ancient capital of the country, called by the Egyptians Men nefer, or “the Good Station;” by the Hebrews, Moph; and by the Arabs, Memf. It was founded by Menes, the first monarch of the first dynasty, who, according to Herodotus, changed the bed of the Nile and made an embankment, 150 stadms above the city, to prevent the new city against inundations. The remains of this bank still exist at Kafr-el Tyat, about 14 m. above Metrahenny, which is the center of old Memphis, and the site of the temple of Ptah or Hphesteum. Menes fortified the city, and laid the foundations of the temple. Uchoreus, a later monarch, is also said to have founded Memphis, and introduced the worship of Apis and Epaphus. The site of the city was well chosen, protected alike by the Libyan and Arabian chains of mountains against the river and the incursions of the sand, defending the approach of the country from the incursions of Asiatic nomads, and communicating with the Red sea and the Mediterranean. The city was composed of two portions—one built of crude bricks; the other, on which was the citadel, of calcareous stone, called the Leukon Telchos, or “White Wall,” which held some of the principal buildings. The palace, built by Menes, was enlarged by his son Athothis, and was always inhabited either by a monarch or his viceroy. Under the Persian rule it was occupied by the satrap; and by the Greek mercenaries under the Saite kings. Under the Romans the circumference was 150 stadms. After the 6th dynasty the city declined in importance, and was apparently held by the Byazkos after the 13th and before the 18th (1500 b.c.). At this period Memphis was ruled by a viceroy, a prince of the blood, and still remained the religious capital of the old worship. It rose again to great importance under the Saite monarchs, about 600 b.c., who restored it, became the seat of a separate monarchy, and was conquered by Sennacherib and his successors. The temples of this city were magnificent, and comprised the Iseum, a large temple of Isis, completed by Amasis II. just prior to Cambyses (535 b.c.); a temple dedicated to Proteus, in the foreign quarter; the temple of the Apis, having a peristyle and court ornamented with figures, opposite the south propylum of the temple of Ptah, where the sacred bull resided; the Serapeum, or temple of Os or Apis, in the quarter recently discovered by M. Mariette (see Serapeum); the Nilometer, removed by Constantine I. to Constantinople, replaced by Julian III. or the apostate; a temple of Ra; and the shrine of the Cabiri. Here were the statues of Rameses II., one of which exists as the fallen colossal, Metrahenny, and others have been discovered by Hekekyen Bey in his excava-
Memory.

vations. These colossi, above 75 ft. high, were of syenitic granite, or of the limestone of Tourah or Mokattam. These temples flourished in all their glory till the Persian conquest. Still more remarkable was the great necropolis of the city, in the center of which towered the pyramids (see PYRAMIDS). During the attempts of the native rulers to throw off the Persian rule, Memphis was an important strategic point. Oechus inflicted severe injury on this town, having plundered the temples and thrown down the walls after he had driven out Nectanebus. Alexander the great here worshiped the Aphis, and his corpse was brought to this city by Ptolemy before it was finally transferred to Alexander. The first Ptolemies were crowned in the serapeum. Ptolemy VIII. destroyed the city, and it had so declined after his time as to become a decayed site. It fell with the rest of Egypt under the Roman rule, and afterwards was conquered by Amru Ben Abas (639-640 A.D.); and Fostat and Cairo were built out of its ruins, which were large and important in the 13th c., when they were seen by Abd-alatif. The few remains of the ancient city are Kom el-Azyzeh to the n., Metrahenny on the w., and the canal of Bedrichani on the s.; but the remains here are submerged many ft. in the soil of the Delta.

Thebes, p. 340; Bunsen, Egypt's Place, ii. p. 47; Champollin-Figeac, L'Egypte, 35, 63, 263, 286; Lepsius, Reise, 20, 51, 63.

MEMPHIS, a city and port of entry on the e. side of the Mississippi river, in the s.w. corner of Tennessee, 420 m. below St. Louis. It is handsomely built on a bluff, 60 ft. above the highest floods. It is the outlet of a large cotton region, receiving, in 1875-76, 429,927 bales. It has fine public buildings and hotels and theater, 48 churches, 3 colleges, 100 schools, 5 daily, and 10 other newspapers, and several large insurance companies; railways connecting it with New Orleans, Charleston, Louisville, Little Rock, etc.; with several foundries, manufactories of boilers, machinery, etc. In the war of secession it fell into the hands of the federal forces in 1862, and was the base of military operations for the capture of Vicksburg, July 4, 1863. Memphis was desolated by a fearful outbreak of yellow-fever in the summer of 1878. Pop. '70, 40,226.

MEMPHIS (ante), capital of Shelby co.; the chief city in Tennessee, and the largest city on the Mississippi river between St. Louis and New Orleans; pop. '80, 33,593. It is situated on the fourth Chickasaw bluff, 800 m. above New Orleans. The view of the city from the river is very attractive; a broad esplanade, extending along the bluff, covered with fine warehouses, presenting a very striking appearance. The streets are broad and regularly laid out, the suburbs being occupied by handsomely residences standing in the midst of fine lawns; the entire length of the city is three miles. A fine park in the center is filled with large old trees, in which thousands of squirrels disport themselves, and are so tame that they will eat from the hands of visitors, clamber upon their knees and shoulders, and hop fearlessly about on the gravelled walks, regardless of the numbers of persons who are commonly promenading. The safety of these attractive little creatures is amply provided for by the general kindness and care that they are not to be molested.

There are six cemeteries in the vicinity of Memphis, of which the principal one is Elmwood, on the s.e. border of the city. There is a local chamber of commerce, a board of health, and a cotton exchange. Railroads centering here make connection with all parts of the country, north and south; while the Mississippi river, affording navigation during the entire year, is the scene of an immense commerce. Owing to its proximity to stagnant water and to an imperfet system of drainage and sewerage, Memphis has frequently been subject to visitations of the yellow-fever, which have nearly depopulated the city. The last epidemic occurred in 1879, lasting from July until cold weather set in. The mass of the inhabitants deserted the city, leaving only the very poor and the colored people. During this season there were several hundred deaths by yellow-fever, an efficient quarantine being sustained. Recent and, it is said, successful efforts have been made to improve the drainage and prevent disease.

MENHIREMAGOG, LAKE, in Canada and in Orleans co., Vermont; about 30 m. long from n. to s., with a width varying from 2 to 5 miles. Its outlet is the Magog river, which discharges into the St. Francis river, a tributary of the St. Lawrence. Its shores are steep and picturesque, and it contains a number of islands. Its scenery and insalities for fishing attract many visitors in the summer. Steamers run, in that season, between its s. point, the town of Newport, Vt., and Magog, the village at its outlet.

MEN, THE, are a somewhat remarkable class of persons found chiefly in those parts of northern Scotland in which the Gaelic language is spoken, and where large undivided parishes, a deficiency of ministers, and other causes have developed a class of religious instructors and overseers who, without regular appointment, somewhat resemble the local preachers of the Methodist church. They are called "men" as a title of respect, in acknowledgment of their mental endowments, knowledge, and piety. They pass into the order informally, and by the gradual reputation which they acquire among the people around them for superior gifts and experience. By excellence in prayer and exhortation, and by constant attendance at the meetings for promoting Christian activity and fellow ship, they step by step advance into the order of "men." There are in many parishes three or four "men," and on communion occasions, Friday being specially devoted
to prayer and exhortation, these way-exhorters have then a public opportunity for exercising their gifts. As there may be 20 or more of them assembled from neighboring parishes, the services of the day are given up to them, presided over by the minister of the parish, who generally sums up the opinions and sentiments that have been expressed.

Many of the “men” wear on these occasions a large blue cloak, and in going about among the people they are received with much respect and kindness. The influence which they acquire is very great, and in some cases is grievously abused. Yet these constitute the exception, not the rule. There is no doubt that in many destitute regions these workers among the people have done much to keep alive and extend true religion. Since the organization of the Free church of Scotland, as the supply of regular gospel ordinances in the Highlands has been greatly increased, the need for the services of the “men” has been proportionally diminished, and their influence is therefore passing away.

MENABREA, Luigi Fedrigo, Count; b. at Chambéry, in Savoy, 1809; educated for an engineer; entered the army as liet., but was early promoted to a professorship of applied mathematics in the military academy of Turin, where he at once distinguished himself by scientific essays contributed to the academies of science of Paris and Turin. In 1848 he promoted the union of Piedmont and Sardinia; was elected a member of the Subalpine parliament, appointed secretary of the minister of war, and the following year secretary of foreign affairs. After participating in vigorous measures to resist the Austrians, he continued a member of the chamber, assuming at first the defense of the Church of Rome, and believing in the possible accord of the papacy with Italian unity. But, through the influence of Cavour, after 1859 he abandoned that hope, and ranged himself with the radical unionists. After the defeat of the Austrians by the French, and the annexation of Savoy to France, he left the province to retain his citizenship of Italy, and was made director of military siege operations against Gête and the king of Naples, in “the Sebastopol of the Bourbons.” It surrendered after 57 days’ siege, for which success he was made liet. gen. and count. In 1861 he succeeded Ricasoli as minister of marine, and in 1862 added the duties of minister of public works. He was a party to the convention between France and Austria in 1864, and of the treaty of Prague in 1866, which finally led to the annexation of Venice to Italy; and it was he who presented to Victor Emmanuel the iron crown of Lombardy. He was called in 1867, on the retirement of Ratazzi, to form a new cabinet. Garibaldi was marching upon Rome, to sever the last link in the chain of papal civil power in Italy. France opposed Garibaldi with her troops. Menabrea did the humiliating duty of endeavoring to buy the withdrawal of the French troops, and the substitution of Italian troops, by a promise to disavow the acts of Garibaldi. Occupying this equivocal position of half-sustaining the temporal power of the pope, keeping the peace with France, and yet advocating the unity of Italy, he fell between all the parties and tendered his resignation. Victor Emmanuel refused to accept it. Menabrea formed a new cabinet and continued with adroitness to pursue the road which Cavour had marked out: viz., to submit to the meddling of France in the defense of the pope till events should ripen for Italian unity. He continued at the head of affairs for two years, temporizing with the pope and the republicans, and enduring the policy of Napoleon through fear. When the pope in 1869 convoked the bishops to announce the syllabus of infallibility, Menabrea proclaimed the reserved rights of the state as without the pale of the pope’s powers. Italy outgrew his timorous policy, and in Nov., 1869, he gave way to the ministry of Lanza-Sella. He has published République et Monarchie dans l’état actuel de la France, 1871.

MENA D0, an important possession of the Netherlands, on the n. of Celebes, is under the government of the Moluccas. The country is volcanic, with many lofty mountains. The mountainous grounds of the province of Minahassa are well adapted for the growth of coffee, which was first planted in 1820, and speedily became favorably known in the market. The coffee-culture is compulsory, and the government monopolizes the produce at a fixed price. In 1874 there were 10,887,200 coffee-trees, which produced 1,004 tons. The rice-crop averages 47,880 tons. There are 400,000 sago and 800,000 cocoa-nut trees, and cacao, tobacco, cotton, and cinchona are cultivated. On Jan. 1, 1875, there were 11,628 horses, 19,887 cattle, 201,284 swine, 8,641 buffaloes, and 17,169 sheep and goats. In this residency, civilization and Christianity have made rapid progress. The pop., on Jan. 1, 1873, amounted to 505,756, of whom 777 were Europeans. Twenty years ago, the pagans were most numerous in the Minahassa district, but 77,184 are now Christians. The town of Menado is neatly built, has a church, a school for the children of Europeans, and others for those of native races.

MENAGE, JEAN, ou GILES DE, a French lexicographer and linguist, was b. at Angers in 1613. Disliking the profession of an advocate, he renounced it, along with an office under government, which his father had transferred to him, entered the church, and fixed his residence in the convent of Notre Dame. His time was chiefly spent in literary pursuits, in which he acquired a great reputation. He was an extreme pedant, full of prejudices and bitter hostilities. His Dictionnaire Etymologique de la Langue Françoise (Par. 1650; best ed. by Jault, 2 vols. Par. 1750), and his Origines della Lingua Italiana, are erudite and valuable works, although they contain many erroneous etymolo-
Menabrea.
Menchikow.

gies. His poems (Latin, Italian, French, and Greek) are of little worth. He died in 1692.

**MENAI STRAIT,** which separates the island of Anglesey from the main-land, runs east and west from its southern extremity to Bangor, a distance of 18 m., and there widens out into Beaumaris bay. Its width varies from about 250 yds. to 2 miles. The navigation is hazardous, but the strait is nevertheless much used for the sake of expedition by vessels under 100 tons, and occasionally by some of larger size. At the entrance of the strait, the tides sometimes rise to a height of 30 ft., and the ordinary neap-tide rises from 10 to 12 feet. Communication between Anglesey and the main-land was formerly maintained by ferry-boats at different points; but a suspension bridge was constructed by government in the line of the great Holyhead road, and subsequently railway communication was established by means of the Britannia bridge (q.v.). The scenery on both sides of the strait is mildly beautiful.

**MENANDER,** the most celebrated Greek poet of the New Comedy, was b. at Athens, 342 B.C. His uncle was the comic poet Alexis; he had Theophrastus for his teacher, and Epicurus for a friend; and the influence of all three is discernible in his style of thought and feeling. Menander was a handsome, light-hearted, and elegant Greek, somewhat luxurious, but not impure in his manners. He was drowned while swimming in the harbor of the Piraeus. Menander wrote more than 100 comedies, which were in high repute among his countrymen, at least after death; but we possess mere fragments of them. We know something of their character, however, from the imitations of them by Terence. Pleasant and refined wit, clear, sententious reflection, and a vein of real earnestness at times, are the qualities most apparent in them. The best edition of the extant fragments of Menander is Meineke's *Fragmenta Comicorum Graecorum* (Berl. 1841).

**MENARD, a co. in central Illinois, along the Sangamon river, which with Salt creek forms its n. boundary; 300 sq.m.; pop. ’80, 13,028. The surface is level, with considerable growth of wood. The soil is fertile, and produces oats, Indian corn, hay, wheat, and potatoes. The Chicago and Alton, and the Springfield and Northwestern railroads pass through it. Co. seat, Petersburg.

**MENARD, a co. in n. central Texas, along the shores of San Saba river; 800 sq.m.; pop. ’80, 1239. The soil is fertile, and there is a considerable growth of wood. The principal production is cattle. It is a good grazing country, which, as yet, has been little opened to cultivation. Co. seat, Menardville.

**MENARD, RENÉ, 1604–61, b. in Paris; sent to Montreal as a French Jesuit missionary in 1640; thence to the Nipissings n. of the lakes; afterwards at Three Rivers. He was at Cayuga in 1656, at Oneida soon afterwards, and remained with the Indians when personal violence and death to the missionaries was frequent among them. In 1658 and 1660 he was with the Ottawas of lake Superior, by whom he was not well treated. His last station was in 1661 at St. Teresa’s on Keweenaw bay.

**MENASHTA, a village of Winnetago co., Wis., on the Chicago and Northwestern, and the Wisconsin Central railroads, 18 m. n. of Oshkosh; pop. of village, 2,484; of township, 3,107. It has a weekly newspaper, a national bank, and several manufac-

**MENAS’SEH BEN ISRAEL** (MAXASSEH BEN JOSEPH BEN ISRAEL), 1604–59, b. Spain; went to Holland, when young, with his father, to escape the inquisition. There he was educated, and when but 18 years old succeeded his father in the rabbi Uziel, as expounder of the Talmud, and preacher in the Amsterdam synagogue. He now began his *Conciliator nel Pentateucho*, which appeared in 1632, and secured for its author a high rank among Hebrew theologians. A Latin translation of it, by Dionysius Vossius, was published the next year, under the title of *Conciliator.*

**MENDLEANS. See CHRISTIANS OF ST. JOHN.

**MENCHIKOW, or MENCHIKOFF, ALEXANDER DANILOVITCH, a Russian field-marshal and minister of state, was b. at Moscow on Nov. 28, 1672. He was a baker’s apprentice, when his intelligent coun temer attracted the notice of gen. Lefort, through whose patronage he was taken into the service of Peter the great. He had the good fortune to discover a conspiracy among the czar’s guards, and his rapid promotion was secured. He accompanied Peter in his travels to Holland and England, and on the death of Lefort was raised to the post of chief adviser. Menchikow was one of the greatest men of his time, excelling equally as a gen. and a diplomatist; and although totally uneducated, he did much to promote the education of the people, and was a liberal patron of the arts and sciences. On Oct. 30, 1706, he defeated the Swedes at Kalisch; he contributed to some of the czar’s other victories; was made a field-marshal on the field of Pultawa; and compelled Löwenhaupt to capitulate with great part of the Swedish army. In 1719 he took Riga; in 1720 he led the Russian troops into Pomerania and Holstein, and took Stettin, but gave it up to Prussia, contrary to the will of the czar. This and his aversion so displeased Peter that he subjected him to a court-martial. He was condemned to death by a majority of voices; but was pardoned on payment of a heavy fine. During the reign of Catharine I. he regained
his influence at court, and, after her death, governed Russia with almost absolute authority in the name of Peter II., whose father-in-law he was just about to become, when he was overthrown by Dolgorouki, and banished to Siberia (Sept., 1727). His immense states and treasures were confiscated. He died Oct. 22 (Nov. 2) 1729. His great-grandson, prince ALEXANDER SERGEJEWITCH MENDELCHOW, was b. in 1769, and after being long an attaché of legation at Vienna, served in the campaigns of 1812-15, rose to the rank of gen, and after the accession of the emperor Nicholas, was employed both in diplomatic and military services. In the Turkish campaign of 1828 he took Anapa after a short siege, but received so severe a wound before Varia as compelled his retirement. He was afterwards for a time at the head of the Russian navy, and raised it to a high state of efficiency. In March, 1823, he was sent as ambassador to Constantinople, where his overbearing behavior produced a speedy rupture between the porte and the czar, and brought about the Crimean war. In this war he commanded both the land and naval forces of Russia, and displayed the utmost energy in defending Sebastopol. In March, 1855, he was appointed commander of Cronstadt. Mendichow was till his death in 1869 one of the most prominent members of the old Russian party.

MENCIUS. See MEN-TSE.

MENDAÑA DE NEY'RA, ALVARO, 1541-95; b. in Spain; emigrated to Peru, and had resided some time at Lima, when his uncle, Lope Garcia de Castro, the viceroy of the country, put him in command of an expedition for purposes of discovery among the islands of the Pacific. With two small ships and 125 men he sailed from Callao Nov. 19, 1567. Among his discoveries was a group of islands which he named "Solomon's islands," thus indicating his belief that Solomon obtained from them the gold used in the temple at Jerusalem. Returning to Lima in 1568 he circulated reports of the wealth of these islands, which led, 27 years later, to an expedition for their colonization, of which he took the command. Sailing from Callao April 11, 1565, he discovered another group of islands, which he named the Marquesas, after the wife of the viceroy of Peru, the marchioness Mendoza. Sailing n.w., other groups of islands were visited, but Mendaña died in October without having reached the end of his voyage, which, however, was completed by his widow. Mendaña's narrative of his first expedition is in the imperial library at Paris.

MENDAÑA ISLANDS. See MARQUESAS, ante.

MENDE, a town of France, capital of the department of Lozère, on the Lot, in a valley surrounded by high hills, about 70 m. n.n.w. of Montpellier. In the vicinity are numerous villas and gardens. Mende has a cathedral surrounded by two spires, and manufactures serges and other coarse cloths. Pop. '76, 6,339.

MENDELSSOHN, Moses, an eminent German philosopher, was b. Sept. 7, 1729, at Dessau. From his father, a Jewish schoolmaster and scribe, he received his first education; and in his 13th year proceeded to Berlin, where, amid very indigent circumstances, he contrived to learn Latin and modern languages, and to apply himself to the study of philosophy, into which early readings, chiefly of Maimonides's *Morch Nohuchim*, had initiated him already. After many years of comparative indigence he became the partner of a rich silk-manufacturer, whose children he had educated. The intimate friend of men like Lessing, Sulzer, Nicolai, he, directly and indirectly, contributed in a vast degree to the extermination of the brutal prejudices against the Jews, and the disregard of their religion and character. On the other hand, he acted in the most beneficent manner on his own co-religionists, by rousing them from the mental apathy with which they regarded his in his day all that had not a distinct reference to religion, and by waging fierce war against their own religious and other prejudices. He was also, on account of his immense influence upon them, called another Moses. He died Jan. 4, 1786, and Ramier wrote the following epitaph on him: "True to the religion of his forefathers, wise as Socrates, teaching immortality, and becoming immortal like Socrates." His principal works are, *Papa, ein Metaphysiker* (with Lessing) (Dan. 1755); *Briefe über die Einpfändungen* (Berl. 1764); *Ueber die Evidenz der Metaphysischen Wissenschaften*, a prize essay of the Berlin academy, which thereupon unanimously resolved to elect him a member of their body; Frederick the great, however, generally prejudiced against the Jews, struck his name off the list: *Phaedon, oder über Unsterblichkeit der Seele* (Berl. 1767) a dialogue in the manner of Plato; *Jeronimus, oder über religiöse Macht des Judenhaumes* (Berl. 1758), chiefly in answer to Lavater's obtrusive, sometimes even offensively worded arguments, by which he intended to convert Mendelssohn to Christianity, or to prove that he was a Christian already. Further, *Morgenstunden* (Berl. 1785)—morning conversations with his children and friends, chiefly in refutation of Pantheism and Spinozism. Besides many other smaller Hebrew and German essays, contributions to the *Bibliothek der schönsten Wissenschaften*, edited by Lessing (to whom, in a manner, he furnished the prototype to his *Nathan der Weise*), etc., his translation of the Pentateuch and the Psalms deserves a prominent place. His works have been collected and edited by G. B. Mendelssohn (Leip., 1843-45, 7 vols.).

MENDELSSOHN-BARTHOLDHY, Felix, a German musical composer, son of Abraham Mendelssohn-Bartholdy, the eminent banker, and grandson of Moses Mendelssohn, the philosopher, was b. at Hamburg, Feb. 3, 1809. His father was a convert to Christianity,
and young Felix was brought up in the Lutheran faith. The affluent circumstances of his parents enabled them to bestow a most liberal and careful education on their son, whose fine genius early showed itself. Zelter was his instructor in composition, Ludwig Berger on the piano. In his ninth year he gave his first public concert in Berlin, and in the following year played in Paris. From this period he commenced to write compositions of all sorts, some of them of a very difficult character, for the piano, violin, violoncello, etc. In 1824 the first of these—three quartets for the piano—were published. In 1825 he went a second time to Paris—his father, on the advice of Cherubini and other eminent artists, having consented that he should devote himself exclusively to music. He now gave concerts both in Paris and Berlin, after which he traveled for three years through England, Spain, Portugal, and Italy. In the first of these countries he obtained enthusiastic applause by his overture to Shakespeare's Midsummer Night's Dream, which, in its blending of the fanciful, the delicate, and the grotesque, is said to have caught the inspiration of Shakespeare himself. He afterwards wrote music to accompany the whole of the play. His Isles of Fingal is a fine memorial of the impression left upon him by the wild scenery of the western Highlands. His letters from Italy also show how profoundly he was affected by that glorious land—the true home of art. Mendelssohn subsequently attempted to start a musical theater for the cultivation of high art, at Düsseldorf, but it did not succeed. In 1828 he accepted the directorship of the Leipsic concerts. Here he was in the center of the musical world of Germany, and was stimulated to his highest and most brilliant efforts; yet it was in England that Mendelssohn first met with a reception proportionate to his genius. His oratorio of St. Paul, after being performed at Dresden and Leipsic, was produced under Mendelssohn's management at the Birmingham festival, Sept. 26, 1837, and received its first public hearing. It and his other oratorio of Elijah, on which he labored for nine years, and which was first brought out at the Birmingham festival of 1846, are reckoned his two greatest works. He died at Leipsic Nov. 4, 1847. Among his best-known compositions are his music for Goethe's Walpurgisnacht, the Antigone and Edipus of Sophocles, Athalie, and a great number of splendid sonatas, concertos, trios. In his Leider ohne Worte (songs without words), he has achieved a great and novel triumph. Mendelssohn's character, which was even finer than his genius, is charmingly delineated in his Letters which have been translated from the German by lady Wallace (London, 1869).

MENDES, a city of ancient Egypt in the delta Parvum, and near the coast. It gave name to the Mendesian district, and was its chief city. It was near the point where the Mendesian arm of the Nile enters the lake of Tanis. It was a place of importance in the time of the Pharaohs, and noted for the manufacture of a perfume called Mendis-sium unguentum. The deity there worshipped was in the form of a goat, and called Pan by the Greek writers. Mendes gradually disappeared from history, being in ruins in the 1st c. B.C., but in its vicinity arose the city of Thmius.

MENDEZ-PINTO, FERNAND, 1510-83, b. Portugal; at first a servant to a gentleman in Portugal. He sailed for the East Indies in 1537, in the hope of making a fortune. The ship on which he embarked was captured by the Turks, and he was sold a slave. Finally, by the good offices of the governor of Ormus, who had redeemed him from slavery, he was enabled to go to India, where he remained for many years. He returned to Portugal, in 1553. He wrote an account of his travels, which was published in 1614, and translated into French in 1634. It contains much curious information in regard to the geography and social condition of the east; but it indicates great credulity or a want of veracity on the part of its author.

MENDICANCY. (See Poor and Poor Laws, ante.) Mendicants are practically all persons who gain a livelihood by begging; a definition excluding those who are willing to work but cannot, owing to lack of demand for labor; and those who temporarily receive assistance because of ill-health or other misfortune. The class we are considering does not exist in uncivilized or savage society. Yet among the least highly civilized we find it flourishing—as in Egypt, and in the case of the lazzaroni of Italy. In large cities mendicancy has become an art, and professional beggars are found in London, Paris, and New York, who have amassed large sums of money by the constant pursuit of a trade which with them has ceased even to be precarious. While we may possibly, with some degree of justice, find the origin of professional begging in the course not only pursued by, but enjoined upon the orders of, mendicant friars in central and southern Europe, it is certain that the concentration of wealth, the decline in the value of money in the minds of those by whom it has been easily obtained, and the consequent habit of lavish giving, must eventually have brought this condition into being, even though the church had not encouraged its establishment. Twenty-five years ago (1855) it was said by an English writer that a time was then past in London when at any time being about 30,000 coster-mongers, or vendors of provisions, to the verge of famine. This is suggestive. The precarious character of the vocation of many of the lower classes of laboring people, and the imminent danger in which they constantly are, must be a grave temptation to the pursuit which we are considering. In thickly settled towns and cities the chances of gaining the necessities of life are certainly greater in this line than in many trades. It is not liable to the fluctuations occasioned by fashion, or changing taste; by the influence of the seasons; or by the other numerous
vicissitudes which deprive ordinary trades of the element of certainty of return. The professional beggar is not limited to any special range, but may vary his hunting-ground by accident, and be equally certain of success. Also there are peculiar attractions in mendicancy for the uneducated and unskilled, yet not lawless portion of a population, in its comparative freedom from restraint; its opportunity for roving, and for a wild companionship with congenial spirits, precluded by the social order of a regular business life; and, finally, the charm and satisfaction which it offers, of gaining something for nothing; of living on humanity without labor yet without crime; of satisfying the stern natural sense of justice which exists in the bosom of the unfortunate and the indigent, by making the rich support the poor—yet without compulsion. It may also be considered as one of the compensating forces of the social organism, occasioned by the reaction from extreme wealth to extreme poverty, and formulated in an unreasonable demand, answered by a groundless concession; in fact a humanitarian paradox.

The difficulty of dealing with poverty justly, and with a due sense of its various causes and results, has been a social problem ever since there has been any society, and quite the most difficult part of this problem to handle wisely, or to control at all, has been mendicancy. The same English writer to whom we have already referred, in writing generally on the charities and poor of London, says: "But the great problem which perplexed our ancestors less than ourselves, only because in a less crowded state of society social evils were more easily dealt with, was mendicancy. In every community there must always be some who cannot dig, and in the most primitive there are always some who will not, and are not ashamed to beg. From the earliest times the sturdy mendicant has constituted himself the representative of the poor, in whose behalf the Gospel pleads so authoritatively. In that character he lounged at the convent-grate, he devoured his dole at the baron's hall-door, he clamored for alms at the church-portal, and in that capacity we presume he is accepted by the modern advocates (happily few in number) of indiscriminate alms-giving. But even in the most picturesque times, when he pretended to show the scallop-shell from the holy hand in his hat, or perhaps the scarlet and gold sashers about his body, he was but a good-for-nothing vagabond." The enactment of the poor-law in Queen Elizabeth's reign has been attributed to a necessity occasioned by the dissolution of the convents, which were supposed to feed the poor to some extent as to make the necessity when they ceased to exist. That this was not true is shown by the fact that acts for the suppression of mendicancy were passed before the dissolution of the monasteries. The act of Elizabeth was passed from a desire to effect a social reform, and similar acts were passed in succeeding reigns down to the present, and for the same reason. But though from time to time acts against able-bodied paupers were multiplied, the vagrant continued to prefer idleness and independence to work or the poor-house, and by degrees the number of beggars swelled, till they exceeded the powers of the bendle and constable to arrest, and of the jail or poor-house to contain, and actually acquired an almost legalized existence. At the close of the great European war the evil had reached its height; ostentatiously loathsome objects paraded the great thoroughfares; professional beggars, by a police of their own, quartered the towns among them, and in 1818 an association was formed in London which was staffed and carried on with great ability. This organization took the name of the society for the suppression of mendicity. A large staff of paid agents was engaged, and the committee for its management counted among its members some naval and military men, trained to habits of order and system; and who, being without professional employment, brought their administrative talents to the service of the new society. This organization did good work, and was the foundation of methods which have since been applied with success; and mendicancy has largely diminished. The reform movement in England in 1834, and new legislation, still further lessened the evil; yet so acute and well informed an observer as the Rev. Charles L. Brace says that "the conclusion of all European experience is that nothing can permanently affect the evil of mendicity but a general diffusion of prosperity, morality, and intelligence," certainly affording a gloomy outlook for the future, both in Europe and America; since concentration of wealth, rather than its diffusion, seems to have become the order of society; and the probability of general "prosperity, morality, and intelligence," in the face of that tendency, is, to say the least, remote.

The theory held by many that pauperism bears a direct relation to the price of corn would seem to have been practically disposed of by the statistics of the sums expended in relief from 1813 to 1860 in England. By these it is seen that while there was a steady decline in the amount from about £6,650,000 in 1818 to £5,550,000 in 1859, the difference of 20 per cent was far less than it should have been to sustain the theory. For the price of corn had fallen during the 46 years, from 125s. per quarter to 42s. 9d., or sixty-six per cent. And this fact goes far to sustain the assertion that pauperism, and equally or even more, mendicancy, rely for their fluctuations in degree upon causes outside of all such material considerations.

The history of mendicancy in France attests the antiquity of the profession, and offers some pertinent facts. Thus, as early as the middle of the 14th c., in the reign of King John, it was found necessary to issue an ordinance commanding all able-bodied beggars to find work or leave Paris, with the alternative of imprisonment, the pillory, and brand-
ing, according to the number of offenses against the law. A similar act was passed in 1418; but Francis I. rescinded both, and instead directed the public authorities to set those persons indicated to work if necessary by force. But it was found that severe laws had but little effect in suppressing the evil; and in 1622 mendicants were directed to be impressed into the naval service, and even expatriated by being sent to the Indies, work-houses were established in France, and thus a new system was begun. In 1688, all previous plans having failed, a law was enacted forcing every beggar to leave Paris, on pain of being sent to the galleys. Even this harsh measure was incompetent to relieve the city of mendicants, much less the entire kingdom; and in 1698 it was estimated that one-tenth of the entire population were beggars. The work-house plan was now tried again, and in four years 80 of these were established. These institutions not only did not succeed in rooting out the evil, but they were found to be, instead of self-supporting, as was anticipated, a severe tax on the state. They were gradually suppressed, and at present very few exist. Mr. Brace remarks as to the various French methods: "Thus, during five centuries every species of penalty and punishment has been tried in vain in France to repress mendicity. Humane legislation has been equally a failure; and the sum of all experience in that country is that all legal means fail to reach this great evil." But the fact is that there is less mendicancy, as any less pauperism in France, in proportion to its population, than there is in any other country in Europe, or in the United States. And it would appear that to seek for the cause of this fortunate condition we must analyze the effect of the French land laws. For the fact that in France, where there is no law of entail for landed property, and where a father cannot by will alienate this species of property in any one direction; but where, on the contrary, land is divided among all the heirs, on the death of the owner,—there must of necessity be such a subdivision of land that the existence of pauperism on a large scale becomes practically impossible: the result being that the land is divided among a larger number of owners than is the case with any other country. Another and curious reason for the condition of France as regards pauperism is found in the fact of the apparently stationary condition of her population. Between 1851 and 1876 the population increased only about 3 per cent, and was nearly what it was in 1870. The birth-rate in France is only 26 in a thousand, being far below, as any other country. An ingenious Frenchman bases on this condition the positive prosperity of his country, on the ground that the number of non-producers is lessened, and so much less drain on the resources of the country for their support is the result.

The record of pauperism and mendicancy in the United States has been similar to that of England in its general conditions. The class of beggars in the large cities and towns has been supplemented by that of "tramps." These are comparatively recent in their origin in the United States; and it is not improbable that they were originally an exportation from England, where they have long been a feature of pauperism. They have increased greatly in number in recent years, and in Massachusetts alone there were said to be a few years ago 25,000 of these peripatetic beggars. It is certain, also, that they are to a certain extent organized, that they associate with each other, and that they communicate by signs and marks placed where they can be found by the initiated. The proportion in Massachusetts applied to the entire population would give 750,000 as the number of tramps in the United States. But in 1871, when the number of tramps was returned, on a certain specified night, at 33,191—very little more than the number in Massachusetts alone, and in the proportion of 1 to 666. Various efforts have been made in the United States in the special direction of reducing the number of tramps, culminating in the passage of severe "tramp laws" in Massachusetts and a few other states. These laws are of very recent enactment, and their effect has not yet been made known. It is probable that unless similar legislative action took place in all the states the effect would be only to drive them from one state to another.

MENDICANT ORDERS, certain religious associations in the Roman church, which, carrying out the principle of religious poverty and self-humiliation to its fullest extent, make it a part of their profession to denude themselves of all property, whether real or personal, and to subsist upon alms. As the scriptural foundation of this practice, the words of our Lord (Matt. xix. 21) to the young man who sought counsel of him, and again (verses 27–30) to his own disciples, are commonly alleged, both by the mendicant orders and in general by all who profess what is called evangelical poverty. In the mendicant orders alms are commonly collected by the lay-brothers; in some, by actual solicitation; in others, by the ringing of the convent bell when the stock of provisions is exhausted. Formerly such orders were numerous in the church; but by a decree of the second council of Lyons in 1274 the mendicant orders were limited to four—the Dominicans, Franciscans, Carmelites, and Augustinians or Austin Friars. See the article also FRIARS. The rule by which individuals are denied the possession of even personal property is strictly understood in Catholic countries. In England and Ireland it was considerably relaxed, but of late years has been enforced with increasing exactness.

MENDIP HILLS, a range in the northern part of Somersetshire, England, extend in a n.w. and s.e. direction, and are about 25 m. in length by from 3 to 6 m. in breadth. In former times the moors of Mendip were attached to the crown as a royal forest, and were frequently hunted over by the Saxon and Norman kings. A considerable portion
of the range is now under cultivation. The summit is Black down, 1100 ft. in height. The lead and calamine mines of Mendip (called grooves, the miners being called groovers) were in operation before the dawn of history.

MENDIZABAL, JUAN ALVAREZ Y, 1790-1853; b. in Cadiz; son of a Jew, brought up in trade, placed in a bank, where he quarreled with the principal, and first noted as a politician in connection with the republican movement in Spain between 1819 and 1823; for which he obtained in England timely loans. In 1824, banished from Spain, he established a commercial house in London; was the medium of a loan to Don Pedro de 1827, to Spain in 1833, and was recalled in 1835 by Toro to take charge of the department of finance. He returned to Spain with the éclat of a completed loan of £1,150,000, made in London. After great boasts of what he would do, followed by small results, he was displaced in May, 1836, and, though twice called back to the portfolio of finance, was not afterwards distinguished.

MENDOCINO, a co. in n.w. California, having the Pacific ocean for its w. boundary, the Mayacamas mountains for its s.e. and the continuation of the Shasta mountain range for its e. boundary; 3,630 sq.m.; pop. 58, 12,890—10,393 of American birth, 1613 colored. It is drained by the Eel river and the South Fork in the e., the Russian river in the s., and the Novarro river. Its surface is mountainous, furnishing good grazing pastures, and is diversified by lakes, fertile valleys, and immense forests of redwood, used for building timber, grow along the coast. Its soil is very fertile, and adapted to the production of grain, fruit, and dairy products. Horses and cattle are raised, and large numbers of sheep. Wool and lumber are the chief products. It has several excellent harbors. County seat, Ukiah.

MENDOTA, a village of La Salle co., Ill., at the junction of the Chicago, Burlington and Quincy, and the Illinois Central railroads. Pop. of village, exclusive of township, 1043. It has 2 churches, 2 graded public schools, a library, 2 banks, an iron foundry, an organ manufactary, and a weekly newspaper.

MENDOZA, a province of the Argentine confederation, South America, along the e. of the Andes, bounded on the n. by the province of S. Juan, on the e. and n.e. by S. Luis, on the s. and s.e. by Buenos Ayres, and on the w. by, Chili; about 34,000 sq.m.; pop. about 65,000. The w. part of the province is traversed by a part of the Andes chain, from which the surface slopes down to the Mendoza river, at which a great plain begins to stretch eastward. This plain is sandy, but with proper irrigation produces good crops of barley, maize, wheat, and lucerne. Apart from the cereal crops the chief productions are wines, brandy, tallow, and soap. Hides and dried fruits are exported to Chili. There are a few silver mines, and copper is known to exist in quantities, but the veins have not as yet been worked. There are extensive saline deposits; and shafts, slates, gypsum, and limestone are found. Rain and dew are infrequent, except along the s. boundary; elsewhere artificial irrigation has to be resorted to, as even grass will not grow on the e. plains without it. Mendoza is one of the federal states of the Argentine republic, but practically manages its own affairs by means of a governor and an assembly. The capital of the province is Mendoza, built on a plain, 2,891 ft. above the level of the sea. Pop. about 10,000.

MENDIZA, the capital of a department of the same name in the Argentine republic (q.v.), is situated on the eastern base of the Andes, 110 m. e.n.e. of Santiago, and at a height of 2,891 ft. above sea-level. It was totally destroyed by an earthquake in 1861, when its buildings were demolished, and most of its inhabitants, 15,000 in number, perished; but it is rapidly recovering.

MENDOZA, ANTONIO DE, 1495-1552; b. Granada; was appointed viceroy of Mexico by Charles V. April 17, 1535, invested with full power of rule. In the administration of the government he made many wise and benevolent reforms, especially in regard to the Indians who had been the victims of much suffering. In 1536 he introduced into the city of Mexico the first printing-press brought to the country; established a mint, at which the first coining, in the same year, was done by his orders; promoted agriculture and developed the mining wealth of the land, and founded the first college there. He repressed a serious Indian revolt, wisely tempering rigor with justice. In 1531 he was transferred to the viceroyalty of Peru. He was the first of 64 viceroys in Mexico, and his government was the longest and most distinguished of all.

MENDOZA, DON DIEGO HURTADO DE, a Spanish classic, distinguished also as a statesman and a gen., was b. at Granada about 1503, studied there and at Salamanca; and shortly after leaving the latter university was sent by the emperor Charles V. as ambassador to Venice. Later, he was present at the council of Trent as imperial plenipotentiary, and in 1547 was appointed ambassador to the papal court. As a gen., he was successful in subjugating Siena, which was handed over to Cosimo I. Medici, as a fief of the Spanish crown. His position, however, was a difficult one; he was hated both by pope and people, and in 1554 the emperor recalled him. During his residence in Italy he showed the greatest zeal in collecting literary treasures, especially ancient MSS. He so learned men for that purpose to Mount Athos, and also took advantage of the regard entertained for him by Soliman the magnificent, sultan of Turkey. In 1568 an affair of gallantry terminated in his banishment from court. He withdrew to Granada, where he
spent his last years in writing his *Guerra contra los Moriscos* (history of the war against the Moors—first published—with parts omitted—in 1610, and in a complete form in 1776, by Portalegre, who prefixed a life of the author). This work is regarded by Mendoza's countrymen as a masterpiece. Mendoza died in 1575. His library is now one of the ornaments of the Escurial. In his poetical epistles he gave his country the first good model for that form of composition. His sonnets and serious poems are of inferior merit.

MENDOZA, INIGO LOPEZ DE, Marquis of Santillana, 1398-1458. b. Spain; son of the grand admiral of Castile, and grandson of the poet Pero Gonzalez Mendoza. His father died during Inigo's infancy, and the family estates, the most extensive in Castile, were seized by the ruling nobles of the kingdom. But Inigo recovered them, either in the courts or on the field, before he was out of his minority. He took a prominent share in the military and political affairs of Castile, and was created marquis of Santillana after the battle of Olmedo. After the fall of the constable Alvarado de Luna, Mendoza retired from public affairs, and devoted himself to literature. His poetry is largely unpublished, though some of it is contained in different collections of songs. He was familiar with Italian and Provengal literature, and many of his most charming poems show the effect of Provencal influence. He introduced the sonnet into Spain, but his own sonnets are of little value. He imitates Dante, in his poems on the death of the marquis of Villena and on the coronation of Jordi. The most important of his poetical works is the *Comedicta de Ponza*; his most pleasing poem is called a *Serranilla*, or little mountain song, and was composed in honor of a little shepherdess, "the milkmaid of sweet Finosoa." In Spain itself his *Refrenes*, a collection of rhymed proverbs, is his most popular work. His principal though perhaps doubtful service to Spanish poetry was his introduction of allegory into poetical composition.

MENDOZA, JUAN GONZALEZ DE, 1540-1617; b. Toledo, Spain; of a wealthy and distinguished family. He joined the army, but resigned after some years to enter the order of St. Augustine; was sent by Philip II. to China in 1580, where he spent three years in gaining information as to the politics, commerce, manners, and customs of the country; he spent two years in Mexico before returning to Spain. He published an account of his observations in China in a work entitled *Historia de las Cosas mas Notables Ritos y Costumbres del Gran Reyno de la China*. An English translation appeared in 1588, and it was reprinted by the Hakluyt society in 1853-54. Father Mendoza was successively bishop of the Lipari islands, vicar-apostolic of Mexico, and bishop of Chiapas and of Popayan, New Granada, where he died.

MENDOZA, PEDRO DE, 1487-1537. b. Spain; an official in the service of Charles V. In 1535 he went on a voyage to South America for the purpose of exploring the south of that continent, and with authority to take possession of and colonize it in the name of Spain. Made governor of the territory he was to conquer, he left Spain with a fleet of 12 ships, containing 500 men. At Rio Janeiro, Osorio, the vice-admiral, was murdered by some of his subordinates. Mendoza then sailed up the Rio de la Plata, and laid the foundations of the city of Buenos Ayres, where he established a colony. His brother, Gonzalo, went to Paraguay and founded Asuncion in 1536. The colony at Buenos Ayres did not prosper from the first. Aside from the privations to which the colonists were exposed, and the mortality incident to a community not yet accustomed to the new climate, the settlement was constantly attacked by the neighboring Indian tribes, or brought to the verge of destruction. Mendoza, after many disappointments, died on his voyage back to Spain.

MENELAUS, in ancient Greek legend, was king of Laccademon, the younger brother of Agamemnon, and husband of the famous Helen. The abduction of his wife by Paris is represented as the cause of the Trojan war. After the fall of Troy he sailed with Helen for his own land; but his fleet was scattered by a storm, and he wandered for eight years about the coasts of Cyprus, Phenicia, Ethiopia, Egypt, and Libya. After his return he lived at Sparta with his wife Helen in great style and happiness.

MENENDEZ DE AVILES, PEDRO, 1519-74; b. at Aviles, Spain. Educated to the sea, he had for many years commanded a privateer which was the terror of the French corsairs. By Philip II. he was given a commission in the regular navy and made captain gen. of the India fleets. In this position he won important victories over the pirates, and was of great service in successfully transporting to Philip the reinforcements which carried the day at the battle of St. Quentin. On June 29, 1563, he sailed from Cadiz with a fleet of 34 vessels with the intention of founding a colony in Florida, of which he had been appointed adelantado. The French Huguenots had already established a foot-hold near the mouth of the St. John's river, under the leadership of Ribaut. The Spaniards were by far the most powerful in numbers and equipment, and in the ensuing contest the main French stronghold, fort Caroline, was captured, many of the colonists were massacred, and when those who had escaped to the ships of Ribaut were wrecked and in a starving condition, Menendez received their surrender, promising to spare them; but, with a treachery and cruelty almost beyond belief, violated his pledged word and slew nearly all of them. Many were hanged and left bearing inscriptions stating that they were killed "not as Frenchmen, but as heretics." When, soon after, the atrocity
was avenged by the French adventurers under Dominique de Gourgues, the Spaniards were hung upon the same trees, with placards stating that they were executed "not as Spaniards, but as cut-throats and murderers." It was in this expedition that St. Andrew was discovered and named. Other posts were established by Menendez further up the coast, as at cape Canaveral and Port Royal. Menendez returned to Spain, but still controlled the affairs of the new colonies. In 1672 he again visited the western continent and carried his explorations still further. He was recalled and ordered to the command of a fleet to be employed in the war with the Low Countries; but died at Santander while engaged in fitting out his vessels.

**MENES**, the first king of the first Egyptian dynasty, who built Memphis, made foreign conquests, introduced luxury, and was subsequently devoured by a hippopotamus. During his reign there was a revolt of the Libyans. His name marks a great chronological epoch, being placed by chronologists 3643, 3592 B.C., or even 5702 B.C. Stricter chronologists make his accession 2717 B.C. This name, which signifies the conductor, has been found on inscriptions, but no contemporary monuments of him are known.—**Bun- sen, Egypt's Place**, ii. p. 579; Lepsius, *Königbüch, quellentaf.*, p. 5; **Böckh, Manetho**, p. 386; Poole, *R. S., Hor. Egypt*, p. 219.

**MENFI**, or **MENFRICI**, a t. of Sicily, in the province of Giargenti, 43 m. s.s.w. of Palermo, crowns a long bare height, about 3 m. from the coast. Pop. 9,900.

**MENG.**, **ANTON RAFAEL**, a modern German artist and writer on art, b. at Aussig, in Bohemia, Mar. 12, 1728. His father, Israel Mengs, was himself a painter, but possessed of little power of appreciation, and whom his young Raphael received his first instructions in art. At the age of thirteen he went to Rome, where he remained three years, devoting his whole time to the study of the works of Michael Angelo, Raphael, and others of the old masters. On his return to Dresden in 1744 he was appointed court-painter to Augustus III., king of Poland and Saxony, but received permission at the same time to go back to Rome. Here he established his reputation by a picture of the "Holy Family." The young peasant-girl who sat for the Virgin so charmed the painter by her beauty that she subsequently passed over to the Roman Catholic church, and married her. In 1754 he accepted the presidency of the newly instituted academy of painting at Rome. Within the next few years he executed the frescos in the church of San Eusebio, and those of "Apollo and the Muses on Parnassus" for cardinal Albani; besides which he copied Raphael's "School of Athens" for lord Percy, and painted several original pictures in oil, among which may be mentioned a "Cleopatra," a "Holy Family," and a "Magdalene." In 1761 he went to Madrid, on an invitation from Charles III. of Spain, and while there executed a great variety of works, the best-known of which is his "Aurora," but ill-health and the intrigues of enemies induced him to return to Italy. He had no sooner arrived than Clement XIV. employed him on a large allegorical subject for the Vatican library, representing Janus dictating to History, who appears in the act of writing. After three years he again visited Spain. To this period belongs his most celebrated effort; it represents the apotheosis of the emperor Trajan, and is executed on the dome of the grand saloon in the royal palace at Madrid. Ill-health, however, again forced him to leave Spain. On his way back to Italy he stopped at Monaco, where he painted his picture of the "Nativity," reckoned by many to be his finest piece. Shortly after reaching Rome he died, June 29, 1779. Mengs's works are careful and elaborate imitations of the great masters. He borrowed the technical qualities of a painter in high perfection, but the living soul of genius, the quickening and creative power of imagination, was not his. His works, therefore, though lofty in their subjects, seldom exhibit more than a correct and cultivated taste. Mengs's writings were edited in Italian by Azara in 1780. There is an English translation (Lond. 1786).

**MENG-TSE** (i.e., the teacher Meng; earlier, Meng-ko; Latinized by the Jesuits into MENCICTS), a Chinese sage, b. in the beginning of the 4th c. B.C., in the village of Tsou, in the present district of Shan-tung. He died about 317 B.C. Meng-tse is the greatest of the early Confucians. His father died while Meng-tse was very young; but he was educated with such admirable care by his mother that the phrase "mother of Meng" has become a proverb for extreme care or protection. At this period China was divided into a number of states, all acknowledging the suzerainty of the emperor of Tsou. Meng-tse traveled to several courts, seeking to introduce his doctrines of "virtue" and "justice;" but unfortunately, as too frequently happens, he found that princes and great men did not admire those things so much as poor scholars. His conversations with rulers and state-functionaries, with his disciples and acquaintances, were taken down by his admirers. They form the Hi-tsi, otherwise called the book of Meng-tse—the fourth of the Four Books. See CONFUCIUS. Many of the thoughts are exquisitely true, suggestive, and subtle. Several translations of it have been published, but they fall far short of the energy, sententiousness, freshness, and vivacity of the original. One of the best is the Latin version of Stanislas Julien, 12 vols. (Paris, 1824). There is also an English one by Collie (Malacca, 1828), and another by Pauthier (Paris, 1851).

**MENIA DEN**, *Abro menhaden*, a fish of the same genus with the shad (q.v.), which is caught in great quantities on the coasts of New York and New England during the summer months, when it visits them for the purpose of spawning. Its length is from 8
to 14 inches; the color of the upper parts is greenish brown, the belly silvery, a black spot on the shoulder, the whole surface iridescent. The menhadens is not a very palatable fish, but is rich in oil, which is used by painters, and is considered superior to linseed oil. Great quantities of this fish are taken in some seasons, and, are sold for manure, one fish being considered equal to a shovelful of barn-yard manure, and 2,500 sufficient for an acre of land.

MENIER, EMILE-JUSTIN, 1826-81; b. Paris; in early life studied with Arflia, Dumas, and Pelouze, to become versed in the science of chemistry. He established large laboratories at St. Denis, which he freely opened for the use of students and scientific men. In 1859 he founded an annual prize for researches into the nature and properties of drugs, and in 1864 organized a school of practical chemistry, devoting the sum of 10,000 francs to establish lecture-courses on this subject. In the town of Noisiel, he built at his own expense model schools for the entire population, and gave 10,000 francs to be distributed among the school teachers in the different departments of France who reported the largest attendance of scholars. At one time he was at the head of the most important wholesale drug and chemical business in France, situated in the old quarter du Temple, in Paris. Retiring from this business, he undertook the manufacture of chocolate on a grand scale, and laid the foundation for a colossal fortune. He founded his factories at Noisiel, where he established a thriving settlement of pretty and convenient houses for his operatives, with schools, a hospital, baths, and other institutions for health and comfort. His factories eventually reached a trade of $5,000,000 per annum, and M. Menier became one of the wealthiest men in France. He resided in Paris in a palatial dwelling in the pure Monceaux, where he gathered together a remarkable and highly valuable collection of objects of art and vertu. In 1879 he purchased the chateau de Noisiel for the sum of $2,000,000. He was also the owner in Nicaragua of a section of territory 25 m. sq., and another tract of 6,000 acres on lake Nicaragua. Here were his plantations of cocoa-trees, whose product he made into chocolate at his factories in Noisiel. In 1862 M. Menier was chairman of one of the international juries of the London exhibition; at the Paris exhibition of 1867 he was commissioner for the republics of Nicaragua and Costa Rica. During the Franco-Prussian war he organized an ambulance service, and was present during several battles, caring personally for the wounded. In 1879 he entered political life, being elected a member of the conseil-general of Seine-et-Marne; and was returned to the chamber of deputies. He was also one of the few Frenchmen who had been elected members of the Clicden club. M. Menier devoted much of his time and influence during the latter years of his life to establishing closer commercial relations between France and the United States, and was one of the principal promoters of the Franco-American treaty of commerce, which he sought strenuously, by means of intelligent and skilful agents, to render acceptable to the two countries. In this effort he had only been partially successful at the time of his death.

MENIFEE, a co. in e. Kentucky, bounded on the n.e. by the Licking, and s. by the Red river, both tributaries of the Kentucky; 450 sq.m.; pop. '80, 5,410. The surface is hilly and broken, but not unfertile. The chief products are Indian corn, wheat, and oats. Sheep-grazing is a prominent industry. Chief town, Frenchburg.

MENIN, a frontier t. of West Flanders, Belgium, on the left bank of the Lys, which separates it from France, 30 m. s.s.w. of Bruges. It was formerly fortified, but its works have been demolished, and it is now a dismal and lifeless town, with some manufactures. Pop. '76, 11,327.

MENINGITIS (Gr. mèninx, a membrane) is the term employed in medicine to designate inflammation of the arachnoid and pia-mater (the middle and innermost of the membranes investing the brain).

This disease has been divided into three stages—the symptoms of the first being those of excitement, resulting from inflammation; those of the second being those of compression, showing that an effusion of fluid into the arachnoid cavity has taken place; while those of the third stage vary according as convalescence or death is the result.

Meningitis is especially apt to occur in children of a tuberculous diathesis, in which case the disease is usually described as acute hydrocephalus (q.v.). Scarlatina, measles, and other diseases caused by a blood-poison, may induce it in children. In adult life, the disease may often be traced to the action of typhous and marsh poisons, to intemperance, sunstroke, mechanical injuries, etc.

When the disease is due to any of the above-named blood-poisons, or to any constitutional cause, little can be done effectually in the way of special treatment. When it arises from mechanical injuries, bleeding, calomel, active purgatives, and cold applications to the head are often of use. The patient should be kept on low diet, and all mental excitement should be most carefully avoided.

MENINGITIS (ante), inflammation of the meninges. The meninges are the three investing membranes of the brain and spinal cord: the dura-mater, which lines the internal surface of the cavities; the pia-mater, which is in contact with the nervous substance; and the arachnoid, lying between the other two. Meningitis is generally confined to the arachnoid and pia-mater. In the former it is arachnitis, and in the latter piliitis; but in whichever membrane the inflammation commences the diagnosis between the two is
either difficult or impossible, and therefore the name meningitis is most applicable to either or both. Inflammation of the cerebral meninges is called cerebral meningitis, and that of the spinal meninges, spinal meningitis. When the membranes of both brain and cord are involved, the affection is called cerebro-spinal meningitis. Inflammation of the substance of the brain is cerebritis, while inflammation of the spinal cord is myelitis (q.v.).

Meningitis may be arranged under the following heads: 1. Inflammation of the dura-mater, or pachymeningitis. 2. Cerebral meningitis, acute and chronic, including rheumatic meningitis. 3. Tubercular meningitis. 4. Spinal meningitis, acute and chronic.

Cerebro-spinal meningitis. 1. Inflammation of the dura-mater; or pachymeningitis (so called because it is inflammation of the thick, tough outer membrane, the dura-mater), was first described by Virchow under the latter title, and also, in some cases, under that of hemotoma of the dura-mater. The inflammation may be on the outer surface of the dura-mater next the osseous substance, but this form is of rare occurrence, and never takes place except from injuries or osseous growths; it is to the affection attacking the inner surface of the dura-mater—that covered by the outer layer of the arachnoid membrane—to which attention is here called. A principal characteristic is the formation of adventitious membranes, which appear to be repetitions of the arachnoid, resembling it in its spider-web structure, not being false membrane, but having blood-vessels, which after a while rupture and cause extravasation of blood, which collects in cysts, thus constituting the peculiar form called hemotoma of the dura-mater. In some cases there are as many as twenty layers of membrane. The extent covered by these cysts varies. They are generally oval, four or five inches long and a half an inch or more in thickness, contains the source of the Roux's meningitis. The brain beneath is, of course, compressed, anaemic, and often softened. The symptoms are partly those of inflammation, and secondarily, those of pressure. The diagnosis is exceedingly difficult, and the termination is usually fatal. 2. Cerebral meningitis. Acute cerebral meningitis is not of very common occurrence, but nevertheless of great importance. The inflammation is of the same character as that which attacks other serous membranes—redness, with serum, coagulated fibrine or lymph, and pus; but these products are beneath, and not upon the surface of the arachnoid; in other words, they are deposited in the meshes of the pia-mater. Generally both hemispheres are involved, constituting what is called a bilateral affection. Post mortem examination often discloses the existence of serum beneath the arachnoid, but this may follow atrophy or anaemia. The condition most to be relied on is lymph, in sufficient quantity to be seen, or pus. The affection may be caused by injuries to the head, sometimes by exposure to the sun. Indulgence in spirituous liquors is not an infrequent cause. Acute cerebral meningitis sometimes occurs in connection with acute rheumatism of the joints, and is then called rheumatic meningitis and cerebral rheumatism; and it is regarded as being produced by the same causes which produce arthritic rheumatism. Acute meningitis may be mistaken for cerebral congestion, and after recovery in cases where the disease has not passed into the second stage, that of compression, it is often impossible to be certain as to what the affection has been, congestion or inflammation. Typhoid fever has been mistaken for meningitis, when there has been much delirium, but the presence of diarrhea, tenderness and gurgling on pressure in the right iliac region in typhoid fever, and the continuance of delirium in the latter affection, are sufficient to mark the distinction. Acute mania has some symptoms like those of acute meningitis, but there is not that morbid acuteness of the senses; moreover, in mania, fever and the symptoms of compression do not follow the delirium. Acute meningitis is a very dangerous disease, some cases ending fatally in 36 hours; but the fatal cases rarely extend beyond 9 days. The most unfavorable symptoms are coma (q.v.), difficulty of swallowing, feebleness of pulse, and want of nervous sensibility (anæsthesia). Recovery frequently takes place after there has been strabismus (see SQUINTING, ante), paralysis, and convulsions, but as a rule more than half of the cases terminate fatally.

Chronic cerebral meningitis, unconnected with a tuberculous condition, is not of frequent occurrence, although not so rare as the acute form. In most instances it is a sub-acute affection from the commencement, and is very insidious in its character, the symptoms being such as not to strongly attract attention. There is pain in the head, but not usually violent, and the febrile symptoms are unimportant. Vomiting is common, but as all these symptoms accompany other diseases, it is difficult to make the distinction. There is often a degree of stupidity or apathy, accompanied by irritability when aroused, and which, taken in connection with all the other symptoms and the circumstances attending the inception of the disease, furnish to the experienced practitioner data for forming in most cases a correct judgment. 3. Tuberculous meningitis. The recognition of this form of meningitis is due to Guersaint in 1833, and Gerhard and Rau in 1865. Post mortem examination reveals usually at the base of the brain, or the arachnoid a fibrosins exudation, covering the pons-varolii, optic commissures and cerebellum; but the most prominent feature is the presence of numerous minute granulations having the appearance of gray tubercles, such as are found in the lungs and spleen in tuberculosis. These milliary tubercles, as they are called, are in the tract of the cerebral vessels, and according to Bastian and others within sheaths which are peculiar to the blood-vessels of the brain, and called perivascular sheaths, because surrounding the blood-vessels. (These perivascular sheaths are also found in the liver, q.v.). The symp-
Meningitis.

Toms are somewhat intermediate between those of acute and chronic simple meningitis, but the affection is frequently preceded by signs of tubercles in the lungs. It generally attacks children between 2 and 7 years of age, rarely appearing during the first year, but it is not confined to childhood. It usually commences with pain in the head, generally in the forehead. Vomiting is a frequent and early symptom, and there is more fever than in simple chronic meningitis. Remissions usually take place daily, with increased symptoms during the night. Sometimes the headache is very severe, attended by a short, sharp cry which has been called the "cephalic cry." There is great sensibility to light and sound. The pupils, in this the first stage, are contracted, and the conjunctiva suffused. A prominent symptom is the flushed face which comes on in paroxysms, often preceding convulsions. In the second stage there is drowsiness and less headache, although lancinating pains often occur. The pulse becomes less frequent, sometimes falling below the normal standard, and it is more rapid and irregular. The respiration also becomes irregular. The pupils are dilated, and not infrequently unequal in size. Strabismus and oscillation of the eyeballs sometimes occur, and the patient often lies with the lids partially or widely open. There is often paralysis of one side of the face, and sometimes, more or less, of one side of the body. The muscles of the back of the neck often have tonic contractions, and there are sometimes contractions of the muscles of the limbs. There is almost always obstinate constipation in consequence of the sluggish and deranged condition of the nervous system, and there is generally retention of urine. The duration varies from 1 to 3 weeks and is almost invariably, some say invariably, fatal.

4. Spinal meningitis. This disease, like cerebral meningitis, may be acute or chronic, and it is also rare; excluding cases arising from injury, even more rare than the cerebral affection. The pathological conditions are similar to those in cerebral meningitis, but the symptoms are somewhat different, owing to effects manifested through the spinal nerves. Pain is felt in the spine, and there is incoordination of the extremities of the body more than by pressure over the spinal column, and there is great increase of sensibility of the surface of the body. The pain is referable to the posterior roots of the cord. Muscular contractions are referable to excitation by the disease of the anterior roots, sometimes causing the bending of the body backwards, producing the condition known as opisthotonos (q.v.). Sometimes the thoracic muscles are the subject of tonic spasm, causing great difficulty of breathing (dyspnea). These are the early symptoms; subsequently paralysis and other symptoms follow, constituting the second stage. Acute spinal meningitis is rapid in its course, generally terminating fatally within 8 or 10 days. Asphyxia is the usual mode of death, in consequence of spasm of the respiratory muscles, or, more frequently perhaps, from paralysis of the respiratory nerves.

5. Cerebro-spinal Meningitis. This disease usually occurs as an epidemic, idiopathic cases being very rare. The epidemic form is a consequence of blood poisoning, and is a very dangerous affection which has sometimes extensively prevailed in different parts of the United States and Europe. It has sometimes received the name of spotted fever in consequence of the appearance of certain spots upon the skin in the course of the attack, but the spots are not constant accompaniments. The latter name was applied to an epidemic which prevailed in New England between the years 1807 and 1816, from the symptoms of which, as described, there is scarcely any doubt it was what is now called cerebro-spinal meningitis. This disease has been considered by some as a variety of typhus fever, but its greater suddenness and the absence of the characteristic mulberry rash of typhus prevent the general adoption of this view. The disease is usually ushered in with a chill followed by violent headache, vertigo, vomiting, and muscular rigidity passing into tetanus. There is here also, as in the other acute meningeal affections, increased sensibility of the skin; the face is pale, the pupils contracted, and the conjunctiva red. There is delirium, and usually as early as the second day in the more severe cases the extensor muscles of the neck and back are strongly contracted. The delirium soon passes into coma. According to Wunderlich there are three forms. In the first, the most rapidly fatal, the temperature rises at the approach of death to 108° F., and continues at this rate for some hours after death. In the second form the fever has an irregular course and short duration. The third form is protracted and with great variations in temperature. In the commencement of an attack of cerebro-spinal meningitis the pulse is often slower than in health, but sometimes is more frequent. It increases with the disease, but generally does not exceed 100 beats per minute till towards the fatal termination, when it became very frequent. Headache is one of the most prominent symptoms. It was wanting in only one of 64 cases analyzed by Ames. The pain is intense, lancinating, and may be seated in the forehead, occiput, or the whole head. It is increased by noise, light, and the motions of the body, and is persistent. There is usually pain also in the spine, but not always throughout its whole length, and the probability is that the pain corresponds in location with the seats of the inflammation. In the less severe cases the delirium is rather slower in being developed, and less severe in much in intensity. At first the patient appears stupid, and the mental depression remains so, but often becomes wildly delirious, and struggles with his attendants. As a rule there is obstinate constipation in consequence of the semi-paralyzed orderanged condition of the nervous system. The tongue varies in appearance, sometimes being large and flabby, and showing marks made by the teeth. As the disease progresses it becomes dry and dark. Petechial spots are frequently
observed, but they are not constant, and accompanying some epidemics more than others. They vary in size from a pin's head to a quarter of an inch or more, and are regarded as being due to an extravasation of hematin. They are of the nature of the ecchymoses which occur in scarlatinus, purpura, and some cases of continued fever, and do not constitute a specific eruption. According to Tournes, however, a rose-colored popular eruption resembling that of typhoid fever, sometimes appears. The duration of the disease varies. Of fatal cases observed by Tournes the shortest duration was 20 hours. Ames states the shortest duration to be 15 hours. The longest duration of fatal cases is stated by Tournes to be 100 days. Of 160 cases analyzed by Dr. S. B. Hunt 12 died within the first 24 hours; 92 died before the end of the fifth day; 14 before the end of the tenth; 4 before the end of the fifteenth, and 18 survived for shorter or longer periods. Some writers regard the disease as belonging to the class of fevers instead of primarily to the nervous system, and this is probably the correct view. Bondin, in 1849, proposed to call it cerebro-spinal typhus. It attacks all ages, but the larger number of cases occur between 20 and 30 years, and the liability is rather small before 7 years. Males are more frequently the subjects than females, but the difference is not great. It prevails more in the winter and spring than during the summer. It is stated to be a disease of confined quarters, such as barracks and prisons. From 1837 to 1842 it prevailed in most of the crowded barracks of France, and has been a frequent visitor of the galleys slaves at Toulon.

**MENIPUS**, one of the most noted of the cynical philosophers, and a pupil of Diogenes, was born at Gadara, in Syria, and flourished in the 1st c. B.C. He was originally a slave, and acquired considerable wealth by usury, but lost it all again, in consequence of which he estranged himself out of mortification. He satirized the philosophers of his time in terms so severe that the most biting satires were afterwards designated Menippian. Lucian pronounces him "the greatest snarer and snapper among all the old dogs" (the cynics). His works were thirteen in number, according to Diogenes; they are all lost.

**MENISPERMA CEE**, a natural order of exogenous plants, mostly tropical and sub-tropical; creeping and twining shrubs, the wood of which is frequently disposed in wedges, and without the zones usual in exogenous stems. The leaves are alternate, generally simple, destitute of stipules; the flowers small, unisexual, often in large panicles or racemes. There are about 300 known species, including those which by some botanists have been included in the two small separate orders **schizandrae** and **lardi- rabaleeae**. The true menispermea are generally bitter and narcotic; some of them are very poisonous, and some are valuable in medicine. See **COLUMBA**, **CISSAMPELOS**, and **COCCULUS**.

**MENNO**, SIMONS, the founder of the later school of Anabaptists (q.v.) in Holland, was born at Witmarsum, in Friesland, in 1496; took orders in 1524, and officiated for some years as a priest, first in the village of Pinjum, and afterwards in his native place. The study of the New Testament, however, about the year 1530, excited grave doubts in his mind regarding the truth both of the doctrine and constitution of the church; and in 1536 he withdrew from it altogether. He now attached himself to the party of the Anabaptists, was re-baptized at Leeuwarden, and appointed a teacher and bishop at Groningen. Henceforth his great endeavor was to organize and unite the scattered members of the Anabaptist sect in Holland and Germany. With this design he spent much time in traveling; but Friesland was his chief residence until persecution compelled him to flee to Wismar. Finally he settled at Oldeslohe, in Holstein, where he found not only protection, but even encouragement, and was allowed to establish a printing-press for the diffusion of his religious opinions. Here he died in 1561. He was a man of gentle, earnest, modest, and spiritual nature, with no trace about him of the wild fanaticism of the earlier Anabaptists. His book of doctrine, entitled *Fundamentbuch von dem rechten Christlichen Glauben*, was published in 1539. See **ANABAPTISTS**.

**MEXONITES**, deriving their name from Simon Menno, are claimed by some Baptists as their predecessors, coming down directly from the Waldenses; but this claim is denied generally by other Protestant denominations, who regard the Mennonites simply as the followers of Menno, who, in the 16th c. drew together the better class of the Anabaptists under new rules, and expounded to them the principles of revealed truth. As thus instructed they professed belief in the personal reign of Christ on the earth during the millennium; in the unlawfulness of oaths, of war—even in resisting violence and wrong.—of lawsuits, and of allowing civil magistrates to be members of the church. All immoral practices they, as a denomination, condemned; and in their own conduct were exemplary, prudent, and devout. So far from being guilty of the excesses which have made the name Anabaptists odious, they are numbered by some writers among the best Christians which the church ever knew, and the best citizens which the state ever had. Menno, in order to unite his followers together, separated them from all other Dutch and German Protestants and gave them a regular system of church order. His statements of doctrine were so explained and modified that they resembled strongly the general system of the reformed churches, and thus greatly promoted the growth and influence of his followers. The stringent discipline which he maintained soon produced divisions in the flock. The parties formed were known by various names, as the fine
and the coarse, denoting different degrees of strictness in discipline, the Flandrians and Waterlanders, named from the districts in which the disputants lived; the orthodox—called from their leader, Dr. Samuel Apostool, Apostoolians—and the remonstrants were divided in their views concerning vital doctrines.

I. The Dutch Mennonites. William, prince of Orange granted the Mennonites a settlement in the United Provinces near the end of the 16th century. In 1626 their confession of faith was published; in 1628 an association was formed among them, and was strengthened in 1649, which in its organization resembled in some respects that of the present Congregationalists in the United States. As a result of this fellowship some of the rigorous rules of Mennon and his successors were softened and improved. Each congregation chose its own pastor who was called an apostle, and was being chosen by its people, provided for himself in the best way he could by engaging in business or trade. Where no pastor could be obtained, the deacon and deaconess ministered respectively to the men and women. In the 17th and 18th c. persecution drove many of the Mennonites from Germany and Switzerland to Holland, so that at one time the denomination, in what they regard as their parent country, contained at least 160,000 persons. In 1735 their theological seminary was established at Amsterdam, the students of which receive instruction in a part of the chapel that also contains the library. A knowledge of Latin and Greek is a necessary qualification for admission; the lectures are in Latin, and instruction is provided in Hebrew, church history, physics, moral philosophy, and kindred studies. This institution was at first supported by contributions obtained in Amsterdam alone, but now churches in other places also send aid. All the students have the矿物 in view, and some of them receive aid from a public fund. The education of Mennonists has made the denomination respectable among other Protestants, and has raised up theologians that are highly esteemed. In 1763 they obtained equality in law among other Protestants, and have since gradually formed themselves into one national body. In 1811 they united in forming a society to promote theological education. A foreign missionary society also receives general support.

II. The Mennonites were numerous in Germany in the 17th century. In Moravia alone they amounted to 70,000. In 1622 they were expelled by Ferdinand II., and after a brief sojourn in Hungary and Transylvania removed to Russia. They were very numerous in eastern Prussia, especially at Danzig, Marienburg, and Elbing, where their cleanliness and industry soon transformed desolate marshy grounds into gardens. But persecution compelled many of them to flee until after 1732, when the king removed some restrictions from them, so that they gradually increased again in numbers until 1759, when the right to acquire property in land was taken away, yet with all their hindrances they have maintained themselves in some parts of Prussia and have especially made the valley of the Vistula "the garden spot of the land." In 1786 Catherine II. invited the Mennonites to settle in Russia with other German emigrants, and between that time and the close of the century about 350 families found there a home, on and near the island of Khortiz, in the lower Dnieper. The privileges pledged to them were: Protection from all attacks; freedom of worship; a gift of 190 acres of land for each family; exemption from taxation for ten years; money for their journey; money and wood with which to establish themselves; freedom of trade and manufactures; the administration of oaths in their own way, and perpetual exemption from military service. These advantages induced a large and constant Mennonite immigration into Russia until 1817, the new colonists settling near their brethren in the government of Taurid, and between the rivers Molotchua, Duleper, and Tokmak; and from that time they continued to increase in numbers and prosperity. They were always protected and favored by the government, and, chiefly through the character, and efforts of Johann Cornies, preserved uninjured their German institutions and habits. This remarkable man, without office or rank, though both were once and again offered him by the government, exerted a very great influence over his countrymen and over the government in their behalf. Through his efforts, besides having their own schools and churches, and retaining their native language and ways of living, they enjoyed also a kind of popular government among themselves; each group of towns being under a magistrat chosen by themselves from among themselves, and forming the organ of communication between them and the imperial government. In 1861 the late emperor, Alexander II., gave new lands and confirmed all the old concessions to a colony of Mennonites who established themselves on the Volga. These lands, indeed, as well as those which Catherine had given, were not altogether without restriction. The holders could bequeath them to their children or sell them to any of their own community, but could not part with them to any one except a Mennonite unless by express permission from the government. But within the last decade the conduct of the imperial government towards this community as well as towards other colonists has been greatly improved. In June, 1871, an edict, addressed to all the colonists of the empire—German Lutherans and Roman Catholics, as well as Mennonites, Bulgarians, and others to whom lands and privileges had been given—limited the period of exemption from military service to ten years, with the proviso that, as to furnishing recruits, the laws ruling colonists should continue in force only till the publication of a general law on military duty. As such a law might be issued at any time, the Mennonites, with the rest, might be compelled to furnish recruits, notwithstanding their belief in the unlawfulness of war. The general
law of Russia does not allow emigration, but in this instance ten years were allowed for any to leave the empire who were unwilling to comply fully with the laws. Inquiries were at once commenced by some of the leading Mennonites concerning the best location for a new home. Many answers highly favorable having been received from several parts of the United States and Canada, and circulated widely among the people, the sum of $20,000 was raised by their voluntary contributions to send a delegation to visit the most promising regions of America and report the result of their observations on their return.

IV. The first Mennonites came to the United States in 1633, influenced doubtless by the sentiments which the society of Friends held in common with them, William Penn invited them to settle in his new province of Pennsylvania. Accepting the kind offer, 500 families within half a century made their homes. In 1708 they built a school and church in Germantown. In the following year another colony settled in what is now Lancaster county, and was strengthened by other families in successive years, so that in 1735, 500 families were found in that county alone. Afterwards their descendants emigrated to various places in Maryland, Ohio, New York, Indiana, and Canada. At the present time, while they are most numerous in the states already mentioned, some of them are found in nearly every part of the land. The results of the visit of the Russian delegation are very apparent in the arrival of large numbers of families who have bought lands on the prairies of the west and in the southern states; and they, probably, are the advance guard of all the Russian Mennonites. As they do not publish their statistics, accurate statements concerning their numbers cannot be made. They have a publishing house at Elkhart, Ind. Their bishops, ministers, and deacons are all chosen by lot and meet semi-annually in district conferences. Their pastors give their services gratuitously. Their confession of faith was translated and published at Philadelphia in 1757. Besides the main body of the denomination there are in America: 1. The Reformed, or strict Mennonites, who in 1818 seceded from the rest and profess to maintain strictly the discipline of Simon Menno. 2. The New Mennonites organized in 1847 by about a dozen ministers of the old denomination. 3. The Evangelical Mennonites, who in 1856 seceded from the previous secession. 4. The Amish Mennonites, who greatly resemble the Reformed, and are sometimes called Hookers, because they substitute hooks for buttons on their clothes. They concern themselves but little in political matters, sometimes voting at elections when school officers are to be chosen. They have no denominational schools or religious paper, but send their children to the public schools and depend for religious literature on the regular Mennonites. See ANABAPTISTS; MENNO; ante.

MENOBRANCHUS. PROTEUS OF THE LAKEs, OR FISH LIZARD, A GENUS OF BATRACHIANS BELONGING TO THE DIVISION OF PERICENIBRANCHATE AMPHIBIA OF THE ORDER AMPHIPEUSUS, WHICH ALSO INCLUDES THE EUROPEAN PROTEUS. SEE PROTEUS, ANTE, THE AXOLOTL (Q.V.), AMPHIUMA (Q.V.), SIREN (Q.V.), MENOPHONME (Q.V.) THE MENOBRANCHUS HAS A LARGE HEAD AND MOUTH; BOTH UPPER JAW AND PALATE ARMED WITH SMALL SHARP TEETH; THREE BRANCHIAL TUFTS ON EACH SIDE OF THE SHORT NECK; TAIL COMPRESSED LATERALLY AND FRINGED WITH A MEMBRANE; FOUR LIMBS, EACH FOUR-TOED, THE TOES HAVING NO NAILS; SMALL EYES WITHOUT LIDS; LARGE TONGUE, MOVABLE ONLY AT TIP; NOSTRILS SMALL AND NEAR THE LIP, WHICH IS FLESHY; BODY LONG AND COVERED WITH A SMOOTH SKIN. THE MOST COMMON SPECIES IS M. MACULATUS, OR SPOTTED MENOBRANCH, WHICH HAS AN ASHY GRAY COLOR WITH DARKER SPOTS AND A BROWN STRIPE EXTENDING FROM THE NOSE OVER THE EYES. IT INHABITS THE GREAT LAKES OF NORTH AMERICA AND LAKE CHAMPLAIN. ANOTHER SPECIES, M. LATERALIS, IS DARK BROWN ABOVE, AND IT HAS DARK BANDS EXTENDING FROM THE NOSTRILS THROUGH THE EYES AND ALONG THE SIDES TO THE TAIL; THE COLOR OF THE BELLY IS A REDDISH BROWN, AND THE BODY IS MORE SLENDER THAN IN M. MACULATUS. IT IS FOUND IN THE OHIO RIVER AND OTHER TRIBUTARIES OF THE MISSISSIPPI ON THE EASTERN SIDE, FROM PENNSYLVANIA TO TENNESSEE.

MENO'MINEE, A CO. IN THE S.W. PART OF THE UPPER PENINSULA OF MICHIGAN; BOUNDED S.E. BY GREEN BAY, AND S.W. IN ITS ENTIRE EXTENT BY MENOMINEE RIVER, WHICH SEPARATES IT FROM WISCONSIN; DRAINING ALSO BY CEDAR RIVER: 1850 SQ. M.; POP. '70, 1791.' IT IS TRaversed BY THE CHICAGO AND NORTHWESTERN RAILROAD. THE SURFACE IS UNEVEN AND COVERED WITH EXCLUSIVE PINE FORESTS. THE CLIMATE IS COLD. LUMBER IS THE CHIEF EXPORT, AND THERE ARE FOUR LARGE SAW-MILLS IN OPERATION. A GREAT PART OF THE POPULATION ARE ENGAGED IN IRON MINES AND MARBLE QUARRIES. CHIEF TOWN, MENOMINEE.

MENO'MONEE, A T., THE CO. SEAT OF DUNN CO., WISCONSIN; ON THE RED CEDAR RIVER AND ON THE WEST WISCONSIN RAILROAD; 25 M. N.W. OF EAU CLAIRE, AND 42 M. N.E. OF RED WING, MINN.; POP. 3,493. THERE IS A LARGE TRADE IN LUMBER AND IN FURS; SEVERAL CARAVAN AND MACHINE SHOPS, A SASH FACTORY AND SEVERAL BRICK YARDS. THE TOWN HAS THE COUNTY COURT-HOUSE, 2 EXCELLENT PUBLIC SCHOOLS, 7 CHURCHES, AND THERE ARE TWO WEEKLY PAPERS.

MENOMONEES, OR MENOMINIES, A TRIBE OF INDIANS FIRST DESCRIBED NEAR THE MENOMINEE RIVER IN WISCONSIN, WHICH EMPTIES INTO GREEN BAY. THE NAME, BOTH OF THE RIVER AND THE TRIBE, IS SYNONYMOUS WITH 'WILD RICE, WHICH IS FOUND IN GREAT ABUNDANCE NEAR THE PATH OF THE RIVER, AND WAS AN IMPORTANT PART OF THEIR FOOD. FATHERS ALLONCE AND ANDRE ESTABLISHED A MISSION AMONG THEM IN 1670, AND DESCRIBE THEM AS LIGHTER IN COMPLEXION THAN THE NEIGHBORING TRIBES. THEY REMAINED ALLIES OF FRANCE IN THE WARS WITH THE ENGLISH, AIDED IN THE RELIEF OF DETROIT IN 1712, AND WERE A PART OF
the French-Indian forces until the time of the revolutionary war, when a part of the tribe went over to the English. In the war of 1812 they again were with the English, and aided in the capture of Mackinaw that year, and under their chief Sonligny formed a part of the Indian force in command of the great chief Tecumseh at the battle on Meigs, on the Maumee, in 1813, and of the party repulsed by col. Crogghan at Sandusky about the same time. Mar. 30, 1817, their chiefs by treaty ceded grants of land to Clarke, Edwards, and Choteau. Successive treaties were made between them and the U.S. government in 1825, 1827, 1831, 1836, 1848, 1852, and 1854. By the last they are in possession of a reservation on the upper Wolf and Oconto rivers in Wisconsin, 50 m. from Green bay, containing 240,400 acres. Their numbers decrease rapidly; in 1823, estimated, 3,900; in 1873, 1,480. The Menomonees are one of the Algonquin tribes.

MENOPOME, Protonotus horrida, one of the largest of batrachians, found in the Ohio and other rivers of the same region, and known on their banks by many names, such as hellbender, mud devil, ground puppy, young alligator, and tweeg. In form it resembles the newt and salamander; the head is flat and broad; the teeth in two concentric rows in the upper jaw; and one row in the lower, numerous and small; it is about 2 ft. long, and of a slaty gray color, with dark spots. Notwithstanding its small teeth it is fierce and voracious, feeding chiefly on fish and batrachians; and partly from its habits, partly from its ugliness, is much disliked by the fishermen of the Ohio, who erroneously regard it as venomous.

MENSES. See MENSTRUATION, ante.

MENCHIKOFF, or Menschikoff. See MENCHIKOW, or MENCHIKOFF, ante.

MENSTRUATION is the term applied to the discharge of blood which issues every month from the generative organs of the human female during the period in which she is capable of procreation.

The first appearance of this discharge, to which the terms menstrus and catamenia (each having reference to the monthly period) are indiscriminately applied, is a decided indication of the arrival of the period of commencing womanhood, and is usually accompanied by an enlargement of the mammary glands, and other less important changes. In this country, menstruation usually commences between the 14th and the 16th years, and terminates between the 48th and 52d years. The interval which most commonly elapses between the successive appearances of the discharge is about four weeks, although it is often shorter; and the duration of the flow is usually three or four days, but is liable to great variations. The first appearance of the discharge is usually preceded and accompanied by pain in the loins and general disturbance of the system, and in many women these symptoms invariably accompany the discharge. As a general rule there is no menstrual flow during pregnancy and lactation, and its cessation is one of the first signs that conception has taken place.

MENSURATION, the name of that branch of the application of arithmetic to geometry which teaches, from the actual measurement of certain lines of a figure, how to find by calculation, the length of other lines, the area of surfaces, and the volume of solids. The determination of lines is, however, generally treated of under trigonometry (q.v.), and surfaces and solids are now understood to form the sole subjects of the art of measurement. As the length of a line is expressed by comparing it with some well-known unit of length, such as a yard, a foot, an inch, and saying how many such units it contains, so the extent of a surface is expressed by saying how often it contains a corresponding superficial unit, that is, a square whose side is a yard, a foot, an inch; and the contents of solid bodies are similarly expressed in cubes or rectangular solids having their length, breadth, and depth, a yard, a foot, an inch. To find the length of a line (except in cases where the length may be calculated from other known lines, as in trigonometry) we have to apply the unit (in the shape of a foot-rule, a yard measure, a chain), and discover by actual trial how many units it contains. But in measuring a surface or a solid we do not require to apply an actual square board, or a cubic block, or even to divide it into such squares or blocks; we have only to measure certain of its boundary-lines or dimensions; and from them we can calculate or infer the contents. To illustrate how this is done, suppose it is required to determine the contents of a rectangular solid. ABCD, of which the side AB is 7 in., and the side AC 3 inches. If AC be divided at the points F and E into 3 portions, each 1 inch long, and parallels be drawn from F and E to AB or CD; and if AB be similarly divided into 7 parts, of 1 inch each, and parallels be drawn to AC or BD through the points of section, then the figure will be divided into a number of equal squares or rectangular figures, whose length and breadth are each 1 inch; and as there are 3 rows of squares, and 7 squares in each row, there must be in all 7X3, or 21 squares. In general terms, if a and b be the lengths of two adjacent sides, there are a rows of little squares, and b squares in each row. Hence the area of a rectangle = the product of two adjacent sides.

The areas of other figures are found from this, by the aid of certain relations or properties of those figures demonstrated by pure geometry; for instance, the area of a parallelogram is the same as the area of a rectangle having the same base and altitude, and is therefore equal to the base multiplied by the height. As a triangle is half of a parallelogram, the rule for its area can be at once deduced. Irregular quadrilaterals and polygons are
measured by dividing them into triangles, the area of each of which is separately calculated. For the area of the circle, see Circle. By reasoning similar to what has been employed in the case of areas, it is shown that the volume of a rectangular parallelepiped or prism is found in cubic inches by multiplying together the length, breadth, and depth in inches; and the oblique parallelepiped, prism, or cylinder, by multiplying the area of the base by the height.

MENTAL PHILOSOPHY. See Mind.

MENTA'NA, BATTLE OF, Nov. 3, 1867. On Oct. 28 and 29 a detachment of French troops, under gen. de Failly, landed at Civita Vecchia, a seaport town of Italy. Garibaldi, who was before the Roman gate of St. Jean, had defeated the pontifical troops at Monte Rotondo, 17 m. n.w. of Rome, with 4 battalions of volunteers; and, proposing to gain possession of Rome and join the papal states to the kingdom of Italy, was intending to proceed the next day to Rome, when hearing of the approach of the French troops he fell back to Monte Rotondo and Mentana, in order to raise defenses. On Nov. 2 he advanced in 2 detachments, one toward Correse and one toward Tivoli. The Tivoli column, meeting the French troops, 2,000 men under Kanzlar and Polhes, led by 3,000 of the pontifical troops, fell back to Mentana, 13 m. n.e. of Rome; were pursued by the enemy; and on Sunday, Nov. 3, an engagement of 4 hours followed, ending in the defeat of the volunteers. The French in this battle made the first trial of the Chassepot gun; their troops were regulars thoroughly drilled and disciplined, and the loss on the other side was heavy and crushing. Garibaldi had undisciplined, poorly armed recruits; infantry only. With the conquering army in front, they crossed the Italian frontier, to find the Italian army in the rear, which overwhelmed them, seized their arms, and took many of their prisoners; among them Garibaldi, who was arrested at Correse on his journey to Caperna, and imprisoned in the fortress of Varignano, near Spezia, an island of Greece; and the Italian troops retired from the papal states. Garibaldi, protesting against this treatment, claiming the protection due to an American citizen and an Italian deputy, was set at liberty on the 26th. To commemorate this victory a medal was struck by order of the pope, in the shape of a cross, made of silver, and presented to all who took part in the battle. It bore the inscription, Fidei et Virtutis, and Hinc Victoria. A monument to the Garibaldians who fell at this battle was dedicated Nov. 25, 1877.

MEN'TCHIKOFF, MENTSCHIKOFF, or MENZIKOFF. See MENCHIKOW or MENCHIKOFF, ante.

MENTONE (Fr. Menton), a t. in the department of Alpes Maritimes, France. It is pleasantly situated on the shore of the Mediterranean, and from its southern exposure, as well as a high sheltering range of mountains on the n., it enjoys a salubrious and agreeable climate. In its environs are groves of orange, lemon, and olive trees. Latterly Mentone has become a favorite winter resort of invalids and health loungers from England, Germany, and other countries; and is greatly improved as a place of residence by the addition of numerous hotels, pensions, etc. In 1860, by a vote of the inhabitants, Mentone was detached from the small principality of Monaco, and annexed to France; the French government paying 4,000,000 of francs to the prince of Monaco for relinquishing his rights, and according to him certain privileges. Mentone is within a mile and a half of the Italian frontier on the railway and Corniche road from Nice to Genoa. Pop. 76, 6,891.

MENTONE (ante) is celebrated for its bone caves, which are situated upon the e. bay. They are about 90 ft. above the Mediterranean, formed by rifts in the Roches Rouges mountain, and have furnished interesting pre-historic fossils and implements. In the spring of 1873 a fossil human skeleton was found in one of these caves, buried 21½ ft. beneath the surface. The skull is said to have had shells upon it, as if the head had been ornamented with them, and the teeth of the stag, these articles being "perforated and forming a net-work about the head." How the net-work was retained in position it is impossible to say with certainty. The cranium was fractured before and behind, so that no perfect measurement could be made. It belongs to the long-headed, or dolichocephalic, branch of the human family, and is said to have a facial angle of 85°. The height of the figure is estimated to have been 6 feet.

MENTOR, a village and township of Lake co., Ohio; 23 m. n.e. of Cleveland on the Lake Shore railroad; the township extends to the shore of lake Erie; pop. '70, 1,666. There are two churches and a graded school. The people are almost all engaged in agriculture and country trade. This little town is noted as having been for some years the residence of gen. James A. Garfield, elected in 1880 president of the United States.

MENTOR, the son of Alcimus, was the trusted friend of Ulysses, who, on setting out for Troy, left to him the charge of his household, and by him Telemachus was educated. His name became a sort of appetitive for an instructor and guide of the young.

MENTZ. See MAINZ, ante.

MENU. See MANU.

MENU RA. See LYRE-BIRD.

MENZALEH, LAKE, a lake of Egypt, extends e. from the Damietta branch of the Nile, and is separated from the Mediterranean by a narrow strip of land, through which,
however, there are several openings. It receives the Pelusiac and Tanitic branches of the Nile, and is 37 m. in length, by about 16 m. in average breadth. Its surface is studded with islands, the most interesting of which is Tennessee, the ancient Teunesus, with Roman remains of baths, tombs, etc. An extensive fishery is carried on on the lake; and its shores abound in wild-fowl. The line of the Suez canal passes through the eastern portion of lake Menzaleh.

MENZEL, WOLFGANG, an eminent German author, was the son of a medical practitioner, and was born at Waldenburg, in Silesia, June 21, 1798. He studied at Jena and Bonn, was for two years schoolmaster at Aargau in Switzerland, and in 1824 returned to Germany. He first made himself known in the literary world by his Streek-verne (Heidelb. 1828), a volume replete with poetry and wit, and opening up many novel and ingenious views of art and literature. He then engaged with several coadjutors in a periodical called Europäische Blätter (Zür. 1824-25), in which war was waged against the prevalent heartlessness and formality of German literature, in which he was led to attack vehemently the school of Goethe. This involved him, however, in a controversy with the extreme admirers of that poet. He was afterward engaged in a succession of controversies, in consequence of opinions expressed by him in his various publications: among which may be noticed his Geschichte der Deutschen (3 vols. Zür. 1834-35, and several editions); Die deutsche Literatur (2 vols. Stuttg. 1828, and several editions); Taschenbuch der neuesten Geschichte (5 vols. Stuttg. 1829-33); Mythologische Forschungen und Sammlungen (1842, etc.); and Geschichte Europas von 1789-1815 (1853). As a poet, he acquired a high reputation by a volume entitled Rübezahl (1829), and another entitled Narissus (1830). His Gesänge der Völker (1851) is a valuable lyrical collection. After the July revolution, he set himself to counteract the French influence that set in strongly among the youth of Germany, whence Börne gave him the nickname of der Franzosenfresser ("the Frenchman-eater"). He also published Preussen und Oesterreich im Jahre 1848, in 1866; Row's Unrecht in 1871; a history of the war of 1870-71; etc. He died in 1873.

MEPHISTOPHELES, one of the seven chief devils in the old demonology; the second of the fallen archangels, and the most powerful of the infernal legions after Satan. He figures in the old legend of Dr. Faustus as the familiar spirit of that renowned magician, and his name was commonly used as a term of jocular reproach. To modern readers he is chiefly known as the cold, scoffing, relentless fiend of Goethe's Faust, and the attendant demon in Marlowe's Faustus.

MEPPEL, an important trading and manufacturing town in the Netherlands province of Drenthe, is situated near the northern boundary of Overijssel. Pop. 7,074. It has a trade in butter, cattle, rye, and buck-wheat. In 1875 the butter brought to market weighed 3,705,779 lbs. The principal manufactures are spinning flax, weaving linens, sail-cloth, and coarse striped woolen fabrics. There are also corn, saw, and oil mills, breweries, etc. The union of several important water-ways with the Meppelwer Diep, through which they flow into the Zuyder Zee, brings a large shipping-trade to the town. Peat is manufactured extensively in the moss-land of Overijssel, the greatest part of which is forwarded from Meppel to Amsterdam and other cities of the Netherlands. Butter, cattle, and bark are sent to England and Germany. Meppel is about nine centuries old, and has often suffered the evils of war, being favorably situated for receiving a garrison.

MEQUINEZ. See MIKNAS.

MERCADANTE, Saverio, 1797-1870; b. Altamura. He studied the violin and the flute under Zingarelli at the conservatorio San Sebastiano at Naples, but soon turned his attention to compositions for the voice, at the earnest solicitation of his master. In 1818 he produced a grand cantata, entitled L'Unione delle Belle Arti, which was performed at the Teatro Fondo, and met with a very favorable reception. This led to an engagement at the Teatro San Carlo, where his first opera, L'Apoteosi d'Ercol, was well received. After this he composed a great number of operas; but many of them were not successful. In 1833 he was appointee' chapel master at the cathedral of Novara. In 1836 his opera, I Briganti, was performed in Paris, but proved a complete failure, in spite of the extraordinary cast of Rubini, Tamburino, Lablache, and Grisi. He was made director of the royal conservatory at Naples in 1840, but became totally blind in 1862. Though his compositions are vivacious and graceful, his opera IL Giuramento and some of his sacred pieces are all that have survived him.

MERCANTILE LAW. This is the only branch of municipal law which, from the necessity of the case, is similar, and in many respects identical with that civilized and trading countries of the world. In determining the relations of the family, the church, and the state, each nation is guided by its own peculiarities of race, of historical tradition, of climate, and numberless other circumstances, which are almost wholly unaffected by the conditions of society in the neighboring states. But when the arrangements for buying, selling, and transmitting commodities from state to state alone are in question, all men are very much in the same position. The single object of all is that the transaction may be effected in such a manner as to avoid what in every case must be sources of loss to somebody, and by which no one ultimately is a gainer—viz., disputae and delay
At a very early period in the trading history of modern Europe, it was found that the
only method by which these objects could be attained was by establishing a common
understanding on all the leading points of mercantile, and more particularly of maritime
law. This was effected by the establishment of those maritime codes, of which the most
famous, though not the earliest, was the Consolato del Mare. It is sometimes spoken of
as a collection of the maritime laws of Barcelona, but it would seem rather to have been
a compilation of the laws and trading customs of various Italian cities—Venice, Pisa,
Genoa, and Amalfi, together with those of the cities with which they chiefly traded—
Barcelona, Marseilles, and the like. That it was published at Barcelona towards the end
of the 13th c., or the beginning of the 14th, in the Catalan dialect, is no proof that
it originated in Spain, and the probability is that it is of Italian origin. As commerce
extended itself to the north-western coasts of Europe, similar codes appeared. There
was the Guilde de la Mer, the Règles d'Oléron, the Usages de Dame, and, most important
of all, the ordinances of the great Hanseatic league. As the central people of Europe, the
French, were early esteemed as cultivators of maritime law, and one of the most
important contributions that ever was made to it was the famous ordinance of
1681, which formed part of the ambitious and in many respects successful legislation
and codification of Louis XIV. See Code. All these earlier attempts at general mer-
cantile legislation were founded, as a matter of course, on the Roman civil law, or rather
on what that system had borrowed from the laws which regulated the intercourse of
the trading communities of Greece, perhaps of Phenicia and Carthage, and which had been
reduced to a system by the Rhodians.

From the intimate relation which subsisted between Scotland and the continent of
Europe, the lawyers of Scotland became early acquainted with the commercial arrange-
ments of the continental states; and to this cause is to be ascribed the fact that down to
the period when the affairs of Scotland were thrown into confusion by the rebellions of
1715 and 1745, mercantile law was cultivated in Scotland with much care and success.
The work of lord Stair, the greatest of all the legal writers of Scotland, is particularly
valuable in this department.

In England the case was very different. After the loss of her French provinces the
legal system of England became wholly insular, and there was no branch in which it
suffered more in consequence of being thus cut off from the general stream of European
progress than the law-merchant. It was lord Mansfield who, whether guided by the
wider traditions of his original country, or deriving his views from the source from which
these traditions sprung, viz., the Roman law, as modified and developed by continental
jurisprudence, introduced those doctrines of modern commercial law which English law-
yers have since developed with so much acuteness and logical consistency. Many
attempts have recently been made to assimilate the commercial laws of England and
Scotland, and a commission of lawyers of both countries was recently appointed for the
purpose. One of the most important results of their deliberations was the mercantile
law amendment act, 19 and 20 Vict. c. 60.

MERCAPTAN and MERCAPTANS, a class of compounds discovered by Zeise in
1833. The name is a contraction of mercuro corpus aptum, given on account of its
powerful reactions with compounds of mercury. Zeise's original mercaptan is ethyl
hydro sulphide, C₂H₅SH. It is the sulphur analogue of ethyl alcohol, and is produced
by the action of hydro sulphide of potassium on ethyl sulphate of calcium. A solution
of caustic potash of sp. gr. 1.8 is saturated with sulphured hydrogen gas and mixed
in a retort with an equal volume of solution of ethyl sulphate of calcium of the same
density. The retort is connected with a condenser and heated by a bath of salt and
water. Mercaptan and water are distilled together, and may be separated by decanta-
tion or by a tap funnel, the sp. gr. of mercaptan being 0.8325 at 69.8° F. and only
slightly soluble in water. It boils at 96.8° F. giving off a vapor having an intolerable
odor of onions, which adheres to the clothing with great obstinacy. It is very inflam-
mable, giving a blue flame. In contact with red oxide of mercury, even in the cold,
mercaptan causes a violent reaction with the formation of water and a white substance
soluble in alcohol, and separating from the solution in crystals having the formula
Hg₂(S₂H₅O)₆.

MERCATOR, GERARD, 1512-94; b. Flanders; the name is a Latinized form of his
real name, Kaufmann, i.e., merchant. Having finished his elementary education at Bois-
le-Duc he studied and took a degree in philosophy at the university of Louvain. After
leaving the university, he made a profound study of the sciences of geography and math-
ematics, and in 1559 was appointed cosmographer to the duke of Juliers. His name is
perpetuated by the projection used in nautical maps, in which the meridians are repre-
sented by parallel lines, and parallels of latitude by straight lines intersecting the merid-
ians at right angles. The projection, however, seems to have been applied to nautical
maps by Edward Wright. Besides a large number of maps, Mercator compiled a chron-
ological table under the name of Chronologia o Mundi Eorudo ad annum 1556; and a
series of geographical tables, Tabula Geographic ad Mentem Ptolomaei Restitutae. He
also wrote two theological treatises, one a Harmony of the Gospels, and the other, which
was condemned by the church, a work on the Creation of the World.

MERCATOR'S PROJECTION, or MERCATOR'S CHART. See Map.
MERCED, a co. in California, extending n.e. from the main coast range, traversed by the San Joaquin river, and by the Visalia division of the Central Pacific railroad; 1860 sq.m.; pop. 2,807. Cattle, wheat, wool, and fruit are the chief products; brandy and wine are the principal manufactures. Capital, Snelling.

MERCER, a co. in n.w. part of Dakota, adjoining Missouri on the n. and e.; 9,000 sq.m.; pop. not enumerated in 1870; in 1880 the census states that it is combined with Billings, Morton, and Stark cos.; total pop., 1568. It is drained by the Big Knife and other branches of the Missouri river. The surface is rolling and capable of cultivation, but at present the locality is sparsely settled and there is little trade or agriculture.

MERCER, a co. n.w. Illinois, bounded w. by the Mississippi river, and traversed by the Chicago, Burlington, and Quincy, and the Rockford, Rock Island and St. Louis railroads; 540 sq.m.; pop. '80, 19,505. The surface is rolling, the soil fertile. Live stock, grain, and wool are the principal products. Coal is mined in various places. Carriages and wagons are the chief articles of manufacture. Capital, Aledo.

MERCER, a co. in the blue-grass region of Kentucky, near the center of the state, and bounded n.e. by the Ohio river; 308 sq.m.; pop. '80, 14,141. Live stock, wheat, corn, and wool are the chief productions. Capital, Harrodsburg.

MERCER, a co. of Missouri, bounded n. by Iowa, and traversed by the south-west division of the Chicago, Rock Island and Pacific railroad; 480 sq.m.; pop. '80, 14,674. It is well timbered, with a fertile soil, containing deposits of iron, copper, and coal. Cattle, grain, and wool are among the chief products. Capital, Princeton.

MERCER, a co. of New Jersey, bounded s.w. by the Delaware river, and traversed by the Camden and Amboy, the New Jersey, the Belvidere, Delaware, and other railroads; about 220 sq.m.; pop. '80, 58,058. The surface is generally level, the soil very fertile and well cultivated. The principal productions are live stock, wood, grain, tobacco, hay, fruit, and garden products. The manufacturing interests include iron, iron castings, stone, earthen and metallic wares, carriages, clothing, woolen goods, flour, etc. Capital, Trenton.

MERCER, a co. in Ohio, bounded on the w. by Indiana; 470 sq.m.; pop. '80, 21,808. The great canal reservoir, probably the largest artificial lake in the world, is nearly all in this county. It is 8 m. in length, 3½ in width, and 10 ft. deep, and covers an area of 17,000 acres. Its waters feed the Miami canal. The chief productions of the county are cattle, grain, and wool. Coal is mined to a considerable extent, and bricks and timber are extensively manufactured. Capital, Celina.

MERCER, a co. of Pennsylvannia, bounded w. by Ohio, and traversed by the Atlantic and Great Western, the Erie and Pittsburg, the Jamestown and Franklin, and the Shenango and Allegheny railroads; 600 sq.m.; pop. 49,977. The surface is uneven, the soil very fertile. Coal is abundant; chief productions, live stock, grain, and wool. There are manufactures of leather, lumber, flour, carriages, iron, and iron castings. Capital, Mercer.

MERCER, a co. of West Virginia, bounded s. by Virginia, and lying between Great Flat-top mountain on the n.w., and East River mountain on the s.e.; 450 sq.m.; pop. '80, 7,467. It is a well-timbered region, with a fertile soil, containing deposits of coal and limestone. Capital, Princeton.

MERCER, CHARLES FENTON, LL.D., 1778-1858: b. Fredericksburg, Va.; graduated at Princeton in 1797; in 1798, in anticipation of a war with France, he was commissioned by Washington as capt. of cavalry; studied law, and in 1802-3 traveled in Europe, was aid-de-camp to the governor of Virginia during the war of 1812; commanded the defenses of Norfolk in 1813, with the then rank of brig. gen.; was a member of the legislature from 1810 to 1817, and chairman of the committee of finance in 1816. When he introduced the bill to incorporate the Chesapeake and Ohio canal company; was elected to Congress as a Federalist in 1816, and remained a member of that body until 1840. In 1833 he visited Europe, and conferred with leading men of different countries in regard to measures for the complete abolition of the foreign slave-trade. He was a leading advocate of the protection of home manufactures. Died at Howard, near Alexandria.

MERCER, HUGH, 1721-77; b. in Aberdeen, Scotland; educated at the university there; entered the medical profession, and served as assistant-surgeon in the army of prince Charles Edward, the "young pretender," in 1745. The inscription proving a failure, he emigrated to America in 1747, settling as a physician near the present town of Mercersburg, Penn. He served as a volunteer in Braddock's campaign, was appointed capt., and so severely wounded in the battle on the Monogahela that he was unable to keep up with the other fugitives from that disastrous field, wandered for several weeks alone in the forest, until at last he reached fort Cumberland, 100 m. from the point of departure. For his courage in this expedition he received a medal from the city of Philadelphia. In 1758 he was promoted to the rank of lieu.col., accompanied gen. Forbes to fort Duquesne, now Pittsburg, and commanded the post for some time. After this he settled as a physician in Fredericksburg, Va., but entered zealously into the revolutionary conflict. He organized and drilled the minute-men of Virginia in 1775, and

U. K. IX.—45
of the militia in 1776, and at Washington's request was chosen a brig. gen. by congress June 5, 1776. He commanded a column in the attack on Trenton, and led the advance in the night march on Princeton, which he had himself advised. Early in the battle there he was mortally wounded and left for dead on the field. Being discovered alive, he was taken to a neighboring farm-house, where he expired in the arms of Maj. Lewis, his aid-de-camp. His funeral in Philadelphia is said to have been attended by 30,000 people, and a monument to his memory was erected at Laurel Hill cemetery in 1840. His son, Hugh, was educated at the expense of the nation.

MERCER, Jesse, 1769-1841; b. Halifax co., N. C. After removing to Georgia he was ordained to the ministry in the Baptist denomination, and became pastor of a church in Wilkes co. in 1789. He was a popular and useful preacher. He took a prominent part in the constitutional convention in 1788. He founded an institution named Mercer university, which at first was at Pennfield, but was removed to Macon, Ga., and is prosperous. He published a collection of hymns entitled *Mercer's Cluster, generally used in the southern Baptist churches; History of the Georgia Baptist Association*; and edited for several years the *Christian Index of Georgia.*

MERCER, JOHN FRANCIS, 1758-1831; b. Va.; educated at William and Mary college; served in the continental congress 1782-85, and was a delegate from Maryland to the convention which formed the federal constitution, which he refused to sign. He was a member of congress from Maryland 1792-94, and governor of that state 1801-03. He also served in the state legislature.

MERCERSBURG, a borough in Franklin co., Penn., at the terminus of a branch of the Cumberland Valley railroad, 35 m. s.w. from Chambersburg, and 62 m. s.w. from Harrisburg. The theological seminary of the German Reformed church, commenced at Carlisle, Penn., in 1835 and removed to York four years later, was, in 1835, located at Mercersburg, where it continued until its removal in 1871 to Lancaster. The high school, commenced by the same denomination at York in 1830, was removed to Mercersburg in 1835; and having, under a charter from the state, became Marshall college, remained there until 1853, when it was removed to Lancaster and combined with Franklin college under the name of Franklin and Marshall college. Mercersburg college was organized 1835, under the care of the German Reformed church, and the theological department was added in 1872.

MERCERSBURG THEOLOGY is the name given to a philosophical representation of Christian doctrine emanating from the theological seminary of the German Reformed church formerly located at Mercersburg, Penn., and especially from Dr. John W. Nevin, one of the professors there. Critical students of theology regard it as presenting substantially Schleiermacher's views modified by American habits of thought and by faith in the inspiration of the Scriptures. It has its starting point in a peculiar psychological theory concerning the person of Christ and the nature of man. This theory determines the phrases expressed as

1. Concerning the person of Christ. Dr. Nevin says that he had not one life of the body and another of the soul; nor one life of his humanity and another of his divinity. It is one life throughout, and it is in all respects a true human life. Christ is the archetypal man in whom the true idea of humanity is brought to view. He is the ideal man in whom only human nature is complete. The writers of the *Mercersburg Review* teach that the incarnation is the proper completion of humanity and that the glorification of Christ was the full advancement of our human nature itself to the power of a divine life.

II. Concerning human nature. "The world in its lower view is not simply the outward theater or stage on which man is set to act his part as a candidate for heaven. In the widest of its different forms of existence it is pervaded throughout with the power of a single life, which comes ultimately to its full sense and force only in the human person." The world is an organic whole which completes itself in man; and humanity is regarded throughout as a single grand fact which is brought to pass not at once, but in the course of history, unfolding always more truth. The central tendency and final end of man is the development of the natural power of life to unfold itself from within, by a self-organizing power, towards a certain end, which end is its own realization, or, in other words, the actual exhibition and actualization in outward form of all the elements, functions, powers, and capacities which potentially it includes. Thus life may be said to be all at its commencement which it can become in the end. Humanity is defined to be a generic life. Man is the manifestation of this generic life in connection with a special corporeal organization, by which it is individualized and becomes personal. It was this generic humanity which was imaged in Adam, and thenceforth was corrupt in all the individual men in whom it was manifested. It was this generic humanity which Christ assumed into personal union with his divinity, not as two distinct substances, but as united to become one generic human life. This purified humanity now develops itself by an inward force in the church, just as from Adam generic humanity was developed in his posterity. It is still, however, assumed as the fundamental idea of the gospel that God and man in Christ are one. This generic humanity is only a form of the life of God. And as to its sinning in Adam, and being thenceforth corrupt, sin and corruption are only imperfect development. God, the universal life principle, as Dr. Nevin calls it, so variously manifested in the different existences of this world, is imperfectly or insuf-
efficiently manifested in man generally, but perfectly in Christ, and through him ultimately in like perfection in his people.

III. Concerning justification. Dr. Nevin says: "Our nature reaches after a true and real union with the nature of God as the necessary complement and consummation of its own life. The idea which it embodies can never be fully actualized under any other form. The incarnation is the proper completion of humanity. Christ is the true ideal man. The word became flesh—not a single man only as one among many, but 'flesh' or humanity in its universal conception. How else could he be the principle of a general life, the origin of a new order of existence for the human world as such? How else could the value of his mediatorial work be made over to us in a real way, by a true imputation, and not a legal fiction only?" "Christianity is a life, not only as revealed at first in Christ, but also as continued in the church. It flows over from Christ to his people, and exists in this form. They do not simply ascend and actuate his doctrine. They are so united to him as to have part in the substance of his life itself."

"By the hypothetical union of the two natures in the person of Jesus Christ, our humanity as fallen in Adam was exalted again to a new and imperishable divine life." "The object of the incarnation was to couple the human nature in real union with the logos as a permanent source of life." "The new life of which Christ is the source and organic principle is in all respects a true human life;" "not a new humanity, wholly discovered from that of Adam, but the humanity of Adam itself, only raised to a higher character, and filled with new meaning and power, by its union with the divine nature." "Christ's life, as now described, rests not in his separate person, but passes over to his people." He communicates his own life substantially to the soul on which he acts, causing it to grow into his very nature. "This is the mystical union, the basis of our whole salvation; this is the medium by which it is possible for us to have an interest in the grace of Christ under any other view." With his substance, his life, his divine human nature, thus communicated to the soul, come his merit, his holiness, his power, his glory. These are predicates of the nature which becomes ours, constituting our personal life and character. Even the resurrection is to be effected, not by the power of Christ operating ab extra, as when he raised Lazarus from the dead, but by a new divine element.

"The fall of Adam was the fall of the race; not simply because he represented the race, but because the race was comprehended in his person. Sin in him was sin incorporated with the inmost life of humanity, and became from this point onward an insurmountable law in the progress of its development." It was "an organic ruin, the ruin of our nature; not simply because all men are sinners, but as making all men to be sinners. The human race is not a sand heap; it is the power of a single life. Adam's sin is therefore our sin. It is imputed to us, indeed, but only because it is ours. A fallen life in the first place, and on the ground of this only, imputed guilt and condemnation. In order that the race might be saved, it was necessary that a work should be wrought not beyond it, but in it. Our nature, humanity, must be healed, the power of sin, incorporated in that nature, must be destroyed. For this purpose the logos, the divine word, took our humanity into personal union with himself. As the bearer of a fallen humanity he must descend with it to the lowest depths of sorrow and pain. He triumphed over the evil; his passion was the world's spiritual crisis in which the principle of health came to its last struggle with the principle of disease and gained the victory. This was the atonement. When Christ died and rose, humanity died and rose in his person. Our nature was thus restored and elevated, and by receiving this renovated nature we are saved. Christ's merits are inseparable from his nature; they cannot be imputed to us, except so far as they are immanent in us. As in the case of Adam, we have his nature, and therefore his sin; so we have the nature of Christ, and therefore his righteousness. The nature we receive from Christ is a theanthropic nature. For as he is one person, his life is one. His divine nature is at the same time human, in the fullest sense. All that is included in him as a person—divinity, soul, and body—is embraced in his life. It is not the life of the logos, separately taken, but the life of the word made flesh, the divinity joined in personal union with our humanity, which is thus exalted to an imperishable divine life. It is a divine human life.

IV. Concerning the church. This being so, "the divine human nature as it exists in the person of Christ passes over to his people, thus constituting the church which is his body, the fullness of him that filleth all in all. The process is not mechanical, but organic. It takes place in the way of history, growth, regular living development." The supernatural becomes natural, and as thus made permanent and historical in the church, must, in the nature of the case, correspond with the form of the supernatural as it appeared in Christ himself. The church must have a true theanthropic character throughout. The union of the divine and human in her constitution must be inward and real, a continuous revelation of God in the flesh, existing in this fact continuing the progress of the human in being the progressive in the way of actual human development in the church, the church is, in very deed, the depository and continuation of the Savior's theanthropic life itself, in which powers and resources are continually at hand, involving a real intercommunication and interpenetration of the human and divine.

V. Concerning the sacraments. A part, at least, of these powers and resources in
lodged in the sacraments of the church, which have a real objective force contained in themselves. Our faith is needed only to make room for that force in our souls. The thing signified is inseparably bound to the signs by the force of a certain appointment. But grace goes inseparably along with the signs, and is truly present for all who are prepared to make it their own. And while union with Christ is by regeneration, regeneration is by the church. It is by the ministrations of this living church, in which the incarnation of Christ is progressive, and by her grace-bearing sacraments that the theanthropic life of Christ is continually carried over to new individuals. The sacraments, therefore, convey and sustain the life of Christ—his divine human life. We partake not of his divinity only, but also of his true and proper humanity; not of his humanity in a separate form, nor of his flesh and blood alone, but of his whole life, as an undivided form of existence. Consequently in the Lord's supper he is present in a peculiar way, as to his entire theanthropic life; the sign and the thing signified, the visible and invisible, form one invisible presence. Unbelievers receive only the outward sign, because they have not the organ of reception for the inward grace. Yet the inward grace is there, and believers receive both—the outward sign and the one undivided theanthropic life of Christ. This gives the eucharist a peculiar and altogether extraordinary power, as providing a mode of receiving Christ to be had nowhere else. Where the way is open for it to take effect, the sacrament serves in itself to convey the life of Christ into the person of a believer.

**MERCHANT COMMISSION.** See **COMMISSION MERCHANT; FACTOR, ANTE.**

**MERCHANT SHIPPING ACT** of 1854 (stat. 17 and 18 Vict. c. 104), a measure which in many important respects amended, and at the same time consolidated, the law of this country relative to merchant shipping. By the merchant shipping repeal act of the same year (stat. 17 and 18 Vict. c. 120), the statutes relative to merchant shipping previously in force were, with one or two unimportant exceptions, repelled; the new act, which formed an almost complete code of the laws affecting merchant-ships, coming in their place. No fewer than nine acts have since been passed, some amending, others supplementing, the act of 1854—viz., the merchant shipping act, 1855 and 1862 (18 and 19 Vict. c. 91, and 25 and 26 Vict. c. 93); the merchant shipping act, 1867 (30 and 31 Vict. c. 124); the colonial shipping act, 1868 (31 and 32 Vict. c. 129); the merchant shipping (colonial) act, 1869 (32 and 33 Vict. c. 11); the merchant shipping act, 1871 (34 and 35 Vict. c. 110); the merchant shipping act, 1872 (35 and 36 Vict. c. 73); the merchant shipping act, 1873 (36 and 37 Vict. c. 85); the merchant shipping act, 1875 (38 and 39 Vict. c. 88). A bill to consolidate and amend the law relating to merchant shipping has been brought before the house of commons, but has not been proceeded with. The act of 1854 is divided into 11 parts; and the principal provisions of the amendment acts are referred to the part of the principal act to which they severally belong, so as to facilitate the reading the acts conjointly. The act of 1857, with the exception of two unimportant clauses, is occupied with a single subject—the enforcement of proper sanitary conditions on board ships. The acts of 1868 and 1869, relating to colonial shipping, are of general importance. The general superintendence of matters relating to merchant ships and seamen is, by the act of 1855, part 1, intrusted to the board of trade, which is invested with powers for compelling local bodies, and shipowners or shipmasters, to perform the duties which the shipping acts impose upon them.

British ships, their ownership, measurement, and registry, is the subject of part II. of the act of 1854. And it is provided that no ship shall be deemed a British ship unless she belong wholly to owners who are of one of the following descriptions: 1. Natural-born subjects; 2. Persons made denizens, or persons naturalized in terms of an act of parliament, or an act of the legislative authority of some British possession; 3. Bodies corporate established under, subject to the laws of, and having their principal place of business in the United Kingdom or some British possession. Every British ship, with a few unimportant exceptions, must be registered; and a ship, unless registered, though subject to all the ordinary liabilities, is not to be recognized as a British ship. The registration is to be made by the principal officer of customs for the time being at any port or place in the United Kingdom approved by the board of trade for the registry of ships, and by certain specified officers in the colonies and possessions abroad. The registration is to comprise the name of the ship, which cannot afterwards be changed without permission of the board of trade, and the names and descriptions of the owners; also the tonnage, as ascertained by specified rules, the build, and description of the vessel, the particulars of her origin, and the name of the master. A certificate of registry, containing all the particulars registered, is given by the registrar to the master. On this certificate, changes in the ownership and changes of the master are indorsed as they occur; and a new certificate may be granted, after certain formalities, in exchange for a former one, or in the event of a former certificate being lost. The master is the person entitled to the custody of this document, and it is a penal offense to detain it from him, upon whatever pretense of right or title. The certificate is given up to the registrar on the ship being lost, or ceasing to be British. The acts of 1871, 1873, and 1875 require certain particulars to be marked on ships in specified ways—viz., the name, the official number, the registered tonnage, a scale denoting the draught of water, the deck-line, and the load-line; and besides
that there are penalties for defacing, or not maintaining such marks, and for making them inaccurately, the ship may be detained until the requirements of the law are complied with. In any case or class of cases, the board of trade may direct that the draught of water, and also the extent of the clear side of a sea-going ship be recorded by the officers of customs, and the record preserved, and also marked in the official log-book. The act of 1873 provides that when a British ship has ceased, for any reason other than capture or transference to a foreign owner, to be registered, she shall not be again put upon the register without a survey to test whether she is seaworthy.

The property in every ship is, for purposes of registration, divided into sixty-four shares. No person is entitled to be registered as owner of any fractional part of a share; but any number of persons not exceeding five may be registered as joint-owners of a share. Counting joint-owners, who are not entitled to dispose in severalty of their respective interests, as constituting one person only, not more than thirty-two persons may be registered at the same time as owners of a ship. The power of disposing of the ship or its shares is vested exclusively in registered owners. Notwithstanding this, persons beneficially or equitably entitled are to have their interests protected upon application to the proper court. When a registered ship, or any share therein, is disposed of to persons qualified to be owners of British ships, the transfer must be made by a bill of sale under seal, according to a form prescribed, and the names of the transferees are to be entered on the register as owners of the ship or share. Mortgages also must be in a form prescribed, and are to be recorded by the registrar upon production to him in each case of the mortgage deed.

In part III., under the heading "masters and seamen," it is provided that local marine boards shall be established at certain ports of the United Kingdom; and that each of these shall consist of 2 ex officio members—the mayor or provost, and the stipendiary magistrate of the place—4 members appointed by the board of trade, and 6 elected annually by the owners of foreign-going ships and of home-trade passenger-ships. The local marine board is required to establish an office (called the shipping office) in the act of 1854, but now, under the act of 1862, called the mercantile marine office) or offices, under the management of a superintendent (originally called shipping-master), whose duty it is to afford facilities for engaging seamen, by keeping registries of their names and character; to superintend and facilitate their engagement and discharge; to provide means for securing the presence on board at the proper time of men who are so engaged; to facilitate the making of apprentice-ships to the sea-service; and to perform such other duties relating to merchant-seamen and merchant-ships as shall be committed to them by the board of trade. The local marine boards are also required to hold examinations for persons who intend to become masters or mates of foreign-going ships or home-trade passenger-ships. And no person can be employed in a foreign-going ship as master, or first, or second, or only mate, or in a home-trade passenger-ship as master, or first or only mate, unless he holds a certificate of competency obtained at such an examination; or else a certificate of service obtained in virtue of his having held a certain rank in the royal navy, or certain employment in the merchant service previous to the passing of the act of 1854, as specified in the act. The act of 1862 extended the requirement of a certificate from the board of trade to engineers employed in steamships. There are first and second class engineers' certificates, and an engineer cannot be employed unless he holds the one or the other—according to his employment and the engine-power of the ship he is engaged at or employed on, or else in consideration of his service previous to 1862, or of the rank he has held in the royal navy.

The master of every ship, excepting ships of less than 80 tons burden, exclusively employed in the coasting-trade, is required to enter into an agreement—in a form prescribed by the board of trade—with every seaman whom he takes to sea from any part of the United Kingdom. This document, which must be signed by the master and by the seamen, sets forth the nature and duration of the voyage; the number and description of the crew; the time at which each seaman is to be on board, or to begin work; the capacity in which he is to serve; the amount of his wages; a scale of provisions; regulations as to conduct; and such punishments for misconduct as the board of trade shall have sanctioned, and as the parties shall have agreed to adopt. In the case of foreign-going ships, the agreement must be made before, and be attested by the superintendent of the mercantile marine office; and seamen engaged abroad must be engaged, if at a colonial port, in the presence of a shipping-master or customs officer; if at a foreign port, in the presence of the consul. The discharge of the crews of foreign-going ships must be made at the mercantile marine office before the superintendent, to whom the shipmaster must deliver a full account of the wages due to each seaman, and of all deductions made from them. It is enacted that no right to wages shall be dependent on the earning of freight; and that every stipulation on the part of the seaman for abandoning his right to wages in the event of the loss of the ship, shall be inoperative. Previous to 1872, time agreements with seamen in home-trade ships could not be made for a longer period than 6 months. This provision was repealed by the act of that year. The act of 1873 provided that in an agreement with seamen, it should only be necessary to state the maximum period which the agreement is to cover, and the places or parts of the world, if any, to which the voyage is not to extend. Some provision was made in the act of 1854 as to the amount of space to be set apart for the accommodation of every seaman,
as to the maintenance of the sleeping-places in a proper state of order and ventilation, and as to the supply of medicines for the voyage; but the clauses of that act relating to these subjects have been repealed, and fuller provision for them has been made by the act of 1867. In this act, special precautions have been taken to insure that ships take to sea with them a sufficient supply of lime-juice and other anti-scorbutics; and the local marine boards are empowered to appoint medical inspectors to examine seamen applying for employment, if the ship-master desires it.

The act of 1854 provided for the establishment in the port of London of a general register and record office for seamen, under the management of a registrar-general of seamen; and required returns to be made to this official by the officers of customs, and through superintendents of mercantile marine offices, by masters of ships both in the home and in the foreign trade, from which a general view might be had as to the state of seamen in the maritime service. Officiating log-books, in forms prescribed, are required to be kept in every ship, other than those exclusively employed in the coasting-trade, either in connection with or distinct from the ordinary log-book; and in these, entries must be made of numerous specified occurrences. Provision is made for the punishment of offenses against discipline and good-conduct committed either by seamen or by ship-masters, and for the trial in this country of persons charged with any crime committed upon the high seas. The act of 1871 provides that where seamen are charged with deserting or refusing to join a ship, or refusing to go to sea, and a fourth of the crew, or 5 or more of the crew, if the number of the crew is 20, allege that the ship is from any cause, as unseaworthiness, overloading, improper loading, or defective equipment, not in a fit condition to proceed to sea, or that the accommodation of the ship is insufficient, the court before which they are charged may order the ship to be surveyed, and unless the opinions of the surveyor be disproved, shall act upon them; the ship-owner or the accused paying the cost of the survey, according as the defense is sustained or overruled. Where the defense is sustained, the court may, under the act of 1873, make an order for compensation to be paid by the ship-owner or ship-master to the seamen. The board of trade may suspend or cancel the certificate (whether of competency or of service) of any master or mate (1) if, after investigation, he is reported to be incompetent, or to have been guilty of any gross act of misconduct, drunkenness, or tyranny; (2) if, after investigation, it is reported that the loss of life or property is due to the neglect of the master or mate, the court shall be empowered, if the loss has been caused by his negligent act or default; (3) if he is suspended by the order of any admiralty court, or naval court held abroad under the provisions of the act; or (4) if he is shown to have been convicted of any offense.

In Part IV., under the head of "Safety and Prevention of Accidents," rules are laid down as to the boats and life-rafts which are to be carried by sea-going ships; and it is provided that the officers of customs shall not grant a clearance to any vessel by which those rules have not been complied with. As to the use of lights and fog-signals on board ships at sea, the regulations now in force are contained in the schedules of the act of 1873, which prohibits the use of red lights on vessels where not required, and the use of blue lights on vessels where required.

The act of 1873, which transfers to the board of trade the powers exercised under the passenger acts by the emigration commissioners, and, in certain cases, by the home secretary, requires that passenger steamers should undergo survey at least once a year. Under the acts of 1871, 1873, and 1875, the board of trade is enabled, either on the information of the master of the ship or of any other person, to order any vessel to be surveyed, and, if the ship is found to be unseaworthy, to make an order for its detention, or for its release, only on the fulfillment of such conditions as the board may prescribe. The owner or master of the vessel must be furnished with a copy of the surveyor's report on which the order of the board of trade has proceeded, and he may appeal to the local court having admiralty jurisdiction, the decision of which is final. The owner of a vessel detained pays the cost of the survey, and the complaint whose case has not been substantiated pays the cost of the survey; and is liable in compensation to the owner of the vessel; the board of trade also is liable in compensation to the owner when it has acted of its own motion, and unseaworthiness has not been established. The act of 1873 also contains the following provision (s. 4): "Every person who sends to sea, or is a party to any attempt to do so, and every master who knowingly takes to sea, a ship in such unseaworthy state, that the life of any person would be likely to be thereby endangered, shall be guilty of a misdemeanor. The burden laid on the accused of proving that he did not intend to insure seaworthiness, or the ship going to sea in such unseaworthy state was, in the circumstances, reasonable and justifiable." Any person prosecuted under this provision is enabled to give evidence on his own behalf. The act of 1873 contains provisions as to
the carriage of dangerous goods, and goods suspected of being dangerous; and the act of 1875 provides for the carrying of grain.

For the provisions as to pilotage, in Part V., we refer to the acts themselves. See also PILOT.

Part VI. deals with the subject of light-houses. See LIGHT-HOUSE; TRINITY HOUSE; and NORTHERN LIGHT-HOUSES.

Part VII. relates to the mercantile marine fund.

Part VIII. makes provision for cases of wreck, casualties, and salvage. An inquiry is to be made whenever any ship is lost, abandoned, or materially damaged on or near the coasts of the United Kingdom; or causes loss or material damage to any other ship on or near such coasts; whenever, by reason of any casualty on board of any ship, on or near such coasts, loss of life ensues; and whenever any such loss, abandonment, damage, or casualty happens elsewhere, and any competent witnesses thereof arrive at any place in the United Kingdom. This inquiry is to be made by the inspecting officer of the coast-guard, or the principal officer of customs of the place at which the occurrence in question happened, or of the place at which competent witnesses of it arrive, if it has happened abroad, or can be conveniently examined; or by some other person appointed for the purpose by the board of trade. Such officer or person, if he thinks fit, or if the board of trade so directs, may have the matter formally investigated before two justices or a stipendiary magistrate; and the board of trade may appoint some person of nautical skill and knowledge to act as assessor to such justices or magistrate. If the conduct of any master or mate is in question, the magistrates may require him to deliver up his certificate pending the inquiry; and the certificate may be canceled or suspended by the board of trade upon their report. The board of trade has the general superintendence of all matters relating to wreck, and has power to appoint a receiver of wreck in any district.

Part IX. relates to the liability of ship-owners: and the provisions of the principal act have here been materially altered by the act of 1862. Under the act of 1862, the owners of any ship, whether British or foreign, are not answerable in damages for any loss of life or personal injury to persons carried in the ship; for any damage or loss caused to any goods on board the ship; for any loss of life or personal injury by reason of the improper navigation of the ship caused to any person carried in any other ship; or for any loss or damage similarly caused to any other ship, or the goods on board of it, when such loss, or injury, or damage happens without their actual fault or privity, except as follows: Where loss of life or personal injury has occurred either alone or together with loss or damage to ships and merchandise, they are liable to the extent of £15 for each ton of the ship’s tonnage; where there is loss or damage only of ships or merchandise, they are liable to the extent of £8 per ton. The tonnage, on account of which the liability in these cases is to be calculated, is, in the case of sailing-ships, the registered tonnage, and, in the case of steamships, the gross tonnage, without deduction on account of the engine-room; and the tonnage of foreign ships is to be estimated according to the rules of measurement laid down for British ships. The act of 1854, however, provided that the owners of sea-going ships should be liable in respect of every loss of life, personal injury, loss of or damage to goods which may arise on distinct occasions, to the same extent as if no other loss, injury, or damage had arisen; and this provision is still in force. In cases of loss of life or personal injury, the act of 1854 empowers the board of trade to institute an inquiry, and provides in detail for the recovery of damages before the sheriff and a jury. The damages are to be assessed at not more than £30 for each case of death or personal injury. These are to be paid to her majesty’s paymaster-general, and to be distributed by him as the board of trade directs; the board having power to direct payment of such compensation, not exceeding the statutory amount, as may be thought fit. A person dissatisfied with the amount of damages awarded to him may bring his action in the ordinary courts, but he is liable in the costs of the action unless he recovers a sum exceeding double the statutory amount.

Part X. of the act of 1854 lays down the legal procedure to be taken in cases arising under the act; and part XI. deals with several miscellaneous matters of no general importance. The act of 1862 provided that foreign ships within British jurisdiction shall be subject to the rules for preventing collisions applicable to British ships. The final issue of Mr. Plimsoll’s indefatigable labors was the passing of the act to amend the merchant shipping act, which became law in Aug., 1876. Here provision is made for the detection of unseaworthy ships, to prevent overloading, to secure that all deck cargoes shall be included in the tonnage, and that grain carried shall not be carried loose in bulk, but shall be kept from shifting either by boards or bulkheads or by being carried in sacks. The act of 1873 provides for the application, by order in council, of all the provisions of the merchant shipping acts to foreign vessels, the states to which they belong assenting. The act of 1862 contains the law on the subject of delivery of goods and lien for freight (for which see LIEN).

MERCHANTS’ MARKS. In the middle ages it was the practice for merchants, traders, and others to whom the proper use of heraldry was not conceded, to be allowed by the heralds to bear devices indicative of their trades or occupations. A cutler might bear
his knife, a tailor his shears, a mason his trowel and compasses. These insignia were in strictness ordered to be borne only in "targets hollow at the chief flanks," yet we often find them on shields, and sometimes even impaled and quartered with arms. Merchants, along with a monogram of their initials, often bear a mark composed of a cross and a figure resembling the Arabic numeral 4 turned backwards—perhaps a symbol of the Holy Trinity, though it was also sometimes believed to represent the mast and yard of a ship. The insignia of their companies were frequently borne by merchants in a chair, with their marks, and occasionally quartered with them. These merchants' marks were probably the origin of the trade brands and marks of our own time. Many of them are to be seen sculptured on the walls and roofs of the churches of the 14th c. and 15th c., and engraved on monumental brasses both in England and on the continent. Seals with merchants' marks are occasionally found appended to conveyances of land.

**MERCIA.** See Heptarchy.

**MERCURY.** See Hermes.

**MERCURY.** See Solar System, ante.

**MERCURY,** or Quicksilver (symb. Hg, equiv. 100—new system, 200—sp. gr. 13.6), one of the so-called noble metals, remarkable as being the only metal that is fluid at ordinary temperatures. It is of a silvery white color, with a striking metallic luster. When pure, it runs in small spherical drops over smooth surfaces; but when not perfectly pure, the drops assume an elongated or tailed form, and often leave a grey stain on the surface of glass or porcelain. Moreover, the pure metal, when shaken with air, presents no change upon its surface; while, if impure, it becomes covered with a grey film. It is slightly volatile at ordinary temperatures, and at 692° it boils, and forms a colorless vapor of sp. gr. 6.976. Hence it is capable of being distilled; and the fact of its being somewhat volatile at ordinary temperatures, helps to explain its pernicious effects upon those whose trades require them to come much in contact with it—as, for example, the makers of barometers, looking-glasses, etc. At a temperature of —39°, it freezes, when it contracts considerably, and becomes malleable. In consequence of the uniform rate at which it expands when heated, from considerably below 6° to above 300°, it is employed in the construction of the mercurial thermometer.

All mercurial compounds are either volatilized or decomposed by heat; and when heated with carbonate of soda, they yield metallic mercury. Votive or virgin quicksilver only occurs in small quantity, usually in cavities of mercurial ores. Of these ores, by far the most important is cinnamon (q.v.). There are two means of obtaining the metal from the cinnamon: the ore may be burned in a furnace, in which case the sulphur is given off as sulphurous acid, and the mercury is collected in a condensing chamber; or the ore may be distilled with some substance capable of combining with the sulphur—as, for example, with slaked lime or iron filings.

The mercury imported into this country is usually almost chemically pure. If the presence of other metals is suspected, it may be pressed through leather, re-distilled, and then digested for a few days in dilute cold nitric acid, which exerts little action on the mercury, if more oxidizable metals are present. The mercury, after being freed from the nitric acid by washing with water, is chemically pure.

There are two oxides of mercury, the black suboxide (Hg₂O) and the red oxide (HgO). Both of these lose all their oxygen when heated, and form salts with acids. The black suboxide, a powerful base, is very unstable when isolated, being readily converted by gentle warmth; or even by mere exposure to light, into red oxide and the metal (Hg₂O = HgO + Hg). The most important of its salts is the nitrate (Hg₂O.NO₃ + 2Aq), from whose watery solution ammonia throws down a black precipitate known in phar- macy as mercurius solubilis Hahnemanni, from its discoverer, and consisting essentially of the black suboxide with some ammonia and nitric acid, which are apparently in combination. Of the red oxide, the most important salts are the nitrate (HgO.NO₃ + 3Aq); the sulphate (HgO.SO₄), which is employed in the manufacture of corrosive sublimate; and the basic sulphate (3HgO.SO₄), which is of a yellow color, and is known as turpeth mineral.

The haloid salts of mercury correspond in their composition to the oxides. Of the most important of these—the chlorides—there are the subchloride (Hg₂Cl), well known as calomel (q.v.), and the chloride (HgCl₃), or corrosive sublimate. The calomel (formerly termed the bichloride, when calomel was regarded as the pro- tochloride, and the equivalent of Hg₂ was regarded of 100), when crystallized from a watery solution, occurs in long white glistening prisms; but when obtained by sublimation, it occurs in white transparent heavy masses, which have a crystalline fracture, and chink with a peculiar metallic sound against the sides of the bottle in which they are contained. This salt melts at 509°, and volatilizes unchanged at about 570°. It has an acrid metallic taste. It is soluble in 16 parts of cold, and in less than three parts of boiling water, and dissolves very freely in alcohol and in ether. Corrosive sub- limate enters into combination with the alkaline chlorides, forming numerous distinct compounds. (A double chloride of ammonium and mercury, represented by the formula 3H₂,NCl,HgCl₂·Aq, has been long known as sal alembith.) It combines with oxide of mercury in various proportions, forming a class of compounds of great interest in theological chemistry, termed oxychlorides of mercury. On adding a solution of corrosive sub-
limate to a solution of ammonia in excess, a compound, which, from its physical characters, is termed \textit{while precipitate}, is thrown down, which is generally supposed to be a compound of chloride of mercury. HgCl, HgN\textsubscript{2}H\textsubscript{2} (Kane). Chloride of ammonium combines with the albuminous tissues generally, forming sparingly-soluble compounds. Hence, in cases of poisoning with the salt, the white of raw eggs is the best antidote; and for the same reason corrosive sublimate is a powerful antiseptic, and is employed to preserve anatomical preparations.

Amongst the most important tests for this substance, which is not unfrequently used as a poison, may be mentioned—1. Iodide of potassium, which, when added to a crystal or to a watery solution of chloride of mercury, gives rise to the formation of a bright scarlet iodide of mercury. 2. The galvanic test, which may be applied in various ways, of which the simplest is the "guinea and key test," devised by Wollaston. He placed a drop of the fluid suspected to contain corrosive sublimate on a guinea, and simultaneously touched it and the surface of the guinea with an iron key; metallic mercury was deposited on the gold in a bright silvery stain. 3. Precipitation on copper, and reduction. To apply this test, we acidulate the suspected fluid with a few drops of hydrochloric acid, and introduce a little fine copper gauze, which soon becomes coated with mercury. On heating the gauze in a reduction tube, the mercury is obtained in well-defined globules.

With iodine and bromine, mercury forms two iodides and bromides, corresponding in composition to the chlorides. Both the iodides are used in medicine; the bromides are of no practical importance. The \textit{subiodide} (HgI\textsubscript{2}) is a green powder formed by triturating 5 parts of iodine with 8 of mercury, and is of far less interest than the \textit{iodide} (HgI\textsubscript{2}), which is most simply obtained by precipitating a solution of corrosive sublimate by a solution of iodide of potassium. The precipitate is at first salmon-colored, but soon changes into a brilliant scarlet crystalline deposit.

Sulphur forms two compounds with mercury—viz., a subsulphide (Hg\textsubscript{2}S), a black powder of little importance, and a sulphide (HgS), which occurs naturally as cinnabar (q.v.). \textit{Sulphide of mercury} is employed as a low-grade, and partly sulphurous, method of obtaining a solution of a persalt of mercury (corrosive sublimate, for example). When dried and sublimed in vessels from which the air is excluded, it assumes its ordinary red color. The well-known pigment \textit{vermilion} is sulphide of mercury, and is sometimes obtained from pure cinnabar, but is more frequently an artificial product.

Mercury unites with most metals to form amalgams (q.v.), several of which are employed in the arts.

Of the numerous organic compounds of mercury, it is unnecessary to mention more than the fulminate (described in the article \textit{Fulminating Mercury} (q.v.), and the cyanide (HgCy), which may be prepared by dissolving the red oxide of mercury in hydrocyanic acid, and is the best source from which to obtain cyanogen.

The uses of mercury are so numerous that a very brief allusion to the most important of these must suffice. It is employed extensively in the extraction of gold and silver from their ores by amalgamation. Its amalgams are largely employed in the processes of silverying and gilding, and some (as those of copper and cadmium) are employed by the dentist for stopping teeth. It is indispensable in the construction of philosophical instruments, and in the laboratory in the form of the mercurial bath, etc. It is the source of the valuable pigment vermilion. The use of its chloride in anatomical preparations has been already noticed; it is similarly found that wood, cordage, and canvas, if soaked in a solution of this salt (1 part to 60 or 80 of water), are better able to resist decay when exposed to the combined destructive influence of air and moisture. The uses of mercury and its preparations in medicine are noticed in a separate article.

**MERCURY AND MERCURIALS. MEDICAL USES OF.** Liquid mercury is no longer used in medicine, although, until lately, it was occasionally given with the view of overcoming, by its weight, obstructions in the intestinal canal. There are, however, many preparations which owe their value to \textit{extinguished} mercury; that is to say, to mercury triturated with other substances, as charcoal, vinegar, oil, etc., till globules can no longer be detected in it. It is possible that, in these cases, the metal is partly reduced to the state of suboxide. Amongst these various preparations must be placed \textit{mercury with chalk}, or \textit{gray powder} \textit{(hydrargryrum cum creta)}, which is the mildest and best mercurial to administer to infants and children, the dose varying with the age; \textit{blue pill} (q.v.); and the various ointments, liniments, and plasters of mercury. \textit{Calomel} (termmed, in some of the pharmacopoeias, \textit{hydrargryi chloridum}, for the same reason that corrosive sublimate, as already mentioned, is termed in the same works \textit{hydrargryi bichloridum}) is perhaps more given than any other medicine of this class, and may be regarded, in so far as its actions are concerned, as a type of mercurials generally. Given in small doses, the first effects of these medicines are observed in the increase of the various secretions, as, for instance, of the saliva (see \textit{Salivation}), of the various fluids poured into the intestinal canal,* and sometimes

* It is very doubtful whether, as is generally believed, mercurials increase the secretion of the essential constituents of the bile. The watery portion is undoubtedly, and the coloring matter probably, increased.
of the urine. When continued in small doses for some time, they cause the absorption of morbid fluids, and even of morbid products that have assumed a partially solid form. The following are some of the diseases in which they are of most importance: (1) In table ulcers, and inflammation of the liver, etc., to increase the secretions and hence relieve the vessels of the affected organ; (2) in various acuté inflammations, especially of serous membranes (q.v.), of the structure of the liver and of the lungs, etc.; (3) in numerous forms of chronic inflammation; (4) in dropsy, dependent upon inflammation of serous membranes or disease of the liver, but not in dropsy from disease of the kidneys, where they are generally injurious; (5) in numerous chronic affections in which an alternative action is required; and (6) as a purgative (to be followed by a black draught), where the patient is in the condition popularly known as bilious (in this case, blue pill is usually as efficacious as calomel).

In syphilis, mercurials were at one time universally prescribed; now they are not considered essential to the cure of this disease, except in comparatively few cases.

If calomel, blue pill, or any other mercurial be given in too large a dose, or for too long a period, most serious consequences may result—such as very profuse salivation, with swelling of the tongue and gums, and loosening of the teeth; purging; certain skin affections; disease of the periosteum and the bones (formerly ascribed to syphilis, but in reality oftener due to the supposed remedy); and a low febrile condition (termed mercurial erythema), accompanied with great general prostration.

The doses of calomel for an adult vary from 3 to 6 grains when taken as a purgative. If the object is to affect the system generally, as in a case of acute inflammation, small doses (half a grain to two grains, combined with a little opium) should be given several times a day; while as an alternative, still smaller doses (not sufficient at all to affect the mouth) should be prescribed. The compound calomel pill popularly known as Plummer’s pill (in which the calomel is associated with oxysulphide of antimony and guaiacum) is a most valuable alternative in chronic skin-diseases—a five-grain pill to be taken every night.

Corrosive sublimate (the bichloride of the pharmacopoeias, and oxyhydrurate of the older chemists), although a very powerful irritant poison, is extremely useful in very small doses as an alternative in many chronic affections of the nervous system, the skin, etc. The dose varies from one-thirtieth to one-eighth of a grain; the average dose of its pharmaceutical solution, the liquor hydrargyri bichloridi, being one dram, which contains one-sixteenth of a grain of the salt. This medicine should always be given on a full stomach.

The above are the chief mercurial preparations that are given internally. Certain external applications require a few remarks. The plasters, ointments, and liniments are absorbed by the skin, and act in the same manner as mercurials taken internally.

While precipitate ointment is the universal remedy for the destruction of lice, and is useful in the treatment of lice, the universal ointment is used for the destruction of lice. It is used as a local application on the skin, and is a most valuable substitute for lice.

The toxicological relations of the mercurial compounds must be briefly glanced at. There are cases on record in which, probably from some peculiarity of constitution, ordinary and even small doses of the milder mercurials have caused death; thus, Christison mentions a case in which two grains of calomel destroyed life by severe salivation and by ulceration of the throat; and similar cases in which small doses of gray powder, blue pill, and calomel have proved fatal are recorded by Taylor in his Medical Jurisprudence.

The preparations employed for the purpose of poisoning are mainly corrosive sublimate and white and red precipitates, corrosive sublimate being used in at least four-fifths of the cases. The symptoms produced by a poisonous dose of this salt come on immediately, there being during the act of swallowing an intense feeling of constriction, and a burning heat in the throat, while a metallic taste is left in the mouth. Violent pain in the stomach and abdomen is felt in a few minutes, and vomiting of mucus and blood, and purging, follow. The pulse becomes small, frequent, and irregular, the tongue white and very revoluted, the skin cold and clammy, the respiration difficult, and death is preceded by fainting or convulsions. Any dose exceeding two grains would probably prove fatal to an adult, unless vomiting were induced, or the whites of eggs administered. Death commonly ensues in from one to five days, but may take place in less than half an hour, or not for three weeks or more.

**MERCURY**, Doc’s, *Mercurialis*, a genus of plants of the natural order euphorbiaceae, having unisexual flowers, a tripartite perianth, 9 to 12 stamens, two simple styles, and a dry two-celled fruit with two seeds. The species are not numerous. The Common Doe MERCURY (*M. perennis*) is very common in woods and shady places in Britain. It has a perfectly simple stem, about a foot high, with rough ovate leaves, and axillary loose spikes of greenish flowers. It turns a glaucous black color in drying, and the root contains two coloring substances, one blue and the other carmine; so that it may probably become of importance in dyeing. It is very poisonous. The mercury which some old writers mention
as a pot-herb is not this plant, but *chenopodium bonus henricus*. Annual Dog Mercury (*M. annua*) is a much rarer British plant, and less poisonous. The leaves are indeed eaten in Germany, as spinach. A half-shrubby species (*M. tomentosa*), found in the countries near the Mediterranean, has enjoyed an extraordinary reputation from ancient times; the absurd belief mentioned by Pliny being still retained, that if a woman after conception drink the juice of the male plant she will give birth to a boy, and if of the female plant her offspring will be a girl—the male plant, however, being mistaken for the female, and the female for the male.

MERCY, SISTERS OF, or ORDER OF OUR LADY OF MERCY, an order of the Roman Catholic church founded in Dublin in 1827. They are of two classes, choir sisters and lay sisters; the choir sisters being occupied with the visitation of the sick and prisoners, the care of poor and virtuous girls, and other charities; the lay sisters being employed in the domestic occupations of the convent, etc. Each community is independent of the largest and most famous of the Order, being subject only to the bishops. The origin of the order was due to Miss Catharine McAuley of Dublin, who, born of Roman Catholic parents and left an orphan, having been educated as a Protestant, joined the Roman Catholic church, and devoted her life and ample fortune to the service of the poor. The order has latterly been introduced into many parts of Ireland, England, Scotland, and America. After a preliminary preparation of six months, candidates assume the white veil and become novices. The novitiate lasts two years. Their vows bind them to poverty, chastity, obedience, and the care of the sick and poor.

MEREDITH, OWEN (pseud.). See Bulwer-Lytton, Edward Robert, Earl.

MEREDITH, William Morris, LL.D., 1799–1873; b. Penn.; a graduate of the University of Pennsylvania at Philadelphia, class of 1812; commenced the practice of law about 1820, and became a distinguished member of the profession. He held many positions in the gift of his native state, representing its district in the legislature from 1824 to 1828, and was president of the city council of Philadelphia from 1834 to 1849. He was attorney-general of Pennsylvania from 1861 to 1867, was elected president of the Pennsylvania constitutional convention in 1857, and was U. S. secretary of the treasury under the presidency of Taylor from Mar. 7, 1849, to July 20, 1850. At the time of the Geneva conference on the Alabama question in 1871, he was offered the position of counsel for the United States, but declined.

MERES, Francis, b. England, 1570; distinguished chiefly as being the author of *Wit's Academy*, a Treasury of Goulden Sentences, Similies, and Examples, 1684. *Palladis Tamia: Wit's Treasure*, being the Second Part of Wit's Commonwealth, a Comparative Discourse of our English Poets with the Greek, Latin, and Italian Poets, appeared in 1597. His references to Shakespeare are considered of value as showing the number of works by that author produced up to that time; in his review of the literature of the day, his criticisms are considered for the most part just. He published *God's Arithmetique*, 1597—a sermon on Eccles. v. 9. He was author of a translation of the *Sinner's Guide* by Fray Luis de Granada.

Mergan Ser, *Mergus*, a genus of birds of the family Anatidae, having a slender, straight, much compressed bill; hooked at the tip, and notched at the edges, almost furnished with teeth. See *Bill*. The species are all inhabitants of the seas and coasts of northern regions, but migrate southwards in winter. The goosander (q.v.) is the largest of the best known British species. The Redbreasted Merganser (*M. serrator*) is plentiful in the northern parts of Britain, at least in winter, and is found in all the northern parts of the world. It is not much smaller than the goosander, which it much resembles.—The Hooded Merganser (*M. cucullatus*), a smaller species, only about 18 in. in entire length, is a very rare visitant of Britain, but is very plentiful in North America.

Merger, in law, is the absorption of one right, estate, interest, or offense in another of a higher degree vesting in or committed by the same person. The doctrine of merger is most commonly brought to bear in the case of real estate. Thus, where there is no intervening estate between a greater and a less limited to the same person, the less estate is absorbed or merged in the greater. If an assignment of the mortgage is made to the mortgagee, the whole estate vests in him. Or if the reversion in fee simple come to the tenant for years, either by descent or purchase, his term for years is merged in the fee. But both estates, to produce a merger, must be held by the same person, by one right, and at one time. Merger occurs either upon the meeting, in the same person, of an estate of higher and an estate of less degree, or by the meeting in the same person of the reversion and the particular estate. The inferior estate is extinguished by the merger, but the greater estate remains the same as before the merger. As a rule, whenever the legal and the equitable estates meet in one and the same person, the former absorbs the latter. But a court of equity will not allow the two interests to be merged, if such merger would be contrary to the intentions of the parties, or if, without prejudice to other parties, the legal and equitable estates can be kept apart, to the profit of the party in whom they would otherwise merge. Instances of a partial merger may occur, where an estate is merged in part, and exists in part. Thus, if a tenant for years acquire the reversion of part of the leased property, he owns part of the property leased in fee-simple, and is a
tenant as to another part. Where two estates meet in the same person but by different rights, merger will not take place.—In criminal law a less offense is merged in a greater which includes it. Thus, every assault includes a battery. But where the offenses are of an equal degree, merger will not take place. In torts, when a felony is also a tort, for which a private person may institute a civil action, the private wrong merges in the public wrong. But the merger in such cases is not complete, and, upon the conviction of the criminal, the civil remedy is revived. This rule of merger in the criminal law obtains in England, where criminal prosecutions are usually conducted by private persons, and the justification of it is to be found in the fear that criminals would not be prosecuted, if the injured person could first obtain civil satisfaction. In this country, criminal proceedings are generally conducted by public prosecutors, and the English doctrine of criminal merger does not obtain. In England itself, it applies only to actions of tort and trespass. Merger is also extended to contracts. Thus, against a debtor by specialty, the remedy for breach of an ordinary simple contract is merged in the higher remedy upon the specialty, and the creditor can resort to the latter only. So where a creditor has obtained a judgment against his debtor by contract, he can only bring suit upon the judgment, if it be unsatisfied.

MERIAN, Maria Sibylla, 1647-1717; b. Germany; daughter of Matthäus Merian, a Swiss engraver, and sister of the historical painter Matthäus Merian; had a natural talent for drawing and painting, which developed in the direction of flowers and insects. She was the pupil of Abraham Mignon, celebrated for his exquisite representations of flowers, fruit, and insects. In 1665 she married Johann Andreas Gruff, a painter, and removed to Nuremberg. She was never called by her married name, more fame attaching to her own, and published, 1679-83, an illustrated work in the Dutch language, 2 vols., Origin of Caterpillars; their Nobrishment and Changes. It was translated into Latin in 1717, published in Amsterdam with a portrait of herself engraved by another hand; and in 1730 a French edition appeared, entitled Histoire Générale des Insectes de l'Europe. In 1688 she went to Surinam, and pursued her studies in South America, remaining there until 1701, publishing the result of her labor under the title of Generation and Transformation of Insects, 2 vols., with colored plates, and an additional volume by one of her daughters. She had 2 daughters, Jane Helen and Dorothea Maria Henrietta, who after their mother's death gave a new edition of her work to the public. The original was published in Amsterdam in 1705. In 1788-71 all her works were published, in Paris, under the title of Histoire des Insectes de l'Europe et de l'Amérique. A number of her original drawings, upon vellum bound in 2 vols., noted for their skill and accuracy, are in the British museum collection among the prints, and, with a portrait of herself, were the property of sir Hans Sloane. They were purchased at a great price, and the European specimens are said to be entirely original delineations, celebrated for scrupulous exactness. There are collections of her drawings in St. Petersburg, Holland, and Frankfort. She excelled as a writer no less than in the more conspicuous professions of painter and naturalist.

MERGUI, a t. and seaport of Mergui, one of the Tenasserin provinces, British Burma, stands on an island in the delta of the Mergui river. Lat. 12° 27' n., long. 98° 43' east. It is about three miles in circuit, and is surrounded by a stockade. Its harbor is spacious and secure. Exports: sapan wood, dried fish, ivory, etc. Pop. '71, 9,877.

MERGUI ARCHIPELAGO, a group of islands in the gulf of Bengal, lying off the southern shores of the Tenasserin province, in lat. from 9° to 13° north. The islands are mountainous, some of them rising to 3,000 ft. above sea-level. Pearls are found on the coasts of many of them; and edible birds'-nests, which are sold to the Chinese and Malays, as also timber and coal, are among the chief articles of export.

MERIAN, Matthias, the elder, 1593-1653; b. at Bâle; lived in Paris and Frankfort. He began in 1640 a work presenting perspective views of some European cities, which were drawn, engraved, and described by himself; the work is regarded as very valuable. It was continued after his death.

MERIDA, a state in n.w. Venezuela, bounded on the n. by Maracaibo; on the e. by Trujillo and Barinas; on the s. by Barinas and the United States of Colombia; and on the w. by Pamporna. The surface consists of elevated table-lands and valleys, between the numerous mountains, off-shoots of the Andes chain, which extend through the country in all directions. The Sierra Nevada, the highest of these mountains, rises to a height of 15,066 feet. There are many rivers and extensive lakes, among which may be mentioned the Laguna de 3,000 ft. above sea-level. The ordinary productions of the temperate and torrid zone are grown. Area, 10,000 sq.m.; pop. 70,000, largely Indians and Mestizos. Capital, Merida.

MERIDA, a t. of Venezuela, South America, capital of a province of the same name, about 60 m. s. of the lake of Maracaibo. It was formerly the largest and one of the most important cities of Venezuela; but in 1812 it was almost wholly destroyed by an earthquake, from which misfortune it has somewhat recovered, and is again in a flourishing condition. Pop. 6,000.

MERIDA, the capital of Yucatan, Mexico, is situated on a barren plain, 25 m. from the gulf of Mexico, in lat. 20° 50' n., long. 89° 40' west. It occupies the site of a former native city, and was founded by the Spaniards in 1542. Merida has a university, a cathedral,
and 13 churches. Its port is Sizal, with which it communicates by a good road. Its trade and manufactures are not extensive. Pop. '71, 38,025, almost all Indians and half-bloods.

**MERIDA** (anc. Augusta Emerita), a small, decayed t. of Spain, in the province of Estremadura, rises on the right bank of the Guadiana, 32 m. e. of Badajoz. It is unique in Spain, and is in some points a rival of Rome itself, on account of the number and magnitude of its remains of Roman antiquity. The Guadiana is here crossed by a Roman bridge of 81 arches, and with a length of 2,575 ft., and a breadth of 26 feet. It was erected by Trajan. There is another Roman bridge over the Albarregas, 450 ft. long, and 25 ft. wide, still quite perfect, in spite of the traffic of 17 centuries. There are also remains of a castle built by the Romans; and among the other most noteworthy monu-
ments of antiquity are an old half-Roman, half-Moorish palace, the Casa de los Corvos, constructed out of a temple dedicated to Diana, several aqueducts, an ancient theater, and a circus. Merida was built 23 years n.c., and flourished in great splendor, until, in 1249, it was taken from the Moors, after which it began to decline. Pop. 5,500.

**MERIDEN,** township and village in Connecticut, 18 m. n.e. of New Haven, containing the state reform school and several manufactories. Pop. '70, 10,495.

**MERIDEN (ante),** incorporated as a town in Conn. in 1806, as a city in 1867; pleasantly situated on elevated land, 94 m. n.e. of New York, and 18 m. s.w. of Hartford; pop. '80, 18,840. It has 3 post-offices, each the center of a considerable trade, called respectively Meriden, West Meriden, and South Meriden. The New York, New Haven and Hartford railroad passes through it. Meriden contains the city hall and 2 national banks. In West Meriden, the principal place, several daily and weekly newspapers are published and it has 1 national bank. The aggregate capital of the banks in both vil-
ages is $1,000,000. They have manufactories of electro-plated silver-ware, tin-ware, cutlery, steel, cement pipe, bronzes, gas-fixtures, machinery, electroplated iron, brass cast-
ings, fire-arms, and woolen goods, employing a capital of $5,000,000, with an annual product of about $15,000,000. The annual product of the Britannia works, an extensive establishment, is estimated at $2,500,000, occupying several factories, and employing nearly 1000 men. The township contains 12 churches, 1 fire insurance company, 1 savi-
ings bank, a well-organized fire department, water-works, and is lighted with gas. It is one of the most enterprising and prosperous manufacturing centers in New England.

**MERIDIAN** (Lat. meridies, midday), the name given to the great circle of the celestial sphere which passes through both poles of the heavens, and also through the zenith and nadir of any place on the earth's surface. Every place on the earth's surface has conse-
quently its own meridian. The meridian is divided by the polar axis into two equal por-
tions, which stretch from pole to pole, one on each side of the earth. It is midday at any place on the earth's surface, when the center of the sun comes upon the meridian of that place; at the same instant it is midday at all places under the same half of that meridian, and midnight at all places under the opposite half. All places under the same meridian have therefore the same longitude (see LATITUDE AND LONGITUDE). Stars attain their greatest altitude when they come upon the meridian; the same thing is true approximately of the sun and planets; and, as at this point the effect of refraction upon these bodies is at a minimum, and their apparent motion is also more uniform, astro-
nomers prefer to make their observations when the body is on the meridian. The instru-
ments used for this purpose are called meridian circles. See CIRCLE, MURAL.

**MERIDIAN,** a village in e. Mississippi, at the junction, in Lauderdale co., of the Vicksburg and Meridian, and the Alabama Great Southern, on the Mobile and Ohio rail-
road; pop. about 4,500. It is 135 m. n.w. of Mobile, and 96 m. e. of Jackson. It con-
tains a court-house, 5 schools, 8 churches, 5 newspapers, and 2 female colleges. Its leading industries are represented by the manufacture of cotton goods and yarn, furni-
ture, saws, doors, and blinds, and plows; other manufactories are foundries, machine shops, steam corn mills, and soda-water factories. It has an excellent trade, due chiefly to its central position in the midst of the lumber region, and is rapidly increasing in wealth and population. It was at this point that the troops of gen. Sherman, on Feb. 16, 1864, accomplished "the most complete destruction of railways ever beheld," accord-
ing to his own official report.

**MERIDIAN MEASUREMENT.** The determination of the form and size of the earth from the measurement of an arc of a meridian has been a favorite problem with mathematicians from the earliest times, but up to the middle of last century their opera-
tions were not carried on with exactness sufficient to render their conclusions of much value. Since that time, however, geodesy has so rapidly progressed, owing to the invention of more accurate instruments and the discovery of new methods, that the measure-
ment of the meridian can now be performed with the utmost accuracy imagin-
able. The modus operandi is as follows: Two stations, having nearly the same longi-
tude, are chosen; their latitude and longitude are accurately determined (the error of a second in latitude introduces a considerable error into the result), and the direction of the meridian to be measured ascertained; then a base line is measured with the greatest accuracy, as an error here generally becomes increased at every subsequent step; and then, by the method known as triangulation (q.v.), the length of the arc of the meridian
contained between the parallels of latitude of the two stations is ascertained. As the previously found latitudes of its two extremities give the number of degrees it contains, the average length of a degree of this arc can be at once determined; and also—on the supposition that the length of a degree is uniform—the length of the whole meridional circumference of the earth. This operation of meridian measurement has been performed at different times on a great many arcs lying between 68° n. lat. and 38° s. lat., and the results show a steady though irregular increase in the length of the degree of latitude as the latitude increases. On the supposition that this law of increase holds good to the poles, the length of every tenth degree of latitude in English feet is as in the following table:

<table>
<thead>
<tr>
<th>Degree of Latitude</th>
<th>Length of Degree in English Feet</th>
<th>Degree of Latitude</th>
<th>Length of Degree in English Feet</th>
</tr>
</thead>
<tbody>
<tr>
<td>0°</td>
<td>362,329</td>
<td>90°</td>
<td>764,000</td>
</tr>
<tr>
<td>10°</td>
<td>362,843</td>
<td>90°</td>
<td>764,544</td>
</tr>
<tr>
<td>20°</td>
<td>363,158</td>
<td>90°</td>
<td>765,597</td>
</tr>
<tr>
<td>30°</td>
<td>363,471</td>
<td>90°</td>
<td>766,532</td>
</tr>
<tr>
<td>40°</td>
<td>364,333</td>
<td>90°</td>
<td>766,091</td>
</tr>
</tbody>
</table>

This result shows that the earth is not spherical, as in that case the length of all degrees of latitude would be alike, but of a more or less spheroidal form—that is having its curvature becoming less and less as we go from the extremity of its greater or equatorial diameter to the lesser or polar axis. See Everett. It was by the measurement of a meridional arc that, in 1792-99, the length of a quadrant of the earth's circumference was determined, in order to form the basis of the French metric system (see Mètèrè).

**Merimeé, Prosper,** novelist, historian, and archaeologist, was born at Paris, Sept. 28, 1803. His father, Jean François Lenore, was a painter of distinction, and secretary to the école des Beaux Arts. The son entered the college of Charlemagne, kept terms as a law-student, and became early acquainted with English and Spanish literature. The influence of Shakespeare, Calderon, and Goethe was then making itself felt in France, and the romantic school, headed by Victor Hugo, was contending for the possession of the stage against the classic traditions of Racine. Merimeé, a devotee of the new sect, published under a double disguise his first work, *Le Théâtre de Clara Gusl*, a collection of studies for the stage, professing to be translated from the Spanish by a certain Joseph l'Estrange. This work raised great expectations, which were never realized. Merimeé did not become a dramatist, and one of these pieces failed when represented in 1850. His next publication, also pseudonymous, *La Guetza, by Hynuithe Miglanovič*, was an effort to embody the spirit of the popular lays of Illyria and Montenegro. It was written to meet the then prevailing rage for Slavonic poetry, and the materials were taken at second hand. It was, however, admired in Germany, and received the approval of Goethe. Merimeé now became a regular contributor to the *Revue de Paris* and the *Revue des Deux Mondes*; and after one or two more anonymous efforts signed his name to *Tamango*. After the revolution of July he entered public life, and before long was made inspector of historical monuments and museums. He visited many parts of France, publishing the results of his researches in a series of reports. During all this time he continued to write for his favorite reviews a series of romantic tales, in which terrible, almost repulsive, subjects are handled with wonderful realistic power, and in a style singularly clear, condensed, and vigorous. This series, in which the *Etruscan Vase* and the *Capture of the Redoubt* are especially noteworthy, culminated in *Colomba* (1841), written by him when fresh from Corsica and its tales of vengeance. After this, his greatest and (with the exception of *Arsène Quijot*, and *Carmen*) his last romance, Merimeé, applied himself to historical researches. The *Conspiracy of Catiline* and the *Social War*, studies of Roman history, preliminary to a life of Caesar, on which he is said to have been occupied many years, appeared in 1844. In this year he was elected to the chair in the academy vacated by the death of C. Nodier. His *History of Dom Pedro the Cruel* (1848), dedicated to the countess of Montijo, the mother of the empress Eugénie, has been translated into English (1850), and reviewed in the *Edinburgh*. After the fall of the Orleans' dynasty he was placed on the commission to draw up an inventory of the art treasures left by them in France. In 1848 he published *Péoïthe Demetrik*, an episode of early Russian history, the preface to which was written in prison, where he was sent for criticizing, in the *Rèvue des Deux Mondes* (1853), the sentence passed on his old acquaintance, M. Libri (q.v.), a sentence which he tried to get reversed in the senate June 11, 1861. Merimeé has also translated from Pushkin and Nicolas Gogol. Among his latest writings may be mentioned an introduction to Marino Vetro's *Poetry of Modern Greece* (1855), two brief articles in the *Revue des Deux Mondes* (1864); and *Lettres à une Inconnue* (1857; Eng. trans. 1874). Merimeé was made a senator in 1853; president of the commission for reorganizing the bibliothèque Impériale in 1858; commander of the legion of honor, April 12, 1860. He was also one of the ten *membres libres* of the académie des Inscriptions. He died Oct., 1870.
 Guests.

**Merino.** an important breed of sheep, originally Spanish, but now widely distributed throughout Europe, and constituting a great part of the wealth of Australia. The Merino has large limbs, and the male has large spiral horns, which do not rise above the head; the skin of the neck is loose and pendulous; the cheeks and forehead bear wool; the fleece is fine, long, soft, and twisted in silky spiral ringlets, abounding in oil, which attracts dust, so that it has generally a dingy appearance. The fleece is sometimes black, and black spots are apt to appear even in the most carefully bred flocks. The Merino sheep fattens slowly, and owes its value altogether to the excellence of its wool. It has not been found profitable in Britain, where the production of mutton is a great part of the object of the sheep-farmer.

**Merino.** See Woolen Manufacture.

**Meriones:** Merionididae, a genus of rodents of the family dipodidae, allied to the common jerboa *dipus pallasii* of Africa and south-western Asia. The best-known species is *meriones hussonicus*, or jumping mouse of North America (*dipus hussonicus* of Baird, Labrador, southward and westward to the Pacific). It is about 3 in. long to the tail, which is from 5 to 6 inches. Its color above is light brown, lined with black; belly white, sides yellowish gray, contrasting finely with the back and belly. It takes very long and rapid leaps, moving probably with greater rapidity when pursued than any other mammal of its size. See Rodentia.

**Merioneth,** a co. of Wales, is bounded on the w. by Cardigan bay, and on the n. by the counties of Caernarvon and Denbigh. Area, 385,919 acres; pop. *71, 46, 598.* The coast immediately south of the town of Harlech rises into cliffs, is skirted by sands, and fringed by three dangerous sandbanks at some distance out to sea. Merioneth is the most mountainous co. in Wales, although its peaks do not rise to the height of some of those in Caernarvonshire. The chain comprising the highest peaks runs from n.w. to s.e., and its summits are Arran Mowddwy (2,955 ft.) and Cader Idris (q.v.). The water is carried by the Dee, which flows n.e., and by the Mawddach and the Dovey, which reach the sea after a s.w. course. The soil of Merioneth is generally poor, and large tracts are unfit for profitable cultivation. Of the total acreage only 151,291 acres were under crop in 1876; and of this portion 113,698 acres were in permanent pasture. There were 376,986 sheep in the county. Slate and limestone are largely quarried; a little lead and copper is mined; and of late gold has been found in Merioneth. In 1866 there were obtained at castle Carndocian 529 oz. of gold, and at Vigra and Clogau 214 ounces.

Woolens and flannels are manufactured. Chief town, Dolgelley (q.v.).

**Merivale,** John Herman, an English scholar and translator, was b. at Exeter in 1779, studied at St. John's college, Cambridge, and was called to the bar in 1805. He contributed largely to Bland's *Collections from the Greek Anthology,* published in 1813, and brought out a second edition himself in 1833. From 1831 to his death in 1844 he held the office of commissioner of bankruptcy. Among his other literary performances may be mentioned *Poems Original and Translated* (1841), and *Minor Poems of Schiller* (1844). Merivale, the Rev. Charles, son of the preceding, was b. in 1800, studied at St. John's college, Cambridge, where he took his degree in 1830, and was successively scholar, fellow, and tutor. He has acquired a great reputation as an author by his *Fall of the Roman Republic* (1853), *History of the Romans under the Empire,* 8 vols. (1859–65), and Boyle lectures (1864–65), etc. Merivale was installed dean of Ely in 1869. Another son, Herman, born in 1805, was appointed prof. of political economy at Oxford in 1837, and permanent under-secretary of state for India in 1859. In the same year he was made c.b. He also wrote on colonization. He died on Feb. 8, 1874.

**Meriwether,** a co. in w. central Georgia; bounded w. by the Flint river, and is drained by many tributary creeks; 550 sq.m.; pop. '80, 17,651–9,836 colored. The surface is hilly and varied. The staples are cotton, Indian corn, and grass; of cotton there are produced not far from 10,000 bales yearly. There are many mineral springs in the co., of which the largest is at Warm springs on Pine rock, 40 m. n.e. of Columbus; it discharges 1400 gallons a minute; the water has a temperature of 90° Fahr., and contains magnesia, carbonic acid, etc. Chief town, Greenville.

**Meriwether, David,** 1755–1825; h. Va.; a soldier at the siege of Savannah 1778–79, in which he was taken prisoner by the British. In 1785 he removed to Georgia and filled several offices in the gift of the state, representing his district in the legislature, and was member of congress 1802–07 as representative from Georgia. He was an earnest supporter of president Jefferson, whose policy he cordially indorsed, and was appointed by him Indian commissioner to adjust the claims of the tribe of Creek Indians in Florida. In 1817 he was chosen presidential elector, and the same year was on the commission with gen. Andrew Jackson and gov. McMinn of Tennessee, to treat with the Cherokee Indians of Georgia, which was concluded July 8, 1817, by which an extensive tract of land, w. of the Appalachee river, was added to the territory of the United States, opening the cotton-growing region of Georgia, now thickly populated, intersected by railroads, and furnishing granite, iron ore, and gold to the mineral wealth of the country. In 1821 he was again chosen presidential elector.

**Merle.** See Blackbird, ante.
MERLE D'AUBIGNE, Jean Henri, a popular ecclesiastical historian, was b. at Eaubives, near Geneva in Switzerland, Aug. 16, 1794, studied there and at Berlin—under Neander—and subsequently became pastor of the French Protestant church in Hamburg. Thence, after a residence of five years, he proceeded to Brussels, became chaplain of King William, who, after the revolution of 1830, invited him to Holland, as tutor to the prince of Orange. Merle, however, declined the offer, and returning to Geneva took part in the institution of a new college for the propagation of orthodox theology, in which he was appointed professor of church history. With the exception of some visits to England and Scotland, where he had numerous readers and admirers, he remained constantly at Geneva. The work which has given him so wide-spread a reputation is his Histoire de la Réformation au Sixième Siècle (1855 et seq.). It is written with the utmost vivacity, and is sometimes eloquent. Its popularity has been immense. Among Merle d'Aubigné's other writings are—Le Luthéranisme et la Réforme (Par. 1844); Germany, England, and Scotland (1845); Le Protecteur, ou la République d'Angleterre aux Jours de Cromwell (1845); Trois Siècles de Lutte en Ecosse (1850); Caractère du Réformateur et de la Réformation de Gênes, and Histoire de la Réformation en Europe au Temps de Calvin (1892-77). He died at Geneva Oct. 20, 1872.

MERLIN, Falco subarcticus or Hypothrombophlebus subarcticus, the smallest of the British falcons, scarcely exceeding a blackbird in size, but very bold and powerful, and possessing all the characters of the true falcons, with the distinction of large hexagonal scales on the front of the tarsi. It is of a bluish ash color above; reddish yellow on the breast and belly; with longitudinal dark spots, the throat of the adult male white. The wings reach to two-thirds of the length of the tail. It builds a nest on the ground, and is fond of localities where large stones are plentiful, on which it is often to be seen perched, and is therefore often called the stone falcon. It is common in most parts of Europe, is found in Asia and North America, and extends southwards in Africa, even to the cape of Good Hope. It was of great repute in the days of falconry, being very easily trained, and flying readily at its quarry. It was therefore often used for taking partridges and wood-pigeons. It is a very lively bird, and often utters a harsh scream. It usually flies low and very rapidly, threading its way, if necessary, through branches and leaves, but it will also follow its prey in mounting upwards to a great height.

MERLIN, the name of an ancient Welsh prophet and enchanter, who is believed to have flourished during the decline of the native British power in its contest with the Saxon invaders. Both the Cambrian and the Strathclyde Britons boasted of a Merlin who was, in all probability, the same personage decked out in different legendary guise.—The Cambrian Merlin called Merlin Emrys or Ambrosius, is said by Geoffr'y of Monmouth, in his Historia Brittonum, to have lived in the 5th c., to have sprung from the intercourse of a demon with a Welsh princess, and to have displayed the possession of miraculous powers from infancy. He is alleged to have been the adviser of King Vortigern, and subsequently of Ambrosius, Uterpendragon, and the great King Arthur. He is often alluded to by our older poets, especially Spenser, in his Fairy Queen, and also figures in Tennyson's Idyls of the King. He has been made the subject of a metrical romance, of which there is a manuscript copy in the advocates' library in Edinburgh. (For an analysis of this romance, see Ellis's Specimens of Early English Metrical Romances.) A collection of prophecies attributed to him appeared in French (Paris, 1495), in English (Lond. 1529 and 1533), and in Latin (Venice, 1554); and their existence is traceable at least as far back as the time of the poet Lawrence (circa 1360).—The Strathclyde, or— if we may be allowed an expression which anticipates history—the Scottish Merlin, called Merlin the Wynt, or Merlin Caledonius, is placed in the 6th c., and appears as a contemporary of St. Kentigern, bishop of Glasgow. His grave is still shown at Drumelzier on the Tweed, where, in attempting to escape across the river from a band of hostile rustics, he was impaled on a hidden stake. A metrical life of him, extending to more than 1500 lines, professedly based on Armoric materials, and incorrectly ascribed to Geoffrey of Monmouth, was published by the Roxburgh club in 1830. His prophecies—published at Edinburgh in 1615—contain those ascribed to the Welsh Merlin.

MERLON, in fortification, is the portion of the parapet between two embrasures. Its length is usually from 15 to 18 feet.

MERLUCIUS, a genus of fishes belonging to the cod family. See Hake, ante. The American hake (M. abdus of DeKay), called whiting in New England, and also silver hake, is from one to two feet long, the upper part of the body rusty brown, with golden hues, by reflection, while alive. It is silvery white in the belly, and the iris has a silvery appearance. Lower jaw longer than upper; teeth long and sharp. It is abundant in British America, and as far south as New Jersey. It is very voracious, and devours many of the smaller fishes. Another American hake belongs to the genus Physus (q. v.).

MERMAID (i.e., sea-maid), an imaginary inhabitant of the sea. The upper parts of mermaids are represented as resembling those of a human being, generally of a female—although the merman is also sometimes heard of—whilst the body terminates in a tail like that of a fish. There is an evident affinity between the stories concerning mermaids and those concerning the sirens and tritons, perhaps also the nereids, of the ancients. The probability is that these stories have originated in the appearance of seals, wal-
ruses, and perhaps still more of the herbivorous cetacea, in regions where they are rare, or to persons unaccustomed to see them. "Large allowances must be made for the workings of an excited imagination, in situations of solitude and apprehension, on the unexpected appearance of an extraordinary and unknown object." Many of the stories concerning mermaids belong to the northern parts of the world, where the herbivorous cetacea are of rare occurrence, and perhaps some of the solitary seals have often given occasion to them. But the herbivorous cetaceans do occasionally wander into the British and probably even into more northern seas. Sir James Emerson Tennent says concerning the dugong (q.v.): "The rude approach to the human outline, observed in the shape of the head of this creature, and the attitude of the mother while suckling her young, holding it to her breast with one flipper, while swimming with the other, holding the heads of both above water; and when disturbed, suddenly diving and displaying her fish-like tail—these, together with her habitual demonstrations of strong maternal affection, probably gave rise to the fable of the mermaid; and thus that earliest invention of mythical physiology may be traced to the Arab seamen and the Greeks, who had watched the movements of the dugong in the waters of Manna." It is right, however, that we should bear in mind the possibility of the existence of the cetacea not yet known to naturalists.—The mermaid is a not unfrequent heraldic bearing. In the heraldry of France, she is called a siren, and in Germany she is occasionally furnished with two fishy tails.

**Mermaid's Glove**, Halichondria palmata, a sponge pretty common in the British seas, and the largest of British sponges. It grows in deep water, and is sometimes two feet in height. It receives its name from the somewhat finger-like arrangement of its branches. It is not slimy, and has a very porous surface; rough, with myriads of minute fragilespicula. Its color is yellowish.

**Merodach**, or **Bel Merodach**, the name of a Babylonian god, as is evident from its occurring in Jer. i. 2 in connection with idols. It is supposed to be the name of a planet, either Mars or Jupiter. It is supposed to be derived from the Persian and the Indo-Germanic mord or mord, which means death, and the affix och found in many Assyrian names, as Nisroch, etc. Merodach was identical with the famous Babylonian Bel or Belus, the word being first probably a mere epithet of the god, and by degrees superseding the proper name. But the names were sometimes distinguished. The golden image in the temple of Babylon seems to have been worshipped as Bel rather than Merodach, while other idols may have represented him as Merodach. The temple described by Herodotus as the temple of Belus is, in the inscriptions, the temple of Merodach. But we do not know what the distinction was between the two names. It is not clear what the aspect of the god was when worshipped. Bel Merodach is represented as the "old man of the gods," the "judge," and Nebuchadnezzar calls him the great lord, the "most ancient," and Neriglissur the "first-born of the gods," "the layer up of treasures." He is regarded as the source of all power, and thus concentrates in his own person the greater part of that homage which had previously been divided among the various gods of the Pantheon. The Babylonian kings were often named after him, as Merodach Baladan, Evil Merodach, etc.

**Mérode**, Fransçois Xavier Marie Frédéric Ghislain De, 1820–74; b. Brussels; a grand-nephew of Lafayette. His father, count Félix de Mérode, had been offered and refused the Roman Catholic cardinalature for the throne of Belgium. His son at first entered the clergy and took part in the Algerian campaign. In 1848 he began the study of theology at Rome, where he was ordained to the priesthood in 1850. Pius IX. at once made him his chamberlain, and canon of St. Peter's. In 1860 he was appointed temporary minister of armies, and recruited, chiefly from foreigners, a pontifical army. In 1865 he went out of office in consequence of a dispute with cardinal Antonelli. The next year he was made archbishop of Melitene, and papal almoner. In 1869, at the instance as is supposed of his brother, count Montalembert, he resisted the declaration of the doctrine of papal infallibility; but he acquiesced in the final enactment of it by the ecumenical council. He gave liberally for the foundation of charitable and educational institutions, and the improvement of public grounds and streets in Rome.

**Meröë.** See Ethiopia.

**Merom**, or Huleh, Lake, generally regarded as the waters of Merom, where the assembled forces of the confederate kings of Canaan were defeated by Joshua, is at the n. end of the Jordan valley, where it forms the central part of a low plain, 16 m. long and 7 wide, and surrounded with hills of various heights. The lake itself is triangular at the base, of which towards the north the upper Jordan enters and from its apex flows out again towards the s. on its steep descent to the sea of Galilee. The falling rains and melting snows periodically increase its size, but its average length is about 44 m. and its width 34. It is surrounded with marshy ground covered with a dense jungle of canes, the home of wild swine and ill-looking buffaloes that are often seen wallowing in the mud or standing almost immersed in the water. The lake is shallow and is covered for acres with yellow and white water lilies and with the true Egyptian papyrus. Hifilus is one of its ancient names, which Josephus employs for the region under the form Ulatha, while he calls the lake itself Semechonitis. The district as well as the lake is still called

U. K. IX.—46
Hülch, is very fertile, but inhabited only by a few Arabs who dwell in tents. There is not a village or a house in any part of it.

**MEROPIDE.** See BEE-EATER.

**MEROPIS.** See Cos, ante.

**MEROSTOMATA** (Gr. meron, thigh; stoma, mouth), an order of crustaceans comprising two sub-orders, eurypterida (Gr. eurus, broad; pteron, wing) and xiphosura (Gr. xiphos, sword; ura, tail), the latter including the only living representative, the king-crab, or horse-shoe crab. The first of these sub-orders is extinct, and their fossils are exclusively paleozoic, all the members being confined to the Silurian, Devonian, and carboniferous formations. The sub-order eurypterida is described by Henry Woodward as composed of "crustaceans with numerous free thoraco-abdominal segments, the first and second of which bear one or more broad lamellar appendages upon their ventral surface, the remaining segments being devoid of appendages; anterior rings united into a carapace bearing a pair of larval eyes near the center, and a pair of large, marginal, or sub-central eyes; the mouth furnished with a broad post-oral plate or metastoma, and five pairs of movable appendages anterior of which form great swimming-feet; the telson, or terminal segment, extremely variable in form; the integument characteristically sculptured." Some of the members of this sub-order were of gigantic dimensions, as *plerygotus angleus*, measuring 6 ft. or more in length. The berry-like bodies found in the old red sandstone of Scotland, and described under the name of *parka decepiens*, are regarded as the eggs of large crustaceans of the eurypterid group. The second sub-order, xiphosura, are characterized by Woodward as follows: "Crustacea having the anterior segments welded together to form a broad, convex buckler, upon the dorsal surface of which are placed the compound eyes and ocelli; the former sub-centrally, the latter in the center in front. The mouth is furnished with a small labrum, a rudimentary metastoma, and six pairs of appendages. Posterior segments of the body are more or less free, and bearing upon their ventral surfaces a series of broad lamellar appendages; the telson, or terminal segment, ensiform." The only living members of this sub-order are the *limuli*, commonly known as king-crabs, horse-shoe crabs. They inhabit the Indian and Japanese seas, the Antilles, and the coasts of North America. The xiphosura commenced their existence in the upper Silurian formation, where they are represented by the *neolimulus falcatus* of Henry Woodward. In this genus the head-shield has a resemblance to that of the king crab, and there are traces of a divisional line crossing the head, and apparently corresponding with the facial suture of the trilobites (q.v.). Compound eyes and ocelli seem to be present, and there are six free thoracic, and probably three free abdominal segments, of which only two have been preserved. No members of the sub-order have been found in the Devonian formation, but several types occur in the carboniferous, the most important member being *peteichia rotundifolia* of the coal measures of Europe, and the genus *eurypros* of the North American coal measures, very similar to each other, the latter, however, having eyes situated on the anterior edge of the cephalic buckler. Limuloid crustaceans are also found in the permian and triassic formations, as well as in the upper Jurassic, the cretaceous, and tertiary. See INVERTEBRATA.

**MEROVINGIANS**, the first dynasty of Frankish kings in Gaul. The name is derived from Merwig or Merovaens, who ruled about the middle of the 5th c., having united a few tribes under his sway. His grandson, Chlodwig or Clovis (q.v.), greatly extended his dominions, and on his death divided his kingdom among his four sons, one of whom, Childeric, ruled over the eastern part of the kingdom until his death, when the kingdom was again divided into four parts—Aquitaine, Burgundy, Neustria, and Austrasia. His grandson, Clotaire II., again united them in 613; but after his death, in 628, two kingdoms, Neustria and Austrasia, were formed, in both of which the Merovingian kings retained a merely nominal power, the real power having passed into the hands of the mayors of the palace. The dynasty of the Merovingians terminated with the deposition of Childeric IV., in 752, and gave place to that of the Carolingians (q.v.), sprung from the Austrasian mayor of the palace. The chief authority for the earlier parts of the history of the Merovingians is Gregory of Tours. See also Thierry's *Recits Merovingiens* (Par. 1839), and Pertz, *Geschichte der Meroving. Hausmeier* (Leip. 1819).

**MERRICK**, a co. in s. central Nebraska; drained by Prairie creek, Loup fork, and Platte river, the latter forming its s.e. boundary; 650 sq. m.; pop., '80, 5541, showing nearly a tenfold increase from that of '70, 537. The Union Pacific railroad traverses the s.e. part of the county. The surface is rolling prairie, well wooded, and very fertile. Wheat and the other cereals are raised in large quantities. Chief town, Central City.

**MERRICK, JAMES LYMAN, 1813-66; b. Monson, Mass.; graduated at Amherst college in 1830, and at the theological seminary at Columbia, S. C., in 1833; ordained as a missionary to Persia in 1834; embarked for Constantinople in 1834, and arrived in 1835 at Tabriz, Persia. Having traveled and labored among the Mohammedans for two years, he joined the Nestorian mission at Oromiah. Returning to America in 1845 he was installed pastor of the Congregational church at Amherst, where he lived until his death. He was a faithful missionary and pastor. He had not only a thorough knowledge of Persian, but was well versed in Arabic, Hebrew, Turkish, Greek, Latin, and
French. He was much interested in the Persian language and literature, and bequeathed his property for the forming of four Persian scholarships in Amherst college and Columbia seminary. He published the Pilgrim's Hymn, a volume of poems; The Life and Religion of Mahommed, translated from the Persian; Keith's Residence of Protestant Missionaries, translated into Persian; A Full Work on Astronomy, left in MS, and translated into Persian; A Friendly Treatise on the Christian Religion; A Treatise on the Orthography and Grammar of the English Language.

MERRILL, Stephen M., D.D., b. Ohio, 1825; became a traveling preacher in the Ohio conference, 1846; was chosen editor of the Western Christian Advocate, 1865; and elected one of the bishops of the Methodist Episcopal church, 1872. His residence is at Chicago.

MERRILL, William E., b. Wis., 1857; appointed brevet 3d lieut. of engineers in 1839, having graduated first in his class at the West Point military academy; promoted to 1st lieut. in 1861, capt. in 1863, and maj. in 1867. His father, capt. M. E. Merrill, was killed in the Mexican war, where he served in the 5th U.S. infantry, under gen. Winfield Scott, falling at the head of his command in the attack on the fortress of Molino del Rey, which guarded the field of Chapultepec, Sept. 8, 1847. During the war of the rebellion William E. was appointed assistant engineer in Vir- ginia and Ohio, and afterward chief engineer of the army of the Cumberland under gen. Rosecrans. He was present at the battles of Chickamauga, Sept. 19, 20, 1863, when the union forces under gen. Rosecrans suffered defeat by gen. Bragg, and at Missionary Ridge on Nov. 24, 1863, when the same army under gen. Grant defeated gen. Bragg. Subsequently, he went with the federal force under gen. Sherman to reinforce gen. Burnside, intrenched at Knoxville; the movement resulting in the raising of the siege and the defeat of Longstreet. In 1864 he raised a regiment of volunteer veteran engineers, and being commissioned col., he served with them in the departments of Tennessee, Alabama, and Georgia, in raising fortifications at unprotected points. At the close of the war he was given a commission on the staff of the lieut.gen. of the army, and engaged in improving the communications of the west, river navigation, surveys, and building roads and bridges. In 1870 he published Iron Truss Bridges for Railroads.

MERRIMACK, a river of New England, U.S., rising in New Hampshire, and falling into the Atlantic ocean at Newburyport, after a course of about 120 miles. It receives several small tributaries, and has numerous falls, affording immense water-power, on the principal of which are the manufacturing towns of Nashua and Manchester, in New Hampshire, and Lowell and Lawrence, in Massachusetts. Navigable 15 m. to Haverhill.

MERRIMACK, a c.o. in s. New Hampshire, drained by the Merrimac river intersecting it centrally, and furnishing extensive water power; 600 sq.m.; pop., '80, 46,211. It is also drained by the Contoocook, Warner, and Black rivers in the w., and Suncook river, with other branches of the Merrimac, and has numerous lakes on the east. Its surface is rough and hilly. It is well timbered, many forests of maple, pine, and oak growing along the rivers, and on the hill tops. The Winnipesaukee river forms part of its n. boundary, flowing s.w. from Great Bay. It contains Kearsage mountain, 2,943 ft. above the level of the sea, 10 m. w. of lake Sunapee, which for 9 m. forms part of its n.w. boundary, the Little Sunapee lake lying a little to the north. It is traversed by the Concord railroad in the e., the Concord and Claremont railroad, and Contoocook branch, the Northern (N.H.), and the Suncook Valley railroad. Its soil is fertile, producing large quantities of fruit, all kinds of grain, wool, Irish potatoes, and dairy products. Much live stock is raised. It has quarries of the finest granite which is extensively exported. Among its manufactures are cotton goods, woolen goods, silver ware, wooden ware, iron castings, leather, carriages, lumber, and paper, machinery, bricks, furniture, leather belting, organs, etc. In the n.e. section is Shaker village, containing a Shaker church, the inhabitants being engaged in the manufacture of hosiery, corn brooms, and weaving machines. Seat of justice, Concord.

MERRITT, Timothy, 1775-1845; b. Conn.; entered the ministry of the Methodist Episcopal church in 1796, and for 34 years was pastor successively in Boston, Lynn, Providence, Springfield, New Bedford, etc. While preaching at Malden he edited Zion's Herald in Boston, and in 1832-36 was assistant editor of the Christian Advocate and Journal in New York. He was a thorough scholar, an able writer, an eloquent preacher, an accomplished debater. He published The Christian's Manual; The Convert's Guide and Preacher's Assistant; Validity and Sufficiency of Infant Baptism, and in connection with the Rev. Wilbur Fisk, Lectures and Discourses on Universal Salvation; also many controversial pamphlets and sermons.

MERRITT, Wesley, b. New York, 1886; after graduating from the U.S. military academy at West Point, class of 1890, was commissioned brevet 2d lieut. of dragoons and in 1892 capt. 3d U.S. cavalry. He was on the staff of the cavalry gen. Stoneman when he made the raid on Richmond in April, 1863, and 2 months after was promoted to vol- unteer brig. gen. For bravery at Gettysburg, where he commanded the reserve cavalry brigade, he was brevetted maj. July, 1863. From 1863 to 1864 he commanded a cavalry division in central Virginia. He commanded a cavalry brigade under gen. Sheridan in
the Richmond campaign of 1864 and did good work at the battle of Yellow Tavern, for which he was brevetted lieut. col. May 11, 1864, and col. for the battle of Hawes's Shop, May 28, 1864. He was present at the battles of Opequan, Cedar Creek, and Fisher's Hill; and commanded a division under gen. Sheridan through the Shenandoah campaign, for which service he was brevetted maj. gen. of volunteers. He distinguished himself at Five Forks, Sailor's Creek, and at the final surrender, and was promoted to maj. gen., his commission dating from Five Forks. On July 28, 1866, he was commissioned lieut. col. of the 9th U. S. cavalry, having some months previous been mustered out of the volunteer service.

MERRY, Robert, 1755-98; b. in London; took a degree at Christ's college, Cambridge, and began the study of law, but was never called to the bar. Having purchased a commission in the army he was for some years a lieutenant, in the horse-guards. After leaving the service, Merry traveled extensively throughout Europe; and in Florence was admitted a member of the noted Della Cruscan academy. After his return to England he published many poems under the signature of Della Crusca. His ambition was to form a new school and his style is similar to that of Mrs. Piozzi and Bertie Greathead. His audacity was much greater than his genius; and the whole school of his imitators was satirized by sir Wm. Gifford of the Quarterly Review in his Meridian and Bardian. In 1791 Merry married an actress, Miss Brunton, and 5 years later emigrated to the United States, and died very suddenly in Baltimore. His principal writings were: Lorenzo; Pendel; and Ambitious Vengeance,—all dramas; and he left many fugitive poems.

MERSEY, an important river of England, separates, in its lower course, the counties of Cheshire and Lancashire, and has its origin in the junction of the Thane and Goyt, on the borders of Derbyshire, e. of Stockport. It flows in a w. s. w. direction, and is joined on the right by the Irwell from Manchester, at which point it becomes navigable for large vessels. Besides the Irwell, the chief affluents are the Bollin and the Weaver from Cheshire. At its junction with the Weaver the Mersey expands into a wide estuary, which forms the Liverpool channel. The estuary is about 10 m. long, and from 1 to 3 m. broad; opposite Liverpool it is a mile and a quarter in width, with a considerable depth at low water. It is much obstructed by sandbanks; but the excellent system of pilotage in practice here renders the navigation comparatively secure. Congers, shrimps, flounders, and sparlings abound in the river and estuary. Entire length with the estuary, nearly 70 miles.

MERTHYR-TYWIDIL is a market t. of South Wales, with a pop., in '71, of 51,949 within the parish, which has a local board of health. The parliamentary borough embraces Aberdare and two other outlying districts; pop. 97,030. It is on the northern border of the county of Glamorgan, abutting upon the county of Brecknock, and surrounded by lofty hills. It is built upon the river Taff, 500 ft. above sea-level, 24 m. from its mouth and port at Cardiff; and it includes the junctions of the greater and lesser Taff, the Morlais, and the Dowhais, streams which there unite to constitute the main river. Merthyr-Tydwil is the seat of the iron trade of Glamorgan, as represented by the great works of Dowhais, Cyfarthfa, and Plymouth, and in a less degree by that of Penydarren. It also contains large collieries, and is celebrated, with Aberdare, for the excellence of its steam coal. The annual make of finished iron in this place, chiefly in the shape of rails, merchant-bars, girders, and ship-plates, may be stated roughly at 100,000 tons. The exports of coal are considerable, and are increasing, but the chief consumption is within the works. The population are all directly dependent upon the works, there being no other trade or manufacture. Railways branch from Merthyr-Tydwil to Brecon, to Swansea, to Cardiff and Penarth, and to Newport and Hereford. The borough was created by the first reform act, and now returns two members. Its chief town-officer is the headborough of the lordship, called the "high constable," and its government is vested in a local board. Dowhais contains some fine public buildings, but Merthyr-Tydwil is deficient in this respect. Though a busy, it is not a striking place, having risen very rapidly with the local trade, and having attained nearly its present dimensions before it was under any but the ordinary parochial government. There are, however, symptoms of improvement. It is well supplied with water, and the infantile mortality, long extraordinary, is now reduced. The people, chiefly Welsh, are industrious, and, on the whole, very orderly. There are 17 established churches, and 113 dissenting chapels in the borough.
MERTON, WALTER DE, d. 1277; b. England; educated in the convent at Merton, in Surrey, and ordained to the priesthood. Henry III. raised him to the lord chancellorship in 1259, from which office he was deposed by the barons under Simon de Montfort in 1263. He returned to that office in 1265, was removed in 1269, and reappointed in 1272. He resigned two years later, when he was appointed to the see of Rochester. He founded at Basingstoke a hospital for superannuated clergymen and travelers in distress; but he is best known by his foundation of Merton college, Oxford, which was completed in 1274. This was a purely secular and literary institution, and became the model of the subsequent Oxford foundations.

MERTON COLLEGE, OXFORD. The house of the scholars of Merton, commonly called M.C., the model of all the secular colleges, was first founded in Maldon in Surrey by Walter de Merton, bishop of Rochester, and lord high chancellor, in 1264, for the maintenance of 20 scholars in the schools of Oxford, and of a warden and three or four ministers of the altar, who were to manage the property. Before 1274 he transferred his warden and ministers to Oxford—thereby not only founding his own college, but contributing in no small degree to fix the university in its present locality. The fellows were to be as many as the means of the house could maintain, and after some changes, this number was fixed by archbishop Laud at 24. They were to be elected first and chiefly from the founder's kin; but this was from an early period evaded, and the commissioners of 1582 speak of a "common belief in the university that the elections to fellowships at Merton were for the most part determined by personal interest." In 1580 Dr. Wylliot, chancellor of Exeter, endowed twelve portuindia, or postmasterships, now called, equivalent to the scholars of other colleges; and in 1604 John Chamber, fellow of Eton, endowed two more—restricted, however, to foundationers from Eton. The ordinances under 17 and 18 Vict. c. 81, considerable changes were made—six fellowships were suspended, of which two were assigned to increase the postmasterships, etc., and four to the endowment of the Lincacre professorship of physiology, of value £800 per annum. The remaining 18 were thrown open, and not to exceed £250 per annum, exclusive of rooms, until the original number of 24 was restored. The number now being completed, they have reached their limiting value of £300. Sixteen postmasterships, and four scholarships (founded by Henry Jackson in 1753), each of the value of £80 a year, are open without restriction, and tenable for 20 terms from election; but the two postmasterships on the foundation of John Chamber are only to be thrown open on the death of a fellow of Eton being found duly qualified. This college possesses 18 benefices, to some of which, however, certain other patrons present in turn.

MERU, in Hindu mythology, a fabulous mountain in the center of the world, 80,000 leagues high. It is the most sacred of all mythical mountains, the abode of Vishnu, and endowed with all imaginable charms.

MERULIDE, or TURDIDE, a family of birds of the order Insessores, sub-order Dendroica, and of navel and compressed bills, which are pointed and notched, but not strongly. They are regarded by many naturalists as intermediate between the Laniidae (Shrikes, etc.) and the Sylviidae (Warblers, etc.). The species are very numerous and are arranged in many genera. They are ever widely distributed over the globe, some of them being found in cold and some in warm climates. Some are migratory, a few species are gregarious at all seasons, many are gregarious only in winter. They generally build their nests in trees. They feed chiefly on soft animal and vegetable substances, as berries, insects, and worms. Many of them are birds of very sweet song; some are remarkable for their imitative powers. To this family belong thrushes (among which are reckoned the blackbird, redwing, fieldfare, ring-ouzel, etc.), orioles, mocking-birds, dippers, etc.

MÉRY, JOSEPH, 1798-1866; b. France, educated at a seminary and subsequently studied law, but early developed a passion for atheistical lore, and was expelled from the seminary on that account. While reading law he had an unfortunate affair, ending in a duel, which resulted in his dismissal from the school, but not in dulling his keen sense of honor, for he was soon after one of the principals in a duel in Paris in which he was severely wounded. Subsequently he lived a dissipated life in Italy, and was ultimately obliged to leave the country. In 1821 he attacked the abbé Elichean in a pamphlet, and was placed under arrest, but not imprisoned by this seclusion he soon found himself again in danger for transgressing the laws regulating the press. The following year he went to Constantinople and returned after a short sojourn (not being on good terms with the French ambassador at that port), to edit a newspaper at Marseilles, and in 1824, found himself once more in Paris, associated with Auguste Marseille Barthélémy the satirist, and together they published La Villelédie, an attack on the ministry of Villelédie. With him he was associated in writing verses dedicated to the Bonaparte family, and satirical verses on other administrations, and published poems, romances, and dramas in rapid succession. In 1828, they published Napoleon en Égypte, a lyrical poem, sending presentation copies to each member of the Bonaparte family. Among his most attractive works, some of which have been translated into English, are Nuits anglaises, first issued as Nuits de Londres; Histoire de l'Egypte; Les confessions de Marion Delorme; Nuits d'Orient; Un carnaval de Paris; and Poésies latines, late edition 1864. He published, 1861, Théâtre de salon, and wrote the libretto for Semiramis and other operas.
MESAGNA, a t. of the province of Lecce, in southern Italy, situated amidst scenery of oriental beauty, 27 m. n.w. of Lecce, and surrounded by strong walls. The district around is fruitful, and yields delicious oil, which forms an important article of the trade of Mesagna. Pop. 8,500.

MESCALA, a river of Mexico, which takes its rise in the s.e. part of the country, not far from Puebla. Its general course is westerly and southerly; and it is about 400 m. in length, emptying into the Pacific at the port of Zacatula. It is known in the first part of its course as the Atoyac, then as the Rio Pablano, and, where it serves as the boundary line between Guerrero and Michoacan, as the Rio de las Balsas; and near the city Zacatula is known by that name. The current of the stream is exceedingly swift and the river consequently not navigable. It has been thought by the natives that the water contains poisonous mineral ingredients, and to this is ascribed the prevalence of a loathsome skin disease among the Tujandans living on its banks. Gold is found on its banks and especially near the mouth.

MESEMBRYACEAE, or FICOIDACEAE, a natural order of exogenous plants, both herbaceous and shrubby, but all succulent. As defined by some botanists, it includes the orders tetragoniaceae, senecionaceae, etc., of others. Of the more restricted mesembryaceae about 400 species are known, a few of which are natives of the south of Europe, but none are British; the greater number belong to South Africa and the South Sea islands. The ice plant (q.v.) belongs to this order. The leaves of some species, when burned, yield soda in great abundance. Large quantities of barilla are made from them in the Canary islands, in Spain, and in Egypt. The seeds of some, as mesembryanthemum crystallinum (the ice plant) and M. genieviiflorum, are ground into flour to make bread. M. genieviiflorum is used as a pot-herb in Africa. The fruit of M. edule (Hottentot's fig) is eaten in South Africa, and that of M. aquilarate (pig's-faces) in Australia. M. emarcedum is called koy by the Hottentots, who beat and twist up the whole plant, allow it to ferment, and chew it like tobacco. When newly fermented it is narcotic and intoxicating. Some species of mesembryanthemum are now common annuals in flower gardens in Britain.

MESENTERY.—MESENTERIC DISEASE. The mesentery derives its name from being connected to the middle portion (Gr. meson) of the small intestine (enteron). It is a broad fold of peritoneum (the great serous membrane of the abdomen), surrounding the jejunum and the ileum, and attached posteriorly to the vertebral column. Its broad border or intestinal border is about 4 in.; its attachment to the vertebral column is about 6 in. in length, and its intestinal border extends from the duodenum to the end of the small intestine. It serves to retain the small intestines in their place, while it at the same time allows the necessary amount of movement, and it contains between its layers the mesenteric vessels, the lacteal vessels, and mesenteric glands. These glands are 100 to 150 in number, and are about the size of an almond. They exert an organizing action on the contents of the lacteals, the chyle being more abundant in fibrine and in corpuscles after it has passed through them. Hence it is obvious that disease of these glands must always seriously affect the process of assimilation. The most important affection of these organs is their scrofulous or tubercular degeneration, which gives rise to the disease known as tubes mesenterica, a disease most common in childhood, but confined to no period of life. In the great majority of cases it is associated with, and often marked by, other results of the tubercular or scrofulous diathesis, such as pulmonary consumption, tubercular peritonitis, scrofulous disease of the spine, rickets, etc.; but sometimes the mesenteric glands seem almost exclusively affected, in which case the disease becomes sufficiently distinct to allow of easy detection. The leading symptoms are acceleration of the pulse, occasional fever, especially towards evening, loss of color and flesh, derangement of the digestive organs (constipation or diarrhoea, and occasional vomiting), a steady pain in the region of the navel, increased by pressure; but perhaps the most characteristic symptom is tumefaction and hardness of the abdomen, with general emaciation. The enlarged glands can sometimes be detected by a careful examination with the hand, especially in advanced cases. The progress of the disease is generally slow, but at length hectic fever sets in, the emaciation becomes extreme, dropical effusion appears, and the patient dies exhausted, if not cut off by the access of some acute inflammation.

The treatment mainly consists in the administration of cod-liver oil, or, if the stomach is too irritable to bear that medicine, of iodide of potassium, combined with some bitter infusion, the bowels being at the same time carefully attended to. The application of stimulating liniments, or of iodine ointment, to the abdomen is often of great service. When the disease has advanced to a certain extent, remedies are of little use, except to palliate some of the more urgent symptoms.

Independent of the disease that has just been noticed, inflammation of these glands is by no means uncommon when the mucous membrane of the small intestine is ulcerated, as, for example, in typhoid or enteric fever.

ME'SHIA, king of Moab in the reigns of Ahab and his sons Ahaziah and Jehoram, kings of Israel, and tributary to the first. He seized the opportunity afforded by the confusion which followed Ahab's death, and the feeble reign of Ahaziah, to shake off the yoke of Israel, and free himself from the heavy tribute imposed upon him. Jehoram,
Mesagna.
Mesmerism.

on succeeding to the throne of Israel, secured the aid of Jehoshaphat, king of Judah, his father's ally, to reduce the Moabites to their former condition of tributaries. The united armies of the two kings were joined by the forces of the king of Edom. The Moabites were defeated. The king took refuge in his last stronghold, and having in vain attempted to force his way through the besieging army, be, in the madness of despair, withdrew to the wall of the city, and in the sight of the allied host offered up his first-born son and successor as a propitiatory sacrifice to Chemosh, the cruel fire-god of the Moabites. The bloody deed had the desired effect of causing the besiegers to retire to their own land. On withdrawing, however, they ravaged the country, and carried off much spoil. The Moabite stone (q.v.) is a memorial of this king.

MESHID, an important city of Persia, capital of the province of Khorassan, in a fertile and well-cultivated plain, on the Tejend, in lat. 36° 17' n., long. 59° 40' east. It is by far the most important town of the n.e. of Persia, being the center of numerous converging routes. The city presents a surprising and beautiful view from a distance. Above the walls, which are of vast circuit, shine the gilded dome of one of the most splendid mosques of the east, the beautiful minarets of the tomb of Imaum Riza, a follower of Ali, and the summits of other sacred buildings. Meshid, as the chief seat of the great sect of the Shiites, is of nearly equal importance with Mecca, the sacred city of the orthodox Mohammedans, and hence it abounds in "holy" men, arrayed in green turbans and sashes, who insteal the pilgrims visiting the city. The town carries on manufactures of woolen goods and of metal-wares, especially sword-blades, gold-work, and articles of jewelry. It is a famous place of pilgrimage, and as center, to some extent, of education. Caravans arrive almost daily. Pop. 70,000. In the neighborhood are the ruins of Thus, the old capital of Khorassan, which contains the tomb of the celebrated poet Firdasi.

MESILLA, a. of valley on the Rio Grande, New Mexico, U. S., acquired of Mexico in 1834 by purchase under the Gadsden treaty. Lat. 32° 17' n., long. 106° 45' west. It is a narrow, but fertile valley, on the southern overland route to California. The town, settled in 1850, had in 1870 a population of 1578.

MESMER, FRANZ (according to others, FRIEDRICH-ANTON), the founder of the doctrine of animal magnetism (q.v.), or mesmerism, was born in 1733 or 1734 at a village near the Bodensee. He studied at Vienna, and there took the degree of doctor of medicine in 1766. About 1772 he began, along with father Hell, to investigate the curative powers of the magnet, and was led to adopt the opinion that there exists a power similar to magnetism, which exercises an extraordinary influence on the human body. This he called animal magnetism, and published an account of his discovery, and of its medicinal value in 1775. Honors were conferred upon him in Germany. In 1778 he went to Paris, where he attracted much attention. His system obtained the support of members of the royal profession, as well as of others; but he refused an offer of an annual pension of 20,000 livres (about £800) to reveal his secret; and this, combined with other circumstances, gave rise to suspicion, and induced the government to appoint a commission composed of physicians and naturalists, whose report was unfavorable to him. He now fell into disrepute, and after a visit to England retired to Meersburg, where he spent the rest of his life in complete obscurity. He died Mar. 5, 1815.

MESMERISM (ante). The following is the account given by Mesmer of the agent by which he claimed to produce the phenomena which distinguished his experience and practice: "Animal magnetism is a fluid universally diffused; it is the medium of a mutual influence between the heavenly bodies, the earth, and animated bodies; it is continuous so as to leave no void; its subtlety admits of no comparison; it is capable of receiving, propagating, and communicating all the impressions of motion; it is susceptible of flux and reflux. The animal body experiences the effects of this agent; by insinuating itself into the substance of the nerves it affects them immediately. There are observed, particularly in the human body, properties analogous to those of the magnet; and in it are discerned poles equally different and opposite. The action and the virtues of animal magnetism may be communicated from one body to other bodies, animate and inanimate. This action takes place at a remote distance without the aid of any intermediate body; it is increased, reflected by mirrors; communicated, propagated, augmented by sound; its virtue may be accumulated, concentrated, transported. Although this fluid is universal, all animal bodies are not equally susceptible of it; there are even some, though a very small number, which have properties so opposite that their very presence destroys all the effects of this fluid on other bodies. Animal magnetism is capable of healing diseases of the nerves immediately, and others meditately. It perfects the action of medicines; it excites and directs salutary crises in such a manner that the physician may render himself master of them; by its means he knows the state of health of each individual, and judges with certainty of the origin, the nature, and the progress of the most complicated diseases; he prevents their increase, and succeeds in healing them, without at any time exposing his patient to dangerous effects or troublesome consequences, whatever be the age, the temperament, and the sex. In animal magnetism nature presents a universal method of healing and preserving mankind." (Memoire sur la Decouverte du Magnetisme Animal, par M. Mesmer, Paris, 1779, p. 74 et seq).

In presenting any question for consideration and discussion it is simple fairness to
permit each side to exhibit its position after its own manner. It is matter for reflection that this statement by Mr. Mesmer has never been authoritatively controverted by any of the numerous opponents whom it has met in the century which has elapsed since it was first promuligated. It should first be remembered as to Mesmer that he was undoubtedly very much of a charlatan; and that partly from the character of his temperament, and partly from the nature of his surroundings, he accompanied his practice by methods which were designed to be so beguiling and, rather than his personal efforts to cloud with an appearance of mystery, and even supernaturalism, processes which were in themselves of the simplest character. The shrewdness of this operator is seen in his careful provision for accidents, and for the unsuccessful termination of any of his experiments or treatment by the explanation that although the fluid is universal in its scope, there are persons obnoxious to its exercise, who can prevent its influence. It should further be noted that the sweeping conclusions of the commissioners appointed by the French government to investigate the validity of Mesmer's pretensions—among which commissioners was Benjamin Franklin—were afterwards qualified materially by the decision of a second commission of no less importance as to the ability of its membership. And it remains to be said that the distinct assertions of Mesmer as to the power of some occult force which he terms animal magnetism have been sustained over and over again by actual experiment and practice; while new features and new developments of the nature of this force have been made known to us within the present generation.

The theory that the cause of the phenomena produced lies in the principle of suggestion is set at rest positively by the fact that subjects have been influenced without the proximity of the operator, and even when the latter was miles distant from them. The point as to its efficacy in disease has been tested numbers of times with success. So far has this been the case that in India amputations have been conducted while the patient was under this influence, and this in the presence of valid witnesses, and successfully. The idea of any other than a psychological control being exercised is disposed of by the remarkable phenomena of phreno-mesmerism, by which certain faculties and propensities have been made to display themselves, by irritation of the corresponding organs of the head, and in cases where the subject was utterly ignorant of the nature and details of phrenology as enunciated by Gall and Spurzheim. The fact that such eminent scientists as Elliotson, Braid, Reichenbach, and Carpenter have added their testimony as to the existence of a certain subtle fluid, such as is described by Mesmer, is not without its bearing on the subject. Elliotson, Reichenbach, and Carpenter have all been in great detail with magnets and crystals, and claimed to have demonstrated the fact of the existence of such a fluid, which he termed od or the odic force, and which he alleged could be brought into exercise in the case of a certain class of subjects termed sensitives, by employing these objects. His plan was the use of passes, making these, however, by means of the magnet or the crystal instead of the hand; the result being to throw the subject into a cataleptic condition, accompanied by the occurrence of phenomena similar to those otherwise attributed to animal magnetism. Braid, by the use of a brilliant object fixed to the forehead, in such a position as to distort the vision when the eyes were directed towards it, produced an identical condition (see HYMNOSITISM).

It will be remembered in this connection that the Hindu devotee, desirous of achieving the condition Nirvana, abstracts his attention from surrounding things, and fixes it upon the pit of his stomach. It has been a common method in the practice of mesmerism, instead of employing passes, to direct the subject to fix his attention and his gaze on a bright object—a king, for instance—held in his hand, the hand resting on his knee as he sits in a comfortable position. In the use of this plan the result has been found to be precisely the same as that gained by the employment of passes.

A German writer, Kluge, has given the following classification of the effects observed in mesmerized subjects: 1. Called waking. Presents no very remarkable phenomena. The intellect and the senses still retain their usual powers and susceptibility. 2. Half-sleep, or imperfect crisis. Most of the senses still remain in a state of activity, that of vision only being impaired, the eye withdrawing itself from the power of the will. 3. The magnetic or mesmeric sleep. The organs of the senses refuse to perform their respective functions, and the patient is in an unconscious state. 4. The perfect crisis, or simple somnambulism. In this stage the patient is said to "wake within himself," and his consciousness returns. He is in a state which can be called neither sleeping nor waking, but which appears to be something between the two. 5. Lucidity, or lucid vision. This is called, in French, clairvoyance; in Germany, Haltesehen. In this state the patient is said to obtain a vision with all his mental organs, but this new vision is not to be confused with accuracy the phenomena of disease which will naturally and inevitably occur, and to determine what are their most appropriate and effectual remedies. He is also said to possess the same faculty of internal inspection with regard to other persons who have been placed in mesmeric connection (en rapport) with him. 6. Universal lucidity; German, allgemeine Klärheit. In this state the lucid vision becomes greatly increased, and extends to objects whether near or at a distance. To this very accurate catalogue we should add a condition—7. Coma. Into this state the patient falls who has been permitted to escape from the influence of the will of the operator. He no longer responds to command, he is apparently unconscious, his pulse recedes to the vanishing-point, and his heart-beats cease to be noticeable. This state closely simulates death, and is believed
Mesmerism.

to be actually premonitory of dissolution. Cases have occurred in which it has required the utmost exertion of all the methods known to those who practice mesmerism to restore to consciousness patients who had reached this condition.

The mesmeric state has been applied mostly to the cure of disease, for which purpose it was used by Mesmer when he first established his public relations. It has also been used for the purpose of producing sleep during surgical operations; and Miss Martlinean relates a case of one of her servants, who when in the mesmeric condition was said to be able to predict future events. The class of diseases which have been cured by its means are those which are known to medical men as functional nervous diseases. Various nervous diseases, such as paralysis, epilepsy, etc., occurring from changes in the structure of various organs, are not susceptible of benefit from the mesmeric state. It is in those cases where no structural lesion can be supposed to exist, and which often yield to sudden changes of the mind from various causes of excitement, and which frequently cease without obvious cause, that the disease has yielded to this remedy.

In 1836 Mr. Colquhoun published in London a work on animal magnetism, entitled Isis Reredita, which attracted considerable attention to the subject, and which contained as an appendix a translation of the report of the second French commission appointed to investigate this subject in 1831, and to which we have already referred. This was followed by the arrival in London of Baron Dupetot, who performed many experiments, some of which were witnessed by Dr. Elliotson, who immediately undertook the further investigation of the subject. The results of the experiments of Dr. Elliotson, which were published in the Lancet, produced a great sensation, and phenomena which had hitherto been regarded as impossible were constantly produced. In 1841 M. La Fontaine, a Frenchman, visited London, and gave public lectures on mesmerism and examples of its phenomena. A number of persons claiming to be "professors" of animal-magnetism, or electro-biology, have from time to time given public exhibitions in the cities and towns of the United States and the British provinces in America. In these exhibitions the object has been to exhibit voluntary patients placed under the control of the operator, and to display the various phenomena which could then be produced. These have been always simple in their nature, and of a character to amuse more than to instruct. No scientific man had given himself to the investigation of this subject to any important extent in America until, during the winter of 1880-81, Dr. George M. Beard, a fellow of New York, a member of the Neurological society, and a man qualified by the nature of his studies and experience, and his avowed skepticism on this subject, to undertake its investigation with a mind at least free from bias in its favor, commenced a series of experiments, and eventually conducted certain of these in public. These experiments were none of them novel in character, except possibly that of showing the insensibility to the most powerful light of the eye of a patient in a mesmeric condition. The experiments were all conclusive as to the nature of the phenomena produced, but the inferences reached by the experimenter and those who witnessed them as to their occasion and origin have not been made public at the time of this writing. But the bald facts of the phenomena have never been disputed by intelligent investigators. Only those unaccustomed to profound investigation have set these down as the result of self-deception or of collusion. It still remains to be discovered what influence produces the conceded result, and to what extent, if at all, the human will is engaged in the matter. Some are suggesting as to these points such hypotheses as this: that the mind of man pervades a force pervading a case of which not the earth, but the other planets; that this force performs specific duties in connection with vitality, and in the form of a positive ether becomes visible under certain conditions, and in the case of animals, including human beings, more readily so to those possessing certain natures and temperaments (sensitive); that this force may be and is exerted without sensible regard to time or distance; that it is subject to evolution and direction by the human will; that it is concentrated in certain material forms, as in the magnet and the crystal, and in certain atmospheric and meteorological conditions, as in snow-storms; that it is correlated with the other forces and, like these, is one of the modes of motion; that it is more elevated in its character than any of the simply material forces; because it responds to mental impressions and psychological influences; that it includes all the forms and modes of expression of all the subordinate, or strictly material, forces; that thus it is enabled to act upon things animate or inanimate, material as well as immaterial, thus accounting for the possibility of phenomena of table-turning, so-called "spiritual" rapping, etc.; that it may even exhibit or manifest conditions simulating intelligence, wherein would appear one explanation of these phenomena in the practice of spiritualism; finally, that it is superior to material laws, whence the phenomenon of levitation, that of untying impossible knots, etc. As suggestions, merely, these may awaken interest in the general subject.

Oersted says (Soul in Nature), "Everything in science prevailing throughout a certain period contains actual scientific truth, though frequently much obscured." The fact that mesmerism, or animal-magnetism as it may more properly be termed, has continued to affect mankind as a possible scientific fact during more than a century of pronounced opposition, would seem to bring it within the category signified by Oersted. And in these days of investigation into the nature of things, and when such extraordinary discoveries are constantly being made as to the limitless nature and scope of the natural forces, it would appear proper to devote a certain fair degree of scientific skill and.
patience in the direction of elucidating the nature and origin of such remarkable pha-
omena. See Animal Magnetism, ante.

MESNE LORD is, in English law, a lord who is himself a tenant to some other lord, called a lord paramount. The phrase is, however, not now used, because subinfeudation was abolished in the time of Edward I.—MESNE Process was the name given to writs which issued in respect of a pending action before final judgment was given.—MESNE Profits are the profits or rents drawn by a person who is wrongfully in possession of real prop-
erty, and who is afterward ejected, in which case the mesne profits are recoverable, along with the estate itself.

MESOPOTAMIA (Gr. mesos, middle, and potamos, a river), the region between the Eu-
phrates and the Tigris; but the name is generally applied to the northern part of this region, which is called by the Arabs Al-Jesira (the island). The northernmost dis-
tricts of Mesopotamia are mountainous, being penetrated by the southern spurs of the
mountains of Armenia; all the rest is a plain, rarely broken by rocky heights. This
plain is dry steppe, green with vegetation only in the wet season; but wherever it is
naturally watered or artificially irrigated it displays fertility. The inhabitants consist
chiefly of Turks, Kurds, Turcomans, and Yesids, with Armenians in the n. and Syrians
and Arabs in the plains. The chief occupation of the people is the feeding of cattle;
and of the civilization of ancient times, or even of that which prevailed in a later period
(during the Ayubite rule), few or no traces now exist. Mesopotamia forms a part of the
Turkish empire, and is divided into several eyalets, or governments. For the history of
the country, see Assyria, Babylonia.

MESZ020 IC (Gr. middle-life), a term introduced by prof. Phillips to designate the
group of geological periods, the fossil remains of which differ equally from those of the
paleozoic (ancient-life) and Cainozoic (newer-life) epochs. It is synonymous with the
more generally employed term secondary, and includes the rocks of the triassic, olio-
tic, and cretaceous periods.

MES PILUS. See MEDLAR.

MESQUITE GRASS, a procumbent pasture-grass, abundant in the s.w. part of the
U.S., and belonging to the genus Aristida.

MESQUITE TREE. See Mesquite Tree, ante.

MESS (Fr. mets, Old Fr. mes, Ital. messo, a dish, from Lat. missum, sent or served up),
originally signified a dish or portion of food; but is used in the British army and navy in
the sense of a number or association of officers or of men taking their meals together.
In societies consisting entirely of the male sex, and of one set of men continually thrown
together, it is a very important social point that the mess should be well regulated.
There are consequently stringent rules—both of the service and of mutual etiquette—
laid down for its government. One officer acts as caterer, receives subscriptions from the
several members, charges the wine to those who drink it, etc.; a steward has charge of
the more menial department, arranging for the cooking, purchase of viands, servants,
rations, etc.

In the navy, the admiralty lend the plate and glass; in the army such expenses are
met by the mess fund, which is kept up by a contribution not exceeding thirty days' pay,
or difference of pay, on the appointment or promotion of an officer, and an annual
subscription from each officer not exceeding eight days' pay, which subscription, in the
case of subalterns, is, since 1872, paid by the state. Of course, each officer has to pay
periodically his share of the general expense for provisions, etc. In the navy, this
expense is limited to £3 a month per head for the ward-room mess, and £1 10s. in the
gun-room. In the army, there is no specific limit, but commanding officers are enjoined
to enforce proper economy. Government assists the mess of regiments serving at home,
and on certain foreign stations where the necessary of life are expensive, with an
annual allowance of £25 for each troop or company. The whole of this allowance is to
be applied in aid of the cost of the first allowance of wine, and towards reducing the
daily expense of the mess, etc. The annual vote for this allowance is about £40,000.

In regiments, there is the officers' mess, to which all the officers of the regiment are
bound to subscribe their regulated entrance-fee; but it is optional with married officers to
use it or not, and if they elect not to do so they are exempted from the annual contribu-
tion, and only pay for their share of the consumption on the special occasions when
they may attend. The sergeants have also a mess, when the commanding officer can suc-
cceed in establishing one. It is considered necessary for discipline that these messes
should be quite exclusive, though, in continental armies, and especially the French, the
case is different, the utmost familiarity being encouraged between all ranks when off
duty. The social equality of officers and men, due to conscription and promotion from
the ranks, suffices to account for the difference of system. The sergeants draw their
rank on all occasions of bearing arms, and in the exercise of the profession of arms; the
officers cannot draw them or not (through their messman), but on foreign stations they almost invariably do so.

There is no mess for staff-officers with an army, unless they form private arrange-
ments among themselves.

In the British navy, if the ship be small there is one general mess—the gun-room—to
which all the officers must belong. If the vessel have a considerable complement, there
is the ward-room mess (of which the captain is not an effective member, as he dines in his own suite of cabins), for the commander, lieutenants, master, chaplain, paymaster, marine officers, surgeon, assistant-surgeon, and chief engineer; the gun-room for sub-lieutenants, second masters, midshipmen, cadets, and master's assistants; and the engineers' mess (governed by the rules for the gun-room), for engineer officers below the rank of chief engineer. Officers or civilians voyaging in a ship of war as passengers are ordinarily elected honorary members of the mess to which their rank would entitle them. Rations are not issued to members of a mess; but each is granted, in lieu thereof, an allowance of £1 a month, with the power of purchasing ship's provisions at government rates.

Common seamen and common soldiers in the navy and army, respectively, mess together in tables comprising a certain number, according to their ratings or squads; but this has no reference to the technical meaning of messine as applied to officers, and is merely for the purpose of economy of fuel and labor in the cooking of their rations.

MESSALINA, Valeria, the daughter of Marcus Valerius Messala Barbatus and wife of the Roman emperor Claudius, a woman infamous for her lasciviousness, her avarice, and the atrocities which she perpetrated. Taking advantage of the weakness and stupidity of the emperor she played the adulteress without restraint, and unrelentingly caused all to be put to death who stood in the way of her unhallowed gratifications. The best blood of Rome flowed at her pleasure. Among her victims were the daughters of Germanicus and Drusus, Justus Catonius, M. Vincius Valerius Asiaticus, and her confederate Polybius. She went so far in vice as to offer her charms for sale like a common prostitute; and at last, during a temporary absence of the emperor, she publicly married one of her favorites, C. Silius, upon which Narcissus, one of the emperor's freedmen, represented to him that Messalina was aiming at his destruction, and received orders for her execution. She was put to death by Enodus, a tribune of the guards, in the gardens of Lucullus, 48 A.D. Her name has become a by-word for crime and lust.

MESSINA. See MESSINA, ante.

MESSAPIA, the name given by the Greeks to the peninsula in the s.e. part of Italy, and called by the Romans Calabria. It was known to the Greeks also by the name of Iapygia. There were two tribes, the Salentini on the s.e. coast near Tarentum, and the Calabri in the n.e. These last the Greeks called Messapians. They were the most powerful, and from them the whole district was called Calabria and Messapia. It was very fertile and celebrated for its wine, olives, and other fruits. The Calabrian horses and the Tarentine cavalry were famous. The inhabitants occupied the cities of Hyria and Brundusium in the 8th c. B.C., when the Greek colony was founded. They fought against the Tarentine colonists and defeated them in a great battle about 478, but gradually yielded to the Greeks. In union with other tribes under the command of Pythus they opposed the Romans, but after his fall were subdued in a single campaign. In the second Punic war they resisted to Hannibal, but were soon conquered.

MESSENE, capital of Messenia, in the Peloponnesus, founded by Epaminondas, 371 B.C. It was situated at the foot of Mount Ithome, on both sides of the Black springs. So great were the zeal and activity of the Thebans and their allies that it was completed and fortified in 85 days. The walls of the city were of stone, exceedingly strong, and well supplied towers and buttresses. The citadel was on Mount Ithome, famous in history for the protracted defense which the Messenians made in their last revolt. It was with the Acropolis the strongest city, next to Corinth, of the Peloponnesus. It was supplied with water from a fountain called Clepsydra. The city was named from the wife of Polycrat, one of the earliest rulers of the country. The ruins of it are visible at the modern village of Mavrati.

MESSENGERS, King's (Queen's), officers employed by secretaries of state to convey dispatches at home and abroad. In former days their occupation consisted, to a considerable extent, in serving the secretaries' warrants for the apprehension of persons accused of high treason and other grave offenses against the state, nor was it unusual for them to keep the prisoners whom they apprehended at their own houses. They are now principally employed in foreign service.

MESSENGERS-AT-ARMS, the officers who execute the process and letters of the courts of session and judicature in Scotland. They are appointed by, and are under the control of the Lyon king-at-arms (q.v.). Act 1587, c. 46, contains various provisions regarding these officers, which show that, prior to that period, the Lyon exercised jurisdiction over them, both as to their admission and the trial of complaints against them. There are a certain number of messengers-at-arms in every county of Scotland, amounting in all, at present, to about one hundred.

MESSENMIA, a district in the s.w. of the Peloponnesus, bounded on the e. by Laconia, on the n. by Arcadia and Elis, and on the s. and w. by the sea. It was composed chiefly of extensive plains, watered by the Pamisos and other streams. Those plains were famous for their fertility, and particularly for their wheat-harvests. At an early period, after the Doric conquest, it rose to power and opulence. Its chief cities were Messene, Methone, and Pylos. It is chiefly noted for its two wars with Sparta, known
as the Messianian wars, the first of which (according to the common chronology) lasted from 743 to 724 B.C.; and the second from 685 to 668 B.C. In both instances the Messenians were defeated, and in consequence a great part of them emigrated to Sicily, where they took possession of Zancle, which then received the name of Messana, the present Messina. After the lapse of 300 years Epaminondas invited their descendants back to Greece, and they joyfully responded to his invitation. Messenia is the name of one of the monarchies of the modern kingdom of Greece.

MESSER, ASA, D.D., LL.D., 1769–1836; b. Mass.; graduated in 1790 at Brown university, in which he was tutor in 1791, professor of languages in 1796, of mathematics and natural philosophy in 1799, and president 1802–27. He was licensed to preach by the First Baptist church in Providence; ordained in 1801, and preached occasionally, while professor and president, for churches of different denominations. After retiring from the presidency he was elected to several city offices by the people of Providence. He published several discourses and orations.

Messerere, Nathaniel, d. 1758; b. N. H.; a ship-builder; one of the 394 New Hampshire men who went in 1745, with the British forces to besiege the fortress of Louisbourg, Nova Scotia, at the sight of whom the detachment of the royal battery on the shore spiked their guns and fled. He was lieu.col. of col. Moore's regiment, and rendered important service. He was present at the attack on fort Edward, in command of the New Hampshire regiment, and bravely defended the position. In 1756 he conducted the New Hampshire troops on the expedition to the French post of Crown Point, on lake Champlain. In 1758 he set out with the second expedition, under gen. Amherst, to Louisbourg, then defended by the chevalier de Drucourt, but died of small-pox before reaching his destination. His son George held offices under government in New Hampshire and Massachusetts, having been appointed stamp agent in the former state and collector in Portsmouth and Boston. During the revolution George espoused the tory cause, and went to England in 1777.

Messiah (Heb. Mashiach), equivalent to the Greek Christos, the Anointed, designates, in the Old Testament, the great deliverer and Savior whom the Jews expected to be sent by God, not only to restore their country to the power and splendor which it exhibited in the days of David, but even, by compelling the Gentiles to acknowledge the supremacy of the theocratic people, to raise it to the summit of universal dominion. This large conception, however, first begins to develop itself after the time of Solomon; for the oldest biblical records in their Messianic indications refer rather to the high degree of prosperity which the chosen people were to expect for themselves. This expectation, already visible in the Abrahamicde, appeared for a moment to have realized itself in the conquest of Canaan; but the subsequent, and often disastrous wars (in the period of the "Judges" and of Saul), as well as the internal feuds and dissensions of the Hebrews themselves—left it, in point of fact, unfulfilled. Nevertheless, the hope of the appearance of the Messiah had rooted itself strongly in the people, and, during the glorious and peaceful reigns of Solomon and his successors, of the dynasty of the house of David, and during the momentous ages that elapsed until its destruction as a kingdom, not only was the hope of a universal world-sovereignty, and of an extraordinary degree of prosperity, warmly cherished, but it was also confidently expected that God would raise up a branch from the stem of David as the Messiah, the founder of the national prosperity, and the bringer-in of the all-embracing theocracy. That branch was declared to be "the anointed of the Lord," and since David applied that epithet to himself, the Jews transferred it to the deliverer whom they expected, and called him "Son of David." The prophetic writings contain many such allusions to the Messiah, whose coming was expected shortly, and even during the time of the generation then living, whose birthplace, in congruity with his Davidic descent, was announced to be Bethlehem and who, it was believed, was to be endowed with divine attributes. These prophetic allusions are commonly termed Messianic Prophecies. Along with such, the prophets associated the idea of a forerunner (Eljiah, Jeremiah, or Moses), whose function was to prepare the people for the appearance of the Messiah. The Messiah was to be preceded by a period of severe misfortune and bitter sorrows, the purpose of which was the reconciliation of the people with God (Isaiah i. 23, etc.; Joel iii.; Dan. ix.; Zech. xiii.). These sorrows are called the woes of the Messiah; they are minutely described in the second book of Esdras—a apocryphal work. Hence sprung up the idea of a suffering Messiah—widely diffused among the Jews—who, by enduring grief and shame, should make atonement for the people, and reconcile them with God. This conception was greatly strengthened by the picture in Isaiah (chapters iii. and lili.), of a "servant of God," which, in fact, is generally regarded as the most distinct prophecy of the Savior. Hence the step further of considering the Messiah an offering and sacrifice for the sins of the people was an easy one; yet, on the other hand, it is singular that no trace of this is found in the Apocrypha, not to mention the popular belief of the Jews, that the Messiah was to live forever (John xii. 34), that a crucified Savior was a stumbling-block to them (1 Cor. i. 23), that even the disciples of Jesus did not comprehend his allusions to his death, and that their faith in him as the Messiah was for long dim and doubtful. In fact, this popular belief of the Jews was the very reason why they did not
recognize Jesus as the Messiah. In the later Judaism (as it shows itself in the Talmud) the conceptions of the Messiah are rich in singularities. It was believed that the true Messiah, the son of David, would be preceded by another Messiah, a son of Joseph or Ephraim, who should suffer death for men as a sin-offering. Century after century the Jews have expected the former, and repeatedly have they risen and placed themselves under the guidance of impostors who took to themselves the sacred name; as, for example, Bar-Cochba (q.v.) in the 2d c.; one Moses in the straits of Candia in the 5th c.; one Julian in Palestine in the 6th c.; several in Persia and Arabia in the 12th c.; and as late as the 18th c., Sabatai Zevi in Aleppo. Even yet the hope of a Messiah is not dead in the hearts of the strict Talmudistic Jews.

The crucial question of theology, however, is not the form in which the doctrine (so to speak) of the Messiah was held by the Jews. All rational students of Scripture, whether "orthodox" or "heterodox," now admit that its growth was gradual, and that it acquired precision and definiteness of outline in the course of ages from its first rude phase, among the pastoral princes of the Syrian wilderness, down to that sublime yet shadowy personality—the Man of Sorrows—that continually floats before the vision of the "Younger Isaiah." The grand question is, Was this doctrine essentially a divine inspiration, an objective truth of God, or only a lofty conception of the religious soul? The strict rationalistic theologians maintain—and endeavor to prove by an analytic examination of the Gospels—that Jesus assumed the dignity of Messiah either to accommodate himself to a rooted conception of his countrymen, or partly because he had come to believe it himself—a conclusion, it is said, at which he might arrive quite honestly, since he felt that the truth which he taught was the real and only "kingdom of God," and that therefore he was justified in applying to himself all that was said (tropically) by the prophetic poets in old times concerning him who should usher in this "golden age" of the world's faith. The mass of orthodox theologians, on the other hand, regarding the so-called Messianic prophecies of the Old Testament as positive, divinely suggested (perhaps, even on the part of their author conscious) predictions of Jesus Christ, repudiate the principle of accommodation, or even spiritual application, and try to show that the Savior accepted the Messianic prophecies as literally and exclusively applicable to him. The historico-spiritual school, represented in Germany by men like Neander, Rothe, Tholuck, etc., and in England, generally speaking, by the divines of the "orthodox" church party, occupy a middle position between these two extremes; with the rationalists, they hold that the Old Testament doctrine of the Messiah was gradually developed, contains many human elements, and does not imply any knowledge of the historical Jesus on the part of those who announce it; with the "orthodox," on the other hand, they assert that the doctrine is the expression of a fact, not of a sentiment—that Jesus of Nazareth was actually the Son of God, the appointed Messiah, and that in him the so-called Messianic prophecies were fulfilled in a far higher sense than ever the prophets could have dreamed. It will thus be seen that the rationalists resolve the doctrine of the Messiah into a merely subjective religious idea; while the orthodox, and also the historicospiritual school of theologians, hold that the doctrine was the expression of a divine fact—the substance of a heavenly faith.

MESSINA, a province in n.e. Sicily separated from the province of Calabria, in Italy, by the straits of Messina, and supposed to have been cut off from the main-land by an earthquake before the 3d century B.C.; 1768 sq. m.; pop. 420,649. It includes the Lipari islands, lying n.w. of it, in the Tyrrhenian sea; its coast is washed by the Ionian sea, and its s.w. boundary is the base of Mt. Etna. It contains the Neptunian range of mountains, part of the Peloric chain, which traverses the n. of Sicily. Its surface is diversified by fertile valleys, which are irrigated by heavy torrents that descend on either side of the mountains in the rainy season, but are dried by the heat of summer. Its productions are wheat, flax, argol, corn, fruits, hemp, nuts, oil, and the red Faro wine; among the exports is the cordial called vino-colto from Milazzo. Sulphur is found in large quantities; also granite, quartz, and mica. Its coast presents a varied outline, the town of Messina on the right of Cape Faro, or Pelorus, at its extreme n.e. point, occupies the section of the coast line called from its form the "sickle," having a convenient harbor with spacious wharves defended by a fort. The whole country has been rocked by wars and shaken by earthquakes, and the cities have a modern appearance, having been, in most cases, rebuilt. It is drained by the rivers Monforte, San Antonio, and other small streams. It is divided into 4 districts and 116 communes. On a projection called cape Milazzo in the n. portion the sea-port town of Milazzo is built, whose inhabitants are fishers and fishermen, and the vine and olive are cultivated. Taormina, built on a steep towering cliff, overlooks the sea on the c., and contains many interesting ruins. On the n. coast are profitable manufactures of earthenware, and a Norman castle; and so substantially have the military works been laid on the natural defenses that it has been considered the Gibraltar of Sicily, and has been the scene of many ancient and modern wars. The province contains many churches and convents, and relics of antiquity of great interest, cenotaphs, tessellated pavements, etc. Its principal city of Messina, the terminus of a railway along the coast to Syracuse, is nearly opposite Reggio (ancient Rhegium), which is 9 m. s.e. across the straits of Messina, the most noted city of s. Italy.
MESSINA, a city of Sicily, chief t. of the province of same name, one of the most ancient and most important cities of the island, is charmingly situated on the strait of Messina, encircled by a zone of abrupt conical rocks, and commands a view of Calabria. Pop. in '71, 71,921. The town is inclosed by old walls, and has several fine squares and wide lava-paved streets. The harbor, which is formed by a projecting tongue of land curved in the form of a sickle (whence its primitive name, Zancle—Gr. sickle—see Messenian), is about 4 m. in circumference, and can contain a thousand ships; it is defended by a citadel and six forts; the depth is sufficient to admit vessels of large size; and the quays are spacious. The trade of Messina, chiefly in silk, oil, wine, coral, fruits, linseed, fish, etc., although less extensive than formerly, is still an important source of wealth to Sicily. The chief imports are cotton and woolen manufactures, hardwoods, and other articles of colonial produce. The damasks and satins of Messina are excellent, and the fisheries important. Messina has steamboat communication with Naples, Marseilles, and Malta. In the 15th c. Messina was a renowned seat of learning; and in the 16th c. a famous school of painting was founded there by Pellegrino da Caravaggio. In modern times it has undergone terrible vicissitudes, having been ruthlessly bombarded by the royal forces on several occasions during the war of independence in 1848.

MESSINA, STRAITS OF (Ital. Furo di Messina, Lat. Mamertimum fretum), between Italy and Sicily, are 22 m. in length, and vary from 24 to 10 m. in breadth. A strong current runs through the strait, which is of great depth. See SCYLLA AND CHARIBDIS.

MESTIZO, the legal term used in English law to describe a dwelling-house and piece of land adjoining.

METALLURGY is the art of extracting metals from their ores. The operations are partly mechanical and partly chemical. Those processes which depend principally on chemical reactions for their results have reference chiefly to the roasting and smelting of ores, and are described under the heads of the different metals. But there are certain preliminary operations of a mechanical kind which metallic ores undergo, such as crushing, jiggling, washing, etc., which we shall describe here, as they are essentially the
same for the ores of lead, copper, tin, zinc, and indeed most of the metals. (For Iron, see that head.)

Ores are first broken up with hammers into pieces of a convenient size for crushing or stamping. Waste material, such as pieces of rock, spar, etc., which always accompany ore, are as far as possible picked out by hand, and the ore itself arranged in sorts according to its purity. Various kinds of apparatus, such as riddles, sieves, etc., are then used for separating it into different sizes, in order to secure a uniform strain on the crushing machinery.

In one of the most approved forms of crushing-mills the ore is raised by means of small inclined planes to a platform, where it is ready to be supplied to the crushing-rollers through an opening. These rollers are mounted in a strong iron frame, held together by wrought-iron bars, and bolted to strong beams. Their distance apart is regulated by means of a lever to which a weight is attached. The bearings of the rollers slide in grooves, so that when any extra pressure is put upon them by a large or hard piece of ore, the lever rises, and allows the space between the rollers to widen. The crushed ore falls upon a series of sieves, which are made to vibrate. These have meshes increasing in fineness as they descend; and the upper two are so wide that pieces of ore too large to pass through them are conducted into the lower part of the bucket-wheel and raised again to the platform to be recrushed. The lower four sieves separate the remaining portion of the crushed ore into different degrees of fineness, which is collected in pits.

Instead of crushing-rollers, sometimes a stamping-mill is used, especially for tin ores, which require to be reduced to a fine powder. The stamping-mill consists of a series of upright spouts wrought to form a weighty piece of iron at the bottom of each. They are raised by means of an axle with projecting cams, and then, falling by their own weight, act like hammers.

After being crushed, the ore is washed and sifted on a jiggling sieve. In one of its simplest forms the ore is placed on a table from which a sieve is filled. It is then immersed in a tub of water and a jiggling motion communicated to it by a workman alternately raising and lowering a handle. This effects two purposes—it washes the ore, and separates the material into two layers: the upper consists of the lighter spar and other impurities, which are raked off; and the lower consists of the heavier and purer portions of the ore, which are now ready for the roasting furnace.

It will be apparent that in the bottom of the tub there must be a quantity of more or less valuable ore, which, from its fineness, has fallen through the sieve. This is called sludge or slime; and the minute particles of ore it contains are recovered either by simply forming an incline on the ground, and washing it with a current of water, or by using an inclined table called a sleeping-table. Ore which has been reduced to powder at the stamping-mill, as well as slime, is washed by this apparatus. The material is put into a chest which is placed in a sloping position, and is supplied with water on turning a stop-cock. The current carries the contents of the chest through an opening at the bottom, and spreads it, with the aid of a series of stops, or small bits of wood, over the surface of the table. A stream of water is then kept flowing over the table till the earthy impurities are all carried down into a trough, the pure particles of the ore remaining, by reason of their greater specific gravity, near the top of the table, whence they are removed to be smelted. Sometimes the table is suspended by chains, and receives a succession of blows at the top from a buffer, moved by cams on the same principle as the stamping-mill. This arrangement is found of great advantage in dressing very poor ores.

The variety of machinery and apparatus used in dressing ores is very great, and they pass under different names in different districts, but they are all very similar in principle to those we have described.

METALS—METALLOIDS. Although each metal is considered in a separate article, there are various points regarding the general physical and chemical characters of these bodies, and the method of classifying them, which require notice. The first thing to define a metal. All the elements are usually divided by chemists into two groups—viz., the non-metallic bodies or metalloids, and the metals; the list of non-metallic bodies containing all those elements in which the characteristic properties of the bodies popularly known as metals (such as silver, gold, iron, etc.) are wanting; these characteristic properties being their metallic luster, their opacity, and their capacity of conducting heat and electricity. The non-metallic elements are 14 in number—viz., oxygen, hydrogen, nitrogen, sulphur, selenium, tellurium, phosphorus, chlorine, bromine, iodine, fluorine, carbon, boron, and silicon, of which five are gases, one a liquid, and the rest are solids at ordinary temperatures.

The division of the elements into these two great groups is, however, not based upon any definite scientific grounds, and it is still an open question whether some of the metalloids, as, for example, tellurium and silicon, should not be placed among the metals. The non-metallic bodies or metalloids being only remarkable as a group for their negative properties, require no special consideration, and we therefore proceed to notice the general properties of the metals.

The following are the most important of the physical properties of the metals:

1. All metals, unless when they are in a finely-pulverized form, exhibit more or less of the characteristic luster termed metallic. Two of the non-metallic elements, iodine
and carbon, in some forms, present also a metallic luster. 2. All metals are good conductors of heat and electricity, although in very unequal degrees. 3. With the exception of mercury, all the metals are solid at ordinary temperatures. With the exception of gold, copper, calcium, and strontium, the metals are more or less white, with a tendency to blue or gray. Most of them have been obtained in crystals, and probably all of them are capable of crystallizing under certain conditions. 4. Metals are remarkable for their opacity, and, with the exception of gold, do not transmit light, even when they are reduced to extremely thin leaves. 5. All the metals are fusible, although the temperatures at which they assume the fluid form are very different (see Fusing Points); and some of them, as mercury, arsenic, cadmium, zinc, etc., are also volatile. 6. Great weight, or a high specific gravity, is popularly but erroneously regarded as a characteristic of a metal; while platinum, osmium, and iridium (the heaviest bodies known in nature) are more than 20 times as heavy as water, lithium, potassium, and sodium are actually lighter than that fluid. 7. Great differences are observable in the hardness, brittleness, and tenacity of metals. While potassium and sodium may be kneaded with the finger, and lead may be marked by the finger-nail, most of them possess a considerable degree of hardness. Antimony, arsenic, and bismuth are so brittle that they may be easily pulverized in a mortar; while others, as iron, gold, silver, and copper, require great force for their disintegration. Taking iron and lead as representing the two extremes of tenacity, it is found that an iron wire will bear a weight 26 times as heavy as a leaden wire of the same diameter. See Ductility, Malleability. 8. It is a remarkable property of the metals that none of them are capable of being dissolved without undergoing chemical change. Sulphur, phosphorus, iodine, etc., may be dissolved, and after the evaporation of the solvent, may be reobtained with all their original properties; but this is never the case with metals.

Amongst the chief chemical properties of metals we next notice:

All the metals, without exception, combine with oxygen, sulphur, and chlorine, and often in several proportions, forming oxides, sulphides (formerly termed sulphurets), and chlorides. Many of them combine with bromine, iodine, and fluorine. The other compounds of this nature, excepting carbide (formerly carburet) of iron, or steel, and the hydrides of arsenic and antimony (commonly known as arseniuretted and antimoniu rected hydrogen), which are of importance in toxicology, may be passed over without notice.

The metallic oxides are, without exception, solid bodies, insoluble in water, and usually present a white or colored earthy appearance. Hence the old name of metallic earth for these oxides.

Those oxides which are termed basic possess the property of directly uniting with the so-called oxy-acids (such as sulphuric, nitric, carbonic, and silicic acid), and of forming a new chemical compound of the second order, termed a salt (q.v.).

The compounds of the metals with chlorine, iodine, bromine, and fluorine, such, for instance, as chloride of sodium, or common salt (ClNa), are termed haloid salts (q.v.). The same metals may also combine both with chlorine and with oxygen in more than one proportion. For example, we have chlorid of mercury (HgCl); suboxide of mercury (Hg2Cl); chloride of mercury (HgCl2); oxide of mercury (HgO). For the compounds of the metals with sulphur, see Sulphides of the Metals.

Metals enter into combination with one another when they are fused together, and such combinations are termed alloys (q.v.), unless when mercury is one of the combining metals, in which case the resulting compound is termed an amalgam. It is doubtful whether all alloys are true chemical compounds. Definite compounds of the metals with each other do, however, certainly exist, and are sometimes found native, as, for example, the crystalized silver and mercury compound represented by the formula AgHg.

In consequence of their strong affinities for the metalloids, the metals are seldom found in a free or uncombined state, even in the inorganic kingdom, and never in animals or plants. The more common metals, in consequence of their strong affinity for oxygen and sulphur, are very rarely met with in the uncombined state; but some of those which are less abundant, such as gold, silver, and platinum, are found uncombined, in which case the terms native and virgin are applied to them; and other metals, as mercury and copper, occur both in a free and in a combined state. Many native alloys are found, but the ordinary sources of the metals are oxides, sulphides, chlorides, and carbonates, sulphates, and other salts. These are termed the ores of the metals. The methods of obtaining the metals from their various ores fall under the head of Metallurgy.

Various classifications of the metals have been suggested by different chemists. The following is probably one of the most convenient:

1. The light metals, subdivided into—
   1. Metals which oxides form powerful bases—viz., iron, manganese, chromium, nickel, cobalt, zinc, cadmium, lead, bismuth, copper, uranium, thallium.
   2. The metals of the alkaline earths—viz., barium, strontium, calcium, magnesium.
   3. The metals of the true earths—viz., aluminium, glucinium, zirconium, yttrium, erbium, terbium, thorium, cerium, lanthanum, didymium.
2. Metals whose oxides form weak bases or acids—viz., arsenic, antimony, titanium, tantalum, niobium (or columbium), tungsten, molybdenum, tin, vanadium, osmium.

3. Metals whose oxides are reduced by heat—nobel metals—viz., mercury, silver, gold, platinum, palladium, iridium, ruthenium, rhodium, osmium. (Several of the rare metals are here omitted.)

Another classification is that by which the metals are arranged in six groups, each group being named after a metal which possesses the common characters in a well-marked degree: viz., (1) the sodium group; (2) the calcium; (3) the iron; (4) the copper; (5) the platinum; and (6) the antimony group.

**METAMORPHIC ROCKS.** Few of the deposits forming the crust of the earth remain in the condition in which they were deposited. By infiltration of a cementing fluid, by pressure, or by some other indurating agency, sand has become converted into sandstone, and clay and mud into shale. In some strata, this operation has been carried still further. There is a class of rocks, including gneiss, mica-schist, clay-slate, marble, and the like, which, while certainly of aqueous or mechanical origin, have, by intense molecular action, become more or less crystalline. To them, the convenient name metamorphic (Gr. transformed) rocks has been given by Lyell.

The metamorphic rocks were formerly considered to be the fundamental strata of the earth's crust. The original incandescent mass, it was said, losing its heat by radiation, a solid mass, and in so far granite was formed. As soon as the deposits of such various ages have been thus altered, the resulting rocks are in structure and composition very similar: their ultimate constituents do not differ from those of ordinary clays and sandstones. In all of them silica forms the largest proportion, consisting of about 60 to 70 per cent; alumina follows next, and then other substances in smaller quantities, such as lime, soda, potash, iron, etc. This similarity of composition, and the abundance of clays and sandstones, suggest the supposition that the metamorphic rocks may be nothing more than these deposits greatly altered; this is confirmed by many observed instances, in which aqueous strata are continuous with, and gradually change into, metamorphic rocks. The granite of Dartmoor has intruded itself into the slate and slaty sandstone, twisting and contorting the strata. Hence some of the great rocks have become micaceous; others more indurated, having the characters of mica-slate and gneiss; while others, again, appear converted into a hard-zoned rock, strongly impregnated with feldspar. In some places in the eastern Pyrenees, the clay-slate becomes crystalline and scaccharoid as it approaches the granite, and loses all trace of the fossils which it elsewhere contains in abundance. These illustrations tell of changes occurring in the proximity of granite, and it has been consequently somewhat hastily concluded that this rock, coming up in a molten condition from below, has, by the radiation of its heat, produced the metamorphism. But the observed stratigraphical position of granite, its sometimes passing by insensible degrees into gneiss, and the experiments of Solly and Bryson on its internal structure, show without doubt that this rock is, at least in many places, an extreme result of metamorphic action, and not the cause of it. To call the energy producing these results metamorphic or molecular action, is simply to hide our ignorance—we get a name, but nothing more. To speak dogmatically on a subject so obscure, is a sign of the same ignorance. The following, however, are the most probable agents that, together or separately, produced these remarkable changes.

1. **Heat.**—From whatever source derived, heat does exist, either distributed universally, or occurring locally in the mass of the earth; and where it exists, thermo-electric influences induce action, which, carried on over immense series of years, might produce in the end great changes. It is generally maintained that granite is the result of crystallization from perfect fusion, and that the strata converted into gneiss must have been reduced to a state of semi-fusion. But we know of crystallization taking place in the most compact amorphous solids without any approach to fusion. In the axles of railway carriages; and of metamorphic action without semi-fusion, as in the highly indurated bottoms of bakers' ovens, in which the clay is subjected to a long-continued though not a great heat; or in the sandstone floor of an iron furnace, which, from long contact with the molten iron, loses its color, becomes white and hard, and breaks with a porcelain fracture, having, indeed, been changed into quartz rock. Besides, the frequent occurrence of cavities in the rock crystals of granite containing a fluid which fills

U. K. IX—47
them only when the temperature is raised to at least 94° Fahr., shows that the crystal could not have been formed at a higher temperature. We are therefore safe in maintaining, that the heat was not in all cases so great as to produce fusion.

2. Pressure.—This alone is sufficient to effect the consolidation and induration of aqueous deposits, converting clay or sand into sandstone. When heat is added to pressure, greater activity is likely to be the result. The undulatory movements of the earth's crust, by carrying down to great depths deposits formed on the surface, bring them under the influence of pressure, heat, and thermo-electricity, and at the same time elevate rocks that have been thus acted upon.

It is thought that heated water may be also a powerful agent, especially when it is subjected to great pressure.

These and other agents, then, operating through immense intervals of time, set in motion chemical attraction, whereby the various substances which entered into the composition of the sedimentary deposits rearranged themselves as they are found in the metamorphic rocks.

The description of the various metamorphic rocks will be found under their different names, viz., Gneiss, Quartzite, Mica-schist, Clay-slate, and Marble.

METAMORPHIC ROCKS (ante), geological formations which have undergone alteration of structure and sometimes of constitution. The subject of metamorphism has within a few years received much attention from geologists, and a great increase of knowledge has been the result. Rocks, such as granite, which were not many years ago regarded as primitive and older than all others, are now known to be of all ages and the result of changes or metamorphisms of other rocks. The word primitive is abolished in geology in its former absolute sense, and is only used to denote the first condition of any formation. Each rock is made up of various substances, or minerals, and is exposed to heat, pressure, or other agencies which are treated in the article Geology. Metamorphic rocks are produced from the various sedimentary rocks, and also from volcanic products; but the chief source is the sedimentary rocks. The geological ages which have produced the greatest amount of metamorphic rocks are the Laurentian and Huronian. The Laurentian age commences in azoic time, and if the term primary could be applied to any formation it would be to theolder of the Laurentian rocks; but it cannot be stated positively that they were the first formed, or, if so, that they have not undergone great alteration. In the Laurentian formations there are found many limestones, but it cannot be demonstrated that they are produced from shells, or that they contained animal life, except oozoon Canadense be regarded as such. See Eozoøx. These Laurentian or archæan rocks extend over the whole globe, and either they or the rocks of which they are the metamorphosed products composed the floor of the first ocean, and constituted the foundation upon which the first life was developed. The action of water and heat caused sedimentary deposits, and when the heat was sufficiently reduced life began, and became, in some degree, an element in the process. The principal areas of archæan rocks in North America are in British America, extending in broad lines from the region of lake Superior north-west to Alaska, on one hand; and on the other, to Labrador, having the form of the letter V, inclosing Hudson's bay within the triangle. There is a much smaller region called the Adirondack, lying in the counties of Essex, Clinton, Franklin, St. Lawrence, Hamilton, and Warren, N.Y., and also an Appalachian line of Laurentian rock, including the highland ridge of Dutchess county, N.Y., and passing through New Jersey, Maryland, and Virginia, forming the Blue ridge, and a long Rocky mountain series, embracing the Wind River mountains, the Laramie range, and other summit ridges of the Rocky mountains. The rocks include granite (q.v.), gneiss (q.v.), mica schist (q.v.), mica slate (q.v.), talc (q.v.), chlorite (q.v.), syenite (q.v.), hornblende (q.v.), serpentine (q.v.), chrysolite (q.v.), apatite (q.v.), and plumbago (q.v.), which is supposed to have a vegetable, but may have had an entire mineral or inorganic origin. The archæan rocks are rich in iron-bearing minerals, as for example in the Missouri iron mountain, containing magnetite, Fe₃O₄, and hematite, Fe₂O₃. Some of the beds are several hundred feet thick. Crystal-lime limestone, often occurring as statuary marble, is one of the rocks found in the archæan formations. See MARBLE. Nearly all geologic ages have produced metamorphic from sedimentary rocks, such as sandstone (q.v.), shale (q.v.), argillite, or clay slate (see ARGILLACEOUS ROCKS), massive limestones (see LIMESTONE), magnesian limestone (see DOLOMITE), hydralic limestone (see CEMENTS), and occasionally volcanic products, as tufa (q.v.). Sandstones have passed into quartzite, quartz rock, or granular quartz. See Quartz Rock in Quartz, ante.

METAMORPHOSIS (Gr. change of form) denoted, in the mythology of the ancients, those transformations of human beings into beasts, stones, trees, and even into fire, water, etc., in fables of which that mythology abounded. The origin and significance of such fables it is often impossible to determine. Some of them probably originated in observation of the wonderful transformations of nature; some in a misapprehension of the metaphors employed by the older poets; and some, perhaps, in mere superstition and love of the marvelous. The wild imagination of the orientals filled their mythologies with metamorphoses in the greatest number; and the classic mythology approaches to them in this respect. They were the theme of some of the poets and other Greek authors of the Alexandrine period, and of Ovid among the Latin classics. The medieval
literature of Europe, especially of Germany, in its fairy tales and other forms of folklore, is also wonderfully rich in metamorphoses.

**Metamorphosis of Animals.** This term is applied to changes which certain animals undergo after their escape from the envelope of the egg, and which are of such a nature as essentially to alter the general form or the mode of life of the individual.

The most remarkable metamorphoses occur in the batrachians, crustaceans, insects, and tape-worms, and are briefly noticed in the articles on those classes of animals. For an excellent general account of the metamorphoses of animals the reader is referred to a series of articles by De Quatrefages in the *Revue des Deux Mondes* for 1853.

**Metamorphosis of Animals (ante).** In the development of an animal the embryo may pass through all the stages of growth to a condition which differs from the adult only in size, proportion, and sexual characteristics, having thereafter only to be nourished to attain full development; or it may leave the egg in a condition remote from that of the adult, and then pass through a greater or less number of stages of distinctly marked characteristics. Each one of these stages is a metamorphosis, and collectively constitute the metamorphoses through which the animal passes. "When metamorphosis occurs the larva may live under conditions totally different from those under which the adult passes its existence. Thus the larva of an animal which is fixed in the adult state may be provided with largely developed locomotive organs; while that of an adult which feeds by suction may be provided with powerful apparatus for the seizure and manipulation of vegetable and animal prey. The larva of a free adult may be parasitic, or that of a parasitic adult free and actively locomotive. Moreover, the whole course of development may take place outside of the body of the parent, or more or less extensively within it; whence the distinction of *oviparous, ovoviviparous, and viviparous animals* (Huxley).

An example of that kind of metamorphosis in which non-parasitic larvae become parasitic pupae and adults is seen in the *rhizocephala*. See *Invertebrate Animals*, subkingdom annulosa, class crustacea, order *rhizocephala*. For further information see various parts of the article on *Invertebrate Animals*, and also *Insects*, *ante*, and *Locusts*, and *Grasshoppers*.

**Metamorphosis of Organis**, in botany, a subject of so much importance that it has been exalted to the rank of a distinct branch of botanical science, under the name of *morphology* or *vegetable morphology*. Attention to it is essential to a philosophical study of botany; yet it may almost be said that nothing was known either of its facts or its laws till the poet Goethe proclaimed them to the world in his treatise entitled *Die Metamorphose der Pflanzen* in 1790. Linnaeus had, indeed, called attention to the development of organs, and the changes which they undergo, and had made this the subject of a thesis entitled *Prolegomena Plantarum* in 1760; but, in a manner very unusual with him, he mixed up with his observations and philosophical speculations certain fanciful suppositions, the falsehood of which soon becoming apparent caused all the rest to be neglected. Wolff afterwards extricated the true from the fanciful in the views of Linnaeus, and gave them greater completeness; but he introduced the subject only incidentally in a paper on comparative anatomy, which failed to attract the attention of botanists, and probably had never been seen by Goethe, whose discovery, apparently altogether original, is one of the finest instances on record of acute observation combined with philosophical generalization.

The metamorphosis of organs is noticed in the articles on particular organs. It is only necessary here to make a very general statement of its facts and laws. A plant is composed of the *axis* and its *appendages*; the axis appearing above ground as the stem and branches, below ground as the root; the appendages being entirely above ground, and essentially leaves; all organs which are not formed of the axis being modified leaves. The proof of this consists very much in the gradual transition of one organ into another, manifest in some plants, although not in others; as of leaves into bracts, one of the most frequently gradual transitions; of leaves into sepals, as seen in the leaf-like sepals of many roses; of sepals into petals, as seen in the petal-like sepals of lilies, crocuses, etc.; of petals into stamens, as seen in water-lilies; and even of stamens into pistils, often exemplified in the common house-leek. The proof is confirmed and completed by observation of the monstrosities which occur in plants, particularly in the frequent return of some part of the flower to its original type, the leaf, and in the conversion of one part of the flower into another, which is often the result of cultivation, and is particularly illustrated in double flowers, the increase of the number of petals being the result of the conversion of stamens into petals.

A flower-bud being a modified leaf-bud (see *Bud*), and a flower therefore the development of a modified leaf-bud, the parts of a flower correspond in their arrangement with the largest branch. But very few laws govern the development of organs in each species of plant. Thus the leaves in one are opposite; in another, alternate; in another, whorled; all depending on the law which governs the growth of the axis in relation to the development of leaves, which is very constant in each species, and in like manner the parts of the flower are developed in whorls around an abbreviated terminal portion of the axis, the energies of the plant being here directed to the reproduction of the species, and not to the increase or growth of the individual. The fruit itself, being formed from the pistil, is to be regarded as formed of modified leaves. Goethe truly
says: "The pod is a leaf which is folded up and grown together at its edges, and the capsule consists of several leaves grown together; and the compound fruit is composed of several leaves united round a common center, their sides being opened so as to form a communication between them, and their edges adhering together."

The metamorphosis of organs has been investigated with great diligence and success, and beautifully elucidated by Miquel, Lindley, Schleiden, and other botanists.

**METAMORPHOSIS OF TISSUE.** See Tissue.

**METAPHOR** (Gr. metáphora, a transference), a figure of speech by means of which one thing is put for another which it only resembles. Thus, the Psalmist speaks of God's law as being "a light to his feet and a lamp to his path." The metaphor is therefore a kind of comparison in which the speaker or writer, casting aside the circumlocution of the ordinary similitude, seeks to attain his end at once by boldly identifying his literal object with another in its essential nature: it is thus of necessity, when well conceived and expressed, graphic and striking in the highest degree, and has been a favorite figure with poets and orators, and the makers of proverbs, in all ages. Even in ordinary language the meanings of words are in great part metaphors, as when we speak of an acute intellect, or a bold promontory.

**METAPHYSICS,** a word of uncertain origin, but first applied to a certain group of the philosophical dissertations of Aristotle (see ARISTOTLE). As since employed, it has had various significations, and now it is chiefly used, or rather confined. In the more confined sense it is allied to the problems of the Aristotelian treatise, and is concerned with the ultimate foundations of our knowledge of existing things. What is the nature of our knowledge of the external world, seeing that mind cannot properly know what is not in contact with itself? has been asked by philosophers, and answered in various ways; and this is the great question of metaphysics (see PERCEPTION, COMMON SENSE). The name "Ontology" has been applied to the same inquiries into our cognizance of existences out of ourselves. But as the solution of this difficult question was found to involve an investigation into the nature of the human mind, it became founded with the science whose object it is to describe fully and systematically the laws and properties of our mental constitution—a science called by the various names of psychology, mental philosophy, moral philosophy; and hence metaphysics came to be an additional name for this more comprehensive department. The word is employed at the present day by writers of repute in both meanings. Thus, Ferrier's *Institutes of Metaphysics* is occupied solely with the questions connected with knowledge, while Larue's *Theory of Knowing and Being.* On the other hand, Mansel's metaphysics is divided into two parts—Psychology, or the science of the facts of consciousness, which expresses the science of mind generally; and Ontology, or the science of the same facts considered in their relation to realities existing without the mind—that is, the problem of perception, or metaphysics in the narrower sense.

**METAPONTUM, or METAPONTUM,** an ancient city of Magna Graecia, Italy; 24 m. from Tarentum, and 14 from Heraclae. It was founded by an emigrating tribe of the Achaeans as early as 700 B.C., and perhaps before that time. In 415 B.C. we find the inhabitants allies of the Athenians in their invasion of Sicily, and for some time previous the town had evidently been in a condition of constantly increasing prosperity. Here the philosopher Pythagoras spent his last days, and in classical times his tomb was still to be seen. In the wars waged against Rome by Pyrrhus and Hannibal, the Metapontines were hostile to the imperial city. At the end of the war of Pyrrhus they were subjugated completely by the Romans, and in 213 B.C. succeeded in throwing off the yoke by admitting the Carthaginians. When the latter retreated from Italy the Metapontines, fearing the vengeance of Rome, fled with Hannibal; and the city was deserted, and soon fell into ruins, some of which may still be seen.

**METASTASIO** (originally TRAPASSI). Pietro, one of Italy's most admired poets, was b. at Rome in 1698, of humble parentage, and gave early evidence of his genius by his boyish improvisations. Metastasio having attracted the usual notice of Gravina, a famous jurisconsult of the day, the latter undertook the entire education and career of the youth, whose paternal name of Trapassi became henceforward Grecized into Metastasio, both words being identical in signification. The young poet speedily advanced in classical and general knowledge; and to his patron's enthusiastic devotion to the Greek drama may doubtless be traced much of the after-bent of Metastasio's own poetic tastes. By the early death of Gravina, Metastasio was placed in possession of considerable property. In 1724 he published one of his most celebrated dramas, La Didone, which, with Il Catanio and Il Siroc, conferred on the poet a European name. In 1730 Metastasio accepted the post of poet-laureate to the imperial court of Vienna. During his sojourn in Vienna, Metastasio composed his Giuseppe Rencorencio, Il Demofonte, and the Olimpia. He died at Vienna in 1782. Metastasio was distinguished for the generosity, integrity, and candor of his nature, the sincerity of his friendships, and the disinterested warmth of his sentiments. His works are innumerable, embracing 69 dramas, 49 cantatas, besides a vast number of elegies, canzonette, sonnets, and translations. They enjoy unexampled popularity among all grades of his countrymen; in their pure classical subjects and forms
the educated student finds instruction and delight; while their facile musical grace and verbal simplicity adapt them to the popular appreciation of the artless beauties of poetry. The best editions of Metastasio are those of Turin (1757, 14 vols.); Paris (1755, 12 vols.); Paris (1780, 12 vols., large 8vo); Genoa (1802, 6 thick vols.); Mantua (1816-20, 20 vols.).

METASTASIS, a change in the seat of a disease from one part of the body to another. Rheumatism and gout are examples. Muscular rheumatism is more or less movable, changing from one set of muscles to another. Arthritic rheumatism is more liable to change persistently from one joint to another, or it may pass to an analogous tissue in another kind of organ, as to the serous membranes of the heart, or pericardium, constituting cardiac rheumatism, a dangerous affection. Gout is well known for its flights from one point to another. Inflammation of the parotid gland, or mumps (q.v.) is also a metastatic affection. The causes of metastasis are rather obscure, but they are undoubtedly intimately connected with the nervous system, whose terminal fibers, ending as they do in the cellular elements of the tissues, influence, in a great measure, their pathological as well as physiological action.

METAYER (Ital. metà, Fr. moutié, half), in French, is the cultivator of a metairie, or farm, the tenant of which gives the landlord a portion of the produce as his rent. In some of the older French dictionaries, such as that of Trevoux, the word is said to apply to any kind of farmer, but in the oldest dictionary of French and English, Cotgrave's, the word is thus interpreted: "Properly one that takes ground, to the halves, or binds himself by contract to answer unto him of whom he holds them half, or a great part of the profits thereof." The term has lately got a meaning in political economy on account of Sismondi, who has styled the question whether this arrangement between landlord and tenant is not so much more advantageous to anyone, both to the parties immediately concerned and to the public at large, that it ought to be specially encouraged. Sismondi appears to have been the first to open this wide view of the influence of the practice, and he has given a chapter to its consideration in his Political Economy (b. iii. chap. 5). He says what cannot be denied, that such an arrangement was a great improvement on mere serfdom, which gave the cultivator no interest in the produce of his industry. But in giving the reasons for his admiration of the system as one which provides in the general case for the wants of the peasant while relieving him of all anxiety about markets and prices, he admits that a metayer peasantry never advance beyond the humble, happy, and contented lot which immediately falls to them. It is a system, therefore, inconsistent with the application of large capital to cultivation, and consequently with the extraction of the highest value which the soil can yield. A tenant will hesitate to lay £50 worth of guano on his fields if half the additional crop it will bring goes to his landlord. To those who maintain that the moral effect of the system is beneficial, this will be no argument against it, but to the political economist it is an argument against the practicability of the system in a rich money-making agricultural country. Where there is an enterprising peasantry without capital it is a valuable resource; a great portion of the valuable agricultural districts of Scotland were thus brought into cultivation by improvers whose rent was a portion of the crop. But while these very districts in a great measure owe their present prosperity and the existence of a set of capitalist-farmers to such a system of cultivation pursued with more energy than M. Sismondi considers natural to it, there is no doubt that the substitution of such an arrangement for money-rent would now be a very serious waste.

METCALFE, a co. in s. Kentucky, drained by the south fork of Green river, which rises within its limits; 370 sq. m.; pop. '80, 9,423—9,414 of American birth, 1036 colored. Its surface is varied, and largely covered with timber. Its soil is fertile, producing large quantities of tobacco, and suited to the production of wool, sweet-potatoes, the products of the dairy, flax, maple sugar, sorghum, honey, fruit, and every kind of grain. Stock-raising receives much attention, and its grist-mills are run by steam. Seat of justice, Edinburgh.

METCALFE, FREDERICK, b. England, 1817; a distinguished scholar and educator, having pursued the regular course of study at the university of Cambridge, graduated in 1838, and was elected fellow of Lincoln college, Oxford. In 1848 he accepted the position of principal of the Brighton college, an institution founded in 1847 for the sons of noblemen. In 1844 he published a translation of prof. A. Becker's Gallus, or Roman Scenes of the Times of Augustus, with notes and exercises, considered of great historical value; 3d edition, 1853. In 1845 a translation of Becker's Charides, a tale illustrative of private life among the ancient Greeks, with notes and exercises. He was the author of History of German Literature, based on the German work of Vilmar, 1858; other works are The Eonian in Norway, or notes of excursions in that country, 1856, The Eonian in Thleemarkter, 1858, The Eonian in Iceland, 1861, and an adaptation, for use in schools, of Whittaker's edition of Dr. Charles Anthon's Virgil, 1846.

METELLUS, the name of a Roman family of the plebeian gens Cecilia, which rose to be one of the first families of the Roman nobility.—One of the most distinguished members of the family was Quintus Cecilius Metellus Macedonius, who received his surname from his victory over Andriecus, an aspirant to the throne of Macedonia (148 B.C.). His life was considered by ancient writers an example of the greatest felicity.
He died 115 B.C.—Another was Quintus Cæcilius Metellus Numidicus, who twice defeated Jugurtha in Numidia (109 B.C.), and was celebrated for his integrity of character, but was superseded in his command by Marius. His son, Quintus Cæcilius Metellus, surnamed Pius, joined Sulla in 85 B.C., but sought to moderate the severity of his proscriptions. He, too, bore a distinguished character for virtue.—Quintus Cæcilius Metellus Creticus conquered Crete, and reduced it to a Roman province (67 B.C.).—Quintus Cæcilius Metellus Pius Scipio, sometimes called Quintus Scipio, and sometimes Scipio Metellus, was a son of Publius Cornelius Scipio, who was adopted by one of the Metelli, and became the father-in-law of Pompey, and his zealous partisan. He commanded under him at Pharsalus, maintained war on his behalf for some time in Africa; and after the battle of Thapsus (46 B.C.), died by his own hand.

Meteosophy sis. See Transmigration of Souls.

Meteorology (Gr. metéora, meteors, or atmospheric phenomena) was originally applied to the consideration of all appearances in the sky, both astronomical and atmospheric; but the term is now confined to that department of natural philosophy which treats of the phenomena of the atmosphere as regards weather and climate. The leading points of this wide subject will be found under such heads as Aërolites, Atmosphere, Barometer, Boiling, Clouds, Dew, Electricity, Evaporation, Fog, Hailstones, Halos, Hoar-frost, Lightning, Magnetism, Rain, Snow, Storms, etc. We confine ourselves here to a historical sketch of the science.

Owing to the complexity of the phenomena, meteorology is the most difficult and involved of the sciences, and seems, indeed, at first sight, almost incapable of being reduced into system. One must look, therefore, to the unconscious in the first place for the splendid and ever-varying panorama of the sky, and the changes of temperature through the day and the seasons, with all the other elements constituting the weather, and thus powerfully affecting the necessities and comfort of man, are of a nature well fitted to arrest his attention. From the time spent in the open air in the early ages, and from the imperfect protection afforded against the inclemency of the seasons, those appearances which experience proved to precede a change of weather would be eagerly recorded and handed down. In this way, many most valuable facts were ascertained and passed current from hand to hand; and, perhaps, there is no science of which more of the leading facts and inferences have been from so early a period incorporated into popular language.

Aristotle was the first who collected, in his work On Meteors, the present prognostics of the weather. Some of these were derived from the Egyptians, who had studied the science as a branch of astronomy, while a considerable number were the result of his own observation, and bear the mark of his singularly acute and reflective mind. The next writer who took up the subject was Theophrastus, one of Aristotle’s pupils, who classified the opinions commonly received regarding the weather under four heads, viz., the prognostics of rain, of wind, of storm, and of fine weather. The subject was discussed purely in its popular and practical bearings, and no attempt was made to explain phenomena whose occurrence appeared so irregular and capricious. Cicero, Virgil, and a few other writers also wrote on the subject without making any substantial accessions to our knowledge; indeed, the treatise of Theophrastus contains nearly all that was known down to comparatively recent times. Partial explanations were attempted by Aristotle and Lucretius, but as they wanted the elements necessary for such an inquiry, being all but totally ignorant of every department of physical science, their explanations were necessarily vague, and often ridiculous and absurd.

In this dormant condition meteorology remained for ages, and no progress was made till proper instruments were invented for making real observations with regard to the temperature, the pressure, the humidity, and the electricity of the air. The discovery of the weight or pressure of the atmosphere made by Torricelli in 1643 was undoubtedly the first step in the progress of meteorology to the rank of a science. This memorable discovery disclosed what was passing in the more elevated regions of the atmosphere, and thus the elevations and depressions of the barometric column largely extended our knowledge of this subtle element. See Barometer.

The invention and gradual perfecting of the thermometer (q.v.) in the same century, formed another capital step; as without it nothing could be known beyond vague impressions regarding temperature, the most important of all the elements of climate. This great invention soon bore excellent fruit. Fahrenheit constructed small and portable thermometers, which, being carried by medical men and travelers over every part of the world, furnished observations of the most valuable description—the comparative temperature of climates, became known, and the exaggerated accounts of travelers with regard to extreme heat and cold were reduced to their proper meaning. Scarcely less important was the introduction of the hygrometer (q.v.), first systematically used by De Saussure (died 1759), and afterwards improved by Dalton, Daniell, and August. From the period of the invention of these instruments, the number of meteorological observers greatly increased, and a large body of well-authenticated facts of the utmost value was collected. The climates of particular parts of the earth were determined, and
the science made great and rapid advances by the investigations undertaken by distinguished philosophers into the laws which regulate the changes of the atmospheric phenomena.

The theory of the trade-winds was first propounded by George Hadley in the Philosophical Transactions for 1735; and it may be mentioned as a remarkable fact that for about half a century it remained quite unnoticed, when it was independently arrived at by Dalton, and published in his essays.

The publication of Dalton’s Meteorological Essays, in 1793, marks an epoch in meteorology. It is the first instance of the principles of philosophy being brought to bear on the explanation of the intricate phenomena of the atmosphere. The idea that vapor is an independent elastic fluid, and that all elastic fluids, whether alone or mixed, exist independently; the great principles of motion of the atmosphere; the theory of winds, their effect on the barometer, and their relation to the temperature and rain; observations on the height of clouds, on thunder, and on meteors; and the relations of magnetism and the aurora borealis, are some of the important questions discussed in these remarkable essays, with an acuteness, a fullness, and a breadth of view that leave little to be desired.

One of the most interesting and truthful subjects of inquiry that engaged the attention of meteorologists was dew. The observations on this subject were first collected and reduced to a perfect theory by Dr. Wells. See Dew.

In 1839 Daniell published his Meteorological Essays and Observations, which, while adding largely to our knowledge in almost every department of the subject, are chiefly valuable as bearing on the hygroscopy of the atmosphere. Though the practical advantages which he anticipated would flow from it have not been realized, yet this difficult and still obscure department of meteorology stands indebted to him more than to any other philosopher. The law of the diffusion of vapor through the air, its influence on the barometric pressure, and its relations to the other constituents of the atmosphere are among the least satisfactorily determined questions in meteorology. Since this element is so important as an indicator of storms and other changes of the weather, and since so much remains still to be achieved, it is to be hoped that it will soon be more thoroughly investigated. A most important addition has lately been made to our knowledge of the vapor of the atmosphere by Professor Tyndall, in his experiments on radiant heat, especially as regards the gases. The vapor of water is there shown to exert extraordinary energy as a radiant and absorbent of heat; and hence the vapor dissolved in the air acts the part of a covering or protection to the earth. As it is, to some extent, Responsible for air and terrestrial radiation. It follows that the air were quite drained of its moisture, the extremes of heat and cold would be so intense and insufferable that all life would instantly perish, there being no screen shielding the earth from the scorching glare of the sun by day and from the equally scorching and blighting effects of its own radiation by night. It is to be expected that this great discovery will soon throw light on many questions of meteorology.

Electrical observations have been, of all meteorological observations, perhaps the least productive, partly owing to their scantiness, from the expense and trouble attending them, and partly, no doubt, to the free and bad use made of the name of electricity by crude theorists in explaining phenomena of which it would have been wiser to have confessed their ignorance. But the brilliant discoveries which have recently been made on the mutual relations of heat, motion, electricity, magnetism, and the other forces of matter, lead us to indulge the hope that the application of these results to meteorology will be attended with discoveries equally brilliant and important.

Humboldt’s treatise on Isothermal Lines (1817) constitutes a notable epoch in experimental meteorology. Döré has since continued the investigation, and in his splendid work, On the Distribution of Heat on the Surface of the Globe, has given charts of the world, showing the temperature for each month and for the year, and also charts of abnormal temperatures. It is scarcely possible to overestimate the value of this work, for though, to a considerable extent, the lines are hypothetical, there can be no doubt that a close approximation to the march of mean temperature and its distribution over the earth through the year has been arrived at. The idea has been carried out with greater fullness of detail by the United States government in the beautiful and elaborate series of charts of temperature and rainfall given in the Army Meteorological Register for 1855. In these charts the temperature and rainfall in the different seasons for every part of the United States, deduced from accurate observations, may be seen at a glance. Buchan has published isothermals for the British Isles, Mohn for Norway, and Blaufford for Hindustan; and isothermals have been published by the Royal Geographical Society.

The establishment of meteorological societies during the last twenty years must also be commemorated as contributing in a high degree to the solid advancement of the science which, more than any other, must depend on extensive and carefully conducted observation. In this respect, the United States stand pre-eminent, the observers there numbering nearly 800. Great Britain is also well represented in the English and Scottish societies, which together number above 200 observers. In France, Germany, Russia, etc., the science is also being widely cultivated. Owing to the disastrous flooding of the Rhone, an inquiry has been carried on for several years, having for its object the determination of those causes which affect the rainfall in the basins of the Rhone and Saône. Observers in Germany and Great Britain have been secured to co-operate with
the French observers, and under the management of a commission it may be expected that important conclusions respecting the rainfall and the progress of storms will be arrived at, and means devised to avert the calamity of these great floods by timely warning being given of their approach.

The objects of meteorological societies is to ascertain the degrees of heat, cold, and moisture in various localities, and the usual periods of their occurrence, together with their effects on the health of the people and upon the different agricultural productions; and by searching into the laws by which the growth of such products is regulated the agriculturists may be enabled to judge with some degree of certainty whether any given article can be profitably cultivated.

But perhaps none of the arts have benefited to so large an extent by the labors of meteorologists, as navigation. The knowledge thus acquired of the prevailing winds over the different parts of the earth during the different seasons of the year—and the regions of storms and calms—and the laws of storms, have both saved innumerable lives, and by pointing out the most expeditious routes to be followed, shortened voyages to a remarkable degree. In connection with this, the name of Captain Maury (q. v.) deserves special commendation for the signal service he has rendered to navigation.

Another fruit of the multiplication of meteorological stations is the prediction of storms and "forecasts" of the weather, which have been carried on in the United States, and commenced with ability and success by Admiral Fitzroy in England. These "forecasts" are based on telegrams which are received every morning from above forty selected stations in Great Britain and Ireland, and on the continent, from Haparanda as far south as Lisbon. These telegrams give the exact state of the barometer, thermometer, hygrometer, and rain-gauge, with the direction and force of the wind, and appearance of the sky, at each of these forty stations at eight in the morning. In the event of there being any storm or other atmospheric disturbance at one or more of these places, a full and accurate description of it is thus conveyed to London; and it is thence the duty of the officials there to consider the direction in which the storm is moving, so as to enable them to give warning of its approach by special signals. But in addition to warnings of storms, Fitzroy also issued daily "forecasts" of the weather likely to occur in the different districts of Great Britain for the following two days, and which were in like manner founded on the state of the atmosphere at distant points, keeping in view the atmospheric currents known generally to prevail at that particular time of the year.

As the cost of this system was about $2,000 annually, a severe test was applied, at the instance of the Treasury, from July 1861 to June 1862, for the purpose of ascertaining whether the expenditure was justified by the success attending it. During the first six months, 415 signals were hoisted, and in 214 cases a storm occurred where a warning was given. It must not be inferred that in the remaining 199 cases there was no storm anywhere; all that was meant was, that no storm occurred at the places where the signal was given; but a storm may have occurred, and probably did occur, in some other part of the country. Now that the system has been longer in use, the signals are given from a better knowledge of the movements of the atmosphere, so that if the test were again applied, the number of failures would be found to be much fewer. Since the barometric depression is in almost all cases spread over a wider area than the storm which accompanies it, and since the storm occasionally passes into the upper regions of the atmosphere, so as to be less felt on the earth's surface at that place, it is obvious that a considerable time must yet elapse before it is sufficiently known in the centre of the movement of the air to be acquired in order to indicate with certainty the particular places where the storm will break out, and where it will not. The problem to be practically worked out is this: Given the telegrams from the stations showing the exact meteorological conditions prevailing over the included area, with indications of a storm approaching in a certain direction, to determine, not the probable area over which the tempest will sweep, but the precise localities which will altogether escape, the places where the storm will rage, and the places where it will not touch the earth, but pass innocuously into the upper regions of the atmosphere: its continuance, its violence, and the particular directions from which the wind will blow at the places visited by the storm while it lasts. Considerable progress has already been made towards the solution of this difficult problem; and if a complete solution be impossible, such an approximation to a solution will doubtless be arrived at as will render it foolhardy to disregard the warnings given.

But these predictions only extend to a few days. Does the present state of the science afford any grounds to hope that prediction for longer periods will yet be attained? Weather-registers extending over long periods give no countenance whatever to the notion, that there are regularly recurring cycles of weather on which prediction may be based. Further, the manner in which good and bad seasons occur in different places with respect to each other, shows clearly that they have little direct immediate dependence on any of the heavenly bodies, but that they depend directly on terrestrial causes. Thus, while the summer of 1861 was almost unprecedentedly wet and cold in Scotland, the same summer was hot and dry to a degree equally unprecedented on the continent of Europe, and particularly in Italy; and such examples may be multiplied almost ad infinitum.

The assumption that the equatorial and polar currents of wind at any locality may
ultimately balance each other, would appear, from recent observation, to give some ground for prediction extending over considerable intervals. Thus, a wet summer was predicted for Britain in 1862, from the circumstance of a most unusual prevalence of e. winds in the spring of that year. An almost incessant continuance of s.w. winds followed, which discharged themselves in deluges of rain, clouded skies, and a consequent low temperature. As these s.w. winds prevailed till the spring of 1863, less s.w. wind was looked for during the summer, which was thus expected to be fine and warm—a prediction which was realized. This prediction holds in about three cases out of four.

The following are a few standard works on Meteorology, in addition to those already referred to: L. F. Kaemtz's Meteorology, translated from the German (Lond. 1845); Dr. Ernst Erhard Schmid's Lehrbuch der Meteorologie (Leipz. 1858); Professor Espy's Fourth Report on Meteorology (Washington, 1857); Drew's Meteorology, a useful handbook (Lond. 3d ed. 1860); Herschel's Meteorology (1861); D. P. Thomson's Introduction to Meteorology (1849); Buchan's Handy Book of Meteorology (1868); Loomis' Treatise on Meteorology (1868).

METEOROLOGY (ante). The advancement in meteorological science in recent years has been mainly in the direction of the application of the laws of storms to practical use, in foretelling perturbations in the interest of commerce and navigation. In this direction great progress has been made, as to which, see SIGNAL SERVICE OF THE UNITED STATES. From the accumulation of statistics and history in this department, the following information concerning the government and private machinery for meteorological observation in different countries, is compiled: The first international meteorological congress occurred at Vienna, in September, 1873. The eightienth government was represented by delegates officially appointed. This congress had been preceded by the Brussels maritime conference in 1855, the conference at Leipzig in 1857, and the meeting at Bordeaux in the latter year. The object of these meetings was to establish an international and reciprocal meteorological system for the benefit of the countries participating, and indeed of the civilized world. This object was so far effected that a strong interest was awakened in the subject on the part of the different governments, and a permanent committee was appointed which holds annual meetings. Among those— and chief among them—who have labored unselfishly to awaken interest in the study of the laws of storms should be ever remembered the names of Redfield, Espy, Fitzroy, Reid, and Maury; besides Humboldt, Dove, Ritter, Sabine, Künz, and Herschel, who preceded them in the same field. Through the efforts of some of these meteorologists the information gained by the experience of navigators has been collated and analyzed, and a very complete knowledge of ocean currents is now has been obtained; while the storms of the Indian ocean and the laws of cyclones have been studied by Meldrum, with the assistance of the Mauritius meteorological society, to the great advantage of the world's information on the science. The first effort in the direction of making regular meteorological observations in the United States was made in 1818 at military posts, under the direction of surgeon-general Lovell, and as these are still continued, they form the oldest unbroken national series of the kind in existence. Certain of the states afterwards entertained the idea, and New York from 1825-1863, Pennsylvania 1886-1842, Ohio in 1843, and Illinois in 1856, formed organizations for the same purpose, but which have all been discontinued. Besides the information obtained from these sources, there has been much service performed in a desultory way by the Franklin institute, Smithsonian institution, state boards of health, agricultural and geological societies, and other organizations, as well as by special expeditions. Half a century ago, James P. Espy, an enthusiast, as well as a clear-headed observer, devoted himself to the study of meteorology, and by lectures and writings sought to popularize the subject. In 1836 he wrote a memoir which gained for him the Magellanic premium awarded by the American philosophical society; and in 1841 appeared his Philosophy of Storms, which publication completely revolutionized the sum of scientific opinion on the subject. The following year he was appointed meteorologist in the surgeon-general's office of the war department, and having already begun the practice of weather-mapping, he continued it daily. His first published report in 1843 is acknowledged to have been "by far the most important contribution to our knowledge of storms that had then been made by any government in the world." This was in 1843; and on Mr. Espy being transferred to the navy department, he published two other reports, dated 1849 and 1851 respectively. His fourth report was made to the U. S. Senate in 1854. Mr. Espy died in 1857, at the age of 72, having devoted forty years of his life to meteorological study and investigation. Thus much is here given concerning this remarkable man, because of the influence which he exerted, and which derived great good from the timely impetus which resulted from his being in the front rank among those nations that have given its due importance to the study of meteorology. This study, with its accompanying record of observation, is prosecuted in the United States at the following points. 1. The independent observatories at Cambridge, Washington, Albany, and New York Central Park. 2. The state weather services of Iowa, receiving reports from 80 observers; Missouri, with 100 observers; and Nebraska; which all publish monthly reviews and annual reports. 3. The state boards of health for Michigan, New Jersey, etc. 4. The state boards of agriculture for Illinois,
Meteorology.

Ohio, etc. 5. The state schools of agriculture at Lansing, Mich., and Boston and Amherst, Mass. 6. The Central Pacific railroad company land office, which receives reports from 120 stations. 7. The army engineer bureau lake survey, which has maintained 8 or 10 important stations on the lakes. 8. The geological and geographical surveys of western territories (Wheeler's, Hayden's, Powell's, etc.), and the U. S. coast survey. 9. The hydrographic office of the navy department, which maintains an hourly series of observations on every vessel in commission, and at all naval stations, and publishes important charts relating to ocean meteorology. 10. The army surgeon-general's office, the Smithsonian Institution, and the agricultural department. Of these three the first continues its observations and the second its publications, although most of the data are transferred to the army signal office. 11. The army signal office, division of reports and telegrams for the benefit of commerce and agriculture. This last-named organization, whose meteorological work began by order of congress in February, 1870, far exceeds in importance, the number of its stations, and the extent of its operations, any mercantile or official one in the world. It maintains a station at 30 river, and about 10 temporary West India stations. It also receives reports from 95 army-post surgeons, 300 voluntary civilian or Smithsonian observers, 120 railroad employees (mostly in California), about 150 observers through the state organizations in Iowa, Missouri, and Kansas, about 40 vessels and stations of the navy, about 20 merchant vessels through their respective owners, and about 390 foreign stations through the central offices of their respective countries. Rainfall reports are thus obtained from about 870 stations within the United States. It publishes a tri-weekly bulletin and map, with predictions based on tri-daily telegraphic reports from 35 additional stations; displays cautionary storm-signals at about 80 coast stations; bulletins the state of the rivers and coming floods; distributes farmers' bulletins or predictions to over 6,000 post-offices; furnishes special predictions to several hundred railroad telegraph offices; and publishes a weekly weather chronicle, a monthly weather review with charts of American storms, temperature, and ocean storms, and an annual report. It also prints for exchange a daily bulletin of international simultaneous observations, with daily chart of the weather, temperature, and pressure throughout the northern hemisphere. This is based on about 700 reports from land and sea contributed by all nations, and made simultaneously with those that are made at 7 h. 35 m. A.M. at Washington, or 12 h. 43 m. P.M. at Greenwich. In the prosecution of its meteorological work and in order to carry out the system of frontier defenses, and in cooperation with the life-saving service on the United States coast, the signal service also builds and maintains lines of telegraph, of which it now controls about 3,000 m. on the Atlantic coast and in the s.w. and n.w. territories. The service employs the whole time of about 15 officers and 475 men, and a portion of the time of about 150 others. The meteorological service of foreign countries is now sustained as follows (1878): West Indies.—Numerous stations are supported in these islands by the respective home governments. The U. S. signal service maintains about 10 stations during the hurricane season. The principal independent stations are at Havana, Cuba; Kingston, Jamaica; and in Barbadoes and Porto Rico. Great Britain.—The meteorological committee of the royal society have charge of the meteorological work in each office in London. There are 7 stations properly equipped, receiving telegraphic reports from 29 British stations, and publishing daily weather-maps, bulletins, storm-warnings and signals, quarterly and annual reports, etc. It receives observations from several hundred vessels at sea, and from about 80 voluntary observers on land, besides minor stations. The medical department of the army also maintains observers at the forts throughout the British colonies, some of which report to the London office. The royal engineers and ordnance survey offices also maintain several stations. The different meteorological societies of the empire publish memoirs which contain reports from different stations. Wind and current charts and pilot charts are published by the hydrographer to the admiralty, based on observations made on shipboard. France.—Observations are maintained since 1878 by the bureau central de météorologie, the departments of France publishing their separate organizations. The meteorological association of France has its own station. It publishes the bulletin meteorologique et hydrographique, a monthly bulletin of storm-warnings, and in conjunction with the association scientifique de France, issues the annual volumes of the Atlas météorologique de France. The meteorological association corresponds with about 50 observers in different parts of the world. Germany.—The headquarters of the meteorological system is in Hamburg, and maintains about 40 stations (27 telegraphic), publishes daily weather-maps and predictions, storm-warnings, and monthly weather reviews, and receives a large number of logs from German vessels. The German forest commission maintains several stations for meteorological observations. There are subordinate organizations with stations in Bavaria, Baden, Prussia, Saxony, and Württemberg; with headquarters respectively at Munich, Carlsruhe, Berlin, Leipsic, and Stuttgart. The whole number of well-equipped stations in Germany is about 200, and slowly increasing. Russia.—Observations are made at most of the universities, and published in full independently at Dorpat, Helsingfors, Tiflis, and Moscow. The central office at Peterhagag publishes reports from various stations provided with 50 telegraphic), 220 rainfall, and 310 thunder-storm stations, distributed throughout the Russian possessions, abstracts of which are published annually. The central office publishes a daily telegraphic bulletin, displays storm-signals, and publishes volumes of memoirs and investigations. The academy of sciences and the geographical society of
Meteorology,
in the advancement of the study. Italy.—Numerous independent meteorological organiza-
tions exist, the Italian alpine club publishing observations made at about 70 stations; and
the observatories at Moncalieri, Turin, Pesaro, Venice, Naples, and Rome, issuing
their own observations. A general Italian meteorological association was organized in
1877. Spain.—The central meteorological office is at Madrid, and receives reports from
30 home stations including Portugal (26 telegraphic), all of which are published annually.
A daily telegraph bulletin is published, and storm-warnings are issued when sent from
Paris or London. In the Spanish colonies, the most important stations are at Manila
and Porto Rico. Portugal.—The meteorological observatory at Lisbon receives reports
from 5 home and as many colonial stations, and from the vessels of the Portuguese navy.
The observations made at Coimbra and Lisbon are published in full. It publishes a daily
telegraphic bulletin (10 telegraphic stations), and repeats the storm-warnings sent from
London and the Belgian observatory at Brussels receives reports by telegraph from 4 stations, and publishes daily weather maps and predictions, annual
volumes of its own detailed observations, and of 4 Belgic and 4 Dutch international and
of 35 Belgie climatological stations; also an annuaire. Austria and Hungary.—The cen-
tral meteorological institution at Vienna has charge of all observations made in the
empire, and receives reports from about 275 stations (26 by telegraph, daily); it publishes a
daily bulletin, storm-warning signals, and annual volume of observations. In Bohemia,
there are about 50 rainfall stations, and a similar system is arranged for Styria. The
hydrographic office has charge of marine meteorology, with a school at Trieste and
observatory at Pola. There are also independent observatories at Cracow, Prague, and
Vienna, which publish their own observations. The central magnetic and
meteorological institution for Hungary is at Buda-Pesth, and was founded in
1870. It publishes annually reports from about 100 stations, mostly well-equipped.
A summary for 33 stations in Carinthia is published monthly at Klagenfurst, and
those of the remaining stations are published separately.
The Royal Meteorological Society of Great Britain has 30 full stations (7 telegraphic), 10 lighthouses, and a large number of minor stations, and
logs of vessels. A telegraphic daily bulletin has been published since 1861. The meteo-
rological observatory at Christiania was founded in 1836. Sweden.—About 30 stations
(9 telegraphic) and several naval vessels report to the central meteorological institute
at Stockholm, which publishes a daily telegraphic bulletin and annual volumes. The Lund and Upsala observatories publish their own observations separately.
Switzerland.—The central institute for Swiss meteorology has its seat at Zürich, and
publishes in full the observations at about 15 stations. The total number of reporting
stations is about 80. The observatories at Bern and Geneva publish their own work in
detail. The central office is maintained by the Swiss association and not by the state.
There are stations in Africa—in the Transvaal, at Zanzibar, Natal, and other places,
besides those in the large colonies; in Algeria observations are made under the direction
of the military authorities, a daily weather bulletin and chart are published, and about
20 observing stations are maintained; at Cape Colony there is a meteorological observa-
tory, the observations of which were sent from 30 or 40 stations: the royal observatory at Cape Town maintains an independent series of observations.
Australia.—The several provincial governments maintain systems at Queensland, 5 tele-
graphic stations; New South Wales, 190 stations (35 telegraphic); South Australia, 110
stations (5 telegraphic); Victoria, about 40 stations (27 telegraphic). The central offices
of these are at Brisbane, Sydney, Adelaide, and Melbourne; there are also individual
stations at Melbourne, Windsor, and Hobart Town, which publish their own obser-
vations. Ceylon.—About 30 stations report to the surveyor-general at Colombo, and
the reports are partially published. China.—Instruments for equipping about 20 stations
were obtained in 1874, but we have no reports. Egypt.—The principal service is that of
the lighthouse keepers, though observations are made at the observatories near Cairo and
at Alexandria, and on the Suez canal. Japan.—Observations are made at the imperial
observatory and at the imperial colleges of mining and engineering, and a system of
station meteorology will be established; there are meteorological stations kept or
received from about 150 equipped stations. New Zealand.—About 20 meteorological stations are
maintained. Philippine islands.—The observatory of the Jesuit college at Manila,
in Luzon, is the only station permanently occupied, and publishes annually its obser-
vations. Netherlands.—The central meteorological institute maintains 14 full and 23
minor stations (4 telegraphic), issues storm-warnings, and publishes annual volumes.
There are a large number of rainfall stations. Its most important colonial station is at
Batavia. Denmark.—The royal Danish meteorological institute receives reports from 13
principal (8 by telegraph) and 70 minor stations in Denmark, also 5 from Iceland and 5 from
Greenland. It publishes daily bulletins, annual volumes, and a daily chart of the
Atlantic ocean. Finland.—The scientific association at Helsingfors maintains 22
stations and publishes its own results. The observatory at Helsingfors is independently
maintained. India.—The provinces of Bengal, the Punjab, the North-West, Madras,
eastern and western, and of meteorology in 1875. In 1875 a general
meteorological office was established in the department of revenue, agriculture, and
commerce. About 300 stations report by mail to the head of this office daily, and about 50
by telegraph. It publishes daily, weekly, and monthly bulletins, and special storm-
warnings. Chili.—An extensive system of observations is maintained at Santiago,

Meteor. Meter.

receiving regular reports from 13 or more stations. Costa Rica.—There is a central office for statistics and meteorological observations, and a station at the capital. Argentine Republic.—The meteorological office is attached to the astronomical observatory, about 30 voluntary observers reporting. There are also scattered stations in South America, at Quito, Lima, Rio Janeiro, Georgetown, Surinam, and Trinidad, Mexico.—A central office in the capital publishes a daily telegraphic bulletin from about 30 stations, and monthly summaries. Canada and Newfoundland.—The Canadian meteorological office is under the minister of the marine, who receives reports from about 20 first-class (14 by telegraph) and about 140 minor stations, distributed throughout the British possessions. It issues daily weather predictions and storm-warnings, and displays storm-signals. Turkey.—The central observatory at Constantinople receives reports from about 30 stations, publishes a daily telegraphic bulletin of 17 stations, and its own observations in full, and issues storm-warnings. Syria.—Observations are maintained at the Syrian college (Protestant mission) in Beyrout, and a more extended system is understood to have been recently organized under the British and American "Palestine Exploration" societies. Mauritius.—The meteorological association of Mauritius was established in the year 1851. It has published irregularly monthly notices, maintains a large number of rainfall stations, and gives warning of such storms as are evidently about to make themselves felt in the vicinity of the island. Beyond this there is no mention of any meteorological work progressing here.

**METEORS.** The whole subject of meteors was treated in the body of the work under the head of  \textit{Siderolites}. The subject, however, has since occupied a great deal of attention, and there is at present a tendency on the part of astronomers and physicists to separate that class of meteors known as "shooting-stars" from the group of \textit{siderolites} (which includes \textit{aëro-siderites}, or masses of meteoric iron; \textit{siderolites}, which are conglomerates of iron and stone; and \textit{aërolites}, which are wholly of stone), on the grounds that the most prominent appearances of the former are \textit{periodic}, while the latter seem to occur at irregular intervals, and that the former have hitherto not been \textit{proved} to leave any traces of their visit on the earth's surface. We are, however, hardly as yet in a position to decide as to the similarity or dissimilarity of the two classes of bodies.

Popular interest has been largely aroused respecting "shooting-stars," by reason of the brilliant display of them which took place on the night of Nov. 13, 1866. This "star-shower," the grandest that has ever been observed in Britain, was confidentially predicted, from the occurrence of a similar shower at the corresponding date in 1799, 1833, and 1834; and the extremely favorable state of the atmosphere rewarded those who were on the watch with a complete view of one of nature's most magnificent displays. The shower commenced about 11½ P.M., with the appearance at brief intervals of single meteors; then they came in twos and threes, steadily and rapidly increasing in number till 1h. 15m. A.M. on Nov. 14, when no fewer than 57 appeared in one minute. From this time the intensity of the shower diminished gradually, wholly ceasing about 4 A.M. The total number of meteors which at that time came within the limits of the earth's atmosphere was estimated at about 240,000, and the number seen at each of the several observatories in Britain averaged nearly 2,000. This star-shower, like those of 1833 and 1834, seemed to proceed from the region of the heavens marked by the stars ζ and γ in the constellation Leo; and it has been shown by astronomers that this was the point towards which the earth in her orbit was moving at the time; consequently, she had either overtaken the meteoric shower or had "met" it proceeding in a contrary direction. The meteors on that occasion presented the usual variety of color, size, and duration; the great majority were white, with a bluish or yellowish tinge; a considerable number were red and orange; and a few were blue; many surpassed the fixed stars in luster, and some were even brighter than Venus (the most brilliant planet as seen from the earth) at her maximum. Most of the meteors left trains of vivid green light 5° to 15° in length, which marked their course through the heavens, and endured for 3° on an average, then becoming dissipated; though some of the trains were almost 40° in length, and remained in sight for several minutes. Prof. Airy observed that the direction of the meteors' flight was little influenced by the earth's attraction, and on the morning of Nov. 14, 1866, a star-shower equal in magnitude to that of 1866 was observed in France and America, but was almost wholly invisible in Britain, on account of the cloudy state of the atmosphere.

The brilliant display of 1866 gave a vigorous impulse to the astronomical investigation of shooting-stars, and it is now generally agreed that the November meteors move in an orbit round the sun, inclined at about 7° to that of the earth, and that, in all probably, this orbit forms a ring or belt of innumerable small fragments of matter, distributed with very variable density of grouping along it, thus corresponding so far to the planetoid (q.v.) group between Mars and Jupiter. It is also agreed that the motion of this meteor ring round the sun is retrograde; that the earth's orbit at that point where she is situated on Nov. 13–14 intersects this ring; and that, probably, in 1799, 1833–34, and 1866–67, it is the same group of meteors which has been observed; and the last-mentioned hypothesis has been made the foundation of a calculation of the probable orbit and periodic time of this meteor-ring. The fact that a November star-shower
Meteors.

Meter.

This page contains a series of text blocks discussing meteor phenomena, including the nature of meteors, their orbits, and the meteor showers that occur. The text references various scientists and observations, such as Prof. Newton, Mr. Herschel, and the meteorologist Herschel, who discusses the origin of meteors as recent fragments from the solar system. The text also mentions the periodic nature of meteor showers and the work of other scientists like F. W. Peters of Altona, who studied the periodicity of certain showers.

The text further discusses the brightening of meteors, their rapid dissipation, and the heat and expansion they cause upon entering the atmosphere. It also touches on the nature of the atmosphere and the resistance it offers to meteoric bodies, explaining why certain meteor showers are more intense than others. The text concludes with a mention of the seasonal variations in meteor activity and the role of the Earth's orbit in the occurrence of meteor showers.

This page is rich in scientific content, providing insights into the meteorological and astronomical phenomena of the time. It highlights the interdisciplinary nature of science during the 19th century, where astronomers, meteorologists, and physicists collaborated to understand these natural occurrences.
another; although this is not at all essential to the notion of meter. See *RHYME*, *Blank Verse*. In the classic languages, meter depended upon the way in which long and short syllables were made to succeed one another. English meter depends, not upon the distinction of long and short, but upon that of accented and unaccented syllables. Thus, in the lines,

The cu'rifew to'lls | the kne'll | of pa'ting da'y.—
War'riors and | chief's, should the | shaft or the | s'word—

the accents occur at regular intervals; and the groups of syllables thus formed constitute each a meter or measure. The groups of long and short syllables composing the meters of classic verse were called *feet*, each foot having a distinctive name. The same names are sometimes applied to English measures, an accented syllable in English being held to be equivalent to a long syllable in Latin or Greek, and an unaccented syllable to a short.

Every meter in English contains one accented syllable, and either one or two unaccented syllables. As the accent may be on the first, second, or third syllable of the group, there thus arise five distinct measures, two dissyllabic and three trisyllabic, as seen in the words—1, fo'ly (corresponding to the classic Trochee); 2, recall (Iambus); 3, terribly (Dactyle); 4, con'tu'sion (Amphibrachys); 5, absentee' (Anapaest).

These measures are arranged in *lines* or *verses*, varying in length in different pieces, and often in the same piece. The ending measure of a line is frequently incomplete, or has a supernumerary syllable; and sometimes one measure is substituted for another. All that is necessary is, that some one measure be so predominant as to give a character to the verse. Constant recurrence of the same measure produces monotony. The following lines exemplify the five measures:

1st Measure.
Rich the | trea'sure.
Be'teris'i'xty | yea'rs of | Eu'rope | tha'n a | cy'cle | of Cal'tha'y.

2d Measure.
Alo'ft | in a'wiful sta'te.
The pro'per stu'dy of | nauk'i'nd | is ma'n.

3d Measure.
Bird of the | wil'derness.
War'riors and | chief's, should the | shaft or the | s'word.

4th Measure.
The de'w of | the mo'ning.
O you'ng Loch'jina'v r has | come out of | the we'st.

5th Measure.
As they ro'ar | on the sho're.
The Ass'y'ril'an came do'wn | like a w'olf | on the fo'ld.

It is instinctively felt that some of these measures are better suited for particular subjects than others. Thus, the first has a brisk, abrupt, energetic character, agreeing well with lively and gay subjects, and also with the intense feeling of such pieces as *Soots rgba ha'e*. The second is by far the most usual meter in English poetry; it occurs, in fact, most frequently in the ordinary prose-movement of the language. It is smooth, graceful, and stately; readily adapting itself to easy narrative, and the expression of the gentler feelings, or to the treatment of severe and sublime subjects. The trisyllabic meters, owing to the number of unaccented syllables in them, are rapid in their movement, and calculated to expresses rushing, bounding, impetuous feelings. They are all less regular than the dissyllabic meters. One of them is frequently substituted for another, as in the opening of Byron's *Bride of Abydos*:

Kno'w ye the | la'nd where the | cy'press and | my'rtle
Are c'mblems | of dee'ds that | are do'ne in | their cli'me;
Where the ra'ge | of the vul'ture, the lo've | of the tu'rite—

where each of the three lines is in a different meter. In addition to this irregularity, one of the unaccented syllables is often wanting. For instance, in Mrs. Hemans's poem, *The Voice of Spring*:

I co'me, | I co'me | ye have ca'lled | me lo'ng;
I co'me | o'er the mou'ntains with li'ght | and so'ng—

the first line has only one measure of three syllables, although the general character of the versification is trisyllabic.

In a kind of verse introduced by Coleridge, and used occasionally by Byron and others, the unaccented syllables are altogether left out of account, and the versification is made to depend upon having a regular number of accents in the line:
Here there are four accents in each line, but the number of syllables varies from eight to eleven.

To scan a line or group of lines, is to divide it into the measures of which it is composed.

The variety of combinations of meters and rhymes that may be formed is endless; but a few of the more usual forms of English versification have received special names, and these we may briefly notice.

Octosyllabics are verses made up each of four measures of the second kind of meter, and therefore containing eight (octo) syllables:

With fru’tless la’bor, Cla’ira bou’nd
And stro’ve | to sta’nch | the gu’shing wou’nd.

Scott’s poems are mostly in octosyllabics, and so is Hudibras, and many other pieces.

Heroic is a term applied to verses containing five measures of the second kind, or ten syllables. Heroics either rhyme in couples, or are without rhymes, constituting blank verse. Many of the chief narrative and didactic poems in the English language are in rhyming heroics; as those of Chaucer, Dryden, Pope, Cowper, etc. Milton’s two great poems, Young’s Night Thoughts, Thoinson’s Seasons, Cowper’s Task, Wordsworth’s Excursion, and many others, are written in blank heroics. Metrical dramas are almost always in blank verse; in which case there is frequently a supernumerary syllable, or even two, at the end of the line:

To be, | or not | to be, | that is | the question:
Whether | ’tis nobler in | the mind | to suffer.

In Elegiacs, the lines are of the same length and the same measure as in heroics; but the rhymes are alternate, and divide the poem into quatrains or stanzas of four lines, as in Gray’s Elegy. The Spenserian stanza, popularized by Spenser in the Fairy Queen, and much used by Byron, differs from common heroics only in the arrangement of the rhymes, and in concluding with an Alexandrine (q.v.)

Service meter, also called common meter, is the form of versification adopted in the metrical Psalms, in many hymns, and other lyrical pieces. From being frequently employed in ballads, this meter is also called ballad meter. The first and third lines often rhyme, as well as the second and fourth.

Such are some of the more usual and definite forms of versification. In many poems, especially the more recent ones, so much license is assumed, that it is difficult to trace any regular recurrence or other law determining the changes of meter, or the lengths of the lines; the poet seeks to suit the modulation at every turn to the varying sentiments. But it may be questioned whether much of this refinement of art is not thrown away, upon ordinary readers at least, who, falling to perceive any special suitableness, are inclined to look upon those violent departures from accustomed regularity as the results of caprice.

The kind of verse called hexameter is described under its own name.

METER, the basis of the “metrical” or modern French system of weights and measures, and the unit of length. The first suggestion of a change in the previous system dates as far back as the time of Philippe le Bel; but up till 1790 no important change had been effected. On May 8, 1790, proposals were made by the French government to the British, for the meeting of an equal number of members from the academy of sciences and the royal society of London, to determine the length of the simple pendulum vibrating seconds in lat. 45° at the level of the sea, with the view of making this the unit of a new system of measures. The British government, however, did not give this proposal a favorable reception, and it fell to the ground. The French government, impatient to effect a reform, obtained the appointment by the academy of sciences of a commission composed of Borda, Lagrange, Laplace, Monge, and Condorcet, to choose from the following three, the length of the pendulum, of the fourth part of the equator, and of the fourth part of the meridian, the one best fitted for their purpose. The commission decided in favor of the last—resolving that the \( \text{breadth of a quadrant of the meridian} \) (the distance from the equator to the pole, measured as along the surface of still water) be taken for the basis of the new system, and be called a “meter.” Delambre and Mechan were immediately charged with the measurement of the meridian between Dunkerque and Barcelona; and the result of their labors was referred to a committee of 20 members, 9 of whom were French, the rest having been deputed by the governments of Holland, Savoy, Denmark, Spain, Tuscany, and the Roman, Cisalpine, Ligurian, and Helvetic republics. By this committee the length of the meter was found to be 443.296 Parisian lines, or 39.3707964 English inches; and standards of it and of the kilogram (see Gram) were constructed, and deposited among the archives of France, where they still remain. The “metrical system” received legal sanction Nov. 2, 1801. The
following are the multiples and fractions of the meter which are in common use, expressed in English measure:

<table>

From the meter the other principal units of measure and weight are at once derived, See Are, Liter, Gram, Franc.

METER (ante). It is probably that in reality the meter of the French archives is not exactly what it was supposed when determined; for the measurement was made upon the supposition that the earth is a regular spheroid having an ellipticity of \( \frac{1}{297} \), but it is more probable according to the investigations of gen. Schubert of the Russian army and capt. Clarke of the British ordnance survey that it has three unequal axes, and that the Paris meridian is a very little longer than was computed by the French mathematicians. Their measurements were accurate and the computations upon them, but they measured only one meridian, that of Paris, and from this deduced the length of the quadrant. It has, however, been computed that if there be an error in the calculation of the French meridian, the prototype meter of the archives is as near as possible the \( \frac{1000000}{3937079} \) part of the quadrant of the meridian which passes through New York.

In consequence of the discussion it was deemed advisable to have a meeting of an international commission to settle the question; 30 independent powers were represented in the commission which assembled at Paris in 1870. Their deliberations were interrupted by the Franco-Russian war, but were resumed, and resulted in an international convention which established at Paris an international bureau of weights and measures supported by contributions of the participating powers. This bureau was given the care of the prototype standards, and other matters connected with the establishment of the system, and its adoption by other powers. The commission came to the conclusion that the prototype meter, and also the kilogram of the archives, shall be recognized as standards irrespective of any doubts as to their variation from the theoretical value of the Paris meridian. See METRIC SYSTEM.

METER, GAS. See GAS, LIGHTING MY, ante.

METHODOIST CHURCH, FREE, organized in 1860 at Pekin, N. Y., by a convention of ministers and laymen who were, or had been, members of the Methodist Episcopal church. The various reasons which led to the movement may be summed up in the conviction avowed that the Methodist church had declined from its original simplicity and spirituality. In proof of this it was alleged that many converts had been received without sufficient evidence of repentance and conversion, that worldly practices were tolerated, and engaging in unlawful business was allowed; that the direct witness of the spirit was wanting in many professors Methodists; that power over all sin was not possessed, and that, while entire sanctification was not often even professedly attained, the preaching concerning it was widely divergent and contradictory; that discipline was generally neglected, and by some abandoned; that simplicity in dress had given place to fashionable attire; that free seats had been exchanged for pews; that choirs and organs had broken up congregational praise; that sermons were often read instead of being preached; that very costly church edifices were built and church fairs held; and that oath-bound fellowship in secret societies with irreligious men was tolerated, and even encouraged. In the new organization, bishops were exchanged for general superintendents, to be elected every four years. Quadrennial, annual, quarterly, and district conferences are held, and lay delegates equal in number to the ministers are admitted. The official board is retained. Attendance at class meetings is made a condition of church membership. The preachers in charge nominate, and the classes elect their leaders. The office of presiding elder is retained under the name of district chairman. The articles of faith are the same as those of the Methodist Episcopal church, with two additional: one designed to give emphasis to the doctrine of entire sanctification, and the other to that of endless future rewards and punishment. No persons are admitted to church membership, even on probation, without professing to exercise saving faith in Christ. All members are also required to lay aside all superfluous ornaments of dress, to abstain from the use of intoxicating beverages and of tobacco, and not to join any society requiring an oath, affirmation, or promise of secrecy as a condition of membership. The denomination has made some progress and cherishes the hope of reviving the spirit of primitive Methodism. Their religious services have much of the early warmth and zeal, and congregational singing is universally practiced among them. They have two literary institutions, one at North Chil, N. Y., and the other at Spring Arbor, Mich.; they are conducted in strict accordance with the principles of the denomination, and are making fair progress. The work of the church has been among the poor.
and less educated classes, whence chiefly their ministers have been taken. They have not as yet had time to opportunity to build up a denominational literature. A monthly magazine entitled The Earnest Christian, and a weekly paper, The Free Methodist, are well sustained. Several writers of considerable practical power are highly esteemed within and beyond the denomination. In 1880 they reported 271 itinerant ministers, 328 local preachers, and 12,642 lay members.

METHODIST EPISCOPAL CHURCH (Methodists, ante) is the name assumed by the Wesleyan Methodists in this country when, after the attainment of national independence, they were organized as a denomination, under rules proposed by John Wesley and adopted by themselves. 1. Their doctrine is set forth in 25 articles, formed several of the others, with the design to offer a broad and liberal basis on which the general body of evangelical Christians might unite together in brotherly love. Since 1834 a restrictive rule has removed from the authorities of the church all power to revoke, alter, or change these articles of religion; or to establish any new standards or rules of doctrine contrary to the existing and established doctrinal standards. Their theology is styled by themselves "Arminian," according to what they consider the true import of the name as exhibited in Wesley's doctrinal sermons, Notes on the New Testament, and other writings. They adopt his doctrine concerning the "witness of the Spirit," called by many "assurance"—which he defines as "an inward impression on the soul, whereby the spirit of God immediately and directly witnesses to my spirit that I am a child of God; that Jesus Christ hath loved me and given himself for me; that all my sins are blotted out, and I, even I, am reconciled to God," and in making this impression Wesley supposes that the Holy Spirit "works upon the soul by his immediate influence, and by a strong, though inexplicable, operation." They generally hold, also, the doctrine which many call "sanctification," or, as Wesley preferred to say, "Christian perfection," and which, as the intelligent among them affirm, negatively "teaches no state, attainable in this life, like that of the angels, or of Adam in paradise, or in which there is an exemption from mistakes, ignorance, infirmities, or temptations," but positively, "that all saints may, by faith, be so filled with the Spirit, that all the powers of the soul shall be recovered from the abnormal, perverted, sinful condition, and, together with the outward conduct, be controlled in entire harmony with love.

II. The government of the Methodist church is administered in a series of 5 conferences (see CONFERENCES OF THE METHODIST EPISCOPAL CHURCH), in addition to which the leaders' and stewards' meeting, presided over by the pastor and consisting of all the class leaders and stewards of his charge, have important functions connected with the well being and efficiency of each particular church. Evangelization, to extend the work, and supervision, to secure firmly all advantages gained, were at the beginning the two fundamental principles adopted, and they are still diligently maintained. The bishops preside in the conferences; form the districts according to their judgment; appoint the preachers to their fields, permitting none to continue more than three successive years in the same charge, except the presiding elders, whose term may extend to four years, and a few others by special appointment; ordain deacons, elders, and bishops newly elected; travel through the country, to make inspection of the church, and, in case of need, to preside in the general conference, the spiritual and temporal affairs of the church. They have no particular dioceses, but exercise a joint jurisdiction over the whole church as an itinerant general superintendency. They annually arrange and divide the work among themselves, being responsible for its performance to the general conference, by which they are elected and have their respective residences assigned. As an elder was originally put in charge of a district containing several circuits, he was practically a presiding officer over them. Thus the office of presiding elder was gradually established, and became very useful. It is a sub-episcopate, charged with the duties of oversight and administration in a limited sphere, and makes the ecclesiastical system complete and strong. Their intimate acquaintance in their districts with both pastors and people, and their presidency in the quarterly conferences, enable the presiding elders to give valuable information and counsel to the bishop in arranging the appointments. In doing this, usage makes them the bishop's assistants in many particulars, as in the church-at-large, with whom the chief responsibility of the appointments on the bishop. Candidates for admission to an annual conference are put on probation for two years in the itinerant work, and are subjected to a thorough examination in prescribed studies; and all who are approved in these trials are ordained deacons; and in two years more, if they complete the required studies, they are ordained as elders. The former administer baptism, solemnize marriage, assist elders in administering the Lord's-supper, and perform all the duties of a traveling preacher; and the latter, in addition to these, administer the Lord's-supper. An elder, deacon, or preacher, may be in charge of a circuit or station with similar functions, except as to the administration of the sacrament. He is the chief executive officer of the local church, charged with the care of its interests according to the requirements of the discipline; and is responsible to the annual conference for his fidelity in performing all his ministerial duties, and for his moral deportment. In subordination to him, class leaders, or sub-pastors, have the special oversight of small portions of the church members whom they meet weekly for "social religious worship, and for instruction,

U. K. IX.—48
encouragement, and admonition.” Local preachers have a share in the acts of the district and quarterly conferences; and as a lay ministry form a body of self-supporting evangelists more numerous than “the itinerancy,” which, in many sections of the church and various phases of society, has been very useful. All church buildings and parsonages belong to the local society, and are held by trustees chosen according to the law of the state or territory wherever a particular mode is prescribed, and in other cases by the quarterly conference. Admission to membership in the church is preceded by a probation of six months or longer, as may be determined in particular cases, after which the probationer may be admitted to full membership by complying with the rules prescribed. Members of other evangelical churches, coming with proper testimonials, are received into fellowship without probation. 1. Pioneer Work. Methodists say the historian of the church presents the church as a missionary body, with all the necessary functions and functionaries of such a body; the only one of Protestant denomination, for the colonial fragments of the English establishment, had not yet been reorganized. Led by their bishops, the itinerants went forward in their work, convinced, as they said, “that they were raised up to reform the continent, and to spread scriptural holiness over these lands.” Thus, “feeling that their one great work was to save souls,” they retained and built up what had already been gained, and, pressing on into new fields, preached wherever hearers could be found. Crossing the Alleghenies they were always with the advance, and were soon found also in New England, Canada, and Nova Scotia. Gowns and prayer-books obstructed their progress and were therefore abandoned. Their system was, in a great degree, constructed to meet the exigencies of the work. Their “class and prayer meetings trained most, if not all, the laity to practical missionary labor, and three or four of them, meeting in any distant part of the field, in a small room or corner at the time, were prepared in a short time to become the nucleus of a church. The lay or local ministry, born out of the tide of population, were found almost everywhere, prior to the arrival of regular preachers ready to sustain religious services—the pioneers of the church in every new field.” At the end of the century they had increased their 15,000 members to 65,000 and their 80 itinerants to 280, besides many who, physically unequal to the strain of the advance, still did their utmost in easier fields. Bishop Coke’s stay in the country was only for limited periods, and after 1787 some of the more arduous portions of the episcopal labors devolved on bishop Asbury alone, who was the chief apostle of the church, consecrating to the work all his powers, making himself an example to all in self-denying toil, giving personal attention to minute details, and visiting much from house to house. One of the first Sunday-schools in America was organized by him in 1786. and four years after the conference-ordered Sunday-schools to be generally established for the instruction of “poor children, white and black, in learning and piety.” 2. Denominational Institutions. (1.) “The Book Concern.” In 1788 a “book steward” was appointed, and a borrowed capital of $600 obtained. In 1804 the concern was removed from Philadelphia to New York, and subsequently enlarged the number of its publications, scattering them through the circuits by making all the preachers agents, who, although too busy to write books, could sell them and thus greatly increase the efficiency of their work. In 1818 the Methodist Magazine was commenced, and, now called the Methodist Quarterly Review, has attained a high rank among religious journals, and has a considerable circulation. In 1820 Zion’s Herald was commenced by the New England Methodists, and was followed, four years after, by the Christian Advocate, the first weekly religious paper published by the book concern. A second publishing house was opened at Cincinnati in 1820; and in 1833 the New York house was removed to larger quarters in Mulberry street, which, in 1836, were consumed by fire at a loss of $250,000. New and better buildings were soon erected on the site, which, having been subsequently enlarged to meet the constantly increasing business, are now used only in the manufacturing of books. The principal office is in the building provided for it and the missionary society, at an expense of a million dollars. (2.) “The Preacher’s Fund.” From the beginning of their history Methodists have had regard to the wants of their sick and superannuated ministers, and of deceased ministers’ destitute families. Funds for their relief have been raised in various ways and have been designated by different names. At present the principal dependence for this purpose is on the contributions of the congregations, which now yield annually $150,000. (3.) “The Missionary Society.” The Methodist church itself is justly regarded by its members as one of “the great home-mission enterprises of the North American continent,” and for a long time it called for all their resources of men and money. The conference of 1784 ordered a collection to be taken annually in all the principal congregations. While the constant extension of the church was thus a missionary movement, further progress was marked in 1819 by the organization of the missionary society, which, having primary reference to home work, joined with that also the foreign field; in this last its operations, having been gradually extended, now embrace mission in Africa, China, India, Japan, Germany, Switzerland, Denmark, Norway, Sweden, Belgium, Italy, Mexico, and South America. Its work is aided by the woman’s foreign missionary society, Sunday-school union, tract, freedman’s aid, and church-extension societies. (4.) “The educational work began with the church itself.” The plan for an academic institute was formed in 1780, the foundation of a building for it being laid at Abington, Md.; and in 1787 Cokesbury college was opened. Its curricu-
lum included "English, Latin, Greek, logic, rhetoric, history, geography, natural philosophy, astronomy; and, when the finances admit of it, Hebrew, French, and German." This building having been burned in 1790, a new one was provided in Baltimore; but in a year, this also was lost in the same way. This repeated calamity led Bishop Asbury to think that the departure of Methodists from the General Conference, and the establishment of schools from which the high-sounding name of colleges might be withheld. One such school was wished to see in every conference. In 1820 the general conference recommended that each annual conference should establish a school for itself. Several conference schools were soon started, and within 12 years five colleges were founded. These were followed by theological seminaries which, at first, were called biblical institutes. The first projected was located at Concord, N. H., in 1847: and, having been afterwards removed to Boston, became, in 1871, the theological department in the university there. The Garrett biblical institute at Evanston, Ill., founded in 1853, received its name and an endowment of $300,000 from a lady of Chicago. The Drew theological seminary at Madison, N. J. (see Madison), was established by the gift of Daniel Drew of New York. There are also schools at several points in the Southern states, in Germany, at Frankfort on the Main, and in India. At the close of the centennial year of American Methodism the church reported 25 colleges and theological schools, having 158 instructors; 5,500 students, about $4,000,000 in endowments and other property, and more than 105,000 volumes in their libraries; and also 77 academies, with 536 instructors and nearly 18,000 students of both sexes.

3. Divisions. (1.) In 1792 James O'Kelly and some other ministers, with a considerable number of members, dissatisfied with the appointing power being vested in the bishop, without appeal, and unable to effect any modification of a system which the great mass of the church cordially approved, withdrew from the denominations and formed themselves into "The Christian Church." (2.) In 1816 the colored members in and around Philadelphia organized themselves into the African Methodist Episcopal church.

(3.) In 1820 a similar movement in and around New York resulted in the formation of the African Methodist Episcopal Zion church. (4.) In 1828 the Canada conference withdrew and became a distinct church. This separation was regarded by both sections as a matter of necessity, and was effected without any interruption of fraternal relations between them. (5.) In 1830 the Methodist Protestant church was formed, having at the outset 36 preachers and 5,000 members. (6.) In 1845, a convention held at Louisville, Ky., impelled by differences of opinion, feeling, and policy on the subject of slavery, the Methodist Episcopal church, South, was formed by the withdrawal of the southern conferences, embracing about 1350 traveling and 3,160 local preachers, with 495,000 members. Through all these divisions and troubles the church pressed on vigorously with its work. During the war of the rebellion it stood with all its moral power on the side of the union, and more than 100,000 of its members entered the armies of their country. Before and after the close of the war it made preparations for celebrating the centenary of American Methodism by all its churches and people "with devout thanksgiving, by special religious services, and liberal thank-offerings," for which the month of Oct., 1866, was set apart. As at the end of the century, notwithstanding its losses, it contained more than a million of members, the hope was cherished that not less than twice that number of dollars would be given to promote its future work. The expected services were held throughout the church, and at the close of the month the total amount of the being $8,760,225, the church, and Increase of the month the number of members of the church, was $2,760,225, the church, and Increase of the month the number of members of the church.

This important change was inaugurated in 1872, after long consideration throughout the church. The plan adopted provides that "the ministerial and lay delegates shall sit and deliberate together as one body, but they shall vote separately whenever such separate vote shall be demanded by one-third of either order; and in such cases the concurrent vote of both orders shall be necessary to complete an action." According to official reports for 1880 there are 95 annual conferences; 13 bishops; 11,798 itinerant and 12,620 local preachers, making with the bishops a total of 24,431; churches, 17,111, containing 1,723,147 lay members, on probation and in full connection; 20,754 Sunday-schools, containing 1,798,763 officers and scholars; amount contributed during the year for the support and extension of the gospel, at home and in other lands, not less than $14,500,000.

METHODIST EPISCOPAL CHURCH, SOUTH (Methodists, ante), was organized by a convention of delegates from the southern annual conferences which met at Louisville, Ky., May 1, 1845. Its first general conference met at Petersburg, Va., May, 1846. The property belonging to the whole church was divided, through the action of the supreme court of the United States, in accordance with the plan adopted by the general conference of 1844. A publishing house was established at Nashville, Tenn.; a quarterly review, weekly and Sunday-school papers, books, and tracts were printed. All things went on prosperously until the war of the rebellion hindered the work of the church and broke up its institutions. Much of its property was used by others during the continuance of military operations in the south, but the greater part of this has since been restored. The church is fast recovering from the effects of the war. At the separation, in 1844, the southern church contained about 450,000 members. In 1860 the number had increased to 757,205, of whom 207,766 were colored people. During the war these figures were greatly reduced. Some modifications in the government of the church.
have been made. The annual conferences are composed of traveling ministers and four lay delegates (one of whom may be a local preacher) from each district. The general conference of United and various other denominations have a number of ministerial and lay delegates from each state. The influence of Wesley's abridged liturgy has been published, but is not much used. The ritual and the psalmody have been revised and improved. Much attention is given to Sunday-schools, and many publications for their use are prepared. Seminaries for both sexes, colleges, and universities have been established in different parts of the south. The publishing house has revised and reprinted the standard Methodist works, and have added to them many new books of history, biography, and theology. The publishing house, destroyed, in part, by fire in 1872, has been rebuilt on a much larger scale. The destitute portions of the south, laid waste by the war, require a large amount of missionary labor; and, in addition to this, missions have been established in China, Mexico, and among the Indians. The statistical reports for 1879, the latest that are accessible at the north, give 39 annual conferences; bishops, 6; traveling preachers, 3,467; local ditto, 8,892; members of churches, 892,476; Sunday-schools, 8,441; containing 58,528 teachers and 921,157 scholars. The amount expended in supporting and extending the gospel at home and abroad is not reported.

METHODOIST PROTESTANT CHURCH, organized in 1850 by a portion of the Methodist Episcopal church who, agreeing with the majority in doctrine, were opposed to the episcopacy and to the exclusion of the laity from a voice in the government of the church. Each annual conference elects by ballot its presiding officer, and in all legislation a great number of lay and religious equality exists, meetings every four years, is composed of delegates elected by the annual conferences in the ratio of one minister and one layman for every 1000 communicants. Under specified restrictions it has authority to make rules for the government of the church declarative of the laws of Christ; to determine the duties and compensation of traveling ministers, preachers, and other officers; to devise ways and means for raising funds; and to declare the boundaries of the annual conferences. The annual conference, consisting of all the ordained itinerant ministers in the district, elects to orders, stations ministers, preachers and missionaries, makes rules for their support, and declares the boundaries of circuits and districts. The quarterly conference—composed of the trustees, ministers, preachers, exhorters, leaders, and stewards of a district—examines the official character of its members, licenses preachers, and recommends candidates for ordination to the annual conference. The classes, leaders, and stewards are similar to those in the Methodist Episcopal church. In 1858 the Methodist Protestant church was divided by differences on the doctrine of the Holy Spirit among the Protestant church of the north-western states, with headquarters at Baltimore. At the time of the division the church contained 2,000 stationed ministers, 1200 churches, 90,000 members, and property worth $1,500,000. In the hope of a speedy reunion of the separated branches, the Protestant Methodists, North, changed their name to The Methodist Church, and removed their headquarters to Pittsburg, Penn. Their college at Adrian, Mich., is flourishing. Their missionary board, while zealously engaged in the home work, has also formed plans for the foreign field. The strength of the Methodist Protestants, South, was principally in Virginia, Maryland, and some parts of Pennsylvania and Ohio. They have three colleges: the Western Maryland, at Westminster, Carroll co.; Yadkin college, North Carolina; and one in Western Virginia. Initiatory steps had been taken with a view to the union of all non-Episcopal Methodists under the title of The Methodist Church, but before this was accomplished the two branches of the Methodist Protestants met in convention at Baltimore in 1872 and formed an organizing union under the original name of the Methodist Protestant Church. In 1880 the reunited church reported 1314 itinerant ministers, 925 local preachers, and 113,495 lay members. Their headquarters are continued both at Baltimore and Pittsburg.

METHODOISTS, the name originally given, about the year 1729, by a student of Christ Church to the brothers Wesley and several other young men of a serious turn of mind, the three were put of different colleges by the authorities, who were then to live together during the winter nights of the week chiefly for religious conversation. The term was selected, it is believed, in allusion to the exact and methodical manner in which they performed the various engagements which a sense of Christian duty induced them to undertake, such as meeting together for the purpose of studying Scripture, visiting the poor, and prisoners in Oxford jail, at regular intervals. Subsequently it came to be applied to the followers of Wesley and his coadjutors, when these had acquired the magnitude of a new sect; and though their founder himself wished that "the very name," to use his own words, "might never be mentioned more, but be buried in eternal oblation," yet it has finally come to be accepted by most if not all of the various denominations who trace their origin mediatly or immediately to the great religious movement commenced by John Wesley. For an account of the origin and earlier development of Methodism see articles on the brothers Wesley and Whitefield. We confine ourselves here to a brief notice of the organization, doctrine, and present condition.

1. Organization—This application was partly imposed by Wesley to suit the exigences of his position. It was not a theoretical and premeditated, but a practical and
extemporaneous system. In the Rules of the Society of the People called Methodists, drawn up by himself, he says: "In the latter end of the year 1739, eight or ten persons came to me in London, who appeared to be deeply convinced of sin, and earnestly groaning for redemption. They desired (as did two or three more the next day) that I would spend some time with them in prayer, and advise them how to flee from the wrath to come, which they saw continually hanging over them. That we might have more time for this great work, I appointed a day when they might all come together, when they found they did every week, viz., on Thursday, in the evening." This he calls "the first Methodist society." Its numbers rapidly increased, and similar "societies" were soon formed in different parts of England, where the evangelistic labors of the Wesleys had awakened in many minds a desire to flee from the wrath to come, and be saved from their sins—the only condition, we may remark, required of any for admission into these societies. In order to ascertain more minutely how the work of salvation was progressing in individual cases, Wesley subdivided the societies into "classes," according to their respective places of abode, each class containing about a dozen persons, under the superintendence of a "leader," whose duties are partly religious and partly financial. 1. He has to see each person in his class once a week, "to inquire how their souls prosper," and to encourage, comfort, or censure, as the case may require. 2. To collect the voluntary contributions of his class, and pay it over to the "stewards" of the society, and to give the ministers all necessary information regarding the spiritual or bodily condition of those under his leadership. For preaching purposes, on the other hand, the"societies" were aggregated—a certain number of them constituting what is called a circuit. This now generally includes a town and a rural circle of 10 or 15 miles. To each circuit two, three, or four ministers are appointed, one of whom is styled the "superintendent;" and here they labor for at least one year, and not more than three. Every quarter the classes are visited by the ministers, who make it a point to converse personally with every member; at the conclusion of which proceeding a "circuit-meeting" is held, composed of ministers, stewards, leaders of classes, lay-preachers, etc. The stewards (who are taken from the societies) deliver their collections to a circuit-steward, and the financial business of the body is here publicly settled. At this quarterly meeting candidates for the office of the ministry are proposed by the president, and the nomination is approved or rejected by the members. Still larger associations are the "districts," composed of from 10 to 20 circuits, the ministers of which meet not less than a year, under the presidency of one of their number, for the following purposes: 1. To examine candidates for the ministry, and to try "cases" of immorality, heresy, insubordination, or inefficiency on the part of the clergy. 2. To decide preliminary questions concerning the building of chapels. 3. To investigate and determine the claims of the poorer circuits to assistance from the general funds of the body. 4. To elect a representative to the committee of conference, whose duty is to nominate ministers for the different stations for the ensuing year—their appointments, however, being subject to the revision of conference. In all the financial and other purely secular business of the districts, laymen (such as circuit-stewards and others) deliberate and vote equally with the clergy. The supreme Methodist assembly is the "conference." The first was held in 1744, when John Wesley met his brother Charles, two or three other clergymen, and a few of the "preachers"—men whom his zeal and fervor had induced to abandon their secular employments and devote themselves to declaring the message of the Gospel. The purpose for which he called them together was to "discuss the means which had been taken to secure the free exercise of the gospel, and the result of our consultations we set down to be the rule of our future practice." In the course of his life Wesley presided at 47 of these annual assemblies. The conference now consists of 100 ministers, mostly seniors, who hold their office according to arrangements prescribed in a deed of declaration, executed by John Wesley himself, and enrolled in chancery. But the representatives previously mentioned, and all the ministers allowed by the district committees to attend—who may or may not be members of the legal conference—sit and vote usually as one body, the 100 confirming their decisions. In this assembly, which is exclusively clerical, every minister's character is subjected to renewed and strict scrutiny, and if any charge be proved against him, he is dealt with accordingly; candidates for the ministry are examined both publicly and privately, and set apart to their sacred office; the entire proceedings of the inferior courts (if we may so call them) are finally reviewed; and the condition, requirements, and prospects of the body are duly considered.

2. Doctrine and Worship. Under this head not much requires to be said. Wesleyan Methodists claim to be considered orthodox, Protestant, and evangelical. The propriety of the last two appellations will probably not be disputed, but a rigid Calvinist might object to the first. They accept the articles of the English church, but believing these articles to have been framed on a basis of comprehension, they consider themselves at liberty to accept them in an Arminian sense. It must not, however, be supposed that they are out-and-out Arminians. Their great distinguishing doctrine is the universality and freedom of the atonement; hence they reject the Calvinistic doctrine of predetermination (which they conceive to be incompatible with the former), but while they maintain the freedom of the will and the responsibility of man, they also maintain his total fall in Adam, and his utter inability to recover himself. If these two appear to the human understanding to conflict, it is nevertheless asserted that the Bible teaches both; and it is
objected to high Calvinism that in its anxiety to be logical it has shown itself unscriptural. Prominence is also given by the Wesleyan Methodists to certain points of religion, some of which are not altogether peculiar to them. They insist on the necessity of men who profess to be Christians feeling a personal interest in the blessings of salvation—i.e., the assurance of forgiveness of sins and adoption into the family of God. This, however, is not to be confounded with a certainty of final salvation. They believe the spirit of God gives no assurance to any man of that, but only of present pardon. In harmony with this view, they reject the doctrine of the necessary perseverance of the saints, and hold that it is fearfully possible to fall from a state of grace, and even to perish at last. After having "received the heavenly gift," and having been "made partakers of the Holy Ghost," they also maintain the perfectibility of Christians, or rather the possibility of their entire sanctification as a privilege to be enjoyed in this life. But Wesley "explains" that "Christian perfection does not imply an exemption from ignorance or mistake, infirmities or temptations; but it implies the being so crucified with Christ as to be able to testify, "I live not, but Christ liveth in me.' He regards the sins of a "perfect" Christian as "involuntary transgressions," and does not think they should be called "sins" at all, though he admits that they need the atoning blood of Christ. The Wesleyan Methodists, in their religious services, use more or less the English liturgy; the morning service being read in many of their chapels, and the sacramental offices being required in all. They observe a "watch-night" on the eve of the new year, on which occasion the religious services are protracted till midnight, and their chapels are generally crowded to excess; and in the beginning of the year remnant, which contains no such a service, is held up as an example (though this form is not invariable), and solemnly vowed to the Lord. But even the ordinary religious services in some places are frequently marked by an ebullition of fervent feeling on the part of the audience, which has a very singular effect upon a stranger.

3. History.—The history of Methodism is for many years the history of Christian effort to evangelize the neglected "masses" of England. The labors of Wesley, and of those whom he inspired to imitate his example, were of the noblest description, and met with remarkable success. The reformation of life which his preaching produced, for example, among the Kingswood colliers and the Cornwall wreckers, is a testimony to the power of religion which cannot be too highly estimated. The zeal which has inspired the body in regard to foreign missions, although in the highest degree honorable, is only the logical development of their efforts at home—for they originally regarded their society in England as simply a vast "home mission," and neither Wesley nor his followers desired to consider themselves a "sect," a new church, in the common usage of the term, but were warmly attached to the old national church, and considered themselves among her true children. When Wesley died (1791) his "societies" had spread over the United Kingdom, the continent of Europe, the states of America, and the West Indies, and numbered 80,000 members. Since then they have largely increased, and, according to the returns for the year 1875, the membership (including the numbers in foreign missions, embracing continental India, Northern Europe, China, Asia Minor, the South Sea and West India islands) amounted then to 594,315 (of whom 393,843 belonged to Great Britain and Ireland), and the number of ministers, 2,905 (of whom 2,050 belonged to the United Kingdom). The annual income of "The Wesleyan Methodist Missionary Society" in 1875 was £190,000.

The Wesleyan Methodists have three theological colleges for the training of ministers, one at Richmond Hill, Surrey, a second at Didsbury, South Lancashire, and a third at Headingley, in Yorkshire, besides the establishments at Sheffield and Tamton; two schools (New Kingswood school and Woodhouse Grove school) for the education of sons of Wesleyan ministers; and two for the daughters, one at Clapton and another at Southport. The boys receive a six years' and the girls a four years' course of instruction. The Methodist Book-room is situated in the City Road, London, and issues hundreds of thousands of religious publications (tracts, etc.) monthly. The newspapers and other periodicals, ecclesiastically in connection with the body, are the larger and smaller Magazines, the Christian Miscellany, Wesleyan Sunday-School Magazine, monthly Exercises on Scripture Lessons, Early Days, the Watchman, the Methodist Recorder, and the London Quarterly Review. Among the more eminent Methodist authors may be named the two Wesleys, Fletcher, Benson, Clarke, Moore, Watson, Drew, Edmondson, Sutcliffe, Jackson, Treffry, Rule, Nichols, Smith, and Etheridge.

Methodist Episcopal Church, the name given to the Society of Wesleyan Methodists in the United States, where the first members of that body—in immigrants from Ireland-established themselves as a religious society in New York in the year 1786. In the course of a year or two their numbers had considerably increased, and they wrote to John Wesley to send them out some competent preachers. Two immediately offered themselves for the work, Richard Boardman and Joseph Plimnoor, who were followed in 1771 by Francis Asbury and Richard Wright. The agitations preceding the war of independence, which soon afterwards broke out, interrupted the labors of the English Methodist preachers in America, all of whom, with the exception of Asbury, returned home before the close of the year 1777; but their place appears to have been supplied by others of native origin, and they continued to prosper, so that, at the termination of the revolution-
ary struggle, they numbered 43 preachers and 13,740 members. Up to this time, the American Wesleyan Methodists had laid no claim to being a distinct religious organization. Like Wesley himself, they regarded themselves as members of the English Episcopal church, or rather of that branch of it then existing in America, and their "preachers" as a body of irregular clerics, or, to use the term in common use, "Episcopal preachers." But we are informed, "are still standing in New York and elsewhere, at whose altars E. P., Boardman, Strawbridge, Asbury, and Rankin, the earliest Methodist preachers, received the holy communion." But the recognition of the United States as an independent country, and the difference of feelings and interests that necessarily sprung up between the congregations at home and those in America, rendered the formation of an independent society inevitable. Wesley became conscious of this, and met the emergency in a manner as bold as it was unexpected. He himself was only a presbyter of the church of England, but having persuaded himself that in the primitive church a presbyter and a bishop were one and the same order, differing only as to their official functions, he assumed the office of the latter, and, with the assistance of some other presbyters who had joined his movement, he set apart and ordained the Rev. Thomas Coke, D.C.L., of Oxford university, bishop of the infant church, Sept. 2, 1784. Coke immediately sailed for America, and appeared, with his credentials, at the conference held at Baltimore, Dec. 25 of the same year. He was unanimously recognized by the assembly of preachers, appointed Asbury coadjutor bishop, and ordained several preachers to the offices of deacon and elder. Wesley also granted the preachers permission (which shows the extensive ecclesiastical power he wielded) to organize a separate and independent church under the episcopal form of government: hence arose the "Methodist Episcopal Church in the United States." Nevertheless, there were not a few who were dissatisfied with the Episcopal form of government. This feeling grew stronger and stronger, until, in 1830, a secession took place, and a new ecclesiastical organization was formed, called the Methodist Protestant Church, whose numbers, according to the returns for 1874, amounted to 63,000 members and 924 preachers. In 1842 a second secession took place, chiefly on the question of slavery—the seceders pronouncing all slave-holding sinful, and excluding slave-holders from church membership and Christian fellowship; and in 1843 a meeting was held at Utica, N. Y., where a new society was constituted and named the Wesleyan Methodist Connection of America, whose members in 1870 amounted to 20,000, and its preachers to 250. But in 1844 a far larger and more important secession took place on the same question, when the whole of the Methodist societies in the then slave-holding states, conceiving themselves aggrieved by the proceedings instituted at the general conference of New York (1844) against the Rev. James O. Andrew, D.D., one of the bishops, and a citizen of Georgia, who had married a lady possessed of slaves, resolved to break off connection with their northern brethren. Hence originated the Methodist Episcopal Church, South, whose numbers, in 1874, were as follows: Traveling preachers, 3,134; local preachers, 5,344; and members, 663,106, including whites, colored, and Indians. To these must be added 200,000 members forming the African Methodist Episcopal church, and 170,000 of the African Methodist Episcopal Zion church. In 1869 a movement began in favor of the reunion of the northern and southern sections of the Methodist Episcopal churches, which may—now that slavery is abolished—be successfully carried out. It may here be stated that the members of the Northern Methodist Episcopal Church amounted in 1874 to 1,945,992.

Returning to the English Wesleyan Methodists, we now proceed to mention the various secessions from the parent body in the order of time.

1. The Methodist New Connection.—This society detached itself from the older one in 1797. Its doctrines and order are the same; the only difference being that it admits one layman to each minister into the conference, and allows them to share in the transaction of all business, both secular and spiritual. These laymen are chosen either by the circuits, or by "guardian representatives" elected for life by the conference. In 1875 the numbers of the new connection were: members, 24,760; preachers, 159. There were in addition 2,849 members on probation.

2. Primitive Methodists, vulgarly designated Ranters, were first formed into a society in 1810, though the founders had separated from the old society some years before. The immediate cause of this separation was a disagreement as to the propriety of camp-meetings for religious purposes; and also upon the question of females being permitted to preach. A third point of difference is the admission to their conference of two lay delegates for every minister. In 1875 their numbers were: members, 173,429; preachers, 11,500.

3. Independent Methodists, who separated in 1810. They are chiefly distinguished by their rejection of a paid ministry, and number in England and Scotland: members, 4,000; preachers, 290; scholars, 6,000.

4. Bible Christians, also called Bryanites, were formed by a local preacher named Bryan, who seceded from the Wesleyans in 1815. The only distinction between them and the original body appears to be that the former receive the eucharistic elements in a sitting posture. In 1875 their numbers were: members, 26,699; preachers, 276.

5. United Free Church Methodists have been recently formed by the amalgamation of two sects of nearly equal numerical strength. The older of these, called the Wesleyan Association, originated in 1834 in the removal of one or two influential
ministers from the original connection. Points of difference subsequently appeared with regard to the constitution of the conference. The younger sect, called the Wesleyan Reform Association, took its rise in 1849 through the expulsion of several ministers from the church body on a charge of insubordination, and being founded on the same principles as the last-mentioned community, arrangements were entered into for their union, which was subsequently effected. Church independence, and freedom of representation in the annual assembly, are two of the most prominent distinctive traits in the organization of the united Methodist free church. Their united numbers in 1875 were:—members, 71,317; ministers, 375; local preachers, 3,366. The Wesleyan Reform Union consists of about 20 ministers and 7,000 members, who have not amalgamated with the Methodist free churches.

This is perhaps also the most convenient place to notice the Welsh Calvinistic Methodists. They are not a secession from the followers of Wesley, but originated partly in the preaching of his friend and fellow-evangelist Whitefield, and partly in that of Howel Harris, a Welsh clergyman of the church of England. Whitefield was a Calvinist; Wesley, as we have seen, was on some points decidedly Arminian. A difference arose between them on the subject of election. Henceforward their paths lay in different directions. Whitefield, however, did not form a religious sect; and after his death (1769) his followers, being left without any distinct bond or organization, either followed the leading of the countess of Huntingdon (q.v.), or became distributed among other denominations, a large portion, especially in Wales, becoming absorbed in the new society gradually forming itself through the preaching of Howel Harris and his coadjutors. This body, however, was not formally constituted a religious society till the beginning of this century.

METHODIUS, a noted theologian of the eastern church of the 3d c.; one of the fathers and martyrs of the church. He was surnamed Eubulus and Eubulus. He was first the bishop of Olympia and Patara in Lyicia, hence called Patarensis, and afterwards presided over the see of Tyre and Palestine. He is supposed to have died early in the 4th century. He was a contemporary of Porphyry, and suffered death probably in A.D. 303 or 311. Ephraemus says that "he was a very learned man, and a strenuous assenter of the truth." Jerome ranks him among the church writers. His principal works are: De Resurrectione, against Origen; De Crocita; De Libero Arbitrio; De Angelico Virginitate et Consilii, written in the form of a dialogue; Oratio de Simeone et Anna Sieu in Festum Occurrem et Purificationem B. Mariae.

METHOMANIA. See DIPSONANIA, ante.

METHUEN TREATY, a commercial treaty between England and Portugal in 1708, so called in consequence of being negotiated by Paul Methuen of Corsham, English ambassadour at Lisbon. It was agreed, by the treaty, that the wines of Portugal should be received by England at a rate of one-third less duty than those of France. In 1836 the Portuguese government relinquished the stipulations of the treaty.

METHYL is an organic radical homologous with ethyl (q.v.), being the lowest term in the series C₅H₅₊ₙ, in this case being equal to 2. Its formula is C₄H₈; but in its free state, two atoms unite to form a single molecule, so that free methyl is more accurately represented by (C₂H₅)₂. It is a colorless gas, of specific gravity 0.699. It burns with a sweet, peculiar flame, and is not liquefied at a temperature of 0°. It is obtained by acting upon iodide of methyl with zinc, in the same manner as in the preparation of ethyl.

Like ethyl, it forms a very numerous class of compounds, of which the following are the most important: Hydroxide of methyl (C₂H₅OH), known as light carbureted hydrogen (q.v.), marsh-gas, and fire-damp, may be obtained either naturally or artificially. As a natural product, it sometimes issues from fissures in coal-seams, rushing forth as if under high pressure. These discharges of this gas are termed "Blowers" by the miners, and it is by the combustion of this fire-damp that the terrific explosions which occasionally take place in coal-pits are caused. For its combustion, twice its volume of oxygen (and consequently ten times its volume of air) is required: the resulting compounds being one volume of carbonic acid and two of steam. The vitiated air thus produced, which is utterly unfit for respiration, is known as the after-damp or choke-damp; and is as much dreaded as the explosion itself. Hydroxide of methyl is also one of the gaseous exhalations from marshes and stagnant pools; and the bubbles that rise to the surface when the mud at the bottom of a pond is stirred up, consist chiefly of this gas. It may be prepared artificially by strongly heating a mixture of crystallized acetate of soda, hydrate of potash, and powdered quicklime. It is a colorless, inodorous, tasteless gas, which may be breathed without apparent injury if well diluted with air. Hydroxide of methyl (C₂H₅O·H₂O), known also as methyl alcohol, wood spirit, and prooxylc spirit (under which title its properties are described), is the strict homologue of vinous or ethyllic alcohol (C₂H₅O·H₂O). Oxide of methyl (C₂H₅O), or methyllic ether, corresponds to the ordinary, or, correctly speaking, the ethyllic ether, and is produced by the distillation of a mixture of methyllic alcohol and sulphuric acid. Oxide of methyl, like oxide of ethyl, combines with acids to form a class of ethereal salts, or compound ethers, as they are termed by some chemists—as, for example: Acetate of methyl (or methyl-acetic ether), C₅H₅O·C₂H₅O₂; butyrate of methyl (or methyl-butyric ether) C₆H₁₂O₄;
nitrate of methyl (or methyl-nitric ether), \(\text{C}_2\text{H}_5\text{O}_3\cdot\text{NO}_2\); salicylate of methyl (or methyl-salicylic ether), \(\text{C}_6\text{H}_5\text{O}_{4}\cdot\text{C}_6\text{H}_5\text{O}_2\). The last-named compound may not only be obtained by distilling a mixture of pyroxylic spirit with salicylic and sulphuric acids, but occurs ready formed in the vegetable kingdom, constituting the essential oil procured from the *betula lenta*, a species of birch, and from the *gaultheria procumbens*, or winter-green.

Methyl may be made to enter into combination with bromine, iodine, chlorine, and fluorine, the bromide and iodide of methyl being colorless fluids, and the chloride and fluoride colorless gases. Amongst the most interesting of the numerous methyl compounds must be mentioned the artificial bases or alkalis, which can be obtained from ammonia by the substitution of one, two, or three equivalents of methyl for one, two, or three of the equivalents of hydrogen contained in the ammonium salt. If only one equivalent of hydrogen is replaced by methyl, the resulting compound is \(\text{N}\text{H}_2\text{(C}_2\text{H}_5\text{)}\) or \(\text{C}_2\text{H}_5\text{N}\), an extremely alkaline gas known as *methylamine*, or *methylique*, which is more soluble in water than any other known gas; water at 55° dissolving 1150 times its bulk. It is a frequent product of the destructive distillation of nitrogenous substances; and it is present when many natural alkaloids, such as narcotine and morphia, are distilled with caustic potash. The product resulting from the substitution of two equivalents of methyl for two of hydrogen, and known as *dimethylamine*, closely resembles methylique. When the three equivalents of hydrogen are replaced by three of methyl, the resulting compound is \(\text{N}(\text{C}_2\text{H}_5)_2\) or \(\text{C}_2\text{H}_5\text{N}\), a colorless gas, which is known as *trimethylamine*, or *trimethylique*, and has a disagreeable fishy odor. It occurs in large quantity in herring-brine, and has been detected in the spirit in which anatomical preparations have been long kept. It is also found in *chenopodium album* (stinking goose-foot), in the flowers of *eratoegus oxyacanthus* (common hawthorn), and in ergot of rye.

**Methylated spirit** consists of a mixture of alcohol, of specific gravity 0.880, with 10 per cent of pyroxylic (q.v.) or wood-spirit. This addition of wood-spirit renders it unfit for drinking, although it scarcely interferes with its power as a solvent. It is allowed by the excise to be sold duty-free for manufacturing purposes, and for preserving specimens in museums.

**Methylen, Bichloride of** (\(\text{C}_4\text{H}_6\cdot\text{Cl}_2\)), is an organic compound which has recently attracted much attention from its value as an anaesthetic agent. Dr. Richardson, who has long been studying the physiological properties of the methyl-compounds, with the view of finding amongst them a safer compound than chloroform, believes, from his experiments on animals, that in the subject of this article he has found such a compound. As the deaths from chloroform may be computed, according to him, at one in 1500 administrations, it is obvious that there is reason for searching for a still safer anaesthetic agent. Dr. Snow, as is well known, thought that he had discovered an almost positively safe agent in amylene (\(\text{C}_6\text{H}_6\cdot\text{H}_3\)); but the value of more than 200 safe administrations was at once destroyed by two rapidly succeeding deaths; and hence a large number of successful cases of the new agent must be reported before it will displace chloroform from its present well-deserved position. In the article on methyl (q.v.), we have shown that the composition of hydride of methyl (or marsh gas) is expressed by \(\text{C}_2\text{H}_5\cdot\text{H}\), which may be written \(\text{C}_2\text{H}_6\cdot\text{H}_3\cdot\text{H}_3\cdot\text{H}\). Now, according to the theory of substitutions, one, two, three, or even all four of the atoms of hydrogen may be replaced by a corresponding number of atoms of chlorine. Thus (a), if one atom of \(\text{H}\) be replaced by one atom of \(\text{Cl}\), we have chloride of methyl, \(\text{C}_2\text{H}_5\cdot\text{Cl}\); (b) if two atoms of \(\text{H}\) are replaced by two atoms of \(\text{Cl}\), the resulting compound is bichloride of methylene, \(\text{C}_2\text{H}_5\cdot\text{Cl}_2\); the \(\text{C}_2\text{H}_5\) here representing a new radical termed methylene, of which very little is known; (c) if three atoms of \(\text{H}\) be replaced by three atoms of \(\text{Cl}\), the resulting compound is trichloride of formyle, \(\text{C}_2\text{H}_5\cdot\text{Cl}_3\), or common chloroform, another radical, viz., formyle, \(\text{C}_2\text{H}_5\cdot\text{Cl}_3\), now appearing; (d) if the whole of the \(\text{H}\) is replaced by \(\text{Cl}\), the resulting compound is tetrachloride of carbon, \(\text{C}_2\text{H}_5\cdot\text{Cl}_4\). We thus have four new bodies which may be constructed step by step out of hydride of methyl or marsh gas, and similarly, by starting with tetrachloride of carbon, the chemist may retrace the individual stages till he gets back to marsh gas. All these derivatives of marsh gas possess the power of producing anaesthesia when they are inhaled as vapor by men and animals. That the latter two—viz., chloroform and tetrachloride of carbon—possess this power, has been long known, Dr. P. Smith having especially directed attention to the properties of the last-named compound; but that the first two also exert the same influence is a fact new to science, for which we are indebted to Dr. Richardson. "I discovered," he observes, "that chloride of methyl was a certain and gentle anaesthetic in July [1867] last, and this led me to hope that something more stable and manageable could be obtained—something that should stand between the chloride of methyl and chloroform. That substance is now found in the bichloride of methylene. This thi compound would produce rapid, safe, and easy general anaesthesia. I discovered by experiment on Aug. 30 of the present year."—*Med. Times*, Oct. 19, 1867.

It is a colorless fluid, having an odor like that of chloroform; and is pleasant to inhale, as it causes little irritation to the mucous membrane. It boils at 88°, and has a spec. gr. of 1.344, while that of its vapor is 2.937 (or nearly three times that of air).
Hence, it boils at a lower temperature than other anaesthetics; while its specific gravity, both as a liquid and a vapor, is lower than that of chloroform, but much higher than that of ether; hence, from its easier evaporation, it requires more free administration than chloroform, and, from its greater vapor-density, it should be given less freely than ether. It mixes readily with absolute ether, and this combination yields a vapor containing corresponding proportions of each, their boiling-points only differing at most by 4°. It also combines with chloroform in all proportions. It should have a neutral reaction to test-paper. If a trace of acid be present—which is possible, but not probable—its inhalation might prove dangerous. To prevent decomposition, it should, like chloroform, be well guarded from the action of light.

The reasons are the animal which Dr. Richardson most employs for experiments on anaesthetic agents generally. They present various advantages over most other animals; one of the most important being that they die with singular readiness under the influence of these agents. On exposing three pigeons to the action of the vapor of a dram of chloroform, bichloride of methane, and tetrachloride of carbon, the peculiarity in the action of the bichloride is the absence, in the sleep it produces, of the so-called second degree of narcotism. The bird glides from the first degree directly into the third, or that of absolute insensibility. The bichloride enters the circulation freely, and sustains the insensibility so well, that intervals of many minutes may be allowed to pass without readministration; while, from its being transformed altogether into vapor at a temperature lower than that of the body, it can be more readily eliminated from the system than chloroform, or tetrachloride of carbon, when its administration is withheld. On animals it acts more evenly on the respiration and circulation than any other of the various substances Richardson has tried; and the only drawback yet observed is, that it sometimes produces vomiting; but this misadventure, so far as we know, has not yet been observed when it has been administered to the human subject, and pigeons are known to vomit on slight provocation. The numbers of the respirations and of the pulse rise and fall together, which is a good point, because there is no condition more perilous than disturbed balance of the circulating and respiratory systems.

All anaesthetics given by inhalation after a certain dose destroy life; but that the destructive power of this new agent is less than that of either chloroform or tetrachloride of carbon, seems proved.

On trying the vapor upon himself, after ascertaining that it could be safely given to the lower animals, Dr. Richardson inhaled it until it produced insensibility. "I found the vapor very pleasant to breathe and little irritating while drowsiness came on and unconsciousness without any noise in the head or oppression. I recovered also, as the animals seemed to recover, at once and completely. I felt as though I had merely shut my eyes, and had opened them again. In the mean time, I had, however, performed certain acts of a motor kind unconsciously; for I inhaled the vapor in the laboratory, and there went to sleep, but I awoke in the yard adjoining. This was on Sept. 28 last, when I inhaled from a cup-shaped sponge. Since then, I have inhaled the vapor in smaller quantities from several instruments, with the effect of proving that there is little difference required for its administration and that of chloroform. A little more bichloride is required in the earlier stages than would be required if chloroform were being used, the fluid being more vaporizable. One dram of bichloride to 40 minims (jds of a dram) of chloroform represents the difference required; but when the narcotism is well set up, less of the bichloride is required to sustain the effect."

The materials on which this article is based are taken from a lecture delivered by Dr. Richardson on Oct. 8, 1867. In an address on anaesthetics by Dr. Tidy, published in the British Medical Journal, Jan. 4, 1879, it is mentioned that Mr. Morgan, a dentist, has "administered methylene 1800 times to persons of all ages, and for periods varying from a few minutes to three-quarters of an hour, without a single accident. He also regards it as safer than chloroform, and speaks of the rapidity with which it effects complete unconsciousness, as a rule two minutes only being needed; the rapidity of recovery, from one to three minutes only being required for the anæsthesia to pass away; and lastly, the rapidity with which consciousness may be abolished, if it return during the operation—as the chief points in its favor. The cause of death from its administration is syncope, not coma; hence, a bloodless condition of the lips—a point easily to be noticed—is the principal indication of danger."

On the other hand, the preliminary report on the action of anaesthetics presented to the committee of the British medical association, and published in the same number of the Journal, does not speak so favorably of methylene. The so-called bichloride of methylene, it is alleged, has no definite and constant boiling point, and therefore appears to be a mixture. The formula, as now generally used, CH₃Cl₂, shows it to be a compound of chloride of methyl and chloroform (CH₂Cl₂+CHCl₃). With frogs under methylene it was found that the heart became rapidly affected and soon stopped. With rabbits, respiration rapidly deteriorated and stopped while the heart was still beating. In lambs, with artificial respiration and with artificial pressure of the heart, the heart was weakened and soon stopped, but not as rapidly as with chloroform. As in the case of chloroform, the right ventricle became enormously distended, the first sign of paralysis being the commencement of the distension. [Ether does not affect the heart, The experimenters found that as anaesthetics, isobutyl chloride (C₂H₅Cl) and ethylene dichloride.
(C\textsubscript{2}H\textsubscript{2})(Cl\textsubscript{2}) combine the advantages of speed and safety, and are therefore preferable to methylene.

Chloride of methyl, the first of the compounds derived by substitution from hydride of methyl, has, according to good authorities, also valuable remedial qualities. Half an ounce of it, diluted with water, and with the addition of a little sugar, acts as a pleasant but potent intoxicator. In smaller doses, it might be useful as a soothing and refrigerating agent.

**METONIC CYCLE, so called from its inventor, Meton, who flourished at Athens about 433 B.C., is a cycle of 19 years, at the end of which time the new moons fall on the same days of the year, and eclipses recur in nearly the same order. This arises from the circumstance, that 19 solar years are nearly equal to 235 lunations, their average values being 6939.6885 and 6939.60249 days respectively.**

**METONIC CYCLE, ante.** The discovery of the Metonic cycle forms an era in the history of the early astronomy of Greece. The Chaldeans established several lunisolar periods; and the difficulty of reconciling the motions of the sun and moon, or of assigning a period at the end of which these two luminaries again occupy the same positions relatively to the stars, had long embarrassed those who had the care of regulating the festivals. The discovery of Meton, therefore, which was brought into use on July 16, 433 B.C., was received with acclamation by the people assembled at the Olympic games, and adopted in all the cities and colonies of Greece. It was also engraved in golden letters on tables of brass, whence it received the appellation of the golden number, and has been the basis of the calendars of all the nations of modern Europe. It is still in ecclesiastical use, with such modifications as time has rendered necessary. —The period of Meton consisted of twelve years, containing twelve months each, and seven years containing thirteen months each; and these last formed the 3d, 5th, 8th, 11th, 13th, 16th, and 19th years of the cycle. He divided the cycle into 125 full months of 30 days, and 110 deficient months of 29 days each; the whole exceeding 19 revolutions of the sun by 93/4 hours, and exceeding 235 lunations by 71 hours. A century after Meton, his cycle was corrected by Calippus by quadrupling the period of 6,940 days, and deducting one day at the end of that time by changing one of the full months into a deficient month. By this change the error of lunation was reduced to one day in 304 years. The calendar, as laid down by Ideler, was as follows:

**METON MYM (Gr. metonymia, signifying a change of name) is a figure of speech by which one thing is put for another to which it bears an important relation, as a part for the whole, the effect for the cause, the abstract for the concrete, etc. For example, "Lying lips are an abomination to the Lord." This figure is very expressive, and is much used in proverbial and other pithy modes of speech.**

**METOPÉ, the space, in the frieze of the Doric order, between the triglyphs—generally ornamented with figures, or bulls' heads, or palmette.**

**METRA, an ingenious pocket-instrument, invented by Mr. Herbert Mackworth about 1858. It combines the thermometer, clinometer, goniometer, anemometer, level, plummet, scales, etc., so that, by its assistance, travelers or engineers can at once record their observations. It enables us to determine the dip of rocks, angles of crystals, temperature, rate of wind, to take levels of large surfaces, determine latitude, and a variety of other matters connected with physical science. As a pocket-instrument it is of great value.**

**METRIC SYSTEM (Meter, ante).** The modern or decimal system of measurement takes name from its unit, the meter. It should be understood that all Indo-European nations originally counted by twelves. They were exposed to the influence of Ur-altaic
races, who seem to have preferred threes and sixes. From the Egyptians they borrowed the count by tens, and from Slemites periods of sevens, and the double-ten or score. All these systems, complicated with varying units as bases, may be traced in the tables of measurement of modern Europe. Besides, although the value of place in notation was known to the Babylonians—and, in fact, it is not easy to write mixed measurement without assuming it—the general use of decimal notation in Europe dates only from the renaissance. Common measurements, then, do not agree with our notation, and the metric system does. It is not in itself best fitted for treating a universal unit, because it neither divides nor cubes as well as a series of doublings—the binary system. As, for instance,

When 64 = 4^3 and 8^2 is written 100 = 4^2 and 10^2, and 256 = 16^2 is written 400 = 20^2. But the binary system is open to the slight objection that it takes eight naughts to express 512, and oktads are evidently more cumbersome than dekads. A system of dodekads would match our multiplication table, correspond better with the traditions of our race, and have the inestimable advantage of possessing 6 and 3 as factors, without which the circle, geometrically considered, can hardly be grappled with. The meter is neither a part of an ascertainable distance nor the true portion of that distance as ascertained; the English yard, 39.13929 in., or the length of a pendulum vibrating seconds of mean time in vacuo, at the latitude of London and the level of the sea, being much more easily and surely measured. The advantages of the metric system are that it is a settled measure, in use by more people than any one other, and that its divisions correspond with what must always remain the notation of the educated world. It was made compulsory in France in 1840, legal in England in 1864, and in the United States by act of July 28, 1866. Its friends have as yet failed to render it acceptable to the nation, and apparently from misconception of the wants and prejudices of the populace. They have not decided upon any neat or consistent way of expressing its abbreviations, so that draftsmen and printers are either unwilling or unable to use them. They have neglected to make for workmen comparative tables giving its equivalents in the measures daily in use by them, and they have never succeeded in giving to the public a few brief rules for interchanging quantities, not necessarily exact, but near enough for hourly use. It is plain that a sudden change in the whole system of measures of a country involves loss of time with perplexity and expense. The advantages of a decimal notation may be shown by retaining some known unit and the popular names, but with change of other divisions; as an English foot, but of 10 in. and running 10 to the pole, etc., very much like the temporary change by the Swiss confederation; or by fixing upon some point which nearly coincides, changing that by legislation to an exact part of the right system, and leaving to time the gradual displacement of the more cumbrous. Thus the addition to an English inch in a yard made equal to a meter is easily made allowance for by tradesmen and workmen on a scale of the present pattern. This seems to account for the failure of the French law of Feb. 11, 1812.

The unit of the system is the Meter, one ten-millionth of the calculated distance from the pole to the equator. See CHEMISTRY, ante (diagram). By prefixing the Greek words deka, hekto, kilo, and myria for multiples, and the Latin deci, centi, and milli for divisionals, there results a series of terms, each increasing by a power of ten. The Liter, or cubic decimeter, of water furnishes a standard for capacity, and a subdivision of it, the Gram, or cubic centimeter, for weight. We have, then, five kinds of measures, of length, surface, volume, capacity, and weight, and (but not carried out) money. It must be noticed that the French law supposes a double and a half to each measure; that many of the divisions have not been adopted in common use; and that certain modifications based on a larger unit have been found convenient in practical and scientific use. One advantage of the decimal system is that when speaking, say of kilom. for distance, or milligr. for weight, we may write 19.736 kilom., or 113.26 milligr., that is without treating them from the scale of meters or liters.

**MEASURES OF LENGTH.**

<table>
<thead>
<tr>

</tbody>
</table>

Note that the sq. decim. is not the tenth of a sq. m., but the square of a tenth, a hundredth. It follows that the decimals are read by pairs; thus, 3.532 sq. m. is read 3 sq. m., 53 sq. decim., 20 sq. centim., etc., etc.

Topographic.

Square myriameter, sq. myriam. = 100,000,000 sq. m.
Square kilometer, sq. kilom. = 1,000,000 " = 0.3854 sq. miles.
Square hektometer, sq. hektom. = 10,000 "
Square dekameter, sq. dekam. = 100 "

Agrarian.

Hektare .................................... hekt. = 10,000 sq. m. = 2.471 acres.
Are ......................................... a. = 100 " = 1,550 sq. yds.
Centiare .................................. centia. = 1 " = 119.6 sq. in.

Myriameters and myriares are used only in geographical or statistical works, and the hektare, like our acre, is the general unit in speaking of farm-land. While the sides of the measures differ by tens, their surfaces differ by hundreds. There are no such terms as decare, kilar, deciare, and milliare, for they are not squares of any multiple of ten.

MEASURES OF VOLUME.

Cubic Measure.

<table>
<thead>
<tr>
<th>CUBIC METER</th>
<th>cu. m.</th>
<th>1</th>
<th>cu. m.</th>
<th>35.31481 cu. ft.</th>
</tr>
</thead>
<tbody>

<td>0.0000003531481 cu. ft.</td>
</tr>
</tbody>
</table>

As before, the tenth of a cubic meter must not be confounded with the cubic decim.; the first is contained ten, the second a thousand times in a cu. m. Decimals must therefore be read by threes; thus, 5,437.93 cu. m. must be read 5 cu. m., 427 cu. decim., 930 cu. centim., etc.

MEASURES FOR FIRE-WOOD.

Dekastere .................................. dekast. = 10. st.
Ster ........................................ st. = 1 " = 1.308 cu. yds.

Note that the decist. is equal to one-tenth of a st., or cu. m., and is not to be confounded with cu. decim.

MEASURES OF CAPACITY.

Unit, the liter, equivalent to one cubic decimeter.

| Myrialiter ................................ myrial. = | Dry Measure. | Wine Measure. |
| Kiloliter ................................ kilol. = | Dry Measure. | 264.177 gallons. |
| Hektoliter ................................ hektol. = | Dry Measure. | 3.381481 cu. ft. |
| Dekaliter ................................ dekal. = | Dry Measure. | 9.08 quarts. |
| LITER ................................... l. = | Wine Measure. | 0.908 " = 1.0567 quarts. |
| Deciliter ................................ decil. = | Wine Measure. | 0.1022 cu. in. |
| Centiliter ................................ centil. = | Wine Measure. | 0.338 fl. oz. |
| Milliliter ................................ millil. = | Wine Measure. | 0.03937 fl. dr. |

The myrial. and kilol. are seldom used; but for grains, potatoes, seeds, as well as alcohol, wine, and oil, the hektol. is in general use. The liter is used as we use both gallon and bushel. The kilol. is a cu. m., the hektol. its tenth part, and the liter a thousandth.
MEASURES OF WEIGHT.

Unit, the gram, weight of a cu. centim. of distilled water, at the temperature of melting ice, 4°C., in the latitude of Paris, in vacuo, and altitude reduced to sea-level.

| Metric ton | met. ton | 2,204.6 lbs. aver. |
| Kilogram | kilo. | 2.2046 kg |
| Hektogram | hектogr. | 3.5207 oz. |
| Dekagram | dekag. | |
| Gram | g. | 15.432 gr. |
| Decigram | decigr. | |
| Centigram | centigr. | |
| Milligram | milligr. | 0.00154 |

The kilo, is the weight of a cu. decim. of water, or a liter. The met. ton is therefore that of a cu. m. of water.

The application of the metric system to coins has not yet been adopted, to the exclusion of any other, by any nation. The republics and the minor kingdoms have a more or less perfect series.

The division of the circle into 100° never was a success, and for reasons already noted. It has been proposed to substitute 600°, or six sextants of 100° each. But, if any change be advisable 120° seems preferable, being handily small, and divisible by 2, 3, 4, 5, 6, 8, and 10.

The thermometer of Celsius, or the centigrade (100°), has 0° at freezing, 32°, and 100° at boiling water, 212°, of the Fahrenheit. It is translated into Fahrenheit, F., or Réaumur, R., by the formula:

\[ C = \frac{5}{9}(F - 32) \text{ or } \frac{5}{4}R. \]

The Wedgewood pyrometer, W., has its 0° at 580.56° C., and each degree of W. = 72.22° C.

The measure of work is the kilogrammeter, or 1 kilo. raised 1 m. high in 1 second, or 7.233 ft., lbs., and a horse-power equals 75.73 kilogram. It has been proposed to substitute tonometers, when 1 h.p. = 15.47 tonnetts. The atmospheric pressure is reckoned at 1,033 kilo., to the sq. centim. The following approximate rules are useful for every-day necessities. As there are 96 eighths to one foot, a drawing to the scale of

\[ \frac{1}{8} = 1’ \text{ is equiv. to 1 centim. } = 1 \text{ m. nearly.} \]

\[ \frac{3}{8} = 1” \text{ ” } 2.5 \text{ decim. } = 1 \text{ m., etc.} \]

Five miles = 8 kilom., and a little more.

The meter is 3 ft. 3 in. \( \frac{3}{8} \), nearly.

The decim. is 4 in., slack.

The centim. is \( \frac{1}{8} \), full.

The sq. meter is 10\( \frac{1}{2} \) sq. ft., and more.

The sq. mile contains nearly 3 sq. kilom., and the sq. kilom. is 247 acres.

The hekt. is nearly 2\( \frac{1}{4} \) acres.

The are is a rood, nearly.

Three cu. yds. contain nearly 4 cu. m.

One cu. m., or st., equals \( \frac{1}{8} \) of a ton of coal, of 40 cu. ft., which is also the U. S. shipping ton, or 33 U. S. bushels; and 2 cords of wood contain a little more than 7 steres.

The liter is a quart, both dry and wine measure (nearly 6 of our so-called quart bottles to 4 liters).

Four and a half 1. to the gallon, imperial.

A new 5 cent nickel weighs 5 grams.

Fifteen grams of letter-weight are called \( \frac{1}{4} \) oz. aver.

The kilo. is 2 pounds, full.

The met. ton is the old big ton.

One horse-power, 33,000 foot-pounds, is 75 kilogmets.

Mechanical equiv. of heat, 772 f. lbs., is 425 kilogmets.

METRONOME, a valuable small machine for indicating the correct time or speed at which a musical composition should be played. It was invented in 1815 by Malzel, the inventor also of the automaton trumpeter. See AUTOMATON. The test of a correct metronome is that when set at 60 it shall beat seconds.

METROPOLIS, a city in Illinois, on the n. bank of the Ohio river; pop., '70, 2,490. It is 88 m. e. of Cairo, and 11 m. above Paducah. Its streets are regularly laid out of a uniform width, and it is built on a high bluff, which slopes gradually toward the river; the lowest line being above high-water mark in the greatest floods. It has a bank, 8 churches, and 2 newspapers. The principal manufactories are potteries and tobacco factories. Lumber is manufactured; it has 2 ship-yards and several flour-mills.

METROPOLIS LOCAL MANAGEMENT ACT. The metropolis of the United Kingdom, owing to its immense size, has been regulated for adile and sanitary purposes.
chiefly by special acts, one of which is called the metropolis local management act. It had long been subject to a special building act, which laid down minute regulations as to the formation of streets, alteration and building of houses; and the metropolis buildings act still contains a code applicable to building regulations, the chief principle of which is, that no person can build or make alterations till they have been duly approved by the inspectors, whose duty it is to see that certain conditions have been complied with as regards the public safety. In 1855 a great change was made in the internal economy of the metropolis by the metropolis local management act, which created the metropolitan board of works, and provided it with extensive powers of drainage, sewerage, lighting, cleaning, removing nuisances, and general improvements, and with powers also to rate the occupiers of houses for the expenses of the general management. Formerly, each vestry did what it thought proper within its own parish, and there was no uniformity observed in the details of management. But the above act contained a code of laws affecting numerous details of street and city life. One important function was the systematic construction of sewers and the removal of nuisances. No new building is now allowed to be built without sufficient drains and water-closets. Paving is enforced in most cases.

**METROPOLITAN**, in church law, the bishop of a metropolis, or "mother city," upon which other episcopal cities are in some sense dependent. The gradations of the hierarchy, on which this dependence is founded, are of very early origin, and may, it is alleged, be traced, at least in germ, in the letters of St. Paul to Timothy and to Titus. The commentaries of the Fathers (as Chrysostom, 15 Hom. in 1 Tim., and Eusebius, Hist. Eccles., 1. iii. c. iv.) recognize it as of apostolic institution. The jurisdiction of metropolitans, according to the ancient law of the church, was very considerable, and extended over all the bishops of that province of which the metropolis was the capital. It was their privilege not only to summon and preside over provincial councils, to consecrate the provincial bishops, but also to decide certain causes, and in other ways to exercise authority within the sees of their suffragans. Recent canons have very much restricted their powers. The metropolitan is distinguished from an ordinary archbishop by his having suffragan bishops subject to him, which is not necessarily the case of an archbishop.

In the church of England the archbishops of Canterbury and York are metropolitan, and in the Protestant Episcopal church of Ireland, those of Armagh and Dublin. In the newly constituted hierarchy of the Roman Catholic church in England, the archbishop of Westminster has the rank of metropolitan. In the Roman Catholic church of Ireland, the archbishops of Armagh, Dublin, Cashel and Tuam all possess the same rank.

**METTERNICH, CLEMENS WENZEL NEPOMUK LOTHAR, Prince von Metternich, and duke of Pontella, an eminent Austrian diplomatist and statesman, was b. at Coblenz, May 15, 1773.** His father, Franz Georg Kari, count von Metternich, was also an Austrian diplomatist, and an associate of Kaunitz. He represented a very ancient and distinguished family, whose original seat was in Jülich. Young Metternich was educated at the university of Strasburg, and afterwards studied law at Mainz and traveled in England. In 1793 he married the granddaughter and heiress of the celebrated minister Kaunitz, but on his acquired vast estates, of the Kaunitz-Kollonitz, with which he attended as representative of the Westphalian counts. His rise was very rapid: he added to the advantages of his birth and connections, a more than ordinary share of diplomatic ability, with the most graceful and winning manners. In 1801 he became Austrian ambassador at Dresden; and on the outbreaking of the third coalition war, he negotiated the treaty of alliance between Austria, Prussia, and Russia. In 1806 he went as ambassador to Paris, and concluded, in 1807, the treaty of Fontainebleau, very favorable to the interests of Austria; but on the outbreaking of the war between France and Austria in 1809, he was detained some time ere he could obtain his passport. In course of that year, he succeeded count von Studio as minister of foreign affairs, concluded the treaty of peace with the French minister Champagny, and accompanied the empress Maria Louisa to Paris. He guided the course of Austria amidst the difficulties of 1812-13. He maintained at first a temporizing policy and a scheme of an armed mediation of Austria; but the obstinacy of Napoleon reduced him to the necessity of adopting at last a decided step, and led him to resolve upon that declaration of war by Austria against France, which took place in Aug., 1813, and he subsequently conducted with great ability the negotiations which ended in the completion of the quadruple alliance. On the eve of the battle of Leipzig, the emperor of Austria bestowed upon him the princely dignity. He was afterwards employed in almost all the chief diplomatic affairs of that eventful time; and after the congress of Chatillon and negotiations with the count d'Artois, he went to Paris, and signed the convention of Fontainebleau with Napoleon, went to England to negotiate concerning a new quadruple alliance, and attended the congress of Vienna, of which he was unanimously elected president. He signed, as Austrian plenipotentiary, the second peace of Paris Nov. 20, 1815. After this, he continued still to conduct the diplomacy of Austria, and in 1821 was appointed chancellor (Haus-, Hof- und Staatskanzler), and in 1826 succeeded count Zichy in the presidency of ministerial conferences on home affairs. His efforts
were now earnestly directed to the maintenance of peace in Europe, and the preservation of the existing state of things in the Austrian dominions by the strictest measures of police and severe despotism. The revolutionary movement of 1848 breaking forth with sudden violence, caused the aged minister to flee from Austria, and to seek refuge in England; nor did he return to Vienna till the end of 1851, when he received great marks of honor and favor from the emperor; but although sometimes consulted, he was never again asked to undertake the cares of office. He died at Vienna, June 11, 1850. The general opinion respecting Metternich has been well expressed by the Times newspaper: "He was renowned rather than great, clever rather than wise, venerated more for his age than his power, admired but not lamented." His son Richard became ambassador at the court of Napoleon III. after the peace of Villanueva.

METTRAY: The reformatory of Mettray is the true parent of all institutions intended to reform and restore to society, and not merely to punish, juvenile delinquents. Mettray was founded by a member of the Parisian bar, struck with the evils and hardship attending the committal to prison of young, and, considering their training and habits, scarcely responsible criminals, there to languish hopelessly for a time, and then to emerge worse than when they entered, resolved, in conjunction with the Vicomte Breignières de Courtelaries, to found a school which should have for its object the reformation of this class of offenders. In 1839 accordingly, the reformatory, or, as it is called, the colony of Mettray, was set on foot, about 5 m. from the city of Tours in France. Thus M. Demetz, by his assiduous labors and self-devotion, rendered to France and Europe one of the greatest benefits that could be conferred on society, by proving that, by agricultural and other labors of industry, and well-considered rules of organization and discipline, the neglected and criminal may be trained to take their place honestly and honorably in society. The children consist wholly of orphans, foundlings, and delinquents, and, in 1872, amounted in number to 792. From the foundation up to that date, 4,287 had been received. The relapses into crime of those who had left the colony amounted only to about 4 percent. The success of this institution is to be attributed not only to the excellent training and close supervision at Mettray itself, but to the care which is taken to preserve the link between the authorities and those who have left the colony. A small payment is made by the state for children sent under judicial sentence; the large extra expenditure necessarily incurred being defrayed from charitable contributions from the individuals constituting the "paternal society of Mettray."

METZ, the strongest fortress of the German imperial territory of Alsace-Lorraine, and capital of the district of Lorraine; before 1871, the main bulwark of France in her northeastern frontier, and capital of the department of Moselle. It is situated on the Moselle at its confluence with the Seille. The strength of Metz consists in its exterior defenses, of which the principal are 11 forts, partly strengthened and improved since the German occupation, and partly entirely new. The city contains many important institutions, barracks, hospital, military schools, and arsenals. The cathedral, a Gothic edifice, begun in 1014, and finished in 1546, is remarkable for its boldness, lightness, and elegance, and has a beautiful spire of open work, 373 ft. in height. The industry of Metz is active; there is a good trade in wine, brandy, indigo, glass; and there are several cloth manufactories in the neighborhood. The pop. of Metz, which in 1869 was 48,325, had in 1875, by reason of emigration into France, decreased to 37,925, or with garrison, 45,856.

Metz, known to the Romans as Diodurum, was afterwards called Mettis (corrupted from Médromatrici, the name of the people), and hence the present form. Under the Franks, Metz was the capital of Austrasia (q.v.). At the division of Charlemagne's empire, Metz, with the rest of Lorraine (q.v.), fell to Germany, and was afterwards made a free city of the empire. In 1552 it was treacherously taken possession of by the French; and although Charles V, besieged the place from October, 1552, to January, 1553, they kept it till it was formally ceded to them in 1648. In August, 1870, Bazaine was compelled to retire into Metz with his army; and after an investment of 70 days, during which no attempt was made to take the city by force (not even a single shell having been fired into it), Europe was startled to hear of the capitulation of Metz, by which 180,000 men and immense military stores fell into German hands (Oct. 27, 1870). By the treaty of Frankfort, Metz was annexed to Germany as part of Lorraine.

METZU, GABRIEL, 1615-67; was b. at Leyden, in s. Holland. Little is known of his early life, and from what artist he acquired his education in the rudiments of painting is unknown. He was, however, still young when already possessed of a high reputation at Amsterdam. As a painter he belonged to the Dutch school, and was essentially a materialist in art. Although he painted a few portraits, most of his subjects were taken from commonplace scenes of middle-class or humble domestic life. Of imagination or high artistic conception he had but a small share; but in minuteness of detail, in perfection of coloring and execution, he was very remarkable. His subjects were such as morning visits, musical parties, ladies at their toilet, a cavalier smoking and drinking at a cabaret; in short, he was a genre painter, and in exact reproduction of scenes of familiar life stands very high. His work commands a great price, and many excellent specimens are to be found in the Louvre and the other principal art-galleries of Europe.
It has been asserted that Metzu died in 1658, but one of his best and undoubtedly genuine works bears date 1667.

**MEUDON**, a t. of France, in the dep. of Seine-et-Oise, 5 m. w. of Paris, on the Versailles and Paris railway. The château, approached by a fine avenue of four rows of lime-trees, was built by the side of an older château, the work of Philibert Delorme, by the grand dauphin, son of Louis XIV., in 1699. During the revolution it was converted into a factory for warlike engines, and surrounded with a permanent camp to keep out spies. The château, as it exists at present, was fitted up for Marie Louise by Napoleon in 1812. It has a fine terrace, gardens beautifully laid out, and commands a very fine prospect. The Forêt de Meudon is a favorite holiday resort of the Parisians. Near it has been erected an expiatory chapel, dedicated to Notre Dame des Flammes, marking the spot where a terrible railway accident occurred in May, 1842, in which more than 100 persons were burned alive. Whitting is manufactured to a considerable extent, and there are numerous bleachfields. Rabelais was curé of Meudon for a long time. The château was for many years a favorite summer residence of Prince Napoleon. Pop. 76. 6,385.

**MEU LEBEKE**, a t. of Belgium, in the province of West Flanders, 20 m. s.w. of Ghent, on the Mandel, a tributary of the Lys. Weaving is carried on, and there are several breweries. It is near a railway, which connects it with Bruges and other places. Pop. 3,800.

**MEURSIUS, or DE MEURS, JOHANNES, 1579-1639;** b. Belgium; educated at Leyden, where he became famous for his classical attainments. At the age of 12 he wrote orations in Latin, at 13 he composed Greek verses, and at 16 he had finished a commentary on Lycophron, the most difficult Greek author. On leaving the university he became tutor to the sons of John of Barneveldt, the grand pensionary, and traveled with them through Europe. He continued his studies on the continent, and the university of Orleans recognized his great learning by conferring upon him the degree of L.L.D. He returned to Holland in 1610, and became professor of history in the academy of Leyden, and the next year was transferred to the chair of Greek. He was made historiographer to the states of Holland, and enjoyed a high degree of favor, till the execution of Barneveldt, his known intimacy with whom exposed him to considerable persecution. He was offered and accepted, in 1623, from the king of Denmark, the professorship of history in the university of Sora, and the position of royal historiographer, and he remained at Sora till his death. His published works are 67 in number; they include editions of many Greek authors, such as Lycophron, Procopius, Porphyry, and Aristoxenes; treatises on Greek and Roman antiquities; and a Glossarium Graeco-Barbarum, still a standard work on the Greeks of the lower empire.

**MEURTHE,** formerly a department in the n.e. of France, immediately s. of the former department of Moselle. The area was about 2,254 sq.m.; pop. '66, 428,387. Its surface is undulating and picturesque; while along the eastern border run the Vosges mountains, rising in one point to 1148 ft. in height. The chief rivers are the Moselle, and its affluents the Meurthe, the Madon, the Seille, etc. This district is no less remarkable for the beauty of its scenery than for the fertility of its soil and the variety of its productions. After the treaty of Frankfort, by which part of Meurthe was ceded to Germany, the rest of Meurthe, together with the small part of the department of Moselle that remained to France, was formed into a new department under the name **MEURTHE-ET-MOSELLE;** area, 2,015 sq.m.; pop. '76, 404,609. Arrondissements: Nancy, Lunéville, Toul (from Meurthe), and Brey (from Moselle); capital, Nancy.

**MEUSE,** a river of northern Europe, rising in the department of Haute Marne in France, flowing northerly through the departments of Vosges, Meuse, and Ardennes, traversing the mountainous region of the "forest of Ardennes," entering Belgium at Namur, where it is joined by the Sambre from the w.; thence runs n.e. past Liège, where it receives the Ourthe, forms a part of the boundary between Belgium and Holland, passes Maestricht and Roermund, and receives the Roer. At Bommel it almost joins the Rhine, and finally mingles its waters by two channels with the Waal, one of the mouths of the Rhine, the easterly channel reaching Rotterdam, and afterwards being joined by the other, when both empty into the North sea. Their delta forms extensive shoals and quicksands. The river is 580 m. long, and can be navigated 460 miles. Canals in Holland and Belgium connect it with their other rivers.

**MEUSE,** a frontier department in the n.e. of France. Area, 2,400 sq.m.; pop. '76, 294,054. The surface is traversed from s.e. to n.w. by two parallel ranges of hills, which form the right and left bank of the river Meuse (see MALAS), and separate it from the basin of the Seine on the w., and from that of the Moselle on the cast. The Meuse, the Oorna, and the Aire are the chief rivers. The soil is generally poor, except in the valleys of the principal rivers, which are remarkably fertile and well cultivated. The usual crops are raised in average quantities. Twenty-two million gallons of wine (red and white) are made annually. The four arrondissements are Bar-le-Duc, Commercy, Montmédy, and Verdun. The capital is Bar-le-Duc.

**MEW,** or SEA MEW, the English name for the common European gull (larus canus) and other small gulls.
MEXICO constitutes the south-west extremity of North America, and occupies a portion of the isthmus which connects the latter with the s. part of the American continent. It is bounded on the n. by the territories of the United States, on the w. by the Pacific ocean, on the s. by the Pacific and Central America, and on the e. by the gulf of Mexico. The area of Mexico is about 750,000 sq. m., and the pop. (1878) about 9,340,000. In 1861 the 8,000,000 inhabitants were thus distributed amongst the various races: Indians, 4,800,000; whites, 1,004,000; half-breeds, 1,190,000; negroes, 6,000. The following table gives the names of the provinces and their chief towns, with the figures for 1869:

</table>

Physical Character, etc. — The great mass of the Mexican territory consists of an elevated plateau, formed by an expansion of the Cordilleras of Central America (q. v.), from which terraced slopes descend with a more or less rapid inclination towards the Atlantic on the e. and the Pacific on the west. This vast tract, which extends from 18° to 35° n. lat., and from 95° to 115° w. long., comprises one of the richest and most varied zones in the world; for while its geographical position secures for it a tropical vegetation, the rapid differences of elevation which characterize it afford it the advantages of temperate climates, in which all the varieties of our European flora and fauna can come to perfection; and it thus combines within its limits an almost unparalleled exuberance and multiplicity of natural products. The table-lands of Mexico lie at elevations varying from 5,000 to more than 9,000 ft. above the level of the sea, and exhibit great differences of level and varieties of soil. They generally incline northward, and are for the most part girt in by low mountain chains, among which rise individual lofty peaks, as Coñfre de Perote (13,400 ft.), Orizava (17,370 ft.), and others; while they are intersected by higher ranges, above which tower a few cones, as Istaicuillatl, the white woman (15,700 ft.), and the volcano of Popocatapetl, or the smoking mountain (17,880 feet). These volcanoes and several others of less note, lying within the parallels of 18° 15' and 19° 30' n. lat., form a transverse volcanic band between the two oceans, and do not follow the inclination of the central chain, as is the case in the volcanoes of South America. Volcanic storms occur isolated, as for instance, the plain of Mixicapan, 2,929 ft. above the sea, where, in 1759, the volcano of Jorullo, which still emits smoke, was formed after an eruption, by which a surface of many square miles was raised several feet above the level of the plain; in fact, every part of the Mexican territory betrays the volcanic nature of its formation, although neither earthquakes nor any other active phenomena have of late been of frequent occurrence. The principal chain, intersecting the table-land, is the Sierra Madre, or Tepe Suene, in which lie the chief gold and silver mines, and which, after traversing the states of Queretaro and Guanajuato, divides into three main branches, the central of which forms the water-shed between the Pacific ocean and the gulf of Mexico. In addition to these great chains, the Mexican territory is intersected by numerous lesser ranges, which on the Pacific side break up the terraced declivities into innumerable deeply cleft valleys, which assume almost the character of steep ravines near their junction with the narrow littoral plains of the Pacific ocean. Violent storms rage on this coast, blestong from the south-west during the hot month when the climate is as prejudicial to whites as on the Mexican gulf, although it is not visited by the yellow-fever. Mexico may be said to be generally deficient in navigable rivers; for although some of the largest have a course of more than 1000 miles, few are free from rapids. The Rio Santiago, or Rio Grande, with a course of 500 m., is
broken near Guadalajara by 60 falls in the space of less than three miles: the Rio Grande del Norte, which forms in its lower course the boundary between Mexico and the United States, has a winding course of nearly 1800 m., but it is only navigable for small sailing vessels to Matamoros, 60 m. from its mouth, where a bar and numerous shoals prevent the passage of large vessels. A similar remark applies to the majority of the rivers which fall into the gulf of Mexico. The eastern coast generally presents great obstacles to navigation, as it is low and sandy, unbroken by bays or inlets, and lined by sandbanks several miles in width; the only points of access being the mouths of rivers, which are not good roadsteads, as with few exceptions, the rivers have little water, except at the rainy season, which generally sets in about June, accompanied by overpowering heat, during the prevalence of which the yellow-fever, or vomito prieto, rages like a pest in all the low lands. Mexico is on the whole badly supplied with water; and since the Spaniards have discontinued the system of irrigation, which was followed by the Aztec races with so much success, many tracts have become barren, and unsuited for the purpose of occupation. The great portion of the table-lands can only be used for pasture. Springs are rare, and many of the rivers flow in mountain beds, without receiving smaller tributaries, while the rapid evaporation on a light soil, covering porous rocks, leaves the surface dry and hot, and unable to support any vegetation, beyond the cactus and some low grasses. The plains, moreover, contain the beds of numerous dry salt lakes, but this is chiefly the case on the north and east of the table-land. The western parts of the plateau between 100° and 102° w. long. (known as the Baxio), yield, by careful irrigation, rich crops of maize and wheat, and rank among the most fertile agricultural districts of Mexico. They are, however, here and there interrupted by sterile tracts, either covered by stones, and then known as "pedegrul," or with lava, when they are characterized as a mal paso (bad country). In contrast with these unprofitable districts, the plains are occasionally broken by depressions of the soil, known as barrancas, descends sometimes 1000 ft., and measuring several miles across, which are covered with luxuriant vegetation of trees and shrubs, and is supplied with water flowing through the middle of the valley. Mexico has numerous lakes, but few of any importance; that of Chapala in Jalisco is one of the most considerable, being more than 90 m. long.

Climate. Products.—The differences of climate, depending upon the different degrees of altitude, are so great in Mexico that the vegetable products of this vast country include almost all that are to be found between the equator and the polar circle. In the course of a few hours, the traveler may experience every gradation of climate, embracing torrid heat and glacial cold, and pass through different zones of vegetation, including wheat and the sugar-cane, the ash and the palm, apples, olives, and guavas. The Spaniards, on their first occupation of Mexico, distinguished its great climatic divisions under the characteristic names, which are still retained, of the tierras calientes (hot or litoral lands), tierras templadas (temperate lands), and tierras frías (cold or high lands). The mean annual heat of the tierras calientes is 77°; and the soil, which is generally fertile, produces maize, rice where water can be procured for irrigation, bananas, pine-apples, oranges, and is so covered by lava and sand that the ploughmen are unable to work the land. This tract has only two seasons—the winter, or season of north winds, and the summer, or season of breezes. In the former, the hurricanes are the terror of navigators, but the coast is clear of yellow-fever, which prevails in the hot season. On the medium elevations of the tierras templadas, the temperature is extremely equable, varying only from about 70° to 80° F.; the climate healthy, and wherever water is abundant, a perpetual summer reigns, yielding a varied and active vegetation, which embraces all the cereals, fruits, and vegetables of central and southern Europe, amongst which maize, oranges, lemons, grapes, and olives are produced in the most exuberant abundance. The tierras frías, which would scarcely have been characterized as cold by discoverers belonging to a less southern climate than Spain, possess a generally temperate climate, the mean annual heat ranging between 66° and 68° F.; but on the highest of the table-lands, the air is keener, and the soil more arid, and agriculture is limited to the cultivation of barley and of the agave, or Mexican cane, which held to the Spaniards as the main article of diet. These Aztecs have been so good agriculturists as to have made a species of rum, or the fermented drink known under the name of pulque. In addition to the vegetable products already referred to, Mexico yields coffee, tobacco—whose growth is, however, limited by governmental restrictions—yams, capiscum, pepper, pimento, indigo, peccacuahua, dragon's-blood, copaiva, fan-palms, india-rubber trees, mahogany, rosewood, ebony, etc.

The products of the mines, which rank among the richest in the world, include the precious metals. The gold mines of Mexico occur principally on the w. side of the Sierra Madre, n. of 24° n. lat., and, until the discovery of the metal in Australia, their yield surpassed the produce of any other part of the world. Silver mines abound in Mexico, and the argentiferous veins, which may be said to intersect every part of the western declivities of the Andes, occur in so... places, as in the Vela Madre lode at Guanajuato, in beds varying from 10 to 50 yards in depth; the precious metal being in these cases intermixed with sulphur compounds, antimony, and arsenic. But although these mines possess the additional special advantage of being situated in fertile districts, affording abundant food to miners and their cattle, their working has been very imper-
Mexico.

feetly carried on, owing to the unsettled state of the country. At the close of the last, and the beginning of the present century, the annual value of the gold and silver of Mexico was upwards of $6,000,000, of which nine-tenths were yielded by the silver; but the political disturbances, preceding and consequent on the wars of independence, have very considerably reduced this sum, which has probably never been reached since Mexico was finally separated from the mother-country. In addition to gold and silver, Mexico yields antimony, mercury, copper, lead, iron, and zinc; while carbonate of soda, used in smelting silver, is found crystallized on the surface of several lakes, and salt works, together with common salt, in dry seasons, on the more arid parts of the surface of the elevated table-lands.

Cattle, horses, asses, mules, and sheep abound in Mexico, where, in consequence of the extent and excellence of the pasture-grounds, all the domestic animals introduced from the old world have multiplied excessively. Buffaloes feed in the lower plains; goats and sheep are plentiful; the tapir, wolf, American lynx, jaguar, wild cat, several species of the skunk, the brown porcupine, stag, deer, etc., are to be found. Parrots, humming-birds, and wild game birds, including turkeys, are abundant; and almost all the lakes yield large quantities of fish. The cochineal insect and the silk worm are reared with great success on the table-land of Mixtecapan.

Commerce, etc.—Notwithstanding the enormous advantages presented by her natural productions, and the important geographical position which she occupies between the Atlantic and the Pacific, Mexico, owing to her unsettled government, and the consequent insecurity of life and property, has not been able to develop her foreign commerce beyond the value of about $10,000,000. The precious metals constitute it, is estimated, nearly nine-tenths of the exports, the remainder being made up by productions of the soil, and industrial products, such as cotton, woolen and silk goods, soap, leather, saddlery, gold and silver face, cigars, brandy, etc. England, France, Hamburg, and Lubeck, and the United States, are the principal powers with which Mexico maintains relations of foreign commerce; while the city of Mexico is the chief focus of internal trade, and Vera Cruz the principal port for maritime commerce. The total value of the foreign trade of Mexico in 1876 was—for imports, $5,600,000; for exports, $5,100,000. For the number of ships entering and clearing the ports of Mexico, see Vera Cruz and Tampico. Mexico possesses about 400 m. of railway, the line from Vera Cruz to Mexico being one of the most wonderful pieces of engineering enterprise in the world. The annual traffic amounts to about 250,000 passengers, and 190,000 tons of freight. The financial condition of Mexico is alarming. Inflations, falling with the cession of independence that the expenditure has been continually increasing beyond the receipts. According to the printed estimates, the estimated amount of the budget for 1875-76 was £4,760,000. The total expenditure for the same year was estimated at £4,980,000. The revenue is derived mainly from the customs. The total amount of the national debt cannot be stated. The loans contracted by the imperial government are entirely repudiated by the present government.

Army, Navy, etc.—In accordance with the old constitution of Mexico, the standing army was to consist of 26,000 men, with a reserve of 65,000 men; but this number, which had fallen to nearly half the required force in 1853, has been so extensively reduced since that period by continual civil wars, that, according to Spanish authorities, the government of the late president Juarez, on the breaking out of hostilities with the French in 1862, was unable to bring into the field more than 5,000 infantry, 800 cavalry, and 9,500 of the national guard. The total strength of the army is now estimated at about 20,000 men. The navy consisted of only some 500 men, while the fleet numbered only 9 small ships of war, carrying in all between 30 and 40 cannon. Education in Mexico, long in the lowest possible condition, even among the wealthier classes, is now steadily improving. Liberal allowances have been made by the central and state governments for establishment of new schools, etc. In 1873 there were in Mexico nearly 4,000 public schools, with about 190,000 scholars.

Religion, etc.—The Roman Catholic is the dominant church of Mexico, but all other sects are tolerated. Mexico has 3 archbishops and 10 bishops. The administration of justice is not what it should be, but is not so inefficient, nor the courts so corrupt, as formerly. Brigandage and smuggling endanger personal security, and seriously damage the resources of the nation, but are gradually disappearing.

The supreme power of the state was, in 1838, vested in the hands of Benito Juarez, who was to bear the title of constitutional president, and administer public affairs in conjunction with a legislative congress, composed of a chamber of senators and lower house of representatives. Each province was to elect two senators and one deputy to every 40,000 inhabitants, and was, moreover, to have a separate provincial legislative chamber, presided over by its governor. President Juarez is undoubtedly, along with Gen. Iturbide, to be regarded as the most distinguished character in modern Mexico. The unfortunate Maximilian was a mere episode in the career of the country. A provisional regency of the Mexican empire was appointed by the Junta Superior del Gobierno; which was itself constituted (June 16, 1863) by a decree of marshal Forey, leader of the French army of invasion. It was composed of 35 members. This junta at the same time established, under French influence, an assembly of notables, whom it charged with deciding in the name of the people what form of government Mexico should adopt.
On July 10, 1863, this body, by an overwhelming majority, decided in favor of a constitutional hereditary monarchy, and that the new ruler should bear the title of emperor of Mexico. See succeeding article. The present constitution dates from 1857. The executive power is vested in a president, elected by universal suffrage, for a period of 6 years. The legislative power is confided to a congress consisting of a house of representatives (for each 80,000 inhabitants), and a senate (with two members for each state).

**History of Mexico.**—The history of ancient Mexico exhibits two distinct and widely differing periods, the former of which, that of the Toltecs, appears to have begun in the 7th and ended with the 12th c.; while the second, that of the Aztecs, began in the year 1200, and may be said to have been closed by the conquest of Cortes in 1519; for although the race has maintained occupation of the Mexican territory, its existence as a nation ceased with the Spanish domination. The origin and primitive seats of the Toltecs are shrouded in mystery; and all that we learn of this people is, that they came from the north, from some undefined locality, which they designated Tulaan, and from which they early called Mexico the place of the first elements of civilization. Their laws and usages stamp them as a people of mild and benevolent inmature, industrious, active, and enterprising. They cultivated the land, introduced maize and cotton, made roads, erected monuments of colossal dimensions, and built temples and cities, whose ruins in various parts of New Spain still attest their skill in architecture, and sufficiently explain why the name Toltec should have passed into a synonym for architect. They knew how to fuse metals, cut and polish the hardest stones, fabricate earthenware, and weave various fabrics; they employed hieroglyphics for the record of events, were acquainted with the causes of eclipses, constructed sun-dials, devised a simple system of notation, and measured time by a solar year, composed of 18 months of 20 days each, adding 5 complementary days to make up the 365, and intercalating 12½ days at the expiration of every 32 years, which brought them within an almost inappreciable fraction to the length of the tropical year, as established by the most accurate observations. These and other arts, with a mild form of religion, and a simple but just mode of justice, were preserved with so little interruption from their predecessors, that the civilization of their predecessors many fierce and sanguinary practices in their religious, and many puerile usages in their social life. Nothing is known of the exact time, and less of the manner and causes of the departure of the Toltecs from Mexico; but it has been conjectured that they went towards the south, and that the colossal architectural remains of the cities of Palenque, Uxmal, and Mitla, in Central America, are the work of their hands. The Aztecs, as we have said, imparted to the institutions of the Toltecs a tinge of their own somber cruelty, and produced an anomalous form of civilization, which astonished the Spaniards by its mingled character of mildness and ferocity. Like the Toltecs and the Chichmeecs, a rude tribe who had succeeded them, the Aztecs came from the north, and after wandering from place to place, founded in 1325 the city of Tenochtitlan, or Mexico. On the arrival of the Spaniards, their empire was found to extend from ocean to ocean, stretching on the Atlantic from 18° to 21° n. lat., and on the Pacific from 14° to 19° n. lat. Their government was an elective empire, the seed of which was sown by the descendants of the Chichmeecs, not a part of them, from his nephews. Their laws were severe, but justice was administered in open courts, the proceedings of which were perpetuated by means of picture-written records.

The Aztecs believed in one supreme invisible creator of all things, the ruler of the universe, named Taotli—a belief, it is conjectured, not native to them, but derived from their predecessors, the Toltecs. Under this supreme being stood 13 chief and 20 inferior divinities, each of whom had his sacred day and festival. At their head was the patron god of the Aztecs, the frightful Huiztiliopochtli, the Mexican Mars. His temples were the most splendid and imposing; in every city of the empire his altars were drenched with the blood of human sacrifice. Cortes and his companions (see Draz) were permitted by Montezuma to enter that in the city of Mexico, and to behold the god himself. He had a broad face, wide mouth, and terrible eyes. He was covered with gold, pearls, and precious stones; and was girt about with golden serpent. . . . On his neck, a fitting ornament were the faces of men woven into his silver, and between his bracings and on the braziers 3 real hearts of men who had that day been sacrificed" (Help's Spanish Conquest in America, vol. ii., book x., chap. 4). The smell of the place, we are told, was like that of a slaughter-house. To supply victims for these sacrifices, the emperors made war on all the neighboring and subsidiary states, or in case of revolt in any city of their dominions, and levied a certain number of men, women, and children by way of indemnity. The victims were borne in triumphal processions and to the sound of music, to the summit of the great temples, where the priests, in sight of assembled crowds, bound them to the sacrificial stone, and opening the breast, tore from it the bleeding heart, which was either laid before the image of their gods, or eaten by the worshipers, after having been carefully cut up and mixed with maize. The victims immediately preceding the Spanish conquest not less than 20,000 victims were annually inmolated. These atrocities were incongruously blended with milier forms of worship that their gods, and per-
Mexico.

the capital, though afterwards it was applied to the whole Aztec empire) in the golden age of the world, but being obliged, from some unexplained cause, to retire from earth, he departed by way of the Mexican gulf, promising to return. This tradition accelerated the success of the Spaniards, whose light skins and long dark hair and beards were regarded as evidences of their affinity with the long-looked-for divinity. The Mexican priesthood formed a rich and powerful order of the state, and were so numerous that Cortes could notnumber more than 5,000 attached to the great temple of Mexico. The sacrifices of the young of both sexes remained till the age of puberty in the hands of the priests and priestesses; and the sacerdotal class were thus able to exercise a widely-diffused influence, which, under the later rulers, was almost equal to that of the emperor himself. The women shared in all the occupations of the men, and were taught, like them, the arts of reading, writing, ciphering, singing in chorus, dancing, etc., and even initiated in the secrets of astronomy and astrology.

On the arrival of Cortes in 1519, the Aztec throne was occupied by Montezuma, an energetic prince, who, after his election to the throne, which for several generations had been occupied by his ancestors, made successful war on the powerful and highly-civilized neighboring state of Tlacazaco, and on Nicaragua and Honduras; after a time, however, he grew indolent, and alienated the affections of his subjects by his arrogance and exactness, and by his unconscionable devotion to the services of the temples. According to the oracles which he frequently consulted, great changes were impending over the empire, the return of Quetzalcoatl was near at hand, and the fall of his race was impending. The tidings of the arrival on the coast of the expedition of Grigalva in 1518 terrified Montezuma and his priestly counselors; and when the hieroglyphic reports of his provincial officers announced the landing in the following year of Cortes and his companions, he endeavored to propitiate the dreaded strangers by sending an embassy charged with valuable gifts to meet them. The road to success was thus open to the Spanish captain, who, with a handful of men, advanced from St. Juan de Ulloa to Mexico, and gradually subdued the entire empire of the Aztecs, whose power crumbled to dust before the greater energy and superior civilization of their Christian invaders. In 1540 Mexico was united with other American territories under the name of New Spain, and governed by viceroyalty appointed by the mother-country. The intolerant spirit of the Catholic clergy led to the suppression of almost every trace of the ancient Aztec nationality and civilization, while the strict system of sequestration enforced in Mexico crippled the resources of the colony; yet notwithstanding these drawbacks, Mexico maintained a remarkable degree of prosperity, and the Spanish colonists were among the most affluent of the sixteenth century, in riches, and natural products. It may be said to have vegetated for nearly three centuries in a state of semi-quiescent prosperity, interrupted by few disturbances of any kind until the year 1810, when the discontent, which had been gaining ground against the vice-regal power during the war of the mother-country with Napoleon, broke into open rebellion under the leadership of a country priest named Hidalgo. The defeat and subsequent execution of the latter in 1811 put a partial stop to the insurrection; but the atrocities committed under the sanction of the new viceroy, Calleja, exacerbated the people, and gave an irresistible impulse to the revolutionary cause. Guerrero and Iturbide in turn gained signal advantages over the Spaniards. For a time Iturbide maintained a self-established imperial rule over the colony; but on the downfall consequent on his tyrannical abuse of power, a constitutional mode of government was inaugurated, and in 1824 the independence of Mexico, which had chosen a federal republican form of government, was finally established, and in the following year definitely recognized by every foreign power except Spain. The Mexican war was stained with excesses and atrocities on both sides; but it must be confessed that the Spaniards gained an unenviable pre-eminence in regard to the wanton cruelty which characterized their method of conducting hostilities. With them the war was one of extermination, every commander being allowed, at his own discretion, to hunt down and slaughter the insurgents like brutes.

The welfare of the new republic was unhappily disturbed by constant outbreaks of civil war under the leadership of the escoses, or aristocratic faction, and the yorkinos, or democrats; and the history of the quarter of a century during which Mexico has exercised independent power, leaves little to recount beyond ever-recurring acts of violence, and the rapid and summary deposition of one president after another. In 1836 Texas secured its independence of the Mexican republic, for which it had struggled for several years, and at the same period differences arose with France, which were, however, brought to a peaceable conclusion after the taking of Vera Cruz in 1838 by the French troops. In 1841 gen. Santa Anna, on the retirement of Bustamante, succeeded in regaining the direction of affairs, from which he had been more than once deposed, and, under the title of dictator, exercised the power of an autocratic ruler. In 1845 Mexico was compelled to recognize the independence of Texas, which was incorporated with the United States, whose troops having entered the Mexican territory, provoked a declaration of war on the part of the Mexican government. Hostilities were carried on with great energy by both parties until 1848, when peace was finally concluded, after several bloody engagements had been fought without any definite result on either side; and the city of Mexico had been stormed and taken by the Americans under gen. Scott. In 1852, after Santa Anna and Herrera had been in turn deposed and recalled to power,
a revolutionary movement of more than ordinary importance brought gen. Cavallos for a
time to the head of affairs; but, when the insubordination and arrogance of the soldiery
threatened universal anarchy, Santa Anna was again recalled, Mar. 17, 1853. Having
reorganized the army, and suppressed by the most cruel severity the insurrection of the
federals, he declared himself president for life, and thus again rekindled civil war. In
1855 he had to flee from the country. Since then, utter confusion has prevailed.
Santa Anna was succeeded by gen. Alvarez, who held office for about two months, after
whom came gen. Comonfort, who was forced to resign in 1858; when a gen. Zulvago
assumed supreme power, but was almost immediately deposed by a gen. Robles. This
person also proving a futility, Benito Juarez was elected; but his claims were contested
by gen. Miramón—the head of the priestly and conservative party—and the country was
plunged in civil war. The act of war was against the French, and the flagrant injustice
perpetrated on foreigners in Mexico during this period of internal disorder, during which
a gen. passed an act suspending all payments to foreigners for two years, could not fail to draw
upon the Mexican government the serious remonstrance of those European powers whose
subjects had just cause of complaint; and the result was to bring a fleet of English,
French, and Spanish ships into the Mexican gulf for the purpose of enforcing satisfac-
tion. In Dec., 1861, the British minister left Mexico, and the Spaniards disembarked a
force at Vera Cruz, and took possession of the fort of St. Juan d’Uloa, a step which was
soon followed by the arrival before the former city of the allied fleet. A proclamation,
signed by the commanders-in-chief of the three naval divisions, and addressed by them
to the Mexican people, elicited no satisfactory reply; and steps were accordingly taken
at once upon the capital. This measure alarmed the provisional government of Mexico, and brought about an armistice, with a view of negotiating a treaty for the
future regulation of commercial and other intercourse between Mexico and those great European
powers. This treaty was drawn up and provisionally ratified by the different command-
ners, but not confirmed on the part of France, and consequently the French troops
retained occupation of the Mexican territory after the English and Spaniards had
decided to join in further hostile demonstrations. In April, 1862, the French emperor
formally declared war against the government of Juarez, who had assumed arbitrary
rule as president of the republic. The French, who spent 58,000,000 on the Mexican
expedition, did not meet with the sympathy and welcome from the people at large which
the assumed unpopularity of Juarez had led them to anticipate; and, although the
taking of Puebla and other decided successes gave them a firmer footing in the country,
it was evident that whatever grievances the Mexican nation had against their govern-
ment, they entertained a deeply rooted hatred against foreigners, and were certainly not
prepared to welcome with cordial unanimity the thorough reorganization of their politi-
cal system which the European powers, with France at their head, were initiating for the
country. — Comp. Le Mexique, Ancien et Moderne, par Michel Chevalier (Hachette,
1863).

MEXICO. [From Supplement.] After the declaration of war against Juarez by the French,
they issued a proclamation to the Mexican people, April 16, 1862, setting forth
that one of the objects of the contest was to rescue them from the tyranny of the presi-
dent, and put the government of the country on a stable footing. Little faith, however,
seems to have been put in these professions; and the invaders, though joined by Mar-
quez, the military leader of the clerical party, met with little success till the arrival of
gen. Forey with a reinforcement from France in September. Forey then took the com-
mand in chief, addressed a proclamation to the Mexicans, promising them perfect liberty
in the choice of a new government in room of that of Juarez; and in the spring of 1863
concentrated the French troops, and marched on Mexico. On his way he took the
strongly fortified city of Puebla after a two months’ siege, capturing its defender, Ortega,
and his whole force (May 19); and, Juarez having fled from the capital, and transferred
the seat of his government to San Luis Potosi at their approach, the French entered
Mexico on June 10. A fortnight afterwards, a provisional government, headed by gen.
Almonte, was established, and an “assembly of notables,” which was called (June 24)
to deliberate upon the best form of government, decided in July, by a vote of 231 to 19,
in favor of a “limited hereditary monarchy,” with a Catholic prince for sovereign, under
the title of “emperor of Mexico,” and resolved in the first place to offer the crown to the
archduke Ferdinand Maximilian (q.v.) of Austria, failing whom, to request the good
offices of the emperor Napoleon in obtaining another monarch. That this resolution
was the fruit of a general earnest wish on the part of the Mexican notables, the feeble and
almost unwilling support most of them accorded to their chosen emperor after his deser-
tion by the French, will not allow us to suppose; but, on the other hand, we have not
the slightest reason for believing that anything approaching intimidation or undue influ-
ence was exercised by the French. Most of them doubtless argued that a government
supported by France would be sufficiently powerful to maintain the country in a state of
tranquillity, and in the hope of this long wished-for result, cast in their lot for empire.
These changes were, of course, vigorously protested against by the republican assembly
at San Luis, and the two parties prepared with eagerness to try the fortune of war. On
Oct. 1 Forey departed from Mexico, and gen. Bazaine took the command of the French
forces, and commenced the campaign with vigor. The result of the winter’s struggle
was that in spring the imperialists were in possession of the whole country, with the exception of the four northern provinces. On Oct. 3, 1863, the archduke Maximilian had been audience at his château of Miramar, near Trieste, to a deputation which was sent to offer him the crown, and had accepted it. On May 29 the emperor and empress landed at Vera Cruz, and on June 12 made their public entry into the capital; and soon after the middle of the year the imperialists had gained possession of every state in the kingdom, Juarez fleeing in August to the United States. As small parties of the republicans still maintained a species of guerrilla warfare in various districts, Maximilian, on Oct. 2, 1865, published a proclamation, menacing with death, according to the laws of war, all who were found in armed opposition to his government; the republic having ceased, not only by the express wish of the nation, but also by the expiry (Nov. 22, 1864) of Juarez's term of office, and his flight beyond the frontiers; an amnesty, however, being accorded to such as submitted before Nov. 15. In accordance with this edict, gens. Arteaga and Salazar, who were defeated and captured Oct. 13, were shot on the 21st; and many hundreds of captured republicans were dealt with under the terms of the same order.

This contest in Mexico had from the commencement excited the liveliest interest in the United States, though the civil war, raging there also, prevented any active interference in the affairs of its neighbor. A general impression existed that France had taken advantage of the troubles of the United States to establish its authority firmly on the American continent; and this belief, along with the violation of the "Monroe doctrine" by the establishment of imperialism in Mexico, induced the United States to give all its sympathy and diplomatic aid to Juarez and his supporters. In Nov. 6, 1865, Secretary Seward forwarded a dispatch to Paris, in which it was stated that the presence of the French army in Mexico was a source of "grave reflection" to the government of the United States, and that the latter could on no account allow the establishment of an imperial government, based on foreign aid, in Mexico, or recognize in that country other than republican institutions. This dispatch led to an interchange of diplomatic notes during the following six months: the Americans holding firmly to their first statements, and even insinuating the probability of an armed interference on behalf of Juarez; till the French emperor, who was wearied with a contest so expensive and, though successful, so barren of lasting fruits, ultimately agreed, in the summer of 1866, to withdraw his troops from Mexico. The Belgian legion and some Austrian levies, however, were not included in this arrangement. Accordingly, from the autumn of 1866 till Feb., 1867, the French troops by degrees evacuated Mexico, and their departure was the signal for a fresh rising on the part of the Juarists. See Maximilian and Juarez. Since 1871 Mexico has remained a republic; but it has repeatedly been disturbed by rebellion and civil war.

MEXICO (ante). Juarez, president of Mexico until 1872, was succeeded by Lerdo de Tejada (q.v.), under whose administration the country remained in a satisfactory condition. This statesman was minister of foreign affairs under Juarez, and his ability as a diplomatist was well recognized. The perpetual tendency to revolt which characterizes the Mexican people, though moderated during the presidency of Lerdo, became active toward the end of 1876; and his re-election for four years precipitated a revolution, headed by Porfirio Diaz, by which the latter gained control of the government, while Lerdo and his cabinet fled. President Diaz remained in possession of the government until 1880, when the regular quadrennial election resulted in the success of the government candidate, gen. M. Gonzalez, who was declared president; he had been secretary of war in 1875. A few revolutionary outbreaks which occurred during President Diaz's administration were promptly suppressed, through the employment of vigorous measures by the government.—A table published in Mexico in 1876 (not entirely trustworthy) gives the pop. of the republic as 8,745,000, and that of the city of Mexico as 250,000. The republic is divided politically into 27 states, one federal district, and one territory. The names of the states are as follows: Aguas Calientes, Campeach, Chiapas, Chihuahua, Coahuila, Colima, Durango, Guanajauto, Guerrero, Hidalgo, Jalisco, Mexico, Michoacan, Morelos, Nuevo Leon, Oaxaca, Puebla, Queretaro, San Luis Potosi, Sinaloa, Sonora, Tabasco, Tamaulipas, Tlaxcala, Vera Cruz, Yucatan, and Zacatecas. Each of these states is administered over by a governor, and an assembly called the state congress. The army of the republic comprised, in 1879, 20 battalions of foot, 14,640 men and 765 officers; 10 corps of horse, 4,940 men and 290 officers; 4 brigades, of 4 batteries each, of artillery, 1,315 men and 148 officers; coast-guards, 71 men and 22 officers; and invalids, 265 men and 19 officers; total, 22,375. The annual expenses of the Mexican army and navy (the latter comprising only 4 gun-boats) average over $8,000,000.—The national debt of Mexico was set down in 1878 at $131,914,665; of which, to Great Britain, $60,311,657; to Spain, $8,460,986; to France, $2,859,917: interest, $57,392,145; miscellaneous (including American claims awards $8,373,123), $6,121,753. The annual revenue is about $17,000,000; the annual expenditure about $19,000,000. The total amount of the exports varies between $25,000,000 and $35,000,000 annually, that of the imports being about the same, though the prevalence of smuggling renders it impossible to more than approximate to the correct figures. The amount of the trade of Mexico-
with the United States is only attainable in part from the published reports, as given in the following table.

**TRADE BETWEEN MEXICO AND THE UNITED STATES (IN PART) FOR 1878.**

At the close of the year 1879 there were 373 m. of railroad in operation in Mexico, the principal line being that between Vera Cruz and the capital. Education was conducted, in 1876, in the republic by 8,103 primary schools; 54 professional and secondary schools; a national preparatory school in the city of Mexico; and other institutions of learning. There were also 40 public libraries; 3 of which, containing an aggregate of 236,000 volumes, were in the capital. The important staple articles of export are mahogany and dye-woods, cochineal, tobacco, coffee, sugar, and the henequen plant (agave Americana), from which is prepared Sisal hemp. During the year 1875–76 Yucatan produced 22,000,000 lbs. of this fiber, representing the product of more than 18,000,000 plants under cultivation. The capital invested in this industry was $5,147,000. Maize is largely cultivated, and yields three, and sometimes four crops annually; but, with wheat and rice, is only grown for home consumption. The value of the exportation of tobacco in 1873 amounted to $132,984.75.

**MEXICO,** or **Mexico,** the capital city of the republic, is situated in 19° 20' n. lat., and 99° 5' w. long., at an elevation of nearly 7,500 ft. above the level of the sea, in the valley of Tenochtitlan, 24 m. w. of lake Texcoco. The pop. was, in 1878, 230,000. This beautiful site of the ancient Tenochtitlan of the Aztec empire, is situated on an extensive plateau, having a range of lofty mountains, and including 5 lakes within its area. The principal streets, which all converge towards the great square of Mexico, are regularly and well laid-out, broad, clean, and well-paved and lighted; but the buildings, both private and public, are low, and of a light style of architecture, in consequence of water being found in many parts of the city at only a few feet below the surface, and partly from apprehension of earthquakes. The plaza mayor, one of the finest squares of the western world, contains the cathedral, a spacious and imposing building, erected on the ruins of the great teocalli, or temple of the Aztec god Mixitli, and adorned with the kelkenda, a circular stone, covered with hieroglyphics, by which the Aztecs used to represent the months of the year. The palace of the cortes, in the same square, consists of various buildings appropriated to offices of state, government schools, and public institutions of various kinds, but like everything else in Mexico, has been suffered gradually to fall to decay since the evacuation of the Spaniards. Mexico contains 14 churches, some monasteries and convents, and numerous charitable institutions; the first hospital has been converted into a barracks. There are schools of jurisprudence, medicine, agriculture, engineering, and an academy of the fine arts, containing valuable Aztec antiquities; also several theaters and a circus: the bull-ring was demolished in 1874. In addition to the ordinary alameda or public walk of a Spanish city, Mexico is remarkable for the extent and beauty of its paseos, or raised paved roads, planted with double rows of trees, which diverge far into the country from every quarter of the city. Mexico still boasts a few of the water-gardens for which the ancient city was so celebrated, and, although no longer floating, as in the days of the Aztecs, they form attractive objects in the midst of the surrounding swamps, which, by the negligence of the Mexicans, have been suffered to increase in the vicinity of the lakes. The trade of Mexico is chiefly a transit-trade, although it has a few manufactures, as cigars of superior quality, gold-lace, hats, carriages, saddlery, etc.; and these articles, together with gold and silver, and some of the numerous valuable natural products of the Mexican plain, it transports, chiefly by means of mule, to Vera Cruz and other ports, importing in return the manufactured goods of Europe and various colonial products.

**MEXICO, a village in n.e. Missouri, a junction of the St. Louis, Kansas City and Northern railroad, with the Louisiana and Missouri river railroad, and the South Branch; pop. '80, 3,841. It is the county seat of Audrain co., and is pleasantly located on an affluent of the Salt river. It is 50 m. n. of Jeffersonville, 108 m. w. of St. Louis. It is the seat of Hardin college, has good public schools, an elegant courthouse, a variety of stores, 3 newspapers, and 3 banks. Its industries are the manufacture of woolen goods and plows.**

**MEXICO, Gulf of, a basin of the Atlantic ocean, the estimated extent of which is 800,000 English sq.m., is closed in by the United States on the n., by Mexico on the w. and s., and its outlet on the e. is narrowed by the island of Yucatan and Florida, which approach within 500 m. of each other. Right in the middle of this entrance is situated the island of Cuba, dividing the strait into two—the strait of Florida, 120 m. wide, between Cuba and Florida, and the strait of Yucatan, 105 m. wide, between Cuba and Yucatan. The former, or northern, entrance connects the gulf with the Atlantic ocean; the latter, or southern, with the Caribbean sea. The depth of water
MEXICO, ANCIENT ARCHITECTURE or, structural remains of the Aztec, Toltec, and other races who peopled Mexico prior to and at the time of the Spanish invasion under Cortez. Although these remains have been from time to time explored and investigated, it has been chiefly with the desire to sustain comprehensive theories of comparative architecture, and from a standpoint of supposed similarity in their case to the remains of ancient Egypt, India, Greece, and, as Lord Kingsborough conceived, of Jerusalem. Humboldt's work on New Spain first excited the curiosity of the Europeans, and rescued the antiquities of Mexico from the oblivion to which they had so long been consigned; but it was not until a comparatively recent period that their value as works of art, and as indications of a considerable advance in civilization, was fully appreciated. Pyramids having even a larger base, and being otherwise scarcely inferior in magnitude to those of Egypt, are found in many parts of Mexico; while the general condition of architecture at the period when these were erected has been found to be of a character to surprise and charm even those familiar with the monuments of the east. Mexican architecture is that of two distinct peoples: the Toltecs, who occupied Mexico prior to the 7th c. of our era, and the Aztecs, with whom may be associated the Chichimecas, who inhabited the country at the time the Spaniards made their entry. That which is believed to belong to the earlier race is also the most remarkable; the latter would seem to have been derived from it. Architecture in its essential features similar to that of the Toltecs exists in various parts of Central America, and may be associated with it. As far as our present knowledge extends, the architecture of Mexico is to be regarded as, in the main, self-developed, rather than borrowed from that of any other country. The buildings display vast labor, and often great skill, and are works of singular interest, promising to repay a far more thorough investigation than they have ever yet received. As in almost every other national architecture, the most important edifices are those devoted to the purposes of religion. These are known as teocallis, and appear, like the Egyptian temples, to have contained apartments for the priests; they also contained sepulchral chambers, and had descending galleries leading down into cavernous recesses or halls, which are variously conjectured to have been used for religious mysteries, or as places for the concealment of treasures, and may probably have been used for both purposes. In plan these buildings are square, in form pyramidal, generally rising in successive stories or stages, like a series of truncated pyramids placed one above another, each successive one being smaller than the one on which it immediately rests, so that it stands upon a platform or terrace; the holy place, or temple proper, being built on the summit, and subordinate in effect to the pyramid. The sides of the pyramids face the cardinal points; their angle of inclination is seldom less than 70°, which differs little from that of the pyramids of Egypt. The largest, most sacred, and best-known of these teocallis is that of Cholula, for which a fancied prototype has been found in the temple of Belus, as described by Herodotus. This pyramid-temple of Cholula is now in appearance little more than a vast mound of earth covered with vegetation, and crowned with a small church. But on near inspection its architectural features are sufficiently distinguishable. The base of this huge structure measures 1440 ft. each way (some authorities say 1488 ft.); its height is 177 ft.; the sides of the base of the great pyramid of Gizeh are only 785 ft., so that the area of the Mexican pyramid is nearly four times that of the greatest of those of Egypt, but it is not a third of their height. The body of the pyramid of Cholula is formed of clay and sun-dried bricks. It consists of four terraces; and on the summit is a small church dedicated to the Virgin, which occupies a temple of the Toltec god of the air. From the perishable material of which it was constructed, the decorative features have almost entirely disappeared, though there are evidences remaining of what were once elaborate and interesting sculptures. In its present condition but a very imperfect notion can be formed of its original appearance. It contains spacious sepulchral cavities; and a square chamber formed of stone and supported by beams of cypress wood was some years ago discovered in it, within which were two skeletons and several painted vases. The buildings outside the limits of the valley of Mexico, and especially those in Central America, are in far better preservation. One of the most stupendous monuments of this style of architecture occurs at Palenque, in the state of Chiapas, Mexico. The great teocalli at Palenque (built, according to the startling assumption of lord Kingsborough, after the model of
the temple of Solomon) comprised within its extensive precincts various sanctuaries and sepulchers, courts and cloisters, subterraneous galleries, and cells for the habitation of the priests. The whole rests on a platform composed of three graduated terraces, and forms a spacious quadrangle inclosed by porticoes. On each side of the exterior is an ascent or flight of stairs, and on the east a second flight leading down, after the first is ascended, into the cloistered court. Beneath the cloisters are what are conjectured to have been initiatory galleries and in the center of the quadrangle is what appears to be the ruins of an altar or "high place." The temple itself is oblong in plan, 70 ft. wide by 26 ft. deep, and is decorated with colonnades and latitudinal columns in its longer sides. The roof is formed by graduated courses of stone, which must at the summit, and had ornamental projections, placed above the openings formed by the supporting piers, which were probably intended to support small idols or ornamental figures. The city of Palenque itself exhibits a variety of buildings, temples, palaces, baths, and private houses, all manifesting excellence of workmanship combined with considerable skill in design. The palaces, or houses of the kings, appear to have resembled the temples in being based on pyramidal substructures, but these are generally oblong instead of square in plan, and much lower than the temple pyramids. Their substructure is usually of stone, and very massive, elaborately sculptured with figures of idols and masks of monstrous proportions, scrolls, mat-work, etc., often executed with great skill. The upper part appears to have been of wood, but has mostly perished. The ruins of Palenque extend for more than 30 m. along the summit of the ridge which separates the country of the wild Maya Indians from the state of Chiapas, and must anciently have embraced a city and its suburbs. The principal buildings are directed to the most prominent heights, and several of them, if not all, have been provided with stone stairs. The principal edifice, which has been sometimes styled a palace, is built in several squares; but the main halls or galleries run in a direction from the n. to the s. and this position has been observed in all the edifices examined, be their situation what it may. The houses have all been substantially built of stome cemented with mortar; but symmetry has been but little studied in their construction, it is supposed less from ignorance than design. Other ruins of considerable magnitude, and distinguished by numerous sculptures, are found upon the neighboring hills. In the vicinity there is one building in particular, apparently a religious edifice, which deserves notice. Two galleries constitute its foundation: the front one occupying its whole length, while the back one is divided into three compartments. Of these the eastern has the appearance of a dungeon; the western is a small room with a chapel ornamented with elegant reliefs. These consist of representations of the human figure, in various attitudes, and adorned generally with bouquets and feathers. There are other ruins of the vicinity which are not of Mexico, but they have not as yet been sufficiently examined for description. One of the most characteristic of the palaces is that of Mitla, the remains of which show that it must have been an edifice of great extent and grandeur. It appears to have originally comprised five distinct portions, which have been regarded as places of retirement for the kings, or as tombs. Three of these still remain. The principal one is nearly 130 ft. long. A staircase leads to a subterranean apartment 88 ft. by 26, the walls of which, like the exterior, appear to have been sculptured or tooled in imitation of mat or basket-work— a species of decoration characteristic of Toltec taste, and often found in sepulchral chambers. This same building has also a spacious hall supported by six plain cylindrical columns of porphyry, without base or capital, and in some respects differing from any found elsewhere. The ceiling which they support is formed of beams and slabs of cypress or sabin wood of large size. Over the principal entrance is a stone lintel 12 ft. long and 3 ft. deep. There is no appearance of windows. The interior of the chambers have been elaborately painted with representations of sacrifices, trophies, weapons, etc.; and with ornaments resembling those found in Etruscan decorations. At Testihuacan, about 25 m. to the n.e. of the city of Mexico, are several hundred small pyramids ranged in files or lines, and two larger ones, which are believed to have been consecrated to the sun and moon. Each of the latter is divided into four platforms, the slopes between which consisted of steps, and on the summit was a colossal stone statue covered with plates of gold, which were stripped off by the soldiers of Cortes, while the statues were destroyed. Besides monuments which are chiefly works of magnificence, others exist which attest the high degree of civilization attained by the Toltecs, such as roads and bridges. The form of these were constructed of huge blocks of stone, and frequently carried on a continued level, so as to be viaducts across valleys. There are also rock-hewn halls and caverns which curiously resemble the Pelasgic remains. Doorways to subterraneous galleries and apartments are found similar to the gate of Mycenae; and another similarity exists in the peculiar triangular form of the other, of which specimens are found in the cloisters of the building at Palenque. There are also extensive works for defensive purposes, earthen sepulchral mounds, etc. The mountain of Tezozoma is nearly covered with ruins of ancient buildings. There is also evident a remarkable skill and high degree of taste in sculpture. Many of the statues found at Otumba, Mitla, Jochichalco, and the magnificent flower-temple of Oajaca, are sculptured in a purely classical style; while vases rivaling those of Egypt and Etruria have been discovered in sepulchral excavations. The successors of the Toltecs, the Chichemacas, the Acolhuas, and other nations of Mexico, built houses and formed
cities, seeming to be well skilled in architecture. The Mexicans (Aztecs) constructed their houses and public edifices with roofs of cedar, fir, cypress, or of a native wood called ojamel; the columns, of common stone, except in the palaces, were either cylindrical or square, and without base or capital. In the palaces these columns were of marble, and even alabaster. The pavements were of a common red stone, sometimes tesselated with marble and other ornamental substances. Cortes, in a letter to Charles V., said of Montezuma: "He had, besides those in the city of Mexico, other such admirable houses for his habitation, that I do not believe I shall ever be able to express their excellency and grandeur; therefore I shall only say that there are no equals to them in Spain." The Mexicans also constructed, for the convenience of their inhabited places, several excellent aqueducts. Those of the capital, for conducting the water from Chapultepec, 2 m. distant, "were two in number, made of stone and cement 5 ft. high, and 2 paces broad, upon a road raised for that purpose upon the lake, by which the water was brought to the entrance of the city, and from thence it branched out through smaller conduits to the surrounding country or roads. It is said that a great temple in the city of Mexico, the sanctuary of Mexico, whence "Mexico," was built by the emperor Alhuiztollt. It occupied the center of the city, and Cortes stated that on the space which it occupied a town of 500 houses could have been erected. It was inclosed by a square wall, 8 ft. high and very thick, crowned with battlements; built of stone and lime, and ornamented with many stone figures in the form of serpents. It had four gates to the four cardinal points, and over each gate was an arsenal filled with offensive and defensive weapons, from which the soldiers were supplied when it was necessary. In the center of the inclosure was an immense flat, solid building, built in five gradually narrowing platforms or terraces, with stairs to each terrace at the s.w. corner, so arranged that each terrace had to be traversed around the entire building before the next staircase could be reached. At the top of the structure, at one end, were two tall towers, sanctuaries; here also was an altar for sacrifice, and two stoves of stone, in which a fire was kept burning night and day. In the space between the wall and the great temple were found three temples; a place for the native religions, edifices, palaces, and chapels for the priests and seminaries for children; and many other buildings, including a great house of entertainment for strangers of distinction who visited the place from curiosity, or to join in the religious rites performed there. Out of the city of Mexico the most celebrated temples were those of Tezcuco, Cholula, and Teotihuacan. Cortes said that from the top of one temple in Cholula he had counted more than 400 towers of others. Torquemada estimates that there were upwards of 40,000 throughout the empire, and there were certainly hundreds in each principal city. The peculiar coincidences of form, position, and ornamentation to be found between these structures and those employed for similar uses among the ancient Egyptians, have given rise to a belief in some relation between them, which is not unfounded; but no certain theory as to this relation has ever yet been formulated. For many years the ruins and monuments of ancient Mexico had been suffered to lie uninvestigated, and their secrets remain unrevealed—further than had occurred in the works to which reference has been already made, and others like them, of a comparatively remote date. In the spring of 1880 an exploring party of engineers, under the direction of M. Charnay, and the Rev. Mr. Bache, undertook an exploration of the ruins of Teotihuacan and other portions of the territory in question, and the result of this examination was communicated to the world by M. Charnay through the pages of the North American Review, from which we gather the following information. The first visit of the exploring party was made to the ruins of Teotihuacan, a city which is said by M. Charnay to have been about 23 m. in circumference. "At first view," he writes, "one can form no just idea of the grandeur of these ruins. As with ruins in general, especially when they are overturned and wrecked like those before us, one experiences a grievous disillusion when he looks at them for the first time. It is only after you have made a thorough study of them in mass and in detail that they impress you with their amazing vastness. Nowhere else in America can you, in my opinion, find a more imposing mass of ancient ruins, nor do I know of anything that can compare with this city of the gods." Here is the pyramid of the sun, whose base is 761 ft. square, and its height 216 ft.; its four sides facing the four cardinal points. It is constructed of volcanic debris laid in vegetable mold. There is no sign of mortar, and it is only the outer surface that was coated with cement, of which large blocks remain in perfect condition. Torquemada said of this city: "All these temples and palaces, and all these houses round about, were wholly built of white polished lime, so that on beholding them from afar one experienced no end of pleasure at the sight. The alleys, the streets, and the plazas were of colored and polished cement, and so fair were they, so cleanly and so shining, that it seemed impossible that human hands should have been able to construct them, or that human feet durst tread them. And so true is this that, all exaggeration aside, my report can be believed, for in addition to what others have certified to me I have myself seen certain ruins that gave proof of all I have said; and amid these temples were trees and flowers, magnificent gardens, and parterres breathing fragrance, all for the service and the ornamentation of the temples." It is stated that there were 27,000 buildings in Teotihuacan, not counting the temples. Charnay says that the term Toltec meant "builder," or "architect," and that it was applied to those who reared cities and built edifices, and not to any particular race or nation. In upper Mexico the material used in building was adobe; in some provinces a mixture of stones
and mud: at Hochcalco and at Teotihuacan a mixture of volcanic stones and mud, covered with a layer of cement; at Mexico it was adobe covered with cement or lime, and polished; at Oaxaca it was stones and mortar overlaid with cement, and this cement modeled into bas-reliefs; at Palenque, too, there are sculptured stones bearing inscriptions; in Yucatan there are pyramids and monuments of stone and mortar; the builders used the material nearest to them, but the general style of the architecture and the methods of building are in all instances nearly identical. Tula, which was another site visited by Charnay, the ancient metropolis of the Toltecs, 65 m. n. of the city of Mexico, was founded in 667. Here he excavated Toltec dwellings, found specimens of their sun-burned bricks, and numerous vases and other articles of pottery. He also claimed to have discovered fragments, or a fragment of a glass vessel, now iridescent from long burial under ground. A palace was also unearthed having 43 apartments. Under the reign of Miti, in 927, the race and empire of the Toltecs reached the climax of their fortunes. The population had increased to such an extent that the nation occupied a territory more than 3,000 m. in circumference. The population of Teotihuacan is believed to have been half a million. M. Charnay's exploration is conducted with all the zeal and enthusiasm which characterized that of Dr. Schliemann in ancient Ilium, and promises to reveal much that has been unsuspected with regard to the ancient civilization of Mexico, as this was displayed in the condition of the arts, and particularly of architecture, among its people. In the mean time it has not advanced sufficiently far at the present writing to have demonstrated either the justness or the inaccuracy of past theorists on the probable origin to which these may be attributed. See Cholula and Palenque, ante.

MEXICO, Picture Writing of. See Hieroglyphics, ante.

MEYENDORFF, the name of a Russian family which originally lived in Saxony. Peter, 1706–1863, was ambassador to Austria in 1850, and signed the convention of Olmütz. George, d. 1806, wrote Voyage d'Orembourg à Boukhara. Felix, d. 1871, was a son-in-law of prince Michael Gorchakoff, chargé d'affaires at Rome, and afterwards at Carlsruhe.

MEYER, Felix, 1633–1713; b. Switzerland; studied art at Nuremberg, and afterwards under Ermel, a landscape painter. He then went to Italy to continue his studies, but the climate proving injurious to his health, he returned to Switzerland. He studied, and represented henceforth in his pictures, the scenery of his country. He was not successful as a figure painter; but as a landscape painter he united a quick imagination with great technical skill and swiftness of execution. In illustration of the latter quality, the story is told that he was one day asked by the abbot of St. Florian, in Upper Austria, the proper design for painting in fresco two great rooms in the abbey, which the artist engaged seemed unable to decorate in a suitable manner. Meyer at once sketched with a piece of charcoal the objects of natural scenery about the abbey which seemed to him worthy to be included in the fresco; and the abbot, impressed with his facility and fertile invention, employed him to carry out in fresco the charcoal sketches. Thenceforward his work received the patronage of the nobility. In the last years of his life he assumed a new manner in his pictures, and his productions in this later manner are by no means equal to his earlier work.

MEYER, Heinrich August Wilhelm, Th. D., 1800–73; b. Gotha. In 1831 he appeared as an exegetical commentator on the New Testament, displaying sound learning and acute criticism, combined with evangelical sentiments. His commentaries are highly esteemed. Besides his commentaries, he edited an important work on the evangelical confession, and preached for many years in the church at Hannover. An English translation of his commentaries is now publishing at Edinburgh, under the direction of Drs. W. P. Dickson, of the university of Glasgow, and F. Crombie, of St. Mary's college. Those on Galatians, Romans, and the Gospel of John have already appeared. Their value is very great.

MEYER, Jean George (Meyer von Bremen), b. in Bremen, 1813; student 1833–42 in the art school of Düsseldorf, where he opened a studio. His first productions were religious works of large size, but the spirit of Meissonier soon possessed him, and he commenced that series of domestic subjects on diminutive canvas of which the exquisite finish and natural pathos have made his name a household word on two continents. In 1852 he established himself in Berlin, and so great has been the demand for his pictures that they have generally been sold into private hands before they could be placed in the great exhibitions. Their usual small size, and lively tone as well as delicacy of finish, make them peculiarly valuable as parlor pictures. Among his well-known paintings are "The Widow's Evening Prayer with Her Children," which has been engraved; "Inundated," "The Return of the Soldier of the Landwehr," also engraved; "The Very Small Brother," engraved; "The First Prayer," engraved; "The Repeated Daughter," "Grandfather's Visit;" "Fisherman's Children." The first named and "The Very Small Brother" were exhibited at the Paris exposition of 1855. A considerable number of his paintings are now in the United States.

MEYER, Johann Heinrich, 1759–1832; b. Switzerland; studied painting at Zürich, under Flüssli, brother of the well-known royal academician, Henry Fuseli.
In 1784 he went to Rome, where he met Goethe, with whom he contracted a friendship; so intimate that he was known in Germany by the name of “Goethe-Meyer.” After spending some time in Venice, Naples, and other Italian cities, he returned to Zürich in 1787. He made at Naples the acquaintance of Tischbein, and of Herder, who was making a tour of Italy as an attaché in the service of the duchess of Weimar. In 1792 he visited Goethe at Weimar, and was appointed to a professorship in the Weimar school of design. Three years later he revisited Italy, again passing much of his time at Naples and Florence. In 1797 he returned to Weimar, which became henceforth his home. He was on intimate terms with the court and the literary men and scholars at Weimar. He was honored with the title of Hofrat, and in 1807 was made a director of the academy there. He continued his intimacy with Goethe, who consulted him on all matters of art; and many of the critical portions of Goethe’s works on art, such as Kunst und Alterthum, und Winckelmann und sein Jahrhundert are to be credited to Meyer. As a painter, his production was scanty. There is an allegorical frieze by him in the palace at Weimar, and he left a few water-colors, for the most part sketches from ancient works of art. It was as a writer on the history and theory of art, and particularly of Greek and Roman art, that he acquired authority. He published, with extensive annotations of his own, the works of Winckelmann. These notes he subsequently expanded into a general history of Greek art, which appeared at Dresden in 1820, under the name of Geschichte der Bildenden Künste bei den Griechen. A third volume of this work was published by Reimer, after Meyer’s death, as Geschichte der Bildenden Künste bei den Griechen und Römern.

MEYEBRER, JAKOB, commonly called GIACOMO MEYEBRER, a celebrated musical composer of the present age, was the son of a wealthy Jewish banker, and was b. at Berlin, Sept. 5, 1794. He was a precocious child, playing tunes on the piano spontaneously even before his fifth year. He began to study music composition under Bernhard Anselm Weber; and in 1810 entered the school of Vogler at Darmstadt, where he formed an intimate friendship with the renowned Karl Maria von Weber. While at Darmstadt, he wrote a cantata, Gott und die Natur. Subsequently, he composed an opera, Jepthah, produced at Munich in 1812; but though warmly admired by his friends, Vogler, Weber, and others, it fell flat on the audience, and was considered a failure. He now proceeded to Vienna, where he acquired a brilliant reputation as a pianist; but another opera which he produced here by command of the court, Die beiden Khidjeten, was no more successful than the previous one. Italian music was the rage at the time, and nobody had a chance who did not imitate Rossini. Meyerbeer was induced by his friend Sallieri to visit Italy, where he became an enthusiastic convert to the new Italian school, and began the composition of a series of operas which proved highly popular. We may mention his Romilda e Constanza (performed at Padua in 1819), Semiramide (Turin, 1819), Ermione di Rossingo (Venice, 1820), the first of Meyerbeer’s compositions that excited a furore; Maria di Anjou (1829), Ercole di Grenada (1829), and Crociato (Venice, 1823). The last of these afforded, perhaps, the most decisive proofs of the high genius of its author, and was received with great applause in Paris, whither Meyerbeer now proceeded, and took up his residence. In 1831, was produced, after numerous rehearsals, his Robert le Diable, which caused an excitement “perhaps unparalleled in the history of the Parisian stage” while it was received with nearly as great enthusiasm in England, Italy, Austria, and Russia; and in 1836, Les Huguenots, in which he reached the climax of his fame. His next opera, Le Prophète (1849), fairly sustained his reputation. It was followed by Pierre le Grand (1854), Dinorah (1858), and L’Africaine (1865). Meyerbeer died May 2, 1864.

MEYERS, a co. in s. central Dakota; drained by the s. fork of White river and by the Keyapaha which separates it on the s. from Nebraska; 1400 sq. m.; pop. ’80, 115—29 of foreign birth. The soil is undulating and broken. As the country is very sparsely settled, there is little agriculture and no manufacturing.

MEYR, Melchior, 1810—71; b. Germany; educated at Munich and Heidelberg. He made his first appearance as a poet, at the age of 35, and as a prose writer three years later. His most important works are Stories from the Rhine, 1856—60; God and his Kingdom, 1860, with its sequel, Emilia, 1863; Charles the Bold, 1862; and Talks with an Oaf (Grobian), 1866.

MEYRICK, Frederick, b. England, 1836; educated at Trinity college, Oxford, of which he was successively scholar, fellow and tutor; graduated in 1847, and has held the university offices of select preacher and public examiner. In 1856 he was appointed one of the queen’s Whitelhall preachers, in 1859 inspector of schools, and in 1869 became rector of Blickling with Erpingham in Norfolk. He was the chief agent in establishing the Anglo-Continental society for making known the principles of the English church in foreign countries, and published several controversial treatises in Latin, Spanish, Italian, etc. He is the author of Practical Working of the Church in Spain; The Moral Theology of the Church of Rome; The Outcast and Poor of London; The Wisdom of Piety; But isn’t Kingsley Right after All?; On Dr. Newman’s Rejection of Liguori’s Doctrine of Equivocation. He has contributed also to Dr. Smith’s Dictionary of the Bible, and to the Speaker’s Commentary edited by Canon Cook.
MEYRICK, Sir Samuel Rush, LL.D., 1783–1848, b. England; educated at Oxford. He married at the age of 20, against the wishes of his father, who disinherited him. In 1810 he published The History and Antiquities of the County of Cardigan. He was now called to the bar, and practiced law in the ecclesiastical and admiralty courts. In 1814, in association with capt. Charles Hamilton Smith, he published a book on the Costume of the Original Inhabitants of the British Islands. But his chief antiquarian work did not appear till 1824, under the title of A Critical Enquiry into American Armor, in 3 vols. 4to. He assisted rev. T. D. Fosbroke, in 1825, in the publication of The Encyclopedias of Antiquities. In the next year, he arranged the arms and armor in the Tower of London, and two years later, he performed the same service at Windsor castle, at the request of George IV. He was knighted by William IV., in 1832. He had already built near Goodrich castle on the Wye, a house called Goodrich court, arranged to exhibit his collection of armor, an account of which is to be found in Joseph Skelton's Engraved Illustrations of Ancient Armor. In 1836 sir Samuel furnished the text to Henry Shaw's Specimens of Ancient Furniture. His last important publication was Lewis Dunn's Heraldic Visitation of Wales, which appeared in 1846.

MEZEN, or Mezene, a river in the n. of European Russia, rises in the n. of the government of Vologda, and flows n.w. into the White sea, having a course of about 450 miles.

MEZEN, or Mezene, a district t. in the government of Archangel, European Russia, 50 m. from the mouth of the river of the same name, remarkable for the salmon and herring fisheries which supply St. Petersburg with frozen fish during winter. Pop. '67, 1746.

MEZERAY, François Eudes de, 1610–83; b. in Sées, France; educated in the university of Caen; was for a time in the commissary department of the army. Its labors proving distasteful, he commenced writing in light literature, and perceiving that historical literature was not of a high order at that time, conceived the notion of supplying the want. His labors attracted the attention of Richelieu. The first vol. of his History of France appeared in 1643 in quarto, illustrated. Industrious, independent, and supercilious towards his predecessors, he produced a work that placed him temporarily at the height of fame. Richelieu sustained him. In 1651 he had published the 3d vol., and been made a member of the academy. His style is vigorous and original, and though far less thorough than modern historians, "his sagacity often supplies his lack of knowledge." After the History of France was completed, he made a translation of "The History of the Turks" by Chalcedyde. During the wars of the Fronde he mingled in the wordy war of pamphlets, poems, madrigals, and satires, with a profuse pen, distinguished more by its grossness than its wit; and largely aimed at cardinal Mazarin and his belles nièces. For the history of France in the 16th c., which was near to him, he is still the highest historical authority of his time.

MEZERON, the bark of daphne mezereum, Lin.; daphne gnidum, Lin.; and daphne laureola, Lin. Natural order thymelaeace. These three plants are small shrubs from 2 to 4 ft. high. Daphne mezereum has rose-red, sessile, fragrant flowers, in small clusters, preceding the deciduous leaves. It is indigenous to hilly and mountainous regions of Europe, extending to the Arctic circle and eastward to Siberia. The other two species grow in southern Europe. D. laureola, spurge laurel, has large evergreen leaves and yellowish-green flowers in axillary clusters. D. gnidum, spurge flax, has narrow, annual leaves, and small white flowers in terminal racemes. Mezeron bark occurs in commerce in long bands about one-half an in. wide, and one-twentieth an in. thick, folded and tied together in bundles, or rolled up into flat disks. The dried bark is inodorous, but has a persistently acrid and burning taste. The bark of D. gnidum is darker, and that of D. laureola is more gray and has a greenish base. They resemble mezereon in acridity. The root bark of the three species is the strongest, but the stem bark is the more common. It is used as an adjunct to sarsaparilla in making the compound decoction and the compound extract of that drug. Ancient and modern authorities assign to mezereon irritant qualities, and it was long ago used as an emetic, purgative, cholagogue, emmenagogue, and sudorific. It has produced narcotism and convulsions, acrid and blood-red urine, and death has sometimes followed its experimental use on animals. In medicinal doses the decoction causes salivation and increased cutaneous and mucous secretions, described as having a peculiar odor. A case is recorded of a girl upon whose cheek the fresh juice had been rubbed. This was followed by a vesicular eruption, fever, internal disorders, and after a period of nine months, death. Notwithstanding this, it is still used as a local irritant in the form of the juice, and that of an ointment. It once had a reputation for curing skin diseases.

MEZIERES, a fortified t. of France, capital of the department of Ardennes on a bend of the Meuse, which washes its walls on two sides, and separates it from Charleville (q. v.). It was strongly fortified by Vauban, and is defended by a citadel. It communicates with the Meuse by a suspended bridge. In 1815 the town held out for two months against the allies, who besieged it after the battle of Waterloo. Over the n. aisle of the church is a bomb-shell, which has been sticking there ever since the town capitulated. In 1520 the chevalier Bayard, with 2,000 men, successfully defended it against 40,000 Spaniards under Charles V. In the Franco-German war of 1871 Mezieres capitulated after a cannonade of two days. Pop. '76, 5,204.
Mezières, Alfred, b. at Rehon on the Moselle in 1826; educated in Paris; professor of foreign literature at Nancy in 1854, and afterwards assistant professor of the same in Paris. Among his published works are Mémoire sur le Pelion et l'Ossa, 1853; Shakespeare, ses Œuvres et ses Critiques, 1861; Prédécesseurs et Contemporains de Shakespeare, 1863. The last two works were crowned by the French academy. Contemporains et Sucessors de Shakespeare, 1864; Dante et l'Italie Nouvelle, 1865; Charivaires et les Homonymes ou l'Art de s'instruire en s'amusant, 1866; Petrarch, 1867; and Recits de l'Invasion, Alsace et Lorrainer, 1871.

MEZÔ-TUR, a t. of Hungary, on the Berettyo, an affluent of the Kôros, 60 m s w. of Debreczen. Pottery is made, and there is an important market. Pop. 67, 20,447.

MEZQUÍTE, the name of two Mexican trees or shrubs, of the natural order leguminosae, suborder papilionaceae, bearing pods filled with a nutritious pulp. The Common MEZQUÍTE (agarpódia glandulosa) is a small shrub, with stems often decumbent, and armed with strong straight spines. It is found in great profusion throughout vast wastes, chiefly consisting of dry and elevated plains. In dry seasons it exudes a great quantity of gum (gum mezquite), similar in quality to gum-arabic, which seems likely to become a considerable article of commerce, and which has begun to be exported to San Francisco from the Mexican ports on the Pacific.—The CURLY MEZQUÍTE or SCREW MEZQUÍTE (strombosperma pubescens), also called SCREW BEAN and TORNIL, although only a shrub or small tree, is of great value in the wild and desert regions of the western part of North America, where it occurs along with willow bushes near springs of water. Its wood is used as fuel, and the pulp of its pods for food. The pods are spirally twisted, into compact rigid cylinders, from an inch to an inch and a half in length.

MEZZO signifies middle, or mean, and is generally used in music in conjunction with some other word, as mezzo-forte—moderately loud; mezzo-piano—rather soft; mezzavoce—with a moderate strength of tone; mezza-orchestra, with half the orchestra, etc. When written alone and applied to the grand piano-forte it denotes that the pedal is to be used, avoiding one of the sets of strings.

MEZZOFANTI, Giuseppe, Cardinal, a remarkable linguist, was b. Sept. 17, 1774, at Bologna, where he received his education, and subsequently (1815) received the office of university librarian. In 1831 he settled in Rome, and was advanced to the dignity of monsignor; in 1833 he was appointed secretary of the college of the propaganda; then keeper of the Vatican library, and in 1838 he was raised to the dignity of cardinal. He died Mar. 15, 1849, at Rome. Mezzofanti's European reputation was founded not on any literary or learned works that he wrote, but on the almost miraculous extent of his linguistic acquisitions. Towards the end of his life he understood and spoke fifty-eight different tongues. As early, indeed, as 1829 lord Byron called him "a walking polyglot, a monster of languages, and a Briareus of parts of speech." He was not in the strict sense a critical or scientific scholar; yet, although his linguistic skill lay chiefly in verbal knowledge, his acquisitions in other departments were by no means inconsiderable. See Russell's Life of Cardinal Mezzofanti (Lon. 1858).

MEZGOJO 50 (Arab. Menzh-jussaf, village of Joseph), a t. of Sicily, in the province of Palermo, 18 m. s.s.e. of Palermo city. It is one of the four colonies of Albanians who, on the death of Scanderbeg, in the 16th c., fled to Sicily to avoid the oppression of the Turks. They preserve their language to this day; and their national custom is, that before the ceremony of marriage is performed, the bridegroom being allowed to marry; but, except on fête-days, they are not to be distinguished in feature or dress from the peasantry of the rest of Sicily. Pop. 5,700.

MEZZOTINT, a style of engraving on copper and steel which was very popular during the first half of the 19th c. in England and America, being applied to reproduction of works of the masters; and also to the illustration of subjects for the class of gift-books known as "annuals," and which were greatly in vogue between 1820 and 1860. In this style of engraving, which essentially differs from every other, the surface of the plate is to be exposed or indented, or hooked all over by the action of an instrument something like a chisel, with a toothed or serrated edge, called a cradle, or mezzotinto grunder. This tool, being rocked to and fro in many directions, indents or bars the plate uniformly over its face, and produces what is called the mezzotinto grain or ground. The barb or nap thus produced retains the printing-ink; and if in this state of preparation an impression were taken from the plate upon paper, it would be uniformly of a deep black color. The directions, or weye, as they are technically called, given to the grounding-tool are determined by a regulated plan, and for this purpose an ingenious sort of scale is used which enables the workman to pass over the plate in almost any number of directions without repeating any one of them. The mezzotinto ground being thus laid, it is at this period that the business of the artist properly commences. Having traced or drawn, with a pencil or other instrument, his outline upon the paper (unless, as is sometimes the case, this should have been etched by the ordinary process previously), he proceeds to remove the map or ground, in conformity with the design, from all those parts which are not intended to be perfectly black in the impression. The instruments required for this purpose are scrapers and burnishers; with the former he scrapes away more and more of the ground in proportion to the brightness of the light, and the burnishers are used to produce perfect whiteness.
where it is required, as the high lights on the forehead or tip of the nose, or white linen in a portrait, etc. As the work proceeds it may be blackened with ink, applied with a printer’s brush or otherwise, to ascertain the effect; after which the scraping may again be proceeded with, the artist taking care always to commence where the strongest lights are intended to appear. The great facility with which mezzotinto engraving can be executed, as compared with line-engraving, was the principal cause of its popularity in the days of the height of its success. But it also possesses peculiar advantages of richness of color, capacity for broad contrast of light and shade, and mellowness of tone, which adapt it for certain classes of work, and, in its proper place, enable it to produce effects not otherwise attainable. The richness and depth of the shadows in this kind of engraving are measurably balanced, however, in the corresponding poverty of the lights. Where these occur in masses in mezzotinto engraving the effect is cold and unsatisfactory. At first copper was used in the production of mezzotinto-engraving, but steel plates eventually superseded them, on account of the greater scope which its hardness afforded to the tools employed, and also the very much larger capacity for impressions of steel plates. The legend which associates the name of prince Rupert with the discovery of the art of mezzotinto-engraving is an interesting one; and, as the Italians say, si non e vero, e ben trovato. It is said that the prince observed one morning a soldier engaged in cleaning his musket, removing from it the rust which the night-dew had occasioned; and perceiving upon it, as he thought, some resemblance to a figure, it occurred to him whether or not, by corroding or grounding plate all over in a manner resembling the rust, he might not afterwards scrape away a design upon it, from which impressions might be obtained. It is alleged that he succeeded, and thereby accomplished the invention. Unfortunately for the claim set forth in behalf of prince Rupert, it has been proven groundless, and the real inventor of the art has never been learned to know. The first mezzotinto-engraving by the original inventor or discoverer. This was Louis von Siegen, a lieut.col, in the service of the Elector Palatine. The first work which was published was a portrait of the princess Amelia-Elizabeth of Hesse, proofs of which before letter bear the date 1642, or fifteen years anterior to the earliest of prince Rupert’s dates. This method of illustration was not only adopted by sir Joshua Reynolds, but even employed in so important a work as Turner’s Liber Studiorum. In the United States the mezzotinto style was a favorite with magazine publishers in the early days of that kind of literature, being introduced from England by John Sartain, an expert mezzotint engraver, in 1830. He published Sartain’s Magazine, illustrated after this fashion. See Engraving.

MGLIN, a t. of Russia, in the government of Tschernigov, 125 m. n.e. of the town of Tschernigov. There is a large cloth-factory, and a considerable number of German families. Pop. 67, 5,842.

MHENIDUNYJ, a t. of British India, in the territory of Oude, 90 m. s.o. of Lucknow, 3 m. s. of the right bank of the river Suce. It is a busy, thriving place, with a population estimated at 20,000.

MHOW, a t. of British India, in the territory of Indore, 13 m. s.w. of the town of Indore, near the Vindhyan mountains, on an eminence on the Gumber river. Near it are the cantonments, which have altogether the appearance of a European town, having a good account of having learned the art from its original inventor or discoverer. This was Louis von Siegen, a lieut.col, in the service of the Elector Palatine. The first work which was published was a portrait of the princess Amelia-Elizabeth of Hesse, proofs of which before letter bear the date 1642, or fifteen years anterior to the earliest of prince Rupert’s dates. This method of illustration was not only adopted by sir Joshua Reynolds, but even employed in so important a work as Turner’s Liber Studiorum. In the United States the mezzotinto style was a favorite with magazine publishers in the early days of that kind of literature, being introduced from England by John Sartain, an expert mezzotint engraver, in 1830. He published Sartain’s Magazine, illustrated after this fashion. See Engraving.

MIA’O. See MIAKO.

MIAGAO, a t. in the island of Panay, one of the Philippine isles, in the province of Iloilo. The inhabitants, who are industrious, comfortable, and well educated, are estimated at 31,000 in number.

MIAKO, or KYOTO, now called SAi-KYO; the ancient capital of Japan, situated in the s.w. of the island of Nipon. Broad and clean streets cross each other at right angles, and the houses are mostly of the better class. During the double rule in Japan it was the residence of the mikado, then only the spiritual emperor, and was and is the stronghold of the national religion. Some of the temples are of great size and splendor. In 1868 the great revolution broke out; the shogun, or temporal ruler, was deposed; and the mikado, who was now invested with complete authority, both temporal and spiritual, removed his court to Yedo. Most of the aristocratic dwellings are consequently tenantless, and the population in 1876 was only 374,496. Miaiko is still, however, the seat of considerable trade with the interior. It is also a center of Japanese literature and art, and is well provided with public schools for boys and girls. It is famed for the manufacture and dyeing of silks. Miaiko is connected by railway with Osaca and Hiogo.

MIALL, EDWARD, b. England, 1829; educated at the Protestant dissenters’ college in Wymondley, Herfordshire, where he studied for the ministry. He was for three years a minister of the Independent church at Ware, and was afterwards settled in the same capacity at Leicester. In 1841 he left Leicester for London, where he established the Nonconformist, which he still owns and edits, and which remains the chief organ of the English dissenters. He contested, unsuccessfully, a seat in parliament in 1845 and 1847;
but was returned from Rochdale in 1852. He was defeated in 1857, but sat for Bradford from 1869 to 1874. He is a leader of the movement for the disestablishment of the English church, and a supporter of universal suffrage. The adherents of the views which he represents gave him, in 1879, a purse of £10,000 in recognition of his services as editor and member of parliament in behalf of complete civil and religious equality. He has written a number of works in support of his ideas—*Views of the Voluntary Principle*, published in 1845; *Ethics of Nonconformity*, 1848; *The British Churches in Relation to the English People*, 1849; *Title-Deeds of the Church of England to her Parochial Endowments*, 1861. Of a less polemical character is his *An Editor off the Line*; or *Wayside Musings and Reminiscences*, 1865.

**MIA M I**, a river of Ohio, United States of America, rises by several branches in the western center of the state, and after a s.w.w. course of 150 m. through one of the richest regions of America, and the important towns of Dayton and Hamilton, empties itself into the Ohio river 20 m. w. of Cincinnati. It is sometimes called the Great Miami, to distinguish it from the Little Miami, a smaller river, which runs parallel to it, 15 to 25 m. e., through the Miami valley.

**MIA M I**, a co. in n. Indiana, crossed centrally by the Wabash and Erie canal, the Evansville and Terre Haute railroad, the Eel River railroad, and the Indianapolis, Peru and Chicago, and Pittsburg, Cincinnati and St. Louis railroads; 380 sq.m.; pop. *80, 24,088—23,843 of American birth, 240 colored.* It is drained by the Wabash, Eel, and Mississinewa rivers, and Pipe creek. Its surface is generally level, the banks of the rivers rising much higher than the interior plains; a large proportion being covered with hard wood forests, oak openings, and groves of sugar-maple trees. Its soil is fertile, especially the bottom lands, producing tobacco, wool, Irish and sweet potatoes, wine, dairy products, hops, flax, maple sugar, sorghum, honey, and grain. Stock raising is extensively carried on, and there is much valuable water power. Its manufactories include a brewery, woolen factories, cabinet-making establishments, and manufactories of carriages, lumber, furniture, cigars, agricultural implements, etc. Seat of justice, Peru.

**MIA M I**, a co. in c. Kansas, having the state line of Mississippi for its e. boundary; intersected centrally by the Kansas City, Port Scott and Gulf railroad, and the Osage branch of the Missouri, Kansas and Texas, forming a junction at Paola; 600 sq.m.; pop. *80, 17,818—16,677 of American birth, 902 colored.* Its surface is undulating and spreads out into broad prairies with a small proportion of woodland. It is drained by the Osage river, or Marais des Cygnes, and Peoria, Wea, and Potawatomie creeks. Live stock is raised, and the fertile soil produces Indian corn, oats, wheat, potatoes, wool, and the products of the dairy. Limestone is the foundation of the soil, and it contains beds of bituminous coal; petroleum is also found. Among its manufactories are carriage shops, and it has saw-mills, and wind-mills for grain. Seat of justice, Paola.

**MIA M I**, a co. in s.w. Ohio, intersected by the Great Miami river, and drained by Greenvilee and Stills water creeks; 400 sq.m.; pop. *80, 36,175—34,030 of American birth, 1,776 colored.* It is traversed by the Dayton and Michigan railroad, and the Columbus, Chicago and Indiana Central railroad, crossing it centrally, and forming a junction at Piqua, and the Miami and Erie canal, following the general course of the Dayton and Michigan railroad, and the Great Miami river. Its surface is undulating and well wooded, particularly in the e. portion. It has limestone quarries in the w., and the soil having generally an under-stratum of Silurian limestone, is very fertile, and produces large quantities of fruit, grain, tobacco, wool, Irish and sweet potatoes, dairy products, flax, maple sugar, sorghum, and honey. Live stock is an important commodity. The extensive hydraulic power of the river is utilized, and its trade in grain is considerable. Among its manufactories are tanneries, distilleries, breweries, spring-wagon and wheel works, machine shops, and oil mills; other manufactures are carriages, furniture, wool, clothing, brick, and metallic wares. Seat of justice, Troy.

**MIA M I S**, a tribe of Indians of the great Algonquin family, and whose habitat was in the neighborhood of Green bay (Wisconsin) as early as 1638, when they were found there by the French. They were also discovered in 1670 about the Fox river, to the number of 8,000, and disclosing social and tribal conditions of a more elevated character than those usual among the tribes so far north. They occupied a village of houses made of matting, and surrounded by a palisade; and their chief displayed several of the adjuncts of rank and authority. Later, this tribe was collected on the St. Joseph's river, and in 1683 they were at war with the Sioux and the Iroquois at the same time, being aided by the Illinois, who were friendly to them, in their struggle with the latter. They afterwards became inimical to the French, and made overtures to the English, being by this time engaged in a war with the Hurons, and threatening the Chippewas. The Miami were in fact a warlike tribe, and not a little aggressive. In 1705 the French brought about a war between them and the Ottawas. Finally, when the French and English war broke out, they were in doubt to which side to ally themselves, but generally supported the English and made depredations on the French. Yet when the French were driven out of that part of the country the Miami united with Pontiac in the capture of the British forts, St. Joseph's and Miami; and when the American revolution began they opposed
The patriots and sided with the English. After the close of the revolutionary war they continued to oppose the settlement of the country by the whites, and in 1790 it was found necessary to send a force against them under gen. Harmer. A series of battles, in which success veered from one side to the other, failed to effect a reconciliation, and hostility continued until 1795, when peace was made. In 1790 they had been able to put in the field only about 1500 warriors, and after the peace they rapidly dwindled in numbers and importance. They now ceded lands between the Wabash river and the Ohio state line, but the new mode of living imposed upon them by the nature of the annual system completed their degradation. Their naturally warlike and energetic character succumbed to the inroads effected by an idle life and facility for obtaining intoxicating liquors; and though they broke into action and attacked the whites on one or two occasions, their ancient spirit had deserted them, and these conflicts availed them nothing. In 1822 their entire number amounted only to between two and three thousand, living on three different reservations. They gradually ceded all their lands to the U. S. government, and in 1846 they were removed to the neighborhood of the fort Leavenworth agency. They then numbered only 250 souls, and were dissipated and wretched in the extreme. About the year 1873 the remains of this once powerful tribe, 150 in number, were finally placed on the Quapaw reservation.

MIANTONOMOH, the name of a sachem of the Narragansett tribe of Indians, who succeeded his uncle, Canonicus, in 1636. He was on friendly terms with the early settlers of Massachusetts, and assisted them during the Pequot war. In 1642 he led an expedition against Uncas, the Mohegan chief, but was unsuccessful, and was captured at Norwich, Conn. Uncas surrendered him into the hands of the commissioners of the United colonies, and his execution being advised by them, he was tomahawked on the spot where he was captured, known as Sachem's plain, and where a monument in commemoration of the event was set up in 1841.

MIAISMA (Gr. pollution; in the plural, Miasmata), or Malaria. It is proved by the experience of all ages that there is an intimate connection between marshy districts and certain diseases, especially the various forms of intermittent and remittent fever; but the exact nature of the noxious agent, and the circumstances on which its formation and extrication depend, are even at the present day not altogether established. It is neither heat nor moisture, for the crews of clean ships, when cruising in the tropics at a distance from land, are usually very healthy; nor is it any known gas extracted from the marsh, for the gases collected by stirring the marshes (carbonic acid, nitrogen, oxygen, and carbureted hydrogen) may be inspired without giving rise to any symptoms resembling those produced by malaria. It may be regarded as an established fact that the noxious agent is a product of vegetable decomposition occurring under certain conditions of heat and moisture. That vegetable decomposition is the source of the poison is inferred from various circumstances. For example, this special morbid influence is nowhere so powerful as in the deltas and along the banks of large lacustrine bodies, where a typical tropical swamp, in their flood, bring down the washings of the soil, full of vegetable remains, which, upon the subsidence of the waters, are left reeking in the hot sun. Again, the poison has been traced, in various places in Italy, France, and the Netherlands, to the practice of stepping in stagnant waters, and even in streams, and in India it was formerly the custom, after extracting the coloring matter, to throw the remains of the indigo into large heaps which, in the course of three years, became excellent manure; it was found, however, that these heaps, alternately soaked by the heavy rains and heated by a tropical sun, decomposed and emitted miasmata precisely similar in their effects to those produced by marshes. Marsh-miasmata are seldom evolved at a temperature under 60°, but at and above 80° they are prevalent and severe; and the nearer we approach the equator, the more violent, as a general rule, do they become. Although moisture is necessary to the evolution of miasmata, an excess of it often acts as a preventive, and by impeding the access of atmospheric air retards or prevents decomposition. This explains the apparent anomaly of an uncommonly rainy season producing opposite effects in different localities, sometimes not far distant from one another. Thus in the West Indies a very rainy season induces general sickness in the dry and well-drained island of Barbadoes; while at Trinidad, whose central portions are "a sea of swamp," and where it rains nine months in the year, the excessive rain is a preservative from sickness; for in the seasons when the rain falls only eight months or less, the swamps become dry and exposed to the sun, and severe remittent fevers are sure to follow.

Chemistry has hitherto failed in detecting any special ingredient to which the air evolved by marshes owes its poisonous qualities. The air collected in the most poisonous districts gives, on analysis, the same gases existing in the same proportions as normal air, nor (if we except the observations of Bauisingault, which have not been confirmed by other chemists) does it give evidence of the presence of any organic body. This is a subject of great practical importance; and both the altitudinal range and the horizontal spread have to be noticed. In Italy it is estimated that an altitude of about 1,500 ft. assures an exemption from marsh-poison; while in the West Indies an elevation of at least 2,000 ft. is necessary. From observations made by sir Gilbert Blane during the ill-fated Walcheren expedition, it appears that in Europe the horizontal spread of marsh-miasmata over fresh water is less than
3,000 ft.; but over salt water—at all events, in the tropics—the horizontal range is greater. The extent to which the poison may spread horizontally over land is a much more complicated question, and depends, to a great extent, upon the nature of the soil. The effect of trees in intercepting miasma is very remarkable, and is probably due partly to their condensing the vapors of the marsh, and partly to their altering the direction of the current of air. Pope Benedict XIV. caused a wood to be cut down which separated Villatri from the Pontine marshes, and in consequence, for many years, there was a most severe and fatal fever in a district previously healthy; and the same results have in many other cases followed the removal of trees.

In districts where this poison exists it is found by experience that those who go out of their houses only during the day, after the morning fogs have dispersed, and before the evening mists appear, often escape the bad effects; and a full meal, with a few grains of quinine, should be taken before exposure to the morning air by travelers in a malarious district.

Dr. Wood-off Philadelphia has pointed out the extraordinary and very important fact, that miasma are neutralized, decomposed, or in some other way rendered innocuous by the air of large cities. Though malarious diseases may rage around a city, and even invade the outskirts, yet they are unable to penetrate into the interior, and individuals who never leave the thickly-built parts almost always escape. What it is in the air of the city which is thus incompatible with malaria, is unknown; but very probably it is connected with the results of combustion, for the fire and smoke of camps are asserted to have had the same effects. See Malaria.

MIAULIS, Andreas Vokos, 1770—1833, b. Greece; adhered to the Greek revolutionists in 1821, and the next year, was put in command of the Greek fleet. In March of that year, he defeated a Turkish-squadron at Patras, and in September, another squadron near Spezzia. In 1825 he burned the fleet commanded by Ibrahim Pasha near Modon. He left the service in 1827, upon the appointment of lord Cochrane, as his superior in command. He was soon restored to his old rank, and stationed at the harbor of Poros. He participated in the insurrection of 1831, and burned the fleet under his command at Poros, to keep it out of the hands of the Russians. He was indicted for treason, but the proceedings came to nothing. In 1832 the naval stations in the Archipelago were placed in his charge. Soon after, he was made vice-admiral.

MIAUTSE, the aborigines or hill-tribes of China. From the dawn of Chinese history, we find the people of the plains contending against those of the high lands, and to the present day the hardy mountainers have maintained their independence. They consist of numerous tribes, occupying large portions of Kwang-té, Kwei-chou, Yun-nan, Szechuan, and adjacent provinces. Some of them own Chinese sway; other tribes are absolutely independent. They are smaller in size and stature, and have shorter necks, and their features are somewhat more angular than the Chinese. Their dialects are various, and wholly different from the Chinese. Dr. Maegowan describes them as skilled in the manufacture of swords. He has shown that the MIAUTSE of Western China and the KARENS or hill-tribes of Burmah are identical.—Reports of Dr. Maegowan’s Lectures.

MIAVA, a market-town of North-west Hungary, on the Mava, an affluent of the Morava, 48 m. e.n.e.of Presburg city. There are manufactures of woolen cloth and bagging, and hemp and flax are cultivated. Pop. ’89, 9,657.

MICA, (from the same root with Lat. mico, to glitter), a mineral consisting essentially of a silicate of alumina, with which are combined small proportions of silicates of potash, soda, lithia, oxide of iron, oxide of manganese, etc., according to which and the somewhat varying external characters, numerous species have been constituted by mineralogists. Common MICA, also called Potash Mica, contains a notable but variable proportion of silicate of potash; it contains also a little fluorine. It is a widely diffused and plentiful mineral, entering largely into the composition of granite, mica-slate, and some other rocks, veins and fissures of which it also often fills up. It has a strong, and often alarming look, at first sight for the readiness with which it splits into thin elastic plates, which are generally transparent. The thickness and elasticity of these plates readily distinguish them from those of tale, and of the laminated variety of gypsum; they are also devoid of the greasy feel of tale. They are sometimes not more than one 300,000th part of an inch in thickness, are generally quite transparent, and are therefore much used in setting objects for the microscope. Plates of Mica of large size are also used in Siberia, Peru, and Mexico as a substitute for glass in windows. Large plates, often a yard in diameter, are found in these countries, and in Norway and Sweden. Mica is advantageously substituted for glass in lanterns, as it bears sudden changes of temperature better than glass, and in ships-of-war, as it is not liable to be broken on the discharge of cannon. Another use of Mica is for making an artificial avanturine; it is also employed in a powdered state to give a brilliant appearance to walls, and as a sand to sprinkle on writing. In the state of a very fine powder, it is known as Cat’s Gold or Cat’s Silver, according to its color. It is usually colorless, but sometimes white, gray, green, red, brown, black, and rarely yellow, owing to the presence of iron, magnesium, chrome, fluorine, etc., in its composition. It is sometimes found in beautiful crystals, which are generally rhombic or six-sided tables. Lithia Mica, or Lepidolite, contains lithia in small proportion. It is often of a rose color, or a peach-blossom color. It is
used for ornamental purposes. It is found in several places in Britain. — Magnesia Mica, or Biotite, contains about as much magnesia as alumina. It is often dark green.

Mical, the sixth (third in the lxx.) of the twelve minor prophets (Micayahu: Who is like unto Jah?), probably a native of Moresheth, prophesied during the reigns of Jotham, Ahaz, and Hezekiah, and was therefore contemporary with Isaiah, and Hosea, and Amos.—The Book of Mical is regarded as divisible into three parts, commencing with “Hear ye,” organically connected, however, with each other, and showing even a progressive development of idea in the mind of the writer. The destruction of Samaria (Israel), the danger and subsequent captivity of Judah; the wickedness of the rulers, the punishments that overtake the land, the glorious restoration of the theocracy; Jehovah’s “controversy with his people” on account of their sins, his warnings, his exhortations, and his sublime promise of forgiveness, form the principal points of Mical’s prophecies, which relate to the invasions by Shalmaneser, Sennacherib, the Babylonian exile, the return, and the re-establishment of the theocracy under Zerubbabel. The style of Mical is clear, vivid, concise, yet richly poetical; some passages, especially in the beginning and the last two chapters, are among the noblest in the Old Testament. The play upon words noticeable in Isaiah is also a marked feature of this writer.

Mical, Prophecy of (Mical, antie), after the heading contained in the first verse, is divided into three sections, each beginning with “Hear ye.” I.—Chapters i. ii., addressed to all the people, describe the coming of the Lord in judgment on the transgressions of Israel and Judah, the doom of Samaria; and the march of the invaders of the land from Samaria south to Jerusalem; denounce luxury and covetousness as the sources of transgression, and call upon them for repelling the people astray; foretell the bonds and of the people into captivity and promise their return under the guidance of the Lord their king. II.—iii.—v., addressed to the heads and princes of the people, condemn their oppressive rapacity, and declare that as they had been deaf to the cry of the poor in their wrongs, they too shall call on the Lord but will not be heard. The false prophets also who had deceived others should themselves be made ashamed. As the judges, priests, and people had become mercenary in all their service all of them should be left destitute, Zion should be a ploughed field, Jerusalem heaps of ruins, and the temple height a forest. This second threatening of judgment is followed by a second and fuller promise of Messianic times when the mountain of the Lord’s house should be exalted on the top of the mountains, all nations flow to it, and the peaceful reign of the Messiah be extended over all the earth. His birth in Bethlehem Ephratah is foretold, yet his being from everlasting also is affirmed; his government, it is declared shall be marked by divine strength and majesty, and his greatness be extended over all the earth. III.—vi., vii. The Lord, calling on the people the third time to hear, and on the mountains to be witnesses of the controversy, appeals to all his past government over Israel as approving his righteousness. The people, answering, complain that the burden of the sacrifices required is too great to be borne, and the Lord in reply says that he asks of them only to do justly, love mercy, and walk humbly with God. That they had failed to comply with these demands is shown by the treasures of wickedness found in their houses, by the scant measures used, the false balances, the deceitful weights. For these crimes punishments will be inflicted; the wheat, the oil, and wine shall be cut off. The prophet mourns the justice of the sentence, and acknowledges the guilt of all classes of the people who do evil with both hands earnestly, the best of them being sharp as briers and thorns. Yet he waits for the salvation of the Lord, triumphing in his pardoning mercy which will certainly be manifested and in his faithfulness which will perform all that he had promised with an oath to Abraham in the days of old.

Micali, Giuseppe, 1776–1844, b. Italy; after prolonged travels, devoted himself to the study of archaeology. His most important work is his Italia sanzat il Dominio de Romani. It was published under that title in 1810, and a revised edition, with extensive changes, appeared in 1832, as Storia degli Antichi Popoli Italiani. Raoul Rochette made a French translation of this work. Micali’s last book was the Monumenti Antichi, which was issued the year of his death.

Mica-chist is, next to gneiss, one of the most abundant of the metamorphic rocks (q.v.). It consists of alternate layers of mica and quartz, but is sometimes composed almost entirely of the thin and shining plates or scales of mica, and from this it passes by insensible gradations into clay-slate. The quartz occurs pure in thin layers like vein quartz. Garnets are in some districts abundant in this rock, making up a large proportion of the whole mass. Mica-chist is believed to be a highly altered shale or clay deposit, and the metamorphic minerals, including the garnets, to have been developed under the influence of metamorphic action from materials already existing in the unaltered strata. In many places the mica-chist has a finely corrugated or wavy structure.

Mica-slate, a variety of mica-chist (q.v.) containing more clayey matter than that which generally passes under the name of schist, and also having the micaceous scales more finely divided, so that they are scarcely visible by the unaided eye. Practical geologists use the term to designate a condition midway between mica-schist and clay slate. Hydromica schist, or slate, is a thin schistose rock consisting principally of
hydrous mica, with occasionally more or less quartz, and having a greasy feel, like talc (q.v.); whitish to pale green, and darker, in color, pearly to glistening luster. It used to be called talcose slate, but contains no talc, as shown by Dr. C. Dewey. There are several varieties.

MICHAEL, THE ARCHANGEL, meaning in Hebrew, "Who is like God," in Scripture a prince among the angels, whom the Divine Being, that appeared to Daniel in human form, described as a guardian of the Jewish people co-operating with him in their behalf, thwarting the efforts of their human adversaries and resisting also the schemes of Satan against them. This is in accordance with other Scripture teachings concerning the angel Jehovah as directing the history of Israel and concerning the angels as subject to him in the work of redeeming men. In the epistle of Jude Michael is called the archangel, and it is said concerning him that "when, contending with the devil, he disputed about the body of Moses, he durst not bring against Satan a railing accusation, but said, The Lord rebuke thee." Some interpret this passage as affirming a dispute about the literal body of Moses which the Lord buried in a sepulcher unknown to men. Others regard the "body of Moses" as a symbolic phrase for the Mosaic law and institutions, in accordance with the common usage among Christians in speaking of the church as the "body of Christ." In the book of Revelation, xii. 7-9, in language which is symbolic whatever its precise significance may be, it is declared that "there was war in heaven; Michael and his angels fought against the dragon and his angels, who prevailed not, neither was their place found any more in heaven. And the great dragon was cast out, that old serpent, called the devil and Satan, who deceiveth the whole world; he was cast out into the earth, and his angels were cast out with him." The nature and method of this war against Satan are not explained; the fact itself is revealed with that mysterious vagueness which hangs over all angelic ministration, but also with positiveness. In addition to what the Scriptures reveal concerning the archangel there are various legends connected with his canonization as a saint in the church of Rome, where his festival, called Michaelmas, is celebrated on Sept. 29. In legendary art he is represented as young and beautiful, winged, in armor, bearing the shield and lance, with his foot on the evil one, and at his side a golden 'sceattor.' An old English gold coin bearing his image was therefore called an "angel." Of such Shakespeare speaks, when he says of a rich man, "he hath a legion of angels" in his purse.

MICHAEL, the name of six emperors of Constantinople,—I. succeeded to the throne on the death of Staumecus, in 811, who conducted a war against the Bulgarians, and was a great and just monarch; he was deposed by Leo, the Armenian, a gen. in his service, 813, and retiring to a monastery, passed the remainder of his life in devotional exercises. —II. was born in upper Phrygia, of an obscure family, but was ennobled by Leo, the Armenian. The latter, however, appears to have become angered against him, and imprisoned and condemned him to death. His life was saved by the assassination of Leo, and Michael was crowned emperor, 820. He was cruel and arbitrary; and his attempt to force his subjects to celebrate the Jewish Sabbath and passover brought about a revolt on the part of his son Eumeneus, who proclaimed himself emperor. The rebellious son was slain near Syracuse, in Sicily. Michael was surmamed "the stammerer." During his reign the Saracens of Spain wrested the island of Crete from the empire, and in 827 the Aglabite Saracens seized Sicily. Michael died, 829.—III. succeeded his father, Theophilus, in 842, under the regency of his mother, Theodora, whom he compelled, with her daughters, to enter a convent. In his reign the Russians first appear as foes to the empire; and the foundation for the separation of the eastern and western churches was laid by a quarrel between the patriarch Photius and the pope Nicholas I. Michael was assassinated by Basil the Macedonian in 867.—IV. surmamed the Paphlogionian, from the place of his birth, was raised to the throne by the empress Zoe, who, on account of her infatuation for him, murdered her husband. He was successful in wars against the Saracens and Bulgarians, but retired to a monastery, where he died in 1041.—V. succeeded the last-named, who was his uncle. Having exiled the empress Zoe, who desired to marry him, he was overthrown by the people, and, after having his eyes put out, was sent to a monastery. —VI. succeeded the empress Theodora in 1056, but retained the throne only a year, when he was compelled to resign in favor of Isaac Connenus, while he retired to a monastery. Michael VI. was surmamed Stratotiotes, and with him the Macedonian dynasty became extinct, his successor being of the family Conneni.

MICHAEL, or MIKAIL, ROMANOFF. —See Romanoff, ante.

MICHAEL VI., surmamed PAPLOGLOUS, emperor of Constantinople. See PALAOLOGUS.

MICHAEL ANGELO (BUONAROTTI), who, in an age when Christian art had reached its zenith, stood almost unrivaled as a painter, sculptor, and architect, was born in 1474 at Chiusi, in Italy. He was of noble origin, having descended on his mother's side from the ancient family of Canossa, in Tuscany, while the Buonarotti had long been associated with places of trust in the Florentine republic. Michael Angelo learned the rudiments of painting from Bertoldo, a pupil of Domenico Ghirlandajo; and having been admitted
as a student into the seminary which was established by Lorenzo the Magnificent for the study of ancient art in connection with the collections of statuary in the Medicean gardens, he attracted the notice of Lorenzo by the artistic skill with which he had restored the mutilated head of a laughing faun, and was received into the palace of the Medici, where he spent several years. Lorenzo's death in 1492, and the temporary reverses which befell the Medici family in consequence of the incapacity of his successor, Piero, led Michael Angelo to retire to Bologna; whence he soon removed to Rome, whither his fame had preceded him. His earliest original works were a kneeling angel, executed for the grave of St. Dominic, at Bologna; the statues of Bacchus and David at Florence; and a magnificent group representing the Mater Dolorosa, which was placed in St. Peter's, at Rome. Next in order of time, and, according to some of his contemporaries, first in merit, ranks Michael Angelo's great cartoon for the ducal palace at Florence, which, though the original, executed by Leonardo da Vinci, has long since perished. This work, which represented a scene in the wars with Pisa, in which most of young Florentines, while bathing in the Arno, are surprised by an attack of the Pisans, showed so marvelous a knowledge of the anatomical development of the human figure, and such extraordinary facility in the powers of execution, that it became a study for artists of every hand, and by its excellence created a new era in art. Pope Julius II. called Michael Angelo to Rome, and commissioned him to make his monument, which was to be erected within St. Peter's. Although this work was never completed on the colossal scale on which it had been designed, and was ultimately erected in the church of St. Pietro ad Vincula, it is a magnificent composition, and is memorable for having giving occasion to the reconstruction of St. Peter's on its present sublime plan, in order the better to adapt it to the colossal dimensions of the proposed monument. The pope insisted upon Michael Angelo painting with his own hand the ceiling of the Sistine chapel, and, although unwillingly, he began in 1508, and completed within less than two years his colossal task, which was of the highest importance of his work. The subjects of these cartoons are taken from the book of Genesis, while between these and the representations of the persons of the Savior's genealogy are colossal figures of the prophets and sibyls. Michael Angelo's genius was too often trammeled by the unworthy tasks in which Leo X. and successive popes engaged him, the former having employed him for years in excavating roads for the transportation of marble from Carrara, and in other ignoble labors. The Florentines and Bolognese vied with the pontiffs in trying to secure his services; and to his skill as an engineer Florence was indebted for the plans of the fortifications by which she was enabled for a prolonged time to resist the attempts of the Medici to recover possession of the city after their expulsion from it. On the surrender of Florence, he returned to Rome, where his great picture of the last judgment was painted for the altar of the Sistine chapel. This colossal fresco, nearly 70 feet in height, which was completed in 1541, was regarded by contemporary critics as having surpassed all his other works for the unparalleled powers of invention and the consummate knowledge of the human figure which it displayed. After its completion, Michael Angelo devoted himself to the perfecting of St. Peter's, which, by the touch of his genius, was converted from a mere Saracenic hall into the most superb model of a Christian church. He refused all remuneration for this labor, which he regarded as a service to the glory of God. Michael Angelo died in 1564, at Rome, but his remains were removed to Florence, and laid within the church of Santa Croce. His piety, benevolence, and liberality made him generally beloved; and in the history of art, no name shines with a more unsullied luster than that of Michael Angelo.—See Vasari's Vite de' Pittori (English translation), and Lives by Duppa (1806), Harford (1857), and Wilson (1876).

MICHAEL BRADACIUS, the first Moravian bishop at Zambeg in the eastern part of Bohemia, in the middle of the 15th century. When the Moravian brethren left the national church and established a ministry of their own, Michael having joined them was sent with two other priests to a Waldensian colony on the frontier of Bohemia and Austria for the purpose of securing the episcopacy. They were consecrated the first bishops of the Bohemian brethren. A church council was organized of which Michael was constituted the president. After a while he resigned, and Matthias of Kunwade became president.

MICHAELIS, JOHANN DAVID, one of the most eminent and learned biblical scholars of the 18th c., was b. on Feb. 27, 1717, at Halle, where his father, Christian Benedict Michaelis, a theologian and orientalist of some distinction, was a professor. After completing his studies at his native university he traveled in England and Holland, where he made the acquaintance of several celebrated scholars. In 1745 he became a professor of philosophy at Göttingen, and took an active part in the formation of a scientific association there. From 1753 to 1770 he was one of the editors of the Göttinger gelehrten Anzeigen, and for some years he filled the office of librarian to the university. During the seven years' war he was occupied in making preparations for an expedition of discovery in Arabia, which was afterwards made by Niebuhr. In the latter years of his life he was almost always in the professorial chair or at his desk. He died on Aug. 22, 1791. Michaelis was a man of vast attainments in history and archeology, and his labors were of great importance in the departments of biblical exegesis and history. He may be
regarded as among the earliest of the critical school of German theologians, but he lived at too early a period to acquire anything like a consistent or systematic theory of the gene-
sis of the Hebrew Scriptures. He loved to rationalize in details, and was never quite
certain what to think about inspiration; at all events, he seeks constantly to prove how
thoroughly human the Mosaic legislation was, though he does not exactly deny its claims
to being considered a Divine revelation. Many of his pupils became professors, and
 disseminated his principles through the German universities.

Michaelis worked on the works **De Historia der Schriften des Neuen Bundes**
(2 vols. Göttingen, 1750; English by bishop Marsh); his **Mosaisches Recht** (6 vols.
Frankfort, 1770-75; English by Dr. Alexander Smith, 1814); and his **Moral** (3 vols.
Göttingen, 1792-1823). See his **Lebensbeschreibung von Ihm Selbst Abgefasst** (Rinteln und Leip.
1793).

MICHAELAS DAISY. See ASTER.

MICHAELS DAY, one of the English quarter-days for payment of rent by tenants
—viz., Sept. 29. Michaelmas term is one of the four legal terms during which the Eng-
lisch courts of law and equity sit daily for dispatch of business. It begins on the 2d and
ends on the 25th of November. Michaelmas head court is the name given in Scotland to
the annual meeting of heritors or freeholders of each county to revise the roll of freeholders,
the duties being now discharged by the commissioners of supply.

MICHAELS DAY (ante), a day set apart according to the Roman Catholic church
to offer thanks to God for the benefits received by the ministry of angels, and called
Michaelmas in honor of St. Michael the archangel, whose power and vigilance saved
the church from her enemies. The feast of St. Michael or Michaelmas was instituted,
according to Brady, in 487, and Sep. 29 was fixed for the celebration, the day on which
St. Michael's church on Mount Garganus was dedicated. There is a tradition that this
feast was instituted by Alexander, bishop of Alexandria. There was a superstitition in the
10th c. that on every Monday morning St. Michael held high mass in the churches.
The Greek and other eastern churches, the church of England, and some other reformed
churches, continue to observe the feast of St. Michael, in order, as Wheatly says in his
book *On the Common Prayer*, "that the people may know what benefits Christians receive
by the ministry of angels."

MICHAUD, JOSEPH FRANÇOIS, 1767-1839; b. in Savoy, educated in the ecclesiastical
college of Bourg; at 19 employed in a book-store at Lyons; author, the following year,
of *Voyage au Mont Blanc*, followed by other essays. In 1790 he had the good fortune
to meet the comtesse Pauni de Beauchenuis who persuaded him to go to Paris, where he
became a hearty follower of Voltaire and Rousseau, espoused republican principles, by the force of
the torrent around him, but was at heart, and by his social liens remained, a conservative
and royalist. After the fall of Robespierre he contributed to the *Quotidienne* articles so
squarely favoring the restoration that it became necessary for him to leave Paris. He
was arrested, condemned to death, escaped, and passed four years in Switzerland
and south France, occupied in light literary work. Returned to Paris in 1799; in 1803 pub-
lished the poem *Printemps d'un Proserpt*. In 1806, in partnership with a younger brother,
a printer, he undertook the great work *Biographie Moderne* in which the public men
who were actively engaged in the great revolution were painted with dark colors.
Michaud was led into history by a request of Mine. Cotton to write an introduction to
her *Mathilde*, which called for an examination of original documents on the crusades,
in which he more deeply interested so that it resulted in a work entitled *Tableau Histor-
ique des Trois Première Croisades*, in the form of a romance published in 1807. Michaud
was made member of the French academy in 1813. After the return of Louis XVIII.
he was a pronounced adherent of the old dynasty, and in the *Quotidienne*, which he then
edited, advocated all the tyrannous reactions of the Bourbon government. His poems
though numerous, and in their time popular with those who sympathized with his opin-
ions, are not of a high order. His *L'Apotheose de Franklin, 1792*, is interesting to Ameri-
cans. The *Dernier Règne de Bonaparte*, published in 1815, is a valuable contribution
to the history of that time.

MICHAUX, ANDRE, 1746-1802; b. France; studied science under the botanist Juss-
sien, and the astronomer Le Monnier. In 1779 he traveled in England, whence he
brought into France some new plants and shrubs. The next year he traveled through
Auvergne and the Pyrenees, and, on his return to Paris, introduced several new
varieties of Spanish grain. In 1782 the count of Provence, afterwards Louis XVIII.
sent him to Persia on a scientific mission. On his arrival he was robbed by the Arabs of
all his effects except his books. Assisted by the British consul at Bassora he went on as
far as Isphahan, where he cured the shah of a dangerous disease. After spending two
years in Persia he brought back to France a fine collection of dried plants and seeds.
In 1785 he traveled extensively in North America on a scientific mission at the expense of
the government; but the French revolution compelled him to return for want of funds.
He was shipwrecked on the voyage to France, and lost nearly all his specimens. On his
arrival in Paris in 1796 the directory would give no adequate recompense for his losses.
In 1800 he sailed for Madagascar, where he died. His most important publications are
*Histoire des Chênes de l'Amérique Septentrionale*. 1801; and *Flora Borealis Americana*,
1803. It is said that much of the latter work is the production of prof. Louis Claude
Richard
MICHAUX, FRANCOIS ANDRE, 1770-1855; b. France; son of Andre. He came to the United States three times in the employ of the French government, and made explorations among the North American forests for the purpose of bringing into Europe new varieties of trees. His Histoire des Arbres du Nouveau Monde contains the results of his American explorations, and gives an account of the distribution and the scientific classification of the principal American timber-trees, and the nature and uses of their timber. He also wrote a work On the Naturalization of Forest Trees in France; Journey to the West of the Alleghany Mountains; and A Notice of the Bermudas.

MICHEL, FRANCISQUE XAVIER, b. in Lyons, 1809, and there educated. He went to Paris on the completion of his school studies, contributed articles to several journals, and soon became interested in the literature of the middle ages. In 1880 he was sent by Guizot to England to examine documents pertaining to the ancient history of France. In 1837 he was in Scotland on the same mission. In 1839 Michel was called to the professorship of foreign literature at Bordeaux. He is member of the academies of inscriptions of Paris, Turin, and Vienna; and of the society of antiquaries of France and London. Among his original works are: Job, ou les Pasteuroux, 1882; Histoire des Croisades, 1883; Deux Armées du Rêgne de Henri II, roi d'Angleterre 1841; Histoire des Races Mundiales de la France et de l'Espagne, 1847. 2 vols., an unique contribution to history; Les Ecossais en France, et les Francois en Ecosse, 1862, 2 vols.; etc.

MICHELET, JULES, a brilliant French historian, b. at Paris, Aug. 21, 1798. He studied with great success under Villemin and Leclerc, and at the age of 23 became a professor in the college Rolin, where he taught history, philosophy, and the classics. In 1826 he published Les Tableaux Synchroniques de l'Histoire Moderne, and was named master of conferences (Maître des Conférences) at the école normale. After the revolution of 1830 he was chosen head of the historic section, intrusted with the care of the archives of the kingdom, assistant to Guizot at the Sorbonne, and tutor to the princess Clémentine, daughter of the French king, and published several valuable books, such as Précis de l'Histoire Moderne (1833, of which there have been more than 20 editions); Précis de l'Histoire de France jusqu'à la Révolution Française (the 7th edition of which appeared in 1849); Mémoires de Luther (1835); Oracles de la Nature, cherchés dans les Symboles et Formules du Droit Universel (1831). In 1838 he succeeded Daum in the college of France, and conte Reinhard in the professorship of moral philosophy. He now plunged into controversy with all the vivacity and impetuosity of his nature. The Jesuits were the grand objects of his dislike; and eloquence, sarcasm, sentiment, and history were all brought to bear upon them with brilliant effect. Three books were the fruits of his polemic: Des Jésuits, in conjunction with Edgar Quinet (1843); Du Prêtre, de la Femme, et de la Famille, (1844); Du Peuple (1846). In 1847 appeared the first volume of his Histoire de la Résolution; and it was finished in 1853, in 6 vols. When the affair of 1848 broke out, acting more wisely than most of his learned confrères, he declined to take an active part in political struggles, and quietly pursued his literary avocations. He, however, lost his situation in the archives office after the coup d'état, by refusing to take the oath of allegiance to Louis Napoleon. Other works of his were L'Oiseau (1858); L'Insecte (1877); L'Amour (1887); and La Fonction du Père et la Mer (1881); La Sœur et les Fils (1889), a plea for compulsory education. His masterpiece is his Histoire de France, continued in Histoire de la Révolution Française, and Histoire du XIXe Siècle. Michelet died in 1874.

MICHELET, KARL LUDWIG, b. Berlin, 1801; graduated at the university of Berlin, receiving the degree of Ph.D. in 1824. The following year he was appointed professor of philosophy and philology in the French gymnasium, and continued to hold this position for twenty-five years. During a portion of this period he was also professor of philosophy in the university of Berlin. He published a large number of works on metaphysical subjects, including the following: System der philosophischen Moral; Die Ethisch des Aristoteles; Geschichte der letzten Systeme der Philosophie in Deutschland von Kant bis Hegel; Anthropologie und Psychologie; etc. From 1860 he edited the Berlin Gedanek, representing the philosophical society of that city.

MICHELIS, FRIEDRICH, b. Germany, 1815; educated to the profession of theology; ordained a priest at Munster, his birthplace, and became a private tutor. In 1864 he received the appointment of professor of philosophy at the lyceum of Braunsberg. Two years later he was an opponent of the ecclesiastical policy of Bismarck in the Prussian chamber. Notwithstanding this fact, he also opposed the Jesuitical influence and the dogma of the infallibility of the pope; publishing several pamphlets in support of his views, and incurring the displeasure of Rome, and eventually excommunication. He wrote in opposition to the theories of Darwin, and his intention appears to have been to reconcile the teachings of modern science with the doctrines of the Roman Catholic church. His most important work is Die Philosophie Plato's in ihrer inneren Beziehung zur Gebriffbarten Wahrheit. He has of late edited an anti-Jesuit publication called Der Katholik.

MICHIGAN, a lake in the United States, the second in size of the five great fresh-water lakes, and the only one lying wholly in the United States, having Michigan on the n. and c., and Wisconsin on the w. It is 820 m. long, 70 m. in mean breadth, and 1000...
Its\nhit the level of the sea, and has been found by accurate observations to have a lunar tidal wave of 3 ft. It is the outlet of numerous rivers, and is connected by a canal, and sometimes by flooded rivers, with the Mississippi, which is believed to have been its ancient outlet. Its principal harbors are those of Chicago, Milwaukee, and Grand Haven; and its bold and, at certain seasons, dangerous shores are guarded by 23 light-houses. It forms, with the lower lakes and the St. Lawrence, a natural outlet for one of the richest grain-growing regions in the world.

MICHIGAN, LAKE (ante), containing an area of about 22,400 sq.m., 2,000 sq.m. larger than lake Huron. Its banks are low and sandy, containing rocky sections of sandstone and limestone, but no high-bluffs. Inland the sand hills rise to the height of 150 ft. Its waters are wearing away the Wisconsin shores and leaving land on the Michigan side. Its outlet is through the straits of Mackinaw into lake Huron at its n.e. extremity, near the old trading-post of Mackinaw. Racine, a city of Wisconsin at the mouth of the Root river, and Manitowoc, Wis., at the mouth of a river of its own name, are among the larger cities on its borders. The best harbors are in the bays, and are artificially formed. Its islands are in the n. portion; the largest, Beaver island, 50 m. long, and the Fox islands in the n.e. It has 2 large bays—Green bay, 100 m. long, and Grand Traverse bay, 30 m. long, and 3 of lesser dimensions. Little Traverse bay, Little bay of Noquet, and Big bay of Noquet. It has important fisheries; white-fish and large trout are taken and exported in large quantities; fresh and canned. The largest rivers which empty into it are the St. Joseph, the Muskegan, the Grand, emptying into the lakes Michigan and Huron; the Kalamazoo, 200 m. long, the Muskeese, 50 m. long, in Michigan; the Fox in Wisconsin, and the Menominee in Wisconsin, emptying into Green bay.

MICHIGAN, one of the United States, lying in lat. 41° 40' to 48° 20' n., and long. 82° 25' to 90° 34' west. It is bounded on the n. by lake Superior and St. Mary's river, e. by lake Huron, river and lake St. Clair, Detroit river, and lake Erie, s. by the states of Ohio and Indiana; and w. by lakes Michigan and Wisconsin, and has an area of 56,243 sq.m., or 33,995,529 acres. It is divided into 77 counties. The capital is Lansing; the chief towns are Detroit, Grand Rapids, East Saginaw, Jackson, Bay City, Saginaw City, etc. Michigan is divided by lakes Michigan and Huron into two irregular peninsulas—the upper, a wild and rough portion of mountains and forests, containing about one-third the area of the state, lies between the northern portions of lakes Michigan and Huron, and lake Superior; while the lower is nearly inclosed in a vast horse-shoe bend of lakes Michigan, Huron, Erie, and the connecting straits and rivers. In the upper peninsula are the Porcupine mountains, rising to a height of 2,000 ft. with sandy plains and forests. The southern is a level, rich, fertile country of prairies and oak-openings, watered by numerous rivers, as the Grand, Kalamazoo, Muskegon, Saginaw, etc. The lower peninsula is of limestone strata, with coal and gyspum; the upper of azoic formations, with metamorphic states, gneiss rocks, trap, and rich mines of copper and iron. The climate is mild in the southern, and cold and bleak in the northern regions. The southern portion produces wheat, maize, fruits, butter, cheese, and wool in great abundance. Vast quantities of pine lumber are exported from the northern half of the state. The principal manufactures are flour and woolens. The extensive coast and rivers afford great facilities to navigation, while several railways traverse the state. The government is similar to those of the other states, and the school system is based on that of Prussia, with abundant revenues from public lands. The university of Michigan at Ann Arbor has 44 professors, and a foundation of 1,000,000 acres of land. The only charge to students who are resident in Michigan is $10 admission, and $15 annual fee. Detroit was settled by the French in 1610, who also established a trading-port at Mackinaw at about the same period. The British took Detroit in 1812, but restored it at the end of the war. The state was admitted to the union in 1837. Pop. '40, 212,267; '50, 397,654; '70, 1,184,396.

MICHIGAN (ante) derives its name from two Chippewa words, watchei and savuanggian, meaning "lake country." The discoverers and first settlers of the territory were the French missionaries and fur-traders, some of whom visited the site of Detroit as early as 1668. About 1744 some of the French Jesuits found their way to the falls of the St. Mary. The first actual settlement by Europeans in the present state was made by Father Claude Gijoux, of Sault Ste. Marie, founded by father Marquette and others in 1668. Three years later Fort Michilimackinac (now Mackinaw) was established. Detroit was founded in 1701 by an expedition under Antoine de la Mothe Candiliane. The territory fell into the hands of the English with other French possessions in 1763. After this event the Indian chief Pontiac organized a conspiracy to exterminate the whites, when a bloody conflict ensued. The garrison at Mackinaw was butchered, and Detroit was subjected to a long siege. It was not until 1766, 15 years after the peace of 1763, that the United States took actual possession of this region, though it was included within the boundaries of the northwest territory, so-called, and amenable to the ordinance of 1787. Afterwards it formed for a time a part of the territory of Indiana. In 1805 it was erected into a separate territory, with substantially its present boundaries, gen. William Hull being appointed governor. During the war of 1812-15 the inhabitants were sorely harassed by the Indians and the British. Gen. Hull surrendered Detroit to the British under circumstances which led to his trial and condemnation to death by court-martial. The sentence was not executed, how-
Michigan.

... and facts afterwards came to light which partially, or it may be wholly, relieved him from blame. Mackinaw was also captured, and at Frenchtown, early in 1818, a number of American prisoners were massacred by the Indians. Shortly afterwards Gen. Harrison succeeded in driving the British out of the territory, and in 1814 a truce was concluded with the Indians. By the Treaty of 1817 a considerable portion of the territory was surveyed, and in 1818 a large body of land was offered to the Indians. In 1819 the treaty was authorized by act of congress to send a delegate to that body. At different times from 1819 to 1836 the Indians ceded large tracts of land to the territory, and at the last-named date all the lower and a part of the upper peninsula had been freed from Indian titles. Parly in 1818 and partly in 1834 the territory now forming the state of Wisconsin was annexed to Michigan; but in 1836 it was erected into a territory by itself, and Michigan was reduced substantially to its original boundaries. Previous to 1823 the legislative power was vested in the governor and judges, but in that year it was transferred to a council consisting of 9 persons selected from 18 chosen by the people of the territory. In 1835 the council was increased to 13 members chosen upon the same plan, but in 1837 the law was changed so as to provide for the election of the councilors by the popular vote. In 1831 Gen. Cass was succeeded by George B. Porter as governor, and the latter, dying in 1834, was succeeded by Steven T. Mason. In 1835 a state constitution was adopted by a convention called for the purpose. It claimed jurisdiction over a strip of land also claimed by Ohio. There was danger that the dispute would lead to bloodshed, but in 1836 congress agreed to admit Michigan to the union upon condition that she should surrender her claim to the disputed territory and accept in lieu thereof a larger area in the upper peninsula. The first convention called to consider this proposal rejected it, but it was accepted by a second in Dec., 1836, and in January following Michigan was admitted to the union as a state. In 1847 the seat of government was removed from Detroit to Lansing, the latter at that time being in a dense wilderness. It is now a flourishing town, and the state capitol is one of the largest and finest structures of the kind in the United States.

Michigan is comprised in two peninsulas of irregular shape, separated from each other by the strait of Mackinaw, connecting lake Michigan with lake Huron. The largest of these peninsulas embraces the whole territory lying between these two lakes, and at its northern extremity from the Great lakes Erie to the mouth of the lake Huron it is divided from Canada by the Detroit and St. Clair rivers, the latter flowing into the former through lake St. Clair. The great mass of the inhabitants of the state at the present time dwell on the southern half of this peninsula, the northern portion, together with the whole of the upper peninsula, being very sparsely inhabited.

The upper peninsula, containing a little more than one-third of the state's area, is rugged and broken, and in parts mountainous. The Porcupine range of mountains is the watershed between the streams flowing into lake Superior and those flowing into lake Michigan. This range at its highest point is 1400 ft. above lake Superior—2,000 ft. above the sea. The surface on each side of the mountains presents a rugged aspect, with some picturesque scenery and considerable variety of soil. At the eastern end the mountains at their highest points do not rise more than 400 ft. above lake Superior. There are numerous lakes and marshes, and great forests, where pine and other soft woods are the prevailing growths, though fine groves of sugar-maple are found in some places. In some portions of the peninsula the forests have been destroyed by fire, thus transforming the region into a desert. The w. extremity of the peninsula is celebrated for its extensive deposits of copper and iron. The sugar-maple is found here in great abundance and of the best quality, but the soft woods are scarce. The land is generally sterile. The northern peninsula is 318 m. in length from e. to w., and from 30 to 160 m. in width, and in 1874 contained 61,814 inhabitants.

The southern peninsula, or Michigan proper, is in almost every respect a contrast to the northern. The surface is generally level, though in the s. it is broken by low conical hills rising from 30 to 300 feet. The length of the peninsula from s. to n. is about 275 m., its width 239 miles. It is unequally divided by a low water-shed extending from s. to n., and rising at the highest point from 600 to 700 feet. The larger portion of the peninsula lies w. of this water-shed, which slopes gradually towards lake Michigan. The shores on both sides are in many places steep, curving picturesquely around numerous bays and inlets. On lake Michigan they are frequently broken by bluffs and sandhills from 100 to 200 ft. high. The s. portion of the peninsula is very fertile, the n. portion less so.

The islands in the state are numerous. The principal of these are isle Royal and Grand isle in lake Superior; Sugar and Nebish islands in St. Mary's strait, and Drummond island at its mouth; Marquette, Mackinaw, and Bois Blanc islands near the n. end of lake Huron; and the Beaver, Fox, and Manitou groups in the n. end of lake Michigan. The principal rivers are the Cheboygan, Thunder Bay, Au Sable, and Saginaw, flowing into lake Huron; the Huron and Raisin, into lake Erie; the St. Joseph, Kalamazoo, Grand, Muskegon, Manistee, Grand Traverse, Manistique, and Escanaba, into lake Michigan; and the Ontonagon and Tequamemon, into lake Superior. Most of these rivers are small, though several are navigable for short distances. Many small ponds are scattered through the state.

There is a coal field of 12,000 sq.m. in extent in the s.e. part of the state, but the veins are so far below the surface that they cannot be worked to advantage. The supplies of
fuel for the iron-works on lake Superior are more cheaply obtained from Ohio. Lime-
stone is abundant, and on the shores of lake Huron, in the n. part of the state, are
formations which yield excellent grindstones. In the valley of Saginaw river salt is
obtained by boring. The most productive copper region in the world, except that of
Chili, is at the n.w. end of the upper peninsula. The veins sometimes bear silver in
small quantities. The copper mines are mainly in the counties of Ontonagon, Houghton,
and Keweenaw. The iron mines are principally in Marquette county. In the peninsula
are remains of ancient mines and mining implements, which justify the presumption
that at some distant period in the past the country was occupied by a race advanced in
civilization.

Among the natural curiosities of the state are the "painted rocks," so-called, on
the shores of lake Superior, not far w. of Sault Ste. Marie. They are sandstone rocks worn
by the water into picturesque shapes, resembling old castles, temples, arches, etc., which,
viewed from a steamer's deck, are impressive and wonderful. In some instances the
upper surface of these bluffs projects so far over the lake that steamers pass directly
under them, and behind cascades which fall from the summits.

The climate of the lower peninsula is so tempered by the proximity of the lakes that
it is much milder than that of other regions in the same latitude. The northern penin-
sula in winter is very cold. The average annual difference of temperature between the
two peninsulas is 7°. Oak openings and prairies are the most characteristic feature of the
lower peninsula. In the forests the prevailing growths are the sugar-maple, oak, walnut,
ash, hickory, elm, linden, locust, dogwood, beech, sycamore, cherry, pine, hemlock, spruce,
tamarack, birch, and other hardiers. In the pine groves there is a source of wealth.
The soils on the lower peninsula are well adapted to the production of fruit.

Apples are produced in large quantities. Peaches grow well on the shores of lake Michigan, while grapes are extensively produced on the shores of lakes Michigan and Erie, and in the river valleys. Pears, quinces, plums, cherries, and the small fruits
generally, are raised in perfection in the interior as well as on the borders of the lakes.

The extensive forests of northern Michigan are a covert for large numbers of wild
animals, among which are the black bear, wolf, lynx, wildcat, panther, fox, weasel,
marten, badger, skunk, mink, otter, raccoon, opossum, beaver, marmot, hare, rabbit,
and squirrel. Deer are plenty in some parts, and the elk is not yet extinct. The birds are
of great variety, and the waters of the state are well stocked with edible fish.

As an agricultural state Michigan ranks high. The number of farms in 1879 was
111,822, embracing 5,785,102 acres of improved and 4,530,486 of unimproved land—in
all, 10,315,588 acres. Number of horses, 272,696; of milch cows, 291,243; of other
cattle, 388,910; hogs, 495,109; sheep, 1,772,312; number of acres in apple orchards,
239,263; in peach orchards, 1,071. The latest crop statistics are those of 1878, from
which the following items are gathered: Bushels of wheat raised, 29,511,889; corn,
36,663,299; oats, 13,454,517; clover-seed, 166,465; barley, 506,463; peas, 641,061; potato-
toes, 6,190,406; tons of hay, 1,124,931; bbls. of wool, 8,666,467; bush. of apples sold,
3,944,206; of peaches, 107,214; bbls. of grapes sold, 1,014,950; bush. of cherries, currants,
plums, and berries, 100,493. The cash value of farms in 1870 was estimated at
$398,240,578; of farming implements and machinery, $13,711,979; wages paid during the
year, $8,421,161; value of farm productions, $1,506,623; of orchard products, $3,447,985;
of produce of market gardens, $352,658; of forest products, $2,559,682; of home manu-
factures, $380,000; of animals slaughtered or sold for slaughter, $11,711,024; of live
stock, $49,508,899. In 1873 there were sold, of dried fruits, 2,064,709 lbs.; of cider,
182,347 bbls.; of wine, 50,958 gals.; of 2-lb. cans of fruit, 1,008,808; of maple sugar,
4,319,793 lbs. The aggregate value of real estate assessed in 1875 was $508,753,096; of
personal property, $86,127,992. These figures are supposed to represent but one-third of
the real value of the property.

According to the census of 1870 there were in the state 9,455 manufacturing estab-
lishments, giving employment to 63,694 persons, of whom 2,941 were females above 15,
and 2,406 were under that age. The capital invested was $71,712,283; wages paid,
$21,205,355; value of products, $118,394,676. The principal industries, with the value of
their products respectively in 1870, were, Agricultural implements, $1,569,566; black-
smithing, $1,581,357; boots and shoes, $2,532,981; carpentering and building, $8,376,353;
carriages and wagons, $2,393,828; railroad cars, $1,488,742; clothing, $2,577,154; cooper-
age, $1,716,768; copper, milled and smelted, $9,260,976; flouring and grist mill products,
$21,174,247; furniture, $1,953,888; iron products, $4,938,947; leather, $2,670,608; dis-
tilled and fermented liquors, $1,281,286; lumber, planed and sawed, $36,675,241;
machinery, $2,360,564; printing and publishing, $1,071,520; salt, $1,175,814; tobacco,
and blinds, $1,865,596; tobacco and cigars, $3,572,700; marine and inland vessels, $1,209,518.
Other industries, the products of which ranged from $90,000 to $967,000 respectively, were
masonry, brick and stone; tin, copper, and sheet-iron ware; wooden ware; ship-building;
meat packed; paper; saddlery and harness. The lumber statistics of 1879 show: Number
of mills, 64; men employed, 4,003; lumber cut, 2,289,066,553 ft.; shingles cut, 685,619,150.
The salt product of 1879 was 2,063,040 bbls.; the wheat product, 10,390,200
bush.; product of iron mines, 1,453,765 tons, valued at $7,413,114. The total product of
the copper mines in 1877 was 24,958 tons; total product from 1845 to 1877 inclusive,
289,188 tons: ingot copper, 1877, 19,966 tons, valued at $7,536,480; total value of product from 1815 to 1877, $116,928,350; total assessments from 1845 to 1877 by working mines, $8,960,000; total dividends paid in same time, $21,780,000; dividends paid in 1877, $1,740,000. The catch of fish from the lakes in 1870 was valued at $507,576.

The value of foreign imports in 1874 was $2,353,786; of exports, $9,528,629; number of vessels which entered the ports of the state, 4,632—tonnage, 1,420,317; vessels cleared, 4,718—tonnage, 1,431,335. The foreign trade is almost entirely with Canada. The exports consist for the most part of grain, flour, hogs, lumber, beef, pork, tobacco, cotton, and railroad cars. The vessels registered in the state in 1874 were: sailing, 368, of 52,907 tons; steamers, 338, of 68,239 tons; vessels built: steamers, 34, of 8,854 tons, sailing, 42, of 15,380 tons.

The railroad statistics for 1878 were as follows: Miles of track, 3,561; capital stock paid in, $148,159,011; total debt, $161,673,748; cost of roads and equipment, $154,256,078. The railroad interests are represented by 41 distinct corporations, but the roads are actually managed by 27 companies. Of the 11,552 stockholders 4,550 reside in the state, holding $4,685,819 of the more than $147,000,000 of capital. But 5 of all the roads paid dividends in 1878, viz.: the Chicago and Northwestern; Detroit Lansing and Northern; Lake Shore and Michigan Southern; Michigan Central; and Mineral Range. There is a ship-canal about a mile long around the falls of the St. Mary's at Sault Ste. Marie, which affords of great advantage in facilitating commerce between lakes Superior and Huron; and another, two miles long, connecting Portage lake with lake Superior on the w. side of Keweenaw point. The first of these canals was opened in 1855, the second in 1873.

In 1873 there were in Michigan 77 national banks, with a capital of $8,892,200; and a circulation of $7,139,217. In 1874 there were 14 state and 14 savings-banks. The capital of the former was $874,400; of the latter, $7,988,675. The number of insurance companies authorized to transact business in Michigan in 1875 was 195, of which 50 were incorporated under the laws of the state. One of these was a life insurance company, with assets amounting to over $900,000, and risks amounting to $11,641,000. Two stock fire companies had risks amounting to $22,000,000; 47 farmers' mutual fire companies, with 57,000 members, had at risk $107,000,000. From 1870 to 1877 the aggregate business of stock fire companies in the state was as follows: Risks, $1,210,261,365; premiums received, $17,071,744; losses, $9,817,689. During the same period these companies paid to the state in taxes about $500,000. The number of life insurance companies of other states doing business in Michigan in 1878 was 28. The whole number of policies on the lives of citizens of the state was about 23,000, representing insurance to the amount of $42,000,000.

Michigan takes a high rank in all matters pertaining to education. The school statistics for the year ending Sept. 1, 1879, were as follows: Number of school districts, 6,248; children of school age, 486,988; whole number attending school, 942,018; number of teachers, 18,616; total wages of teachers, $1,880,945; average monthly wages of male teachers, $88.69; of female teachers, $23.48. Amount of moneys from preceding year, $729,744; received from two-mill tax, $494,011; from primary school fund ($2,743,519), $229,384; from district taxes, $2,049,755; from all other sources, $340,893—total receipts for the year, $3,843,790. Expenditures: Male teachers, $712,594; female teachers, $1,160,865; for building and repairs, $64,135; bonded indebtedness, $329,466; all other purposes, $497,576. The state normal school, opened in 1833, has graduated nearly 1000 teachers. It is well organized and efficiently managed, having four courses of instruction—common school, full English, ancient languages, and modern languages. Few states of the union have made more ample provision for the higher education of youth than Michigan. High schools or academies, supported by state funds and taxes, are established in all the larger cities and towns; the state university at Ann Arbor, one of the foremost of American colleges in respect both of its endowments and courses of instruction, went into operation in 1843, and is open to students of both sexes on equal terms. The state agricultural college, near Lansing, affords instruction for those who wish to fit themselves for agricultural pursuits. Besides these there are six other colleges under the patronage of different religious denominations, nearly all of which are open to students of both sexes. There are for women several seminaries of a high grade. The professional schools equal the best elsewhere.

The bonded debt of the state in 1879 was $913,149; and at the same time there were on hand applicable to its payment funds amounting to $912,000. The total resources of the state, applicable to ordinary expenses, amounted in 1879 to $2,620,135; the expenses of the year were $3,019,855, leaving a balance of $690,267. The trust funds (mainly for educational purposes) for which the state is accountable amount to $3,419,143. The new capitol at Lansing, costing $1,300,000, the corner-stone of which was laid in 1873, was dedicated Jan. 1, 1879.
and college libraries, 37,734 volumes; public school libraries, 125,331 volumes; 1731 Sunday-school libraries, 239,471 volumes; 436 church libraries, 811,591 volumes; 116 circulating libraries, 53,704 volumes.

The principal charitable, reformatory, and penal institutions of the state are: the Michigan asylum for the insane at Kalamazoo, organized 1854; the eastern Michigan asylum, founded at Pontiac, 1873; the Michigan state retreat for the insane, near Detroit, under the care of the sisters of charity; the institution for the deaf and dumb, at Flint; the state asylum for the blind (now nearly completed); the state public school at Coldwater, designed to "provide for all the dependent children of the state, whether in or out of the county poor-houses, who are sound in body and mind, to maintain and educate them while temporarily in the school." and until homes can be provided for them; the state reformatory school at Lansing; the state house of correction at Ionia; the reform school for girls; the Detroit industrial school; the state prison at Jackson.

The population of Michigan has risen from 531 in 1800 to 1,636,331 in 1880. The inhabitants of foreign birth numbered in 1870 only 268,000. The number of males in 1874 was 697,184; of females, 636,817. The governor and other state officers are elected once in two years, the day of election being the Tuesday after the first Monday in November. The governor's veto can be set aside by a vote of two-thirds of both houses of the legislature. The legislative power is vested in a senate of 32 and a house of representatives not exceeding 100 members, elected for two years, and meeting every alternate year on the first Wednesday of January. The supreme court consists of a chief-justice and three associate justices, elected for 8 years, and eligible to re-election. The court has both appellate and original jurisdiction. There are 14 circuit courts, each presided over by one judge, elected for 6 years; they have original jurisdiction in all matters civil and criminal, and appellate jurisdiction from all inferior courts. The salaries of the supreme court judges are $4,000 per annum, those of the circuit court judges, $1800. A probate judge is elected in each county for 4 years; justices of the peace in every township for the same term. The church organizations in 1870 numbered 2,339; church edifices, 1413; church property, $8,196,816. The principal denominations are: Baptist, Free Will Baptist, Christian, Congregational, Episcopal, Evangelical Association, Friends, Disciples, Jews, Lutheran, Methodist, Presbyterian, Reformed, Dutch, Reformed German, Roman Catholic, Second Advent, Spiritualist, United Brethren in Christ, Unitarian, and Universalist.

The electoral votes of Michigan for president and vice-president of the United States have been cast as follows: 1836, 3 for Van Buren and Johnson; 1840, 3 for Harrison and Tyler; 1844, 5 for Polk and Dallas; 1848, 5 for Cass and Butler; 1852, 6 for Pierce and King; 1856, 6 for Fremont and Dayton; 1860, 6 for Lincoln and Hamlin; 1864, 8 for Lincoln and Johnson; 1868, 8 for Grant and Colfax; 1872, 11 for Grant and Wilson; 1876, 11 for Hayes and Wheeler; 1880, 11 for Garfield and Arthur.

MICHIGAN CITY, a t. in Indiana, on the s. shore of lake Michigan and on the Michigan central railroad, at the junction of the Louisville, New Albany, and Chicago-railroad with the Indianapolis, Peru, and Chicago; pop., 70,3,985. It is delightfully situated at the mouth of Trail creek, about 38 m. from Chicago by water, 56 m. by rail, 13 m., n.w. of La Porte, and 140 m., n.w. of Indianapolis. It is the center of an important trade in salt and lumber, and the commerce of the lake, and as a shipping point for iron ore. It contains the northern state prison, has two newspapers, and a national bank. It has good schools and is the seat of Ames college. Its industries are the manufacture of lumber, wagons, boots and shoes, and furniture; and it has planing mills, foundries, locomotive works, and the railroad repair shops of the lines which center there.

MICHIGAN STATE AGRICULTURAL COLLEGE, at Lansing the capital of the state, is the oldest of all the institutions of the kind in the country. It was established in obedience to a direct provision of the constitution of the state, Feb. 12, 1855, and opened to students May 13, 1857. It is endowed by the sale of lands given by the general government to the state in 1852. Of the 255,673 acres so given, 86,121 acres have been sold, forming a fund of $375,104, on which the state pays 7 per cent interest to the college for its current expenses. The annual income of about $18,000 is supplemented by liberal appropriations on the part of the state. The property of the college, exclusive of the lands and endowment fund, is $275,000. The college buildings stand in a park of about 100 acres, being a part of its farm of 676 acres. The principal buildings are a college hall for classes, library, general museum, and hall rooms, two dormitories with the armory in one of them, a chemical laboratory, a botanical laboratory, a greenhouse with propagating houses attached, an apiary, 5 farm barns, piggery, carpenter's shop, 5 dwelling houses. It has farm gardens of various kinds, botanical grounds, an arboretum, orchards, stock, etc. Its collections in natural history and its apparatus are of considerable value. Its library contains about 5,000 bound volumes and 900 pamphlets. The college has but one course of study, four years in length, embracing, besides agriculture, horticulture, and the sciences connected therewith, the elements of a general education. It has 7 professors, and 6 other officers, 283 students; and 205 alumni. Women are admitted into the classes, and one woman has been graduated. Students are required to labor three hours each day, Saturdays and Sundays excepted, and for the most of this labor a small compensation is given. The state has on deposit arms and accoutrements.
MICHIGAN, UNIVERSITY or, at Ann Arbor, Washtenaw co., Mich., was founded in 1837, though not opened until 1842. Its first endowment was the gift by congress in 1826 of two townships of land. It is supported by the state, and open to students of both sexes, without charge for tuition, on payment of a small matriculation fee and the annual payment of $15. It is a part of the public educational system of the state, the constitution providing for the perpetuation of the governing body of the institution, the board of regents. It aims to complete and crown the work which is begun in the public schools, by furnishing ample facilities for liberal education in literature, science and the arts, and for thorough professional study of medicine, law, and dentistry. While Michigan has endowed the university primarily for the higher education of her own sons and daughters, she also opens its doors to all students, wherever their homes. Students from other states are asked to pay a larger admission and tuition than students from Michigan, but in all other respects their advantages are the same. The university, in the department of literature, science and the arts, the department of medicine and surgery, the department of law, the school of pharmacy, the homoeopathic medical college, and the dental college. Each of these departments and colleges has its faculty of instruction, who are charged with the special management of it. The university senate is composed of all the faculties, and considers questions of common interest and importance to them all. Postgraduate courses are provided for the graduates of this university, or for the graduates of any college or university who may desire to pursue advanced study whether for a second degree or not. The school of pharmacy is a distinct school, having a regular course of two years. The libraries of the university accessible to the students, amount, in the circulating, to about 30,000 volumes. The astronomical observatory contains the large meridian circle constructed by the famous makers, Pistor & Martinus, of Berlin, one of the largest and best of the kind; a sidereal clock and a Tiece, of Berlin; the collimators for the meridian circle; the library of the observatory; and the solar instruments. One of these is a chronograph with Bond's new isodynamic escapement, for recording observations by the electro-magnetic method. In the dome is mounted a large refracting telescope, with an object glass 13 in. in diameter, constructed by the late Henry Fitz, of New York. A set of self-registering meteorological instruments has recently been added. It consists of Hough's barograph and thermograph, Robinson's anemometer with Gibbons's self-registering attachment and an anemograph. Means have been provided for the erection of a small observatory for the purpose of instruction, on the observatory grounds near the main building. A fire-proof museum building 127 by 47 ft., has just been erected. The collections in the museum embrace 6,000 mineralogical specimens; a geological cabinet, with 41,000 specimens; zoological cabinet with over 110,000 specimens; a botanical cabinet, containing 10,000 species, 20,000 entries, and 70,000 specimens; exhibitions in archæology and relics, embracing memoirs of the native Indian tribes; collection in department of fine arts and history, embracing a gallery of casts of the most valuable ancient statues and busts, terra cotta models, gallery of engravings and photographic views executed in Italy and Greece, historical medallions, and copies of modern statues, busts and reliefs by the great masters. The anatomical museum is rich in valuable specimens. There are no dormitories and no common connected with the university. The university (1880) is served by 36 professors, 9 assistant professors, and 16 lecturers and assistants. Number of students in 1880: department of literature, science and art, 448; department of medicine and surgery, 350; department of law, 395; school of pharmacy, 81; homoeopathic medical college, 70; college of dental surgery, 83; total, 1427. President, James B. Angell, LL.D.

MICHILIMACKINAC. See MACKINAW, ante.

MICHOCAN', or MECHO'ACAN, a political division, or state of Mexico, extending over the table-land of the same name, and the low country lying between it and the Pacific, and a portion of the hilly country s. of these districts: 21,609 sq.m.; pop. '65, 618,240. Its n.e. districts are watered by the river Santiago. The Sierra Madre and its branches traverse it in all directions; and within its territory are the lake of Patzcuaro, the peak of Tancitaro, and the volcano of Xorullo (Jorullo). The Cerro de Santa Rosa, in the district of Tlapujahua, about 17,000 ft. in height, is the highest point. The mountain ridges are divided by fertile valleys, drained by the Lerma, Mescala, and other rivers, and numerous mountain streams. The largest lakes are the Patzcuaro, and, already named, 30 m. in circumference; and Chapala, which is 60 m. long, and 20 wide. The coast line is 100 m. in extent, on the only ports being San Telmo, Matatina, and Bueeria. The state is divided into 17 districts; the climate is very variable, the mean annual temperature in the capital being 71° F. The country has large mineral deposits, including gold, silver, copper, iron, coal, cinnabar, lead, sulphur, emery, lithographic stone, and copperas. The mines are but little worked, the annual yield being at present a little more than one million dollars, that of silver being one-third of the amount. In the districts along the n. boundary line carbonate of soda is collected. There are manufactures of importance, including sarapes (Mexican shawls), blankets, silver ware, flour, and glass. Cabinet and dye-woods are exported; also coffee, indigo, silk, gold, silver, and copper, chiefly to contiguous states and to Guatemala. Education is conducted in this state through a system of

and a volunteer military company drills once (usually twice) a week. There is no preparatory department. President, T. C. Abbot.
including a state college, 53 girls' schools, and 28 for boys. Capital, Morelia (formerly Valladolid).

MICIPSA. See Jugurtha, ante.

MICKIEWICZ, Adam, 1798-1855; b. Poland; son of a Lithuanian nobleman, who pursued unsuccessfully the profession of an advocate. Mickiewicz received his elementary education at the schools in Nowogrod and Minsk, and in his eighteenth year entered the university of Wilna, where his uncle was a professor. This university, for whose regency the poet Campbell was at one time a candidate, was then the most important educational institution in Russian Poland. There Mickiewicz became acquainted with the Polish revolutionist, Thomas Zan, and joined one of the patriotic secret societies which Zan was forming at Wilna. He gave most of his time, while at the university, to chemistry and poetry; his first published poem was addressed to Lelewel, university professor of history, and an ardent Polish patriot. After leaving Wilna, he became professor of classical literature in the college at Kowno, and it was during his residence there that two volumes of his poems were published, in 1822. Like Byron, Mickiewicz 'woke up to find himself famous.' The poems in these two volumes, though of varying degrees of merit, at once gave their author a reputation superior to that of any native poet. Many of them are founded on old Lithuanian superstitions and folk-songs. Two longer poems are contained in this collection: one of them, Grażyna, tells how a Lithuanian princess, for her husband's honor, dies, in his armor, upon the field. The other, Dedyń, or The Ancestors, is a sort of autobiographical drama of marked power. Dunockowski, the translator of Homer, attacked him for his romanticism; but a new school of rising poets gathered round him, and became known as the 'School of Mickiewicz.' His popularity with his countrymen was raised to an unbounded pitch by his imprisonment by the Russian authorities on account of his connection with the Polish secret societies. His friend Zan was sentenced to perpetual imprisonment; and Mickiewicz was condemned to perpetual banishment in Russia. He resided at first in St. Petersburg, where he made the acquaintance of Pushkin and other literary men. His intimacy with Pushkin excited the suspicions of the Russian government, which forced him to remove to Odessa. He traveled through the Crimea, and records his impressions of the military service, which were very popular, perhaps as being the first written in Polish; but they are inferior to most of his other work. He lived for a time in the household of prince Galitzin, the governor of Moscow; but was soon allowed to remove to St. Petersburg. There, in 1828, he published Conrad Wallenrod, which, though having a distinct political animus, escaped the Russian censorship. It relates the story of a Lithuanian, who rose, in the 14th c., to the mastership of the order of Teutonic knights, enemies of Lithuania, solely to have a better opportunity to destroy them. The intention of the poem was clear to the Poles, but was lost upon the Russians. The work was translated into Russian, and the emperor Nicholas complimented its author. It is said that he was even offered a post in the Russian service, but he declined, and requested to be given permission to visit Italy for his health. His request was granted, through the good offices of the Russian poet Zhukovsky, and he started for Italy, by way of Germany, where he met Goethe. He took up his residence in Rome, where he became an intimate friend of James Fenimore Cooper. At Rome he composed the verses of Napoleon, which appeared in 1830. He lived in Paris, and, in the following year, published a new volume of his verses, Wallenrod. He had gone as far as Posen, on his way to participate in the insurrection, when the news came that it was quelled. He went to Dresden, where he wrote a second part of Desidy, which appeared at Paris in 1832. This second part is likewise autobiographical, and gives an account of the poet's imprisonment at Wilna. He here represents himself in a scene which has been pronounced worthy of Goethe, as possessed of the devil, who is driven out from him by a priest. His last work of any length was a poem called Pan Tadeusz, or Sir Thaddeus, which appeared in 1834. It is entirely different in character and construction from the poet's other works. It deals with Lithuanian domestic life at the time of the approach of Napoleon's army in the campaign of 1812. Two years before the publication of Pan Tadeusz he wrote an absurd and eccentric work called A Book of the Polish Nation and the Polish Pilgrimage. In this book he attributes all the calamities which have fallen upon Poland to its toleration of Protestantism. Count Montalembert translated the book into French, on account of the warmth of its Roman Catholicism. He was married at Paris, in 1834, to a Polish lady named Cella Smyyanowska, to whom some of his earlier verses are addressed. In 1839 he became professor of classical literature at Lausanne, and the next year he was called to the newly established chair of the Slavonic languages and literature in the college of France. His first lectures were successful; but he soon began to display a peculiar fanaticism. A Polish impostor, named Towianski, who had cured Mme. Mickiewicz by mesmerism in 1841, pretended to have revelations from the Virgin Mary, and these were interpreted by Mickiewicz. The latter finally ceased to allude to Slavonic literature at all in his lectures, but extolled Towianski as the new Messiah, and preached the worship of Napoleon Bonaparte. In 1844 the French government put a stop to the lectures, and ordered Towianski out of Paris. Mickiewicz's name, however, was not expunged from the list of professors. In 1848, after the February revolution, he went to Italy, in the vain hope of inducing the pope to do something in behalf of Poland. At the beginning of the
Micipsa. Microcosmic. 

Criminea war he presented the cause of Poland to Louis Napoleon, who sent him on a mission to the east in 1835; and he died at Constantinople. The best edition of his works was published at Paris in 1844, edited, under his own supervision, by Alexander Chodzke. The Polish Pilgrimage was translated into English by Lach Szyma, and the Welensred by Leon Jablonski. A poetical version of the latter work, by Cutley, appeared at London in 1840. Mickiewicz stands at the head of the literature of his own country, and his position in the general literature of Europe is unique. No century, except Byron, to whom he has often been compared, has left more original poetical work of undoubted intellectual power and imagination; but the prose writings of Mickiewicz are, for the most part, extravagant and feeble.

MICKLE, WILLIAM JULIUS, 1734-88, b. Scotland; son of a Presbyterian clergyman, who had been assistant to Dr. Watts, and had been one of the translators of Bayle's Dictionary. After his father's death Mickle entered the business of his uncle, an Edinburgh brewer, who finally admitted him as a partner. He had, however, little business aptitude, and in 1755 he went up to London to get a commission in the navy. His efforts in this direction were unsuccessful, but he made the acquaintance in London of the first lord Lyttelton, who advised him to continue those poetical studies to which he had already given much of his time. He secured employment for a time as a corrector for the Clarendon press in Oxford. This was about 1765, and between that year and 1770 he published a number of minor pieces, one of which, an elegiac ode called Pollio, attracted considerable attention. A poem, in the Spenserian manner, appeared in 1767, and again, with many alterations and additions, as Sir Mervyr, some ten years later. In his Letter to Dr. Horneod, and his Voltaire in the Shades, he attacked Arimism and deism; and about the same time he wrote a tragedy called The Siege of Marseilles, which was refused by all the managers, and was not represented. He had long projected an English version of the Lusiad of Camoens; and his translation of the first book of that work appeared in 1771. He now left Oxford, though still maintaining himself by his work as a corrector there, and removed to the country, where he continued his translation of Camoens, which was completed in 1775. This translation, though severely criticised in England on account of its diffuseness and inexactness, secured for Mickle the honor of an election to the royal academy of Portugal, during his residence in that country, where he had gone in 1779 as secretary to gov. Johnstone, and prize-agent. He published, while in Portugal, a poem called Almada Hill. On his return to England he wrote a number of pieces in verse and prose; the last of his productions was a ballad called Eskdale Bruce.

MICMACS, the name of a tribe of Indians belonging to the Algonquin family, and inhabiting the maritime provinces of the Dominion of Canada—New Brunswick, Nova Scotia, Cape Breton, and Prince Edward Island—and Newfoundland. They were found by the Cabots in their voyage in 1497, and some of them were taken to England as specimens of the North American Indian race. They preferred the sea-coast, and were expert hunters and fishermen. At the time of the French settlement of Canada there were believed to be between 3,000 and 4,000 Micmacs in the lower provinces; and missionaries worked among them with good results, particularly in gaining their permanent friendship for the French people. They fought and plundered the English persistently until 1760, after which date treaties were made with them, and reservations were set aside for them in New Brunswick. Efforts were made to direct their attention to agricultural pursuits, but these were unavailing. This tribe was peculiar in possessing a system of hieroglyphics of considerably more scope than existed among any other of the northern tribes. In 1873 there were 3,600 Micmacs, of whom 2,163 were in Nova Scotia and Cape Breton, 1,886 in New Brunswick, and 70 in Newfoundland.

MICROCOM AND MACROCOM. The belief, current in ancient times, that the world or cosmos was animated, or had a soul (see ANIMA MUNDI), led to the notion that the parts and members of organic beings must have their counterparts in the members of the cosmos. Thus, in a hymn ascribed to Orpheus, the sun and moon are looked upon as the eyes of the animating godhead, the earth and its mountains as his body, the ether as his intellect, the sky as his wings. The natural philosophers of the 16th c.—Paracelsus at their head—look up this notion anew in a somewhat modified shape, and considered the world an organism on the large scale, and man as a world, or cosmos, in miniature; hence they called man a microcosm (Gr. little world), and the universe itself the macrocosm (great world). With this was associated the belief that the vital movements of the microcosm exactly corresponded to those of the macrocosm, and represented them, as it were, in copy; and this led naturally to the further assumption that the movements of the stars must exercise an influence on the temperament and fortunes of men. See Astrology.

MICROCOMIC SALT is a tribasic phosphate of soda, oxide of ammonium, and water, which crystallizes with 8 equivalents of water, its formula being NaO.H,NO,HO,PO,4+8Aq. It is prepared by mixing a hot solution of 6 parts of phosphate of soda with a concentrated solution of 1 part of muriate of ammonia, when the microcosmic salt crystallizes in large transparent prisms, while common salt remains in solution. On the application of heat it first loses its water of crystallization, and then its oxide of ammonium and basic water, so that only metaphosphate of soda remains, which, from its
ready fusibility into a colorless glass, is valuable as a flux in blow-pipe experiments. See Blow-pipe. This salt occurs in decomposed urine.

MICROMETER. (Gr. mikros, little; metron, measure) is an instrument used for the measurement of minute distances and angles. Its different forms, depending on different principles, may be divided into two sections, according as they are applied to physics or astronomy. Of the former section are the vernier (q.v.) and the micrometer screw, the latter instrument being merely a screw with a very regular thread, and a large round head, which is carefully graduated, generally to sixtieths, and furnished with an index. It is easily seen that if a complete turn of the screw advance its point 1/10th of an inch, a turn sufficient to pass the index from one graduation to another will only advance it 1/10th of an inch, etc. This is the micrometer used in the construction and graduation of instruments. Of those applied to astronomical purposes, the most simple is a short tube, across the opening of which are stretched two parallel threads, which are moved to or from each other by screws. These threads are crossed by a third perpendicularly, and the whole apparatus is placed in the focus of a lens. The distance of two stars is found by adjusting the two parallel threads, one to pass through the center of each star, taking care that the threads are placed perpendicular to the line joining the stars, and finding how many turns and parts of a turn of the screw are required to bring the wires to coincide. The angle of position of two stars is also obtained by turning round the instrument till the third wire, which is normally horizontal, bisects both stars; and reading off on the circumference the arc passed over.

MICRONESIA and MELANESIA, names of Greek origin, meaning respectively "small islands" and "black islands." The first is used by most geographers to describe the Ladrone and Caroline islands, Marshall's islands, the Kingsmill group, Radaick and Rabieck chains, the Gilbert group, and many others of small size. All of these are in the n.w. part of Polynesia and e. of India, being all n. of the equator and between 180° and 180° e. long. The most important of the groups are described under the proper titles. The inhabitants of the various groups speak a tongue which is not similar to those used in other parts of Polynesia, but nearer akin to that of the Malays, to whom many of the islanders bear a strong resemblance in color and features. Like most of the Polynesian groups, the islands are of coral or volcanic formation, scarcely rising above the level of the sea. Very little political or social connection exists between the different groups. The civilization and language of Micronesia were evidently derived in ancient times from contact with or descent from the Malays. The language is clear, flowing, and indicates that the inhabitants have at some time in the past been in a much higher state of civilization than when first visited by Europeans. Missionary stations have been established upon many of the islands and large numbers of the natives have been Christianized. On the other hand, the custom of ships, and especially whalers, of using the islands as a watering-station, has introduced drunkenness, debauchery, and disease to such an extent that the population is rapidly decreasing. The natives are distinguished from those of Australasia by their brown complexions and straight hair. In Melanesia, as the name implies, the inhabitants have the characteristics of the negro race. This name is given by some modern writers on geography to that part of Australasia lying s. of the equator and of Micronesia, and including Papua or New Guinea, New Ireland, Solomon's isles, the Louisiade group, New Hebrides, New Caledonia, and many small groups. The name is given altogether on the physiological grounds indicated, and is hardly well established as a geographical designation. See, for description, the articles under the names of the separate islands: also POLYNESIA, ante.

MICROPHONE. This instrument, invented in 1878 by prof. Hughes, does for faint sounds what the microscope (q.v.) does for matter too small for sight; the fall of a bit of tissue-paper or the tread of a fly being rendered audible at many miles distance. In principle the microphone illustrates the action of sonorous vibrations on the strength of an electric current. One of the most sensitive substances for micrometrical action is a homogeneous conductor the compressions and dilatations of the molecules balance each other, and no variation of current ensues, while under minute subdivision, with electrical continuity, sonorous waves affect the strength of an electric current, and variations in the current reproduce sonorous waves. One form of microphone consists of a piece of mercury-tempered carbon an inch long, placed vertically between two carbon-blocks hollowed to receive its ends, wires connecting the blocks with the battery and the receiver by which the sounds are to be heard. "A piece of willow- charcoal," says the inventor, "the size of a pin's head is sufficient to reproduce articulate speech." Two nails laid parallel, with wire connections, and a third nail laid across them, make a simple form of microphone. A few cells of any form of battery may be used. A continuous sound has been made by the mutual interaction of the microphone and telephone (q.v.), each instrument in turn repeating the sound made by the other. Many useful applications of the microphone have been made or suggested.
MICROSCOPE (Gr. mikros, small, and skopeo, I see) is an instrument for enabling us to examine objects which are so small as to be almost or quite indiscernible by the unaided eye. Its early history is obscure; but as it is quite evident the property of magnifying possessed by the lens must have been noticed as soon as it was made, we are quite safe in attributing its existence in its simplest form to a period considerably anterior to the time of Christ. It is generally believed that the first compound microscope was made by Zacharias Jansen, a Dutchman, in the year 1590, and was exhibited to James I. in London by his astronomer, Cornelius Drebbel, in 1619. It was then a very imperfect instru-
ment, coloring and distorting all objects. For many years it was more a toy than a useful 
instrument, and it was not until the invention of the achromatic lens by Hall and Dollond, 
and its application to the microscope by Lister and others, that it reached the advanced 
position it now occupies among scientific instruments.

An object to be magnified requires simply that it be brought nearer to the eye than 
when first examined, but as the focal distance of the eye ranges from 6 in. to 14 in.—10 in. 
being the average focal distance—it follows that a limit to the magnifying power of the 
eye is attained whenever the object to be examined is brought so near. If, however, we 
blacken a card, and pierce a hole in it with a fine needle, and then examine a minute object, 
as, for instance the wing of an insect held about an inch from the card, we shall see it 
distinctly, and that too magnified about ten times its size. This is explained by the fact 
that the pin-hole limits the divergence of the pencil of rays, so that the eye can converge 
it sufficiently on the retina to produce a distinct impression, which is faint; and did not 
the blackened card exclude all other light, it would be lost. If we now remove the 
blackened card without either removing our eye or the object under examination, it will 
be found that the insect's wing is almost invisible, the unassisted eye being unable to see 
clearly an object so near as one inch; thus demonstrating the blackened card with the 
needle-hole in it to be as decided a magnifying instrument as any set of lenses.

By the apparent size of an object is understood the angle formed by two lines drawn 
from the center of the eye to the extremities of the object, which is larger when the 
object is nearer the eye than when further removed. This angle is called the angle of 
vision, and is quite distinct from the angle of the pencil of light, by which the object is 
seen. The focal length of a lens determines its magnifying power. The object to be 
examined is placed in its focus, so that the light which diverges from each point may, 
after refraction by the lens, proceed to the eye in lines as nearly parallel as is necessary 
for distinct vision. Thus, in fig. 1, AB is 
a double convex lens, in the focus of 
which we have drawn an arrow, EF, to 
represent the object under inspection. 
The cones drawn from its extremities 
are portions of the rays of light diverging 
from these points, and falling on the 
len. These rays, if not interrupted in 
their course by the lens AB, would be 
log divergent, and by turning their being 
brought to a focus upon the retina by 
the lenses which constitute the eye. 
But as they are first passed through the lens AB, they are bent into nearly parallel lines, 
or into lines diverging from some points within the limits of distinct vision, as from CD. 
Thus bent, these rays are received by the eye as if proceeding from the larger arrow CD, 
which we may suppose to be 10 in. from the eye, and then the ratio of the length of the 
virtual image to that of the real arrow (nearly 10 to 1) gives the magnifying power of 
the lens in question. The ratio of CD to EF is the same as that of HG to KG. Now, 
HG is the distance of distinct vision, and KG the focal length of the lens, so that the 
magnifying power of a lens is obtained by dividing the distance of distinct vision (10 in. 
for most individuals) by its focal length. Thus, if the focal length of a lens be \( \frac{1}{4} \) in., 
the magnifying power is \( \frac{10}{\frac{1}{4}} = 40 \). This supposes that the distance between the eye and 
the lens is so small as not materially to interfere with the correctness of this statement.

We have supposed the whole of the light to enter the eye through the lens AB (fig. 1), 
but we must now state that so large a pencil of light passing through a single lens would 
be so distorted by its spherical figure, and by the chromatic dispersion of the glass, as to 
produce a very indistinct and imperfect image. This is so far rectified by applying a 
stop to the lens, so as to allow only the central portion of the pencil to pass. 
But whilst such a limited pencil would represent correctly the form 
and color of the object, so small a pencil of light is unable to bear diffusion 
over the magnified picture, and is therefore incapable of displaying those or-
ganic markings on animals or plants which are often of so much importance 
in distinguishing one class of objects from another. Dr. Wollaston was the 
first to overcome this difficulty, which he achieved by constructing a double-
let (fig. 2) which consists of two plano-convex lenses, having their focal lengths in the pro-
portion of 1 to 3, and placed at a distance best ascertained by experiment. Their plane

object. By this arrangement the distortion caused by the first lens is corrected by the second, and a well-defined and illuminated image is seen. Dr. Wollaston's doublet was further improved by Mr. Holland, who substituted two lenses for the first in Dr. Wollaston's doublet, and retained the stop between them and the third. This combination, though generally called a triplet, is virtually a doublet, insomuch as the two lenses only accomplish what the anterior lens did in Dr. Wollaston's doublet, although with less precision. In this combination (fig. 9) of lenses, the errors are still further reduced by the close approximation of the lenses to the object, which causes the refractions to take place near the axis, and thus we have a still larger pencil of light transmitted, and have also a more distinct and vivid image presented to the eye.

Simple Microscope.—By this term we mean an instrument by means of which we view the object through the lens directly. These instruments may be divided into two classes—those simply used in the hand, and those provided with a stand or frame, so arranged as to be capable of being adjusted by means of a screw to its exact focal distance, and of being moved over different parts of the object. The single lenses used may be either a double convex or a plano-convex. When a higher power is wanted, a doublet, such as we have already described, may be employed, or a Coddington lens which consists (fig. 4) of a sphere in which a groove is cut and filled up with opaque matter. This is perhaps the most convenient hand lens, as it matters little, from its spherical form, in what position it is held. In the simple microscope, single or combined lenses may be employed, and may be from one to ten inches. There are many different kinds of stands for simple microscopes made, but as they are principally used for dissection, the most important point next to good glasses is to secure a firm large stage for supporting the objects under examination. When low powers alone are used, the stage-movements may be dispensed with; but when the doublet or triplet is employed, some more delicate adjustment than that of the hand is necessary.

Compound Microscope.—In the compound microscope the observer does not view the object directly, but an inverted image or picture of the object is formed by one lens or set of lenses, and that image is seen through another lens. The compound microscope consists of two lenses, an object and an eye lens; but each of these may be compounded of several lenses playing the part of one, as in the simple microscope. The eye-lens is that placed next the eye, and the object-lens that next the object. The former is also called the ocular, and the latter the objective. The object-glass is generally made of two or three achromatic lenses, while the eye-piece generally consists of two plano-convex lenses, with their flat faces next the eye, and separated at half the sums of their focal lengths, with a diaphragm or stop between them. Lenses of high power are so small as to admit only a very small beam of light, and consequently what is gained in magnifying power is often worthless from deficient illumination. Various devices have been employed to overcome this difficulty. The light may be concentrated by achromatic condensers placed beneath the stage, or the curvature of the lens may be such as to allow as large a number of divergent rays as possible to impinge upon it. Such a lens is said to have a large "angle of aperture," the angle of aperture being that made by two lines converging from the margins of the lens to its focal point. Recently lenses, termed "immersion lenses," have been constructed, of such a curvature that when immersed in a drop of water placed over the object, light is admitted on all sides. With an immersion lens, there is high magnifying power with sufficient illumination.

The following diagram (fig. 5) explains the manner in which the compound microscope acts. We have here represented the triple achromatic objective, consisting of three achromatic lenses combined in one tube, in connection with the eye-piece, which consists of the field-glass FF, and the eye-glass EE. Three rays of light are represented as proceeding from the center, and three from each end of the object. These rays would, if not interfered with, form an image at AA; but coming in contact with the field-glass FF, they are bent, and made to converge at BB, where the image is formed, at which place a stop or diaphragm is placed to intercept all light, except what is required to form a distinct image. From BB, the rays proceed to the eye-glass EE, which do in the simple microscope, and as we have already explained, the image is formed at BB is viewed as an original object by an observer through the eye-piece EE. The lens FF is not essential to a compound microscope: but as it is quite evident that the rays proceeding to AA would fall without the eye-lens EE, if it was removed, and only a part of the object would thus be brought under view, it is always made use of in the compound microscope.

A mirror is placed under the stage for reflecting the light through the object under
Microscope.

observation. This method of illumination by transmitted light is used when the object is transparent. When opaque, light is reflected on the object by a bull's-eye lens, called a condenser. The best instruments are supplied with six or seven object-glasses, varying in magnifying power from 90 to 2,500 diameters. The eye-pieces supplied are three in number, each of which consists of two plano-convex lenses, between which a stop or diaphragm is placed, half-way between the two lenses. As the magnifying power of a compound microscope depends on the product of the magnifying powers of the object-glass and the eye-piece, it follows that its power may be increased or diminished by a change in either or both of these glasses.

In the mechanical arrangements, it is of importance to have the instrument so constructed that while every facility is afforded for making observations and easy means of adjustment, there should also be great steadiness, without which, indeed, no satisfactory results will be obtained. These ends are achieved in various ways, of which Fig. 6 is one of the simplest: a, brass stand, supported on three feet; b, mirror, supported on trunnions; c, diaphragm, pierced with circular holes of various sizes, to regulate the admission to the object of reflected light from the mirror; d, stage-plate, on which the object is placed; e, screw, with milled head for fine adjustment; f, the object-glass, or objective; g, brass tube in which the body of the instrument is moved, so as to effect the coarse adjustment; h, the eye-piece, or ocular.

The microscope has now become so important an instrument in education, that almost every department of science in which it can be employed has a microscope suited to its particular kind of work, and a special treatise explaining and illustrating its use; and many branches of science have instruments peculiarly their own. Thus, chemists, anatomists, zoologists, etc., have each an instrument which they value as being peculiarly adapted for their special fields of inquiry and observation. From this instrument the chemist, and natural philosophers generally, have derived great assistance in studying the different kinds of crystals; for, by means of it, they can not only observe and recognize the great variety of forms that exist, but at any moment, and with little trouble, they may witness the process of crystallization, and leisurely study it. Those sciences in which it is most used, and for which it has done most, are anatomy, physiology, botany, zoology, medicine, mineralogy, and geology. In the practice of medicine all medical men who aim at a scientific treatment of disease have fully recognized how useful it has been as an agent in diagnosis, more especially in diseases of the kidneys. In the detection of crime and the vindication of innocence it is no less useful, as by means of it we can with certainty determine whether a suspicious stain, found, for instance, on the clothing of an individual charged with murder has been caused by blood or by another coloring-matter. In like manner we can determine whether hair found in similar circumstances belongs to a human being or not. It has also enabled us to distinguish the difference existing between substances that have a similar chemical reaction (e.g., the various kinds of starch, as flour, potato, sago, etc.), and thus we are provided with an agent quick in detecting adulteration.

A few hints to amateur observers may not be out of place here. In choosing an instrument, the simpler it is the better. The essential point to attend to is to have good glasses, which are tested by their power of showing some very minute markings, such as we find on chalcedons. The circumference of the field of view should not be tinged with color, and the definition should be as good at the edge as at the center. The beginner should use low powers in preference to high ones. The best light is that reflected from a white cloud during the day. Artificial light should, if possible, be avoided. The table must be steady on which the microscope is placed, and when not in use the instrument should be covered by means of a glass shade. The observer also requires a few oblong glass slides, and a few circles of thin glass, called covering-glasses, to lay over the preparation under examination. For making sections, dissecting, and the various manipulatory operations attending the use of the microscope, he requires, moreover, a pair of forceps, a knife, or, perhaps better, a razor ground flat on the one side, a few needles fixed in handles, and two or three hair-pencils. So equipped, the observer is able to begin examinations of texture at once with pleasure and advantage. Begin with simple objects, such as pollen and thin slices of the cuticle of flowers, mosses, and different kinds of starch, such as starch, dicotyledons, monocotyledons, le moos, buck yam, cica, arrow-root, etc., and notice particularly their different characters. Make as thin a section as possible, place it on the center of the slide, and allow a drop of water to fall on it from the end of the handle of the needle. Then allow the covering-glass to fall gently on it—obliquely, so as to press out any small bubbles of air. He should also have a few bottles containing "reagents," such as dilute acetic acid (equal parts of pyrelo- ney acid and water) and liquor potassa. By means of these reagents, peculiarities of structure may often be observed.
Microscopes vary much in price, from 5s. to upwards of £100. A good serviceable dissecting simple microscope may be had from any philosophical-instrument maker for from 9s. to 15s. Compound microscopes are more expensive, but a wonderfully good instrument for beginners can be had at 30s. It has one eye-glass and three object-glasses, and magnifies from 70 to 200 diameters. If a superior instrument is wished—one suited for most purposes of observation and research—any one of the following will be found well worth the price. The microscope of Hartnack, with a joint, so that it may be inclined at any angle, has two eye-pieces, two object-glasses, magnifies from 50 to 450 diameters, and costs about £7; Nacket's microscope has three eye-pieces, three object-glasses, magnifies from 50 to 750 diameters, and costs £10; Smith and Beck's educational microscope has two eye-pieces, two object-glasses, magnifies from 50 to 350 diameters, and costs £10; Ross supplies microscopes from £5 to £100, with various number of glasses.

For a more complete account of the different kinds of microscopes, and the various purposes to which they are applied, see Quekett On the Microscope (1855); Carpenter On the Microscope (1862); Hogg On the Microscope (1855); and How to work with the Microscope (1864), by Beale.

MICROSCOPIC ANIMALS. See ANIMALCULE, ante.

MICROTASIMETER, an instrument invented by Mr. Thomas A. Edison for the purpose of measuring very minute variations of pressure caused by the expansion or contraction of any given body, from whatever causes, heat, moisture, etc. A part of the apparatus is constructed upon the principle of the pyrometer, and when the expansion is caused by moisture, upon that of some forms of hygrometer. But the novel and unique part of the invention consists in the effect which the pressure of the expanding rod has upon the electric resistance of a piece of carbon placed in the circuit of a galvanic battery. A rod of vulcanite is used as the expanding element when it is desired to use the instrument to ascertain slight variations in the heat vibrations coming from any object, as the sun, or a gas, or electric light. This rod is adjusted in a strong frame kept at an equal temperature, so that no expansions or contractions shall exert any influence, except those which take place in the vulcanite rod itself. In the chamber which receives one end of this rod, or plate, there is placed a follower, or slide, a piece of carbon, which becomes compressed with great force upon the expansion of the vulcanite rod. If radiant heat is to be measured, a large funnel is placed in front of the apparatus to gather the rays and throw them upon the rod or plate. When the rays increase in intensity the rod expands, compresses the button, and changes its conducting capacity, which at every moment is indicated by a galvanometer. The instrument has been used successfully to ascertain the variations in the radiation from the sun during an eclipse. It may also be used to note the variations taking place on a day when clouds are passing across the sun's disk, or when the transmission of his rays differs from increase or decrease of moisture. It may be used as a delicate hygrometer by substituting in place of the vulcanite rod a body containing gelatine, which expands under the influence of moisture.

MICROZA MIA, a genus of plants of the natural order cycadaceae. They are widely diffused over Australia. The fronds resemble those of palms, and are used in the Roman Catholic church on Palm Sunday. The underground stem is large and turnip-like, but covered with scales or leaf-scars, and contains a substance resembling tragacanth. The nuts of M. spiralis are edible, but are only used in times of scarcity.

MIDAS, a genus of platyrhine monkeys belonging to the family hapalidae, which also contains the marmosets. The common name for the different species is tamarin. It has the following characters: Muzzle short, frontal angle, 60°; forehead with an appearance of prominence, arising from the great angle of the upper edge of the orbits; upper incisors contiguous, under incisors of the same size as upper; nails like claws, excepting those of the thumbs behind; tail the same as in the marmoset, or jacchus of Geoffroy, and dental formula the same, except that in the latter the incisors are more irregular. There are seven species, the typical one being midas rosalia, the marakina or silky tamarin. This very beautiful little-monkey is of a golden yellow color, varying to a redder tint, rather paler on the back and thighs. The long and silky hair about the head and neck forms a kind of mane, on account of which it has sometimes been called the lion-monkey. Its beauty and gentleness render it a great pet; but it is delicate, and requires to be kept warm and dry. It is squirrel-like in its habits, a native of Guayana and the south of Brazil, from Rio Janeiro to cape Frio. There is a black and red variety, and one of a bright, shining red. The species should not be confounded with M. leonina of Humboldt, which is probably the smallest monkey known. It is brownish, and has a well-developed mane of that color which bristles up when the animal is angry so as to look like a little lion. It has a black face, a white mouth, and a tail black above and white below. It inhabits the plains bordering on the eastern slope of the Cordilleras, and is rare.

MIDAS, a common name of the more ancient Phrygian kings, of whom Midas, the son of Gordius and Cybele, is the most famous. He was a pupil of Orpheus. Among the many legends regarding him is one that Bacchus granted his wish that whatever
he touched might become gold; from which so great inconvenience ensued, that he was glad to get himself relieved from the burden by washing, at the command of the god, in the Pactolus, the sands of which became thenceforth productive of gold. Another legend represents him as having offended Apollo by assigning the prize in a musical competition to Pana and as having therefore been endowed by him with a pair of ass's ears, which he concealed under his Phrygian cap, but which were discovered by his servant.

MIDDELBURG, a t. of the Netherlands, capital of the province of Zeeland, in the island of Walcheren. It is connected with the sea by a canal, 5 m. long, which admits ships of heavy burden, and is a station of the railway from Flushing to Roosendaal to join the Dutch and Belgian lines. Pop., Jan. 1, 1875, 18,926. The city is nearly circular, and a league in circumference, surrounded by a broad canal. In former times Middelburg was one of the leading mercantile cities of the United Provinces, sending many ships to the East and West Indies, America, and all European ports, founding the colonies of Surinam, Berbice, Essequibo, Demerara, etc.; but the opening of the Scheldt for Antwerp, and other causes, have reduced the foreign trade to single ships to Java. Many of the inhabitants are wealthy, which, with its being the meeting-place of the provincial states of Zeeland, and possessing a considerable trade in grain, salt, etc.—making beer, vinegar, starch, leather, having snuff, chocolate, oil, and saw mills, and foundries—make it still a city of importance. It is the finest city of the northern provinces, having handsome houses, ornamented with gardens, and the canals and streets shaded with trees. The town-house, founded in 1468, has a beautiful tower, and is decorated with 25 colossal statues of counts and countesses of Holland. At the beginning of the 13th c. an abbey was founded, which was later enriched by Willem I, count of Holland and Zeeland. The buildings are now occupied as the meeting-place of the provincial states.

Middelburg does not date further back than the 9th century. In 1574 the Spaniards, under Montdragon, were compelled by famine to give up Middelburg, after having defended it for 22 months against prince Willem I. Though troops are stationed in Middelburg, it is no longer tenable against an enemy.

MIDDLE AGES, the designation applied to the great historic period between the times of classical antiquity and modern times. The beginning and close of this period are not very definite. It is usual, however, to regard the middle ages as beginning with the overthrow of the western Roman empire in the year 476; and there is a pretty general concurrence in fixing on the reformation as the great event which brought this period to a close. It began with the rise of the Frankish upon the ruins of the ancient Roman empire, and with the commencement of civilization among the barbarous tribes which had taken possession of the former Roman provinces. In course of it the different nations of modern Europe were formed, and their political and social systems developed. It was a period of much superstition, in connection with which much religious enthusiasm very extensively prevailed, manifested in many great religious endowments, in magnificent ecclesiastical buildings, in pilgrimages, and, above all, in the crusades. In the earlier parts of this period the church was much occupied in the extension of its bounds, and the union of the Germanic races of the north, which were not always consistent with the spirit of Christianity. During the middle ages the hierarchy acquired enormous power and wealth, and the papacy rose from comparatively small beginnings to its utmost greatness. During the middle ages chivalry had its rise and decline, modifying and in many respects tending to refine the feelings and usages of society. Towards the close of the middle ages the revival of letters, the increase of knowledge, and the formation of a wealthy and influential class in society, distinct alike from the aristocracy and the peasantry, tended, even before the reformation, both to the diminution of the power of the hierarchy and the decay of the feudal system. See Guizot's Histoire de la Civilisation; Rühs's Handbuch der Geschichte des Mittelalters; and Hallam's History of the Middle Ages.

MIDDLE AGES (ante), the period in history from the 5th to the 15th c., or between the fall of the Roman empire and the reformation. Its beginning witnessed the successful invasion of southern Europe by the barbarians of the north. The Vandals were masters of Africa; Spain was divided between the Suevi and the Visigoths, the latter occupying also a large portion of Gaul; Italy was in the hands of the Ostrogoths; while a tribe of Germans under Clovis had invaded and conquered France. The comparatively weak Byzantine or eastern empire had already begun to decline, through the weakness and licentiousness of its rulers. Paganism had been overthrown, and Christianity was gradually penetrating into the unknown wilderness of northern and central Europe. What were known as the "dark ages," the first centuries of this period, had commenced the destruction of the old civilization which had been propagated from Phcenicia, and had culminated in the ascendency of Greece and Rome. Western Europe, including even Italy, "lay prostrate at the feet of barbarian conquerors, and was a howling waste, in which the law of the strongest only prevailed."—The middle ages closed with the advent of Luther, Melanchthon, and Calvin, and the great battle for the freedom of the human conscience; with the discovery of America by Columbus; and with the invention of the art of printing by Gutenberg, Faust, and Schöffer, and
its application to the printing of the Bible at Mayence. In the beginning of this period the countries which we have named were swayed by incidental leaders and potencies, and given up a prey to a soldier who lived by depredation and rapine. Protection for life or property there was none; and even the savage chieftains of that ignorant age soon perceived the necessity for some authoritative restraint. Out of this necessity grew the feudal system, in France, Germany, Aragon, a large part of Italy, England, and Scotland, probably occasioned in part by the gradual destruction of slavery, and in part to the fall of the Roman empire, for so long a time the seat of government of the world. It was natural that with Rome fallen, Europe should become divided among petty barons and princes, whose authority could only exist so long as they were enabled to sustain it by force of arms. Under these circumstances, each lord fortified his possessions; and it was then that many of the castles and fortresses were erected, whose ruins are to-day the admiration of tourists in Europe. Every man who was capable of bearing arms was a soldier; and there was no such thing as a laboring class, since the hides and villains who did the drudgery under the feudal system were held to be but little above the brutes whose care was one of their chief duties. Of this period it has been censurably said, "the peculiar general character of feudalism is the dismemberment of the people and of power into a number of petty nations and petty sovereigns; the absence of any central government." The foundation of this system consisted in the allotment of land in fec (Latin feoda), with the powers of bequest and inheritance, to the petty chieftains, who on their part agreed to give their services and those of their vassals, whenever called upon, either to repel invasion or to make incursions into the territory of others. Later, these barons, counts, and others, were permitted to take upon them the management of the defence of their castles or villages, and to adopt armorial bearings. This whole movement was the slow formation of the royal and noble elements of society as organized in future centuries.

With feudalism intervened another element of specific influence—the introduction of monasticism and the monastic orders throughout Europe; for the foundation of monasteries in Europe proves to have been a necessity to the progress of civilization. They served as a nucleus around which settlements were formed, the settlements growing into towns, the towns into cities. The prelates and abbots were feudal nobles, equally with the barons and counts. Their tenure of land was the same; and though they were not absolutely required to perform military service, there were many fighting men among them who did so, while none were exempt from furnishing their quota of armed vassals. And as the church grew strong in Rome, some reflection of her strength was felt wherever her servants were; until it was often the case that the lords and barons were made to experience a power in the hands of the abbots that they themselves did not possess. While the monastic system had undeniable and great evils, the teachings of the monks led generally toward a respectable, honest, and humane mode of life; and on such teachings the arts of peace and culture began to take root and flourish amid disorder and depredation, such as had not been known before since the foundation of Rome.

A new feature was after a time introduced into the feudal system by the occasional calling together of an assembly of the feudal lords by the sovereign—more, it is true, with the view of sustaining amicable relations with them than for any purpose of the division either of power or responsibility. At first these assemblies were merely festive gatherings; but after a time they assumed the form of advisory, and at last of deliberative meetings, when all legislative enactments were considered and debated. There were even in some of these gatherings traces of representative legislation; they were the first faint beginnings of the constitutional monarchy of a later age. The convocation of the French states-general, in 1302, was the first positive departure in this direction. The feudal system was now gradually discarded. The petty feud of the early part of the middle ages became the great wars of their latter centuries, when the simple feudal compact could not supply such armies as were required. The tendency towards consolidation began now to be felt; just as that of displacement and separation had held sway, at first, in the stronger states of Rome. Kingships grew into enormous possessions and great wealth. Mercenary troops were employed in war, hired from monarchs or states not engaged in the conflict; and thus the idea of standing armies for emergencies grew into being. In fact, centralization of power began to be the law under which kings and emperors were conducting their policy, while representation was being made the lever with which the people were seeking to gain greater freedom of conscience and of person. This general condition spread through England and Scotland, France, Germany, Italy, and Spain. In Italy, Lombardy, and Venice arose republican governments; and the anomaly of great cities self-governed appears as one of the extraordinary features of the middle ages. Venice grew great in the arts and in commerce, and the marvelous promise of the period was broken only by intestine quarrels and the fantastic fights of the Guelphs and Ghibellines, and of other powerful Italian families, which, however, resulted in the destruction of the franchises of the people, and the foundation of petty principalities. The rule of the liberty which had been achieved by the free cities. The history of Florence, Pisa, Genoa, and Venice, during a major part of the middle ages, is that of all Italy after the period when the northern portion of that country was under the control of the German emperors. Their commerce covered the Mediterranean, the Black sea, and the Adriatic, and extended into the far east by caravans. In the
darkest and most barbarous period, Venice conducted an extensive traffic both with the Greek and Saracen regions of the Levant. The crusades, which swept over Europe with an unexampled wave of enthusiasm, enriched and aggrandized Venice more perhaps than any other city. Her splendor, however, may be dated from the capture of Constantinople by the Latins in 1204, by an enterprise which, originally intended for the recovery of Jerusalem, was diverted to this more profitable adventure, in which not only the Venetian nations but the French were engaged. In the meantime wars assumed a scientific character, gunpowder was introduced into Europe, probably through the Saracens, and artillery began to be used in the early part of the 14th century. But incessant revolutions and family feuds tore the Italian republics to pieces, until Florence, the last of them, succumbed under the domination of Lorenzo de' Medici.

Charlemagne, king of the Franks and emperor of the Romans (768–814 A.D.), after his conquest of the Saxons and the Lombards, was invited into Spain to interpose in the wars of the Arabs and Moors in that country, and seized and added to his dominions all that territory lying between the Pyrenees and the Ebro. The Saracens conquered Spain in 711 A.D., and left behind them monuments whose ruins attest to this day the wonderful progress of oriental art under the caliphs, and give evidence of the spirit and enterprise which characterized the Arabs from the time of Mohammed to that of their expulsion from Spain (1492), when they had erected new empires in three-quarters of the globe.

The beginning of the 13th c. had seen an eruption of barbarians from Chinese Tartary, extending across all Asia and as far as the Euxine, which was not even paralleled by the invasion of Spain by the Saracens, or that of Italy by the savages of the north. Reducing the caliphate of Bagdad, they subverted the governments of Persia, Syria, and Iconium. To them it was owing that the Turks of the latter country, under Othman, penetrated through Asia Minor into Europe, from whence not all the western powers in six centuries have disillusioned them.

The power of the church in the middle ages began in the conversion of Constantine, emperor of the west, who was baptized shortly before his death, 337 A.D. It was gained by slow steps, beginning with the accumulation of territory, and being extended by assumption of the authority to declare excommunication and interdict. By gaining vast wealth, and by playing upon the fears of weak princes, the bishops gradually encroached upon the rights and privileges of the highest potentates of Europe, until the pontifical authority of Rome controlled nearly every king and emperor from the Adriatic to the North sea. It was this influence that organized the crusades, and that occasioned half the wars that convulsed Europe during a period of ten centuries, yet without which, at this peculiar age of the world, civilization, the arts, letters, and commerce alike would have languished or remained unborn. The missionary enterprise of the church, after the discovery of America, populated the western continent, and opened an entire hemisphere to new empire and a new civilization. Devotion to the church prompted the genius of Raphael and Michael Angelo, and gave form to the wonderful conceptions which resulted in the spread of Gothic architecture, the most original, the most comprehensive, and the most symbolic that the world ever saw. It has already been shown how the ceaseless energy and enterprise of the church was the foundation of the advance from barbarism to civilization which characterized central and northern Europe between the 6th and 13th centuries. During this period, that portion of the world seen by Marco Polo, such an awakening out of darkness and incapacity into light and power as that which followed the culmination of the strength of the church. Yet it was in the period immediately succeeding the reformation—the first and fiercest blow struck at the influence and prerogative of the church—that this awakening—renaissance—reached its height. When the middle ages closed, a Protestant queen was on the throne of England, then in the zenith of power and splendor. Calvin, Luther, and Melanchthon were defying the pope and making all Europe ring with tones deeper and further reaching than even those of the Vatican. The schools of art of Antwerp, Venice, Rome, and Siena had revived the genius of the Augustan age, and the newly-discovered power of the press was beginning that vast dispensation of intelligence which marks the modern period. Meanwhile, Cabot, Vespuccius, and Vasco de Gama were sailing forth to discover new continents; Cortes and Pizarro were destroying the hitherto unknown Aztec civilization; and but a hundred years since the Pilgrim fathers planted the first seeds of freedom in America, leading in the new epoch of wars, conquest, legislation, disintegration, and rebuilding, which we call modern history.

**MIDDLE BASE AND MIDDLE CHIEF.** See Points of Escutcheon.

**MIDDLE BASS ISLAND.** See Put-in-Bay Islands.

**MIDDLEBOROUGH.** a t. in s.e. Massachusetts, on the Nantasket river, the junction of several lines of the Old Colony railroad—the Cape Cod branch, Boston to Provincetown, the Middleborough, Taunton and Providence, and the Old Colony and Newport. It is one of the most ancient towns in Plymouth co., and a summer resort of great attractiveness, on account of the picturesque beauty of its scenery and numerous features of historic interest within the town limits. Previous to the incorporation of the town of Lakeville, which was taken from its territory, it was the largest town in the state, and now numbers more than 60 sq.m.; pop. '90, 5,297. It lies on both sides
of the river, which runs in a winding course from large lakes (in the adjoining town) 5 m. away, with three falls furnishing valuable water-power, emptying into Taunton river. Game and fish abound in the lakes and their vicinity, and a small excursion steamer plies between the picnic grounds on the lakes to a pier at the upper falls. It comprises the thriving villages (all with churches, post-offices, and manufactures) of North Middleborough (Titicut), South Middleborough, The Rock, East Middleborough (Eddyville), a number of smaller villages and neighborhoods, and Middleborough Four Corners, the central portion, which is designated as Middleborough. It has several public halls, an elegant town house containing a commodious hall, a room for the district court, the public library, and a bank, besides the town offices, erected at a cost of $50,000, standing on an eminence commanding a view of many points of interest, among them Muttock Hill cemetery, about a mile from the Corners, a beautiful spot, where rest some of the founders of the old colony. In this vicinity is Oliver's walks, the site of the mansion of judge Oliver, who in the revolution espoused the Tory cause and went to England. It was the seat of Peirce academy (Baptist), founded 1808, with a classical department, a valuable public library, and an average attendance of 300 pupils, including many from the southern states. During the rebellion its popularity diminished, and it has since been discontinued. The town has excellent public schools, is lighted by gas, and is laid out regularly, with numerous mapsles, elms, and other ornamental trees shading the streets and highways, which are celebrated for their beautiful drives. It contains the Bay State straw-works, employing a large number of girls in its extensive factories and at their homes in the adjoining towns and villages, 5 shoe-factories, 3 churches, 2 newspapers (1 monthly), 2 printing-offices, a hotel, the Star mills (wooden), and manufactories of lumber, shovels, needles, trunks, boxes, varnish, marble-works, and a variety of stores. It is a center of an important trade in horses, which are brought from Vermont and Canada. It is 12 m. from Plymouth, 10 m. from Taunton, 20 m. from New Bedford, 20 m. from Fall River, and 34 m. from Boston.

MIDDLEBURY, a t. in central Vermont, delightfully situated on Otter creek, a small stream flowing n.w. and emptying into lake Champlain; in a mountainous region, presenting very attractive scenery; pop. '80, 2,993. The Central Vermont railroad passes through it. It is 33 m. n.w. of Rutland, 35 m. s. of Burlington, and 33 m. s.w. of Montpelier. It has valuable water-power. It is the seat of Middlebury college, and has excellent public schools and a public library. It contains a national bank, 2 newspapers, 6 churches, 3 hotels, and a well-organized fire department. It has six quarries, where marble of various colors is quarried and exported, and it has iron foundries and flour-mills; other industries are the manufacture of sashes, doors and blinds, cotton, wool, paper, and leather.

MIDDLEBURY COLLEGE, in Middlebury, Vt., opened in 1800, under Congregational control, has three buildings valued at $100,000, an interest-bearing endowment of $180,000, and an income of $13,000 annually. There are 11 instructors, and a library of 13,000 volumes. President (1881), Rev. Cyrus Hamlin, d.d., formerly a well-known missionary in Turkey.

MIDDLE C. in music, receives its name from its position on the general scale. It is the note which is a fifth above the F or bass clef, and a fifth below the G or treble clef. The C clef always represents the note termed middle C, and the lines and spaces above or below are designated accordingly.

MIDDLE LATITUDE SAILING. See SAILINGS.

MIDDLE LEVEL. Under the heading BEDFORD LEVEL, a remarkable district, covering 400,000 acres, is described, bounding the Wash on all sides except seaward, extending landward nearly to Brandon, Cambridge, Peterborough, and Bolingbroke, and embracing portions of the six counties of Northampton, Huntingdon, Cambridge, Lincoln, Suffolk, and Norfolk. It nearly coincides in area with what is popularly known as the Fens. The whole region was, centuries ago, converted into an unprofitable marsh by repeated incursions of the sea, coupled with obstructions to the outward flow of the rivers Nene, Cam, Ouse, Welland, etc. Vast operations have been carried on ever since the time of Charles I., by digging new channels and outfalls, and employing windmills and steam-engines to pump the water from the marshes and ponds into these artificial channels. The Bedford level is divided into the North, the Middle, and the South levels, managed by commissioners, whose powers are derived from special acts of parliament. The improved value of the land is the fund out of which the expense of the engineering works is defrayed. It was in one of these districts (the Middle level, between the Nene and the Old Bedford river) that an irrigation took place in 1862, which strikingly illustrates the dependence of the safety of the whole region on well-formed and well-main- tained embankments. There was a sluice, called St. Germain's sluice, situated at the confluence of the Middle level main outfall drain with the river Ouse, near the upper end of another artificial channel, known as the Eau Brink cut. The drain was made in 1847, and was enlarged ten years afterwards to a bottom-width of 48 ft., a side-slope of 2 to 1, and a level of 7 ft. below low-water spring-tide in the river; the rise of high-water spring-tide at that point was 19 ft., and the sill of the sluice was 6 ft. below low-water spring-tide.
On May 4, 1862, this sluice gave way without the slightest warning: the tidal waters undermined the brickwork, and formed a hole in the bed of the river, into which the works of the sluice sank. The tidal waters rushed up the opening, and ebbed and flowed throughout a distance of 20 miles. The commissioners of the Middle level applied to Mr. Hawkshaw, the engineer, to devise means for repairing the disaster. An earth and cradle-dam was attempted to be thrown across the drain, at about 500 yards from the fallen sluice; but this was relinquished in favor of a permanent coffer-dam of pile-work, at a distance of half a mile from the sluice; and after incessant exertions from May 16 to June 19, the tidal waters were at length effectually shut out by a strong dam. The failure of the St. Germain's sluice was not the only irruption that had to be battled with; eight days after that failure, under the pressure of a high spring-tide, the west bank of the drain gave way, on May 12, at a point about 4 miles from the sluice; the bank had been built only to resist upland waters, and not a rush and a pressure of the sea. The rupture carried away 70 yards of the bank, scouring out a hole 10 feet deep at the spot, and admitting a rush of water which covered 6,000 acres of fertile land to a depth of 2 or 3 feet, increased at successive high-tides to 10,000 acres.

When the finishing of the dam had enabled Mr. Hawkshaw to shut out the tidal waters, means had to be devised for getting rid of the flooding waters, and providing an outlet for the usual rivers and land-drainage of the Middle level. It was resolved to utilize some of the old outlets at other spots, and to supplement their action by enormous siphons, placed over the coffer-dam. Sixteen siphons were provided. They were made of cast iron, 3 feet 6 in. internal diameter, and somewhat over 1 in. thick; they rested on the top of the dam, and on inclined framework supported by piles at the sides. The valves were so arranged, that the siphons could be put in operation, either by exhausting the air or by filling them with water. When only six of the siphons were in position, they carried 9,000 gallons of water per minute over the dam.—For more minute details of the dam and the siphons, see Mr. Hawkshaw's paper read before the institute of civil engineers in 1863.

There are large items both of cost and of compensation in works of this kind. Nearly the whole of the Middle level is 15 feet below high-water spring-tides; it is difficult to keep out the sea-water, and at the same time to preserve an outlet for the land-water, especially Whittlesea mere; there are 130,000 acres to be drained somehow or other; but as the land is rich for farming, the commissioners, in past years, did not hesitate to spend £400,000 on 11 miles of drain, and £50,000 on the sluice. The drain runs through a district called Marshland, between Linn and Wisbeach; and as the bursting of the bank caused this district to be deluged with water, the commissioners have had to compensate the Marshland farmers and others; the amount of this compensation was frequently litigated between 1862 and 1867. As concerns the land itself, it is found to be more fertile after such inundations than before, owing to the amount of silt deposited on the fields. After repairing the breach in the bank, the 10,000 inundated acres were drained without much difficulty, through the Marshland, Smeeth, and Fen drain, and the Marshland sewer; the siphons are permanent channels, to carry off the usual land-waters regularly. The siphons were subjected to a severe trial in Jan., 1867, by the ice which accumulated around their lower ends; but iron gratings effectually resisted the entrance of the ice into the siphons.

MIDDLE PARK, one of the numerous fertile valleys which extend over broad distances in Colorado, being inclosed by spurs of the Rocky mountains, and remarkable for the variety and picturesque character of their scenery. It is in Summit co., about 3,000 square miles in extent, being 65 m. in length by 45 in width, and is 7,500 ft. above the level of the sea. It lies directly s. of North park, from which it is separated by one of the cross ranges of the great mountain chain. On its eastern side the Snow-range or continental divide sweeps around it, and it is completely surrounded by lofty mountains, among which Long's peak, Gray's peak, and Mt. Lincoln, from 15,000 to 14,000 ft. high, stand prominent. The head-waters of Grand river and the Blue river water this territory, both flowing westward to the Colorado. A portion of the park is heavily wooded, but much of it presents an expanse of grass-grown meadows, dotted with wild-flowers. Wild game is plentiful, and includes bears, elk, mountain-sheep, deer, and antelopes, and the waters are filled with fish. The climate is genial and the temperature equable. The most important feature of the park for tourists is the hot sulphur springs, 500, from Geyser spring and 600 from Central City. These springs are found near a branch of the Grand river, about 12 m. from the southern termination of the park. Their waters are said to exercise a curative influence in cases of cutaneous disease, rheumatism, and neuralgia. About these springs a settlement for the accommodation of invalids is rapidly spreading into a considerable town. Grand lake, a handsomely sheet of water, offering excellent trout and other fishing, is 27 m. from the Hot Springs, and is a point much frequented by excursion parties of tourists and convalescents.

MIDDLESBROUGH, the center of the n. of England iron manufacture, is an important market t., port, and parliamentary borough in the North Riding of Yorkshire, at the mouth of the Tees, 48 m. n.e. from York, returning one member to parliament. The town is of recent growth, and owes its origin as a port to its convenient position for the
shipment of coals brought down by railway from the mines in South Durham. In 1842 a commodious dock was constructed, which has recently been very considerably enlarged, and will admit ships of the largest tonnage.

On the discovery, in 1840, of immense beds of ironstone, extending throughout the whole range of the Cleveland hills, a portion of which lies close to the town, the smelting of iron was speedily embarked in on an extensive scale, which has since increased to a marvelous extent, to which has been added iron-foundries, the manufacture of rails, locomotive engines, tubes, boilers, etc.; chemical works, potteries, and ship-building are also carried on to a large extent. The town of Middlesbrough was incorporated in 1838, and constituted a parliamentary borough in 1868, is well built, and some of the streets present handsome specimens of architecture. The royal exchange, built in 1867, is a large and handsome building; within its spacious interior the weekly iron-market is held on Tuesdays, and is attended by parties connected with the iron trade from all parts of the world.

The coal measures beneath the town are the richest and best in England. The coals are of various kinds, and have been extensively mined for some years past. The town is extensively supplied with water from the River Tees, and is connected by the Tees and Seaburn Railway and the North Eastern Railway, the latter of which enters the town from the north. The town is also supplied with gas from the town gas works, and electricity is supplied by the town electric supply company.

The town of Middlesbrough is the seat of the following educational institutions: Middlesbrough Technical College, Middlesbrough School of Art, Middlesbrough College of Physical Education, and Middlesbrough College of Music. The town has several public libraries, and a number of public parks and gardens.

Middlesbrough is the centre of a large manufacturing district, and is the seat of a number of important industries, including the manufacture of iron and steel, agricultural implements, and a variety of other goods. The town is also a centre for the distribution of coal and other mineral products, and is connected by a number of railways with other parts of the country.
MIDDLESEX, a co. in e. Virginia, having the Chesapeake bay for its s.e. boundary, the Rappahannock river for its n., and the Piankatsauk river for its s. border; 150 sq.m.; pop. '80, 6,352—6,342 of American birth, 3,634 colored. Its surface consists mostly of level plains with low marshes in some sections. Its soil is a sandy loam, producing wheat, oats, corn, and dairy products. Cattle, sheep, and swine are raised, and oysters are abundant. Seat of justice, Saluda.

MIDDLESEX, a co. in s.w. Ontario, drained by the Thames river, forming part of its s.w. boundary; about 1228 sq.m.; pop. '71, 82,595. It is intersected by the Great Western railway, the branch railroad to Sarina, the London and Port Stanley railway, the Grand Trunk, and a branch from St. Mary's. It is a fine agricultural region, and has white sulphur springs in the e. portion. It has 3 ridings. It is also supplied with water power by the Aux Sables and Sydenham rivers; and has extensive iron-foundries, machine shops, chemical works, breweries, and manufactories of boots and shoes, soap, candles, musical instruments, carriages, cabinet-making establishments, and has a large trade in grain and country produce. Seat of justice, London.

MIDDLESEX, the metropolitan co. of England, in the s.e. of the country, bounded on the n. by Hertford, and on the s. by Surrey, and about 60 m. inland (westward) from the North sea, with which it communicates by the river Thames. Next to Rutland, it is the smallest of the English counties, its area being only 180,136 statute acres; but its population is inferior only to that of Lancashire, and was, in 1871, 2,539,756. The surface is on the whole level, with gentle undulations. The Thames, which forms its southern boundary, and its affluents, are the only rivers of the county. Two of these, the Colne and the Lea, form respectively the western and the eastern boundaries of the county. The surface is also traversed by the Grand Junction and Regent's canals, and the New river, an artificial cut intended to supply the capital with water. The soil is in general poor, with the exception of a tract along the banks of the Thames, which consists of a good fertile loam. The county is chiefly occupied in grass and hay farms, and in market-gardens, the produce of which is sent to supply the metropolis. Parliamentary elections of members for Middlesex are held at Brentford, which is the county town. There are no other towns of importance except London.

MIDDLE TEMPLE, one of the four English inns of court, having the exclusive privilege of calling persons to the bar. See INNS OF COURT.

MIDDLE THIBET. See LADAKH, ante.

MIDDLETOWN, a small manufacturing t. of Lancashire, 6 m. n.n.e. of Manchester. Pop. '61, 9,576; '71, 14,597. It is chiefly dependent upon its manufactories of cotton cloth and silks.

MIDDLETOWN, a small decaying market t. of Ireland, in the county of Cork, and 13 m. by railway e. of the city of that name. It contains a college, founded in 1696, noticeable as the place in which John Philipot Curran was educated, and still of considerable reputation, and carries on a general trade. Pop. '71, 3,603.

MIDDLETOWN, ARTHUR, 1685-1745 about, was the son of Edward Livingston, and an eminent member of the South Carolina colony. The proprietary system, which existed under the royal charter, was obnoxious to the colonists, and in 1719, under the lead of Middletown, they succeeded in placing themselves under the immediate protection of the crown. He had previously (1712) been made a member of the council; and in 1725 succeeded Nicholson as governor, which position he held for six years, and for the remainder of his life was a member of the royal council.

MIDDLETOWN, ARTHUR, 1743-48, b. S. C.; educated at Harrow and Westminster, and at Cambridge. On his return to this country he took a prominent part in the affairs of his native state, where his family possessed large estates and exerted a great influence. His father, Henry Middletown, had been president of congress in 1775, and he himself, after serving with distinction on the first committee of safety, was sent by his native state in 1776 to congress, where he signed the declaration of independence. He remained in congress till 1777; and two years later, after refusing the governorship of South Carolina, he joined in the defense of Charleston. The British troops pillaged his plantation, one of the most valuable in the state; and in 1780 he was made prisoner at the capture of Charleston. His plantation was confiscated, and he was confined first at St. Augustine, and afterwards in the Jersey prison ship till near the close of 1780, when he was exchanged. He was again returned to congress, where he remained till the war was closed. He was afterwards a member of the senate of his native state. His writings are confined to a number of essays on political subjects, published under the pseudonym of "Andrew Marvell." To his skill as a stenographer we are indebted for a report of many debates in which he took part, and whose records would otherwise have been lost to us.

MIDDLETOWN, CONVYER, D.B., a well-known divine and scholar of the church of England, was b. in 1653 at Richmond, in Yorkshire. He studied at Cambridge, where he took the degree of B.A. in 1702, was elected a fellow in 1706, and shortly after married a lady of fortune. His life was a series of bitter, and, on the whole, not very creditable controversies, though he is said to have been rather a likable person in private. His first and most formidable opponent was Richard Bentley (q.v.); afterwards his polemics
were chiefly of a theological character. The views he expressed and defended were generally such as to draw down upon him the imputation of being an "infidel in disguise," though some of them—such as that the Jews borrowed some of their customs from Egypt, and that the primitive writers in vindicating Scripture found it necessary sometimes to recur to allegory—are now established beyond all doubt; while a third opinion, viz., that the Scriptures are not of absolute and universal inspiration, has since Middleton's day been adopted by many of the most learned and accomplished divines even of his own church. Middleton died at Hildersham, in Cambridgeshire, July 28, 1729. His principal writings are The History of the Life of M. Tullius Cicero (2 vols. 1741), a work interesting and valuable, but neither very interesting nor quite accurate. His celebrated Letter from Rome, showing an exact Conformity between Papery and Paganery; or the Religion of the Greeks, Romans derived from that of their Heathen Ancestors (1729), provoked the most violent indignation among Roman Catholics, and is still read with interest. All his pamphlets, treatises, etc., were collected and published under the title of Miscellaneous Works (4 vols. Lond. 1752-57), and contain much that is curious and valuable on theological and antiquarian topics.

MIDDLETON, Edward, 1640-1700, about the first of a family well known in the political history of this country, and especially of South Carolina. He was born in Twickenham, England, from which place he emigrated to this country and took up his residence in South Carolina, being one of the very earliest settlers. Here he took an active part in the affairs of the young colony and was useful not only from his great wealth but also from his political sagacity. He was of very liberal tendencies, and seems to have foreseen the separation of the colonies from the mother country. In 1680, ten years after the settlement of the colony, he was a member of the council under the lord-proprietors.

MIDDLETON, Henry, 1771-1846, was the son of Arthur Middleton, signer of the Declaration of Independence, and was b. in Charleston, S. C. He was a member of the state legislature 1801-10; was then elected governor of the state and in 1815 was elected to congress, where he served two terms. In 1820 he was appointed U. S. minister to Russia, in which capacity he served for about ten years and on his return to this country retired from public life.

MIDDLETON, Henry, b. not far from 1700, son of gov. Arthur Middleton, and like all his family, took much interest in the political affairs of the state. He is chiefly known as president of the congress of 1775, to which he was sent as a delegate by the colonial convention of South Carolina; and notwithstanding his great age at the time was an active and efficient supporter of the revolutionary measures.

MIDDLETON, Thomas, d. 1626, b. England; lived in the reigns of Elizabeth, James I., and Charles I. Very little is known of his life beyond the fact that he was made chronicler to the city of London in 1620. His earliest known piece belongs to 1602 and his latest, to 1626. The best of his numerous plays are A Mad World, my Masters, and The Roaring Girl. The latter is interesting from the picture it contains of the London life of that day. Its heroine was an actual person, the notorious Moll Cutpurse, who also figures in the Amends for Ladies of Field, a contemporary of Middleton. Another play of Middleton's, The Witch, is supposed to have furnished or suggested to Shakespeare, some of the incantation scenes of Macbeth. A tragedy founded upon the story of Bianca Capello is distinguished by a forcible action. The comedy, A Trick to Catch the Old One, is full of spirit and humor, as are most of Middleton's comedies. His language is often coarse, and his characters ruthless; he has little skill in the construction of plots, but his works are full of life. He displays a richness of humor in his comedy, and an occasional power of imagination in his tragedy, which entitle him to a high rank among the Elizabethan dramatists of the second class. He worked with Rowley on the composition of The Fair Quarrel, the Spanish Gipsy and The Changeling, with Rowley and Massinger on The Old Love, and with Fletcher and Jonson wrote The Widow, printed in Dodsley's Plays.

MIDDLETON, Thomas Fanshawe, D.D., 1769-1829, b. England; educated at Christ's hospital, and Cambridge, and ordained in the English church in 1792. He was appointed to the curacy of Gainsborough in Lincolnshire, where for a time he edited a periodical called the Country Spectator. In 1794 he acted as tutor to the sons of the archdeacon of Lincoln, Dr. John Prettyman, who presented him in 1795, to the living of Tansor, in Northamptonshire, whence he was transferred in 1799, to St. Peter's, Manchester. In 1801 he became rector of Bytham, in Lincolnshire, and began his most important book, a treatise on the Doctrine of the Greek Article, which appeared in 1808. In 1811 he became vicar of St. Pancras, Middlesex, and in 1814 was consecrated first bishop of Calcutta. In this capacity he did much to promote the advancement of Christianity and education. He founded the bishop's college at Calcutta in 1820, to educate missionaries and clergyman for the English Asiatic possessions, and he established a consistory court at the same place. In his book on the Greek article, after laying down the rules to which it is subject, and applying them to New Testament interpretation he attempts the discussion of passages from which the divinity of Christ may be argued for or against, according to the special force of the Greek article in that particular connection. The
work created considerable theological discussion, and was opposed by a number of Unitarian writers.

MIDDLETOWN, a city and township in Connecticut, United States, at the head of navigation, on the right bank of the Connecticut river, 23 m. from its mouth. It is a well-built town, with a handsome custom-house, Wesleyan university, episcopal seminary, 18 churches, four banks, 3 cotton factories, foundries, mills, etc. Pop. of city in 1870, 6,923.

MIDDLETOWN (ante), a city in s. Connecticut, incorporated 1874; on the Connecticut Valley railroad and the Boston and New York Air Line, at the terminus of a branch of the New York, New Haven and Hartford railroad; pop. '80, 11,751. It is a port of entry, admitting to the wharves vessels drawing 9 ft. of water. It is a stopping place for New York and Hartford steamboats, daily line. It is built on rising ground, commanding a fine view of charming environs, and is situated on the w. bank of the Connecticut river, 31 m. above its mouth, directly s. of one of its small tributary estuaries and one of the county seats of Middlesex county. It is regularly laid out, with wide streets at right angles; buildings principally of brick, and residences, particularly on the hills, having spacious grounds, tastefully ornamented. Main street, in the mercantile quarter, is a wide and level thoroughfare, and High street contains the most fashionable residences. The streets are well shaded by trees. It contains a court-house, built of Portland freestone; 6 hotels, 7 banks—4 national—with an aggregate capital of $969,300, and 3 institutions for savings, having $8,000,000 of deposits. It has a custom-house, 5 newspapers, 15 churches, and a public library. It is the seat of Berkeley divinity school (Episcopal), established in 1854, having a library of 14,000 vols.; also of the Wesleyan university (Methodist), organized 1831, having a library of 25,000 vols., a valuable cabinet, and fine telescope; and has excellent public schools. In the suburbs are the commodious buildings of the state general hospital for the insane, and it has also the state normal school for girls. In the vicinity are valuable mineral deposits: feldspar, columbite (very rare), gold, silver, and an abandoned lead-mine opened in revolutionary times. It is 15 m. s. of Hartford and 24 m. n.e. of New Haven, at an equal distance from New York and Boston. It is the center of an important trade; has some ship-building, and various manufactures—among them britannia ware, silver-plated ware, cotton goods, sewing-machines, rules, chisels, guns, screws, etc. Across the river is the t. of Portland, connected with it by an iron railway bridge of the Boston and New York Air Line.

MIDDLETOWN, a village in Orange co., N. Y., the terminus of the New Jersey Midland railroad, at the junction of the Erie railroad with the New York and Oswego Midland railroad; pop. '70, 6,049. It is a part of the township of Wallkill, and is on the Wallkill river, built on the long, sloping sides of low hills. It is 24 m. w. of Newburgh, and 66 m. n.w. of New York by rail. The Shawangunk mountains, a portion of the Appalachian system, lie at the w. of it, and on the e. are the highlands of the Hudson. It has 9 churches, 2 national banks, a savings-bank, several public halls (1 masonic), a public library and reading-room, a union school, Wallkill academy, and several private schools; and it is the seat of the state asylum for the insane (homeopathic) established 1874. It has an opera-house, two hotels, and 4 newspapers. Its streets are wide, ornamented with shade-trees, well sewered, and lighted by gas. It has an efficient fire department and police force. Its water-works conduct its water supply 2 m. from lake Monroe, the reservoir containing 80 acres, situated nearly 200 ft. above the level of the village. In the s.w. portion is Hillside cemetery, a beautiful spot containing 50 acres, well laid out and carefully tended. Its leading industries are the manufacture of wool hats, blankets, saws, files, carpet-bags, furnaces, agricultural implements, lawn mowers, gloves, patent medicines, etc., and it is the center of an important country trade in garden produce and stock.

MIDDLETOWN, a t. in Dauphin co., Pennsylvania, 9 m. s.e. of Harrisburg, at the mouth of Swatara creek, on the e. side of the Susquehanna, and the Pennsylvania railroad and Union canal, and connected by ferry with the Middletown ferry station on the Northern Central railroad; pop. '70, 2,580. It has a number of churches, newspapers, a bank, and an orphan asylum. There are grist, planing, and saw mills, car and machine shops, and a foundry.

MIDDLEWICH, a small market t. of England, Cheshire, on the Grand Trunk canal, 20 m. e. of Chester. Salt is extensively made; boat-building is carried on, and brick-works are in operation. Pop. '71, 3,083.

MIDGE, the common name of many species of small dipterous insects, of the family Tipulidae, much resembling gnats, but having a shorter proboscis. Their larve are aquatic: the perfect insects are often very annoying both to human beings and to cattle. The little pink-colored tortuous worm known to anglers as the blood-worm, frequent in water-barrels and in the mud near the edges of ponds and ditches, is the larva of a species of midge (Chironomus plumosus), a little larger than the common gnat, very abundant in Britain, particularly in marshy situations. The larva is much sought after both by birds and fishes, and is a very tempting bait for the latter. The pupa is cylindrical, with respiratory organs on the sides of the thorax. When the insect is ready to quit its pupa case,
it rises to the surface of the water and there remains suspended for a short time; the perfect insect, when it has issued from the case, also stands for a short time on the surface of the water. The genus is remarkable for the long hairs with which the antennae of the male are furnished. Another genus of midges (simulid) contains many species which are most tormenting to men and cattle, by entering the ears and nostrils, and alighting on the eyelids. Several species are British. They swarm on marshes and damp heaths in the warmer months. But none of them is nearly so mischievous as a species (S. columnariusensis) found on the banks of the Danube, and so plentiful, that horses and cattle are often suffocated by the numbers which get into the windpipe.

MIDHURST, a market t. and parliamentary borough of England, in Sussex, on the Rother, a navigable tributary of the Arun, 50 m. s.w. of London. Here are the ruins of an old castle of the Boltons, lords of Midhurst; and within half a mile e. of the town stood Cowdroy house, the seat of the Montagues, which, with the exception of the gate-house, was burned down in 1793. Midhurst returns one member to parliament. Pop. (1861) of parliamentary borough, 6,405; (1871) 6,753.

MIDIANITES, an Arab race, descended, according to Scripture, from Midian, the son of Abraham by Keturah. They occupied the greater part of the country between the n. side of the Arabian gulf and Arabia Felix as far as the plains of Moab. Others more civilized (if not, indeed, of Cushite origin) dwelt in the vicinity of the Sinaitic peninsula, and carried on a trade, particularly with Egypt. To the latter, we may presume, belonged Jethro, priest or "sheik" of Midian—the father-in-law of Moses. The Midianites were very troublesome neighbors to the Israelites till Gideon's victory over them. Their national god was Baal-Peor.

MIDLAND, a co. in central Michigan, intersected by the Flint and Pere Marquette railroad; 550 sq.m.; pop. 80,689—5,158 of American birth, 26 colored. It is drained by the Tittibawaese river, formed by the union of the Chipewa, Pine, and Tobacco rivers within its limits. Its surface is generally level prairie, largely covered with building timber, with groves of sugar maple, and pine growing on the low hills. Lumber is one of the chief commodities, and is largely exported. Its soil is fertile in some sections, producing oats, Indian corn, potatoes, wheat, rye, and the products of the dairy. Its soil and climate are favorable for stock-raising. It has manufactures of lumber, salt, and flour. Capital, Midland.

MIDLOTHIAN. See EDINBURGHSHIRE, ante.

MIDNAPOOR, a district in s.w. Bengal, forming part of the province of Orissa; 4,015 sq.m.; pop. about 500,000. It is traversed by the Cosai river and many smaller streams. The soil is rich and produces in abundance rice, sugar, tobacco, cotton, and indigo; but much of the district is jungle and the atmosphere is exceedingly unhealthy. Tigers and poisonous reptiles infest the district, and the annual loss of life from this cause is sometimes very large. The inhabitants are in religion partly Buddhists and in part Mohammedans. Midnapoor and Jellasore are the main towns; the former is the capital, and is 65 m. s.w. of Calcutta.

MIDRASH (Heb. darash, to search, explain the Scriptures) is the general name given to the exposition of the Old Testament, which for about 1500 years, formed the center of all mental activity, both in and out of the schools, among the Jews after the Babylonish exile. The prohibitions and ordinances contained in the Mosaic records, to which a precise meaning was not in all cases attached, were, according to certain hermeneutical rules, specified and particularized, and further surrounded by traditional ordinances and prohibitions: Halacha (q.v.) = rule by which to go, or the binding, authoritative, civil, and religious law. The chief codes of this are the Mishna (q.v.), Gemara (q.v.), Sifra (an amplification on Leviticus), Sifri (on Numbers and Deuteronomy), and Mechiltha (on a portion of Exodus). Another branch of the Midrash, however, is the Haggada (q.v.), a kind of free poetical homiletics on the whole body of the Old Testament (the Halacha being chiefly confined to the Pentateuch). The chief collections of that part of the Midrash are Midrash Rabba, 500 to 1100 A.D. (on Pentateuch and Megilloth), and Pesikta (700), the extracts from which (Jalkut, Pesikta, Rabbati, Sutarta, etc.) only are known, the original itself never having been printed.

MIDSHIPS, the second rank attained by combatant officers in the royal navy. After two years service as a cadet under the aspirant becomes a midshipman, which is rather an apprenticeship for his after-naval career than any really effective appointment. The midshipman's time is principally devoted to receiving instruction, both in the ordinary subjects of a gentleman's education, and in the special professional duties of a naval officer. After 14 years' service as such, the midshipman is required to pass a qualifying examination in geography, history, and general knowledge; and two years later he must pass in French conversation, and in seamanship, steam, and gunnery. He then becomes a sub-Pent. (q.v.); and if 19 years of age, is eligible for promotion to lieut., whenever opportunity offers.

A midshipman only receives 1s. 9d. a day (£31, 18s. 9d. per annum); he is consequently dependent on his friends for more or less pecuniary assistance until he becomes a sub-lieutenant.
MIDSHIPMAN (ante), in the U. S. navy, is the ninth and lowest grade of officers in the line of promotion. The appointments for service are made from the cadet-graduates of the Annapolis naval academy, where the course of study lasts six years, and includes a very thorough training in theoretical and practical navigation, mathematics, the natural sciences, modern languages, etc. Cadets are appointed to the academy on the recommendation of the members of congress for the districts in which they reside, and on conditions similar to those governing the appointments to West Point. Since 1865 ten cadets are also appointed from among the apprentices of the school ships after a competitive examination. After passing the examination at the academy, the midshipmen receive their warrants and enter upon actual service, with the pay of $800 per annum. Promotion to the rank of ensign follows after two years' actual sea duty, and a strict examination before a board of three captains and two commanders.

MIDSUMMER DAY, one of the four English quarter-days for payment of rent by tenants, viz., June 24. See LANDLORD AND TENANT.

MIDSUMMER EVE. See JOHN'S (ST.) EVE.

MIDWIFE.—MIDWIFERY. Midwife (Anglo-Saxon, mid-net, meaning probably a woman hired for mede, or reward) is the name applied to a woman who assists in parturition or delivery. From this is derived the term midwifery, for that department of medical science which concerns itself with delivery, and its allied subjects. Writers who prefer words derived from Latin and Greek roots to such plain old English words as our twelfe have substituted for it obstetrix (Lat. obstetrix, a woman who stands near, a midwife), and tokology (Gr. tókh, child-birth), or gynakology (Gr. gyné, woman); for a male practitioner in this line of the medical art the French name accoucher is used; and recently an obnoxious new verb, to accoucher (Fr. accoucher, to deliver a woman), has made its appearance in medical literature.

Midwifery, as a branch of medical science, is understood to include the study of the anatomy of the parts of the female body concerned; the doctrine of conception and of sterility, and the signs and duration of pregnancy; parturition in all its varieties; and the diseases peculiar to the puerperal state. To enter into details of such matters would be out of place in this work. With regard to parturition itself, it may be interesting to remark that in a vast majority of cases the labor is what is called "natural," that is, the child presents itself in the normal position, and unaided nature completes the delivery within 24 hours with safety to the mother and child. Dr. Smellie calculated that 990 in 1000 are "natural" labors; and the later statistics of Dr. Collins, based on 15,850 cases, give a similar result—viz., 995 in 1000.

"Unnatural" labor arises either from malformation, disease, or weakness on the part of the mother, or from abnormal conditions of the child; and manual or instrumental aid becomes necessary to prevent the labor from being dangerously prolonged, or—in the more extreme cases—to render delivery at all possible. Of instrumental applications, by far the most important and frequent is that of the forceps (q.v.), which is not intended to injure either mother or child. In 123,295 cases of labor attended by British practitioners, there were 342 forceps cases, or 1 in 360; of these about 1 in 21 proved fatal to the mother, while 1 child in 4 was lost. In craniotomy the head of the child is intentionally destroyed, with a view to save the life of the mother, the death of both being otherwise inevitable. Among British practitioners this operation is not often resorted to; it proves fatal to about 1 mother in 5%. See also CESAREAN OPERATION.

History.—From all the passages in the Scriptures where midwifery is referred to, it is plain that women were the only practitioners of this art among the Hebrews and the Egyptians (see Gen. xxxv. 17, and xxxviii. 28, and Ex. i. 15—21), and it is equally certain that the Greeks and Romans confined this branch of medicine to women. Pythagore, the mother of Socrates, was a midwife; and Plato explains the functions and mentions the duties undertaken by these women. The Greek and Roman physicians were not ignorant of midwifery, for Hippocrates refers to the necessity of turning the child in certain cases, although his doctrines on this point, as also on the management of the placenta, are replete with danger, and Celsus, nearly four centuries later, treats of the mechanism of labor with great clearness. A gradual increase in the knowledge of this subject may be traced in the writings of Aetius and Paulus Aegineta, who advocates the operation of craniotomy in certain cases. Rhazes seems to have been the first to advocate the rupture of the membranes, when, by their toughness, they impede labor; and Avicenna gave the first description of an instrument partially resembling the more modern forceps.

At the commencement of the 16th c. Eucherius Rhodon published a little book which soon acquired a great celebrity. It was translated from the original high-German into Latin, French, and English, and is remarkable as being the first book published on this subject in England. Its title is The Byrth of Mankynde, otherwise named the Woman's Book, by Thomas Raynold, physician (London, 1540), and it contains no external evidence that it is a mere translation. In 1573 Ambrose Paré published a small work in which he showed that foot-presentations were not dangerous, and that in mal-presentations it was better to deliver by the feet than to attempt to bring down the head.

In the early part of the 17th c. the sage-femme (the French term corresponding to our English midwife) of Marie de Medici published a collection of observations on mid-
The art of midwifery has steadily progressed. The by-laws precluding practitioners in midwifery from the fellowship of the London college of physicians, and other equally offensive rules in other institutions, have been repealed; there are professors of, or lecturers on, midwifery in all our medical schools (excepting at the universities of Oxford and Cambridge); and a knowledge of this department of medicine is now required from every candidate for the medical profession. And not only are the members of the medical profession compelled to be as well versed in midwifery as in medicine or surgery, but the ignorant midwives of past times are now replaced by comparatively well-educated nurses, with diplomas, certifying that they have regularly attended lectures on midwifery, and have taken personal charge of a certain number of labors under the superintendence of a qualified teacher. And that properly educated women are capable of undertaking all the responsibilities of this department of practice is shown by such cases as those of mesdames Boivin and Lachapelle, who (to use the words of prof. Velpeau), "although the pupils of Baudelocque, were not afraid to shake off, to a certain extent, the yoke of his scientific authority, and whose high position and dignity form the starting-point of a new era for the science of obstetrics in Paris."

MIE'RRIS, Frans, the elder, 1635-81; b. Holland; studied under Abraham Toorne Vlieet, a celebrated Dutch designer, and afterwards under Gerard Dow, who called him the prince of his scholars. The subject which Mieris most frequently treats is domestic life, and in particular costumes. His pictures are rare and command a high price. His portrait of the wife of Cornelius Plaets is considered one of his finest works. The Florence gallery has many of his pictures. His son, William, 1662-1747, was also an artist. He had attained a considerable degree of skill under the direction of his father, upon whose death he turned his attention to making studies from nature. His earlier works portray domestic scenes, in the manner of his father; afterwards he took up historical and romantic subjects. His painting of Rinaldo sleeping in the lap of Armida, surrounded by the loves and graces, was so successful that he treated the same subject three times afterwards. He also painted in landscape and modeled in clay with considerable skill. His landscapes are not always natural, and in his historical compositions his costumes are often inappropriate. He is surpassed by his father in elaboration and exactness, but surpasses him in the brilliancy of his coloring and the

---

6 The exact date of this important invention is not known, but in 1617 Dr. Peter Chamberlen published a pamphlet entitled A Voiue in Rhamo, in which he speaks of his father's (Dr. Paul Chamberlen) discovery for the saving of infantile life. Hence the forceps must have been invented in the first half of the 17th century.
representation of natural objects. Francis Miera, sometimes called Francis the younger, 1689–1763, was the son of William, with whom he studied art. But he never attained high rank as an artist, his efforts in that direction being mostly confined to copying the pictures of his father and grandfather. His tastes were for historical and antiquarian researches.

Mierosławski, Ludwik, 1814–78; b. France; son of a Polish officer in the service of France, his mother being French. He received his education at the military school in Kalisz, and when only 16 years of age united himself with the Polish insurgents. This was at the beginning of the revolution of 1830, and Mierosławski distinguished himself greatly, and was made an officer, serving through the campaigns of 1831 and until the fall of Warsaw, when he settled in Paris. Here he devoted himself to historical and other writing, publishing a number of books in Polish and French, particularly a military history of the revolution in Poland. He became the central figure of the club of Polish refugees in Paris, and, in 1846, took the command of another revolutionary movement, which failed, and resulted in his imprisonment and sentence to death. The outbreak of the general revolutionary movement of 1848 on the continent saved him from this fate, and he repaired at once to Poland on being released from prison in March of that year, and fought in a number of well contested engagements, gaining a complete victory at Milosław. But the insurgents were at length subdued, and Mierosławski resigned his command. In the following year he was in command of the revolutionary movement in Sicily, and was wounded at Catania. He was next heard of in Baden, where he was given to understand he had been unsuccessful, and after the capture of the fortress of Rastadt, in which he had been taken, retired to France, where he once more retired to Paris. The Polish insurrection of 1863 brought him again to the front, but only to be defeated in the battle of Raziejewo, after which he retired finally to France, and devoted the remainder of his life to political writing.

Mifflin, a co. in central Pennsylvania, drained by the Juniata river and its branches, and intersected by the Pennsylvania railroad and two local branches, and also by the Pennsylvania canal; 375 sq.m.; pop. ’50, 19,577–19,000 of American birth. There are many hills, but in the valleys the soil is very fertile; wheat, oats, Indian corn, and potatoes being the staples. There are factories of woolen goods, axes, tools, clothing, harness, and saddles, 6 flour mills, and 11 tanneries. Co. seat, Lewiston.

Mifflin, Thomas, 1744–1800; b. Philadelphia, of Quaker parentage. He received his education in the university of Pennsylvania, and in a business establishment. In 1765 he visited Europe, and on his return joined his brother in a copartnership, and rapidly attained to position and influence. In 1773 and the following year he was a member of the legislature, and in 1774 a delegate to the first congress. He was commissioned a maj. in one of the first regiments raised in Philadelphia for the war, and was aide-de-camp to gen. Washington, with the rank of col. He was rapidly promoted, becoming in succession quartermaster-gen. and adj.gen.; and commissioned brig.gen. May 16, 1776, and maj.gen. Feb. 19, 1777. During the retreat from Long Island he commanded the covering party, and was afterwards prominent in going through the country arousing the patriotism of the people by stirring appeals; he was enabled by this means to bring essential aid to gen. Washington before the battles of Trenton and Princeton. He became dissatisfied after the New Jersey campaign, and engaged in opposition to the commander-in-chief, being a prominent member of the movement known as the “Conway cabal.” He was elected a delegate to congress in 1782, and became its president the following year. He was a member and speaker of the Pennsylvania state legislature in 1783, and a delegate to the constitutional convention of 1787. He held various state positions until 1791, when he was made governor, holding the office until 1800. He contributed greatly to the suppression of the whisky insurrection in 1794.

Migne, Jacques Paul, b. in St. Flour, Cantal, in 1800; educated at Orléans. In 1824 he became a priest and performed the functions of his office till 1838, when a pamphlet published by him, entitled De la Liberté, par on Prêtre, brought upon him the censure of the bishop of Orléans, who forbid its publication. Migne quit his pastorate, went to Paris, and the same year established L’Univers Religieux, designed to harmonize the church with the free spirit of civil government; but pleasing neither extreme his journalistic venture was assumed by others, and he commenced the publication of a collection of works entitled Cours Complètes de Théologie et d’Ecriture Sainte, and founded a publishing house on a large scale called L’Imprimerie Catholique, designed to furnish standard religious works at a low price. He established the daily Verité, which in 1856 became the Courrier de Paris. In 1861 he founded the weekly Verité, a religious journal. The publishing house was burned in 1868; 3,044,152 francs insurance received indicates the extent to which the establishment had grown. It was immediately rebuilt, Migne remaining its chief director. The Cours Complet, etc., first mentioned, finally grew into an immense series of volumes of standard authors under the general head of Bibliothèque Universelle du Clergé et des Lettres Instruits. The different parts of this series have had an immense sale.
MIGNET, FRANÇOIS AUGUSTE ALEXIS, a French historian, was born May 8, 1796, at Aix in Provence, studied law in his native city along with Thiers, and went to Paris in 1821 to devote himself to a literary life. He found employment in writing for the public journals, and having given lectures on modern history, which were received with great approbation, he was induced to write his Histoire de la Révolution Française (2 vols. Par. 1824; 10th edition, 1840), a work in which that great event is regarded less in its moral than its philosophical aspects. It has therefore been reproached with leading to fatalism. His style is brilliant but academic. After the revolution of 1830 he became a counselor of state, and keeper of the archives of the ministry of foreign affairs; but lost these offices in 1848, since which time he has lived in retirement. He has edited Négociations relatives à la Succession d'Espagne sous Louis XIV. (4 vols. Par. 1836-42), to which he prefixed a masterly historic introduction. Among his later works are Histoire de Marie Stuart (2 vols. Par. 1851), and Charles Quint, son Abdication et sa Mort au Monastère de Yuste (1854); Élégies Historiques (1864); and Rivalité de François I. et de Charles V. For a Histoire de la Réforme, de la Ligue, et du Régne de Henri IV. he is said to have collected hundreds of volumes of manuscript correspondence.

MIGNONETTE, Reseda odorata, a plant of the natural order resedaceae, a native of the n. of Africa, in universal cultivation on account of the delicious fragrance of its flowers. It is, according to circumstances and the mode of cultivation, an annual or a perennial, and even half-shrubby plant, with lanceolate entire or trifid leaves, and erect terminal racemes of small whiteish flowers, which have the calyx 6-parted, and as long as the corolla; the capsules 3-toothed. It is to be seen during summer in almost every garden, and during winter in almost every green-house in Britain; it is often cultivated in flower-pots in apartments, and no flower is so common in the boxes which are placed outside of windows in towns. Yet it was first introduced into England by lord Bateman, who brought it from the royal garden at Paris in 1732; nor had it then been long known in France. It rapidly became a universal favorite throughout Europe. The French name mignonette, now its popular name everywhere, signifies little darling. What is called tree mignonette is not even a distinct variety, but merely the common kind trained in an erect form, and prevented from early flowering by pinching off the ends of the shoots.—Weld (q.v.) belongs to the same genus.

MIGRATIONS OF ANIMALS, which must not be confounded with their diffusion over a more or less extended area, are apparently always guided by an instinct operating on all, or nearly all, the individuals of a species, and leading them to move in a definite direction in search of food or (in the case of fishes) of a fit position for spawning.

Among mammals, such migrations are comparatively rare. The most remarkable instance is that of the lemmings, which at no definite epochs, but generally once or twice in a quarter of a century, traverse Norland and Finnmark in vast hordes, ending their career in the western ocean, into which they enter, and come to a suicidal end; or, taking a direction through Swedish Lapland, are drowned in the gulf of Bothnia. M. Martin, who was a member of the great scientific Scandinavian expedition, seems to doubt the generally entertained view of these animals casting themselves into the Western ocean, and believes that most of them perish from the cold in crossing the rivers, while many are killed by dogs, foxes, and a species of horned owl (Strix brachyotos), which in large numbers always accompanies these emigrations.

According to Gmelin, the Arctic fox (Vulpes lagopus) always accompanies the lemmings in such numbers that, on this ground, it is entitled to be considered a migratory animal; but independently of these special migrations, it is stated by sir James Ross that “the young generally migrate to the southward late in the autumn, and collect in vast multitudes on the shores of Hudson's bay; they return early the following spring to the northward, and seldom again leave the spot they select as a breeding-place.”

The sprig-bok (Antidorcas euchore) is accustomed to make pilgrimages from one spot to another in the vast plains of southern Africa. Hordes of many thousands are led by their chiefs in these migrations, and the wonderful density of the moving mass may be imagined from the fact that a flock of sheep has been ineffectually entangled and carried along without the possibility of escape. Want of water is said to be the cause of these migrations, but Dr. Livingstone thinks that there must be other causes.

The occasional incursions of wolves, in very severe winters, into districts in which they are not commonly found, and the long excursions of large groups of monkeys (entellus and rheas), hardly fall within the scope of this article.

Many of the cetacea are probably migratory. “The migrations of the porpoise (Phocoena communis) appear—says Marcel de Serres in his prize-essay, Des Causes des Migrations des divers Animal, p. 83—to be as periodic as those of certain species of birds. During the winter, they constantly proceed from n. to s.; and when they feel the warmth of summer, they turn northwards. Thus they are common in summer in Greenland, while they are rare on our own coasts, where they abound in winter.”

The number of species of birds that periodically migrate is so great that it is impossible to find space for a list of them. Marcel de Serres, in the work already quoted, gives a “Tableau de l'Epoque des Passages des Oiseaux,” which extends over nearly 100 pages. See BIRDS OF PASSAGE. The desire for a suitable temperature and the search for their proper food are the apparent causes stimulating birds to these migrations; and in most
instances especially in the case of insectivorous birds, the food is intimately associated with the temperature.

The migrations of many species of fishes are as remarkable for their regular periodicity as those of birds. In some cases, fishes that are produced in fresh-water streams migrate to the ocean, and after spending some time in salt water, return (generally, with singular instinct, to the same fresh-water stream) to fresh water to propagate their species. Some of these fishes—as, for example, the lamprey (petromyzon marinus)—spend most of their lives at sea, and others, as the salmon, in fresh water. The remarkable migrations formerly, but erroneously supposed to be made by herrings, are noticed in the article on that fish. Many fishes of the same family as the herring, the clupeidae—as, for example, the sprat and pilchard—leave the deep sea for shallow water during the spawning period, when they approach our coasts in vast shoals. All such migrations as these seem mainly due to a reproductive impulse. See FISHES, LAND-CRAB.

Amongst insects, the locust (locusta migratoria) is most remarkable for its migrations. These insects are probably produced much more abundantly some years than others, and as in such years their birthplace cannot afford them sufficient vegetation, they are led to migrate in search of food. Some idea of the occasional extent of their wanderings may be formed from the fact that, in the early part of 1810, myriads of locusts appeared in Bengal, from whence they proceeded westward completely across the great Indian peninsula to Guzerat and the neighboring provinces, from whence they pursued their course southwards towards Bombay, the whole period of their migration extending over between two and three years; while, in relation to their numbers, capt. Beaufort calculated a swarm that appeared at Sardis, in Asia Minor, in 1811, at upwards of 168,000,000,000,000.

MIGUEL, Dom Maria Evarist, b. at Lisbon Oct. 26, 1802, was the third son of John VI. of Portugal. He spent his early years in Brazil, unrestrained and uneducated. When he returned, with the Portuguese fleet in 1819, he could neither read nor write, and showed no talent for anything but fencing. He joined his mother, Charlotte Joachim de Spai, in her plots for the overthrow of the constitution and the establishment of a despotic government; part of the scheme being, that his weak father should be either formally deposed, or virtually deprived of all power. The aged marquis of Loulé, the faithful servant of the king, having been removed out of the way by assassination, Miguel, as infant-generalissimo, caused the ministers to be arrested, April 30, 1824, and his father to be closely watched in his palace; but the plot failed, and Miguel and his mother were banished. He led for some time a remarkably wild and profligate life in foreign countries. After the death of his father in 1826, the queen’s party set forth a claim to the throne on his behalf, as his elder brother, Dom Pedro, was emperor of Brazil; and on May 2, 1826, Pedro resigned the crown of Portugal in favor of his eldest daughter, Donna Maria da Gloria, proposing that her uncle Miguel should be her husband, and regent of the kingdom till her majority, to all which Miguel agreed. But plans were now made for driving Miguel from Portugal. Miguel was deposed and exiled. But scarcely had he been conveyed to Genoa, when he protested against this deed, and consequently all his estates in Portugal were confiscated, and an annual pension which had been secured to him was stopped. He went to Rome, where the papal government acknowledged him as rightful king of Portugal, solely because he had petted the Portuguese priest in his war against the national liberties. Latterly he lived at the castle of Bronnbach, in Baden, where he died Nov., 1848.

MIKADO. This is the popular title of the emperor of Japan, though in official documents the term tenno (heavenly king) or tenshi (child of heaven) are most frequently used. Other titles used in the native parlance or literature are nin-ō (king of men), 6-ō or dai-ō (great king), ko-tei (ruler of nations). Other terms, arising from the application of the name of the mikado’s place of residence to his person, are: dai-ri (imperial palace), chō-tei (hall of audience), kinri (the forbidden interior), go-sho (palace of the imperial household). These names are used in old European works on Japan. The term mikado means honorable gate, like the Turkish “sublime porte,” and the Egyptian “pharao.”

The dynasty of mikados is the oldest in the world, the present ruler Mutsuhito (q.v.), being the 133d of the imperial line. The first mikado was Jimmu Tenno, who began to reign 660 B.C., the professed starting-point of Japanese chronology. The first seventeen mikados in the official list are said to have died at ages ranging from 100 to 141 years. The mikados have each a personal name, but no family name, and the name of any one mikado is never repeated; though in two instances in the list, two mikados reigned each twice, and have each two posthumous titles. Seven of these sovereigns of Japan were females. The average duration of each reign is nearly 21 years. The mikados claim descent from the heavenly gods, and their regalia of sovereignty are a mirror, crystal ball, and sword. The possession of these palatiae is the test of legit-
Mikania, a genus of plants of the natural order composite, nearly allied to eupatorium (q.v.). The heads of flowers are 4-flowered, and have four involucral leaves. Mikania officinalis is a Brazilian species, with erect stem, and heart-shaped leaves, abounding in a bitter principle and an aromatic oil, and valuable as a tonic and febrifuge. Mikania Guaco and Mikania opifera also natives of the warm parts of South America, are among the plants which have acquired a high reputation—deserved or undeserved—for the cure of snake bites. They are twining herbaceous plants. Mikania Guaco is remarkable for the large indigo-blue spots on the under side of its ovate leaves. The mode of using this plant, which is one of those called Guaco, or Huaco, by the Indians, is by dropping the juice of the fresh leaves into the wound made by a serpent; or little cakes are formed of the bruised plants, which are said to retain their power for a long time. The whole subject requires investigation.

MI KLOS (St.) TOROK, a t. of Hungary, in the county of Heves, near the Theiss, about 70 m. s.e. of Pesth, with which it is connected by railway. Pop. '69, 13,024, chiefly employed in rearing horses and cattle, and in fishing.

MIKLOSICH, FRANZ, the most learned living Slavist, was b. at Luttenberg, in the Slavic part of Styria, Nov. 20, 1813. After studying law at the university of Graz, he went, in 1838, to Vienna to practice as an advocate; but in 1844 obtained a situation in the imperial library. In 1850 he was appointed professor of Slavic in Vienna. His principal works are—Radice Lingue Palaeoslavonice (Leip. 1845); Lexicon Lingua Palaeo- slavonice (Vienna, 1850); Vergleichende Grammatik der Slav. Sprachen (1852-71), a work which has done for Slavic what the works of Grimm and Diez have done for German and Romanic, Die Bildung der Slav. Personennamen was published in 1880; and Die Zigeunernaraya in 1872-77.

MIKNAS, ME'GUEINE, or MEKNAZA, a t. in the province of Fez, in Morocco, 38 m. W. by S. from the town of Fez, stands in a fertile valley near the Sebu. It is surrounded by triple walls and a moat is laid out and well built, and contains the finest imperial palace in Morocco. This vast pile, erected by the sultan Mulay Ismail, is built of marble, and the surrounding grounds are laid out in gardens, said to be the most beautiful in Morocco, and here and there adorned with fountains. Miknas is the summer residence of the sultan. Pop. estimated at from 15,000 to 55,000, who carry on an extensive trade in native produce. The chief manufactures are of painted earthenware and leather. In the vicinity are large plantations of olives.

MILAM, a c. in central Texas, drained by the Brazos and Little rivers and many tributaries of the latter, and intersected by the International railroad; 1150 sq.m.; pop. '80, 18,659—3,952 colored. The surface is uneven and hilly, and in large part covered by forests. The staples are cotton, Indian corn, sweet potatoes, wool, and butter. Sheep grazing and cattle breeding are carried on to a considerable extent. Chief town, Cameron.

MILAN, a province in w. part of Lombardy in n. central Italy; bounded n. by the province of Como, e. by Bergamo, s. by Cremona and Pavia, and w. by Pavia and Novara; 1155 sq.m.; pop. '72, 1,069,794. It is drained by the Ticino, which separates it from Piedmont on the w., by the Addio on the n., and also by the Lambro, Olona, and other branches of the latter. The province is traversed by railroads leading to Venice, Como, Padua, and Turin. The province is traversed by railroads leading to Venice, Como, Padua, and Turin. The province is traversed by railroads leading to Venice, Como, Padua, and Turin. When subject to the Austrian power the area of Milan was but about 746 sq.m., and it was divided into 15 districts; but in the readjustment of boundaries which followed the establishment of Italian unity and the kingdom of Victor Emmanuel, it was considerably enlarged. Besides the capital, Milan, the only town of any size is Monza, 10 m. n.e. of Milan on the river Lambro, which has about 20,000 inhabitants, and is specially noteworthy for its old cathedral. The portraits of all the sovereigns who have worn the iron crown of Lombardy are to be seen at Monza. The surface of the province of Milan is level, it being a part of the great plain of Lombardy, and the country is intersected by many canals for irrigation; by which means the soil is rendered exceedingly productive. The staple products are fruit, corn, rice, and silk. The cattle are unusually fine. There are many flourishing villages, farms, and country seats; and the whole aspect of the province is indicative of great prosperity. It is now divided into the districts of Abbiategrasso, Gallarate, Lodli, Milan, and Monza.

MILAN (Ital. Milano), the chief city of Lombardy, stands on the river Olona, in the center of the great plain of Lombardy. Pop. (1872) of city, 199,069; of surrounding district, called Corpi Santi, 62,978. From its position on the line of the chief routes of
the central Alps it derives great commercial advantages, while its fine canal system opens for it communication with the principal rivers of Italy. The Naviglio Grande, or Grand canal, connects Milan with the Ticino, and the Martesana canal with the Adda. The city, which is almost circular, is encompassed on three sides by walls and low ramparts; it has a circuit of about \( \frac{74}{5} \) m., and is entered by 10 gates. Notwithstanding its great antiquity, Milan possesses but few remains of its early splendid structures, in consequence of the many calamitous wars by which it has been ravaged. Modern Milan is a monotonous and populous city, most of its streets are regular, wide, and well paved, and kept with scrupulous care; the dwellings are commodious and tasteful, though of a less imposing character than the great feudal Tuscan houses. Milan abounds in churches worthy of note: of these the principal is the famous Gothic cathedral, the Duomo, which, with the exception of St. Peter’s in Rome, is the most magnificent ecclesiastical structure in Italy. It has a façade of white Carrara marble, and is adorned by 106 pinnacles and 4,500 statues, besides a variety of carvings of unsurpassable beauty. In form it is a Latin cross, with a length of 485, and a breadth of 252 ft. The height of the dome is 335 ft. Its foundation was laid in 1386 by Gian Galeazzo Visconti, and during its erection many of the greatest European architects contributed designs for its embellishment. Within it Napoleon was crowned king of Italy in 1805. Besides the Duomo may be mentioned the church of St. Ambrose (founded by that saint in the 4th c.), the most ancient in Milan, containing inscriptions, sarcophagi, and monuments full of antiquarian interest, and the one in which the German emperors were crowned kings of Italy; the Dominican church of Santa Maria delle Grazie, which contains in its refectory the famous “Cenacolo,” or “Last Supper,” by Leonardo da Vinci; and that of San Carlo Borromneo (1847); of St. Nazaro, which possesses several masterpieces of the best schools of Italian art; and of St. Sebastiano, once a Roman temple.

Among the secular buildings of Milan, the most noteworthy is the magnificent Brera palace, formerly a Jesuit college, and now used for public schools of the fine arts, with the official name of Palace of Arts and Sciences. Within its vast precincts this unique institution includes an academy of art, a choice gallery of paintings of the Bolognese and Lombard schools, a fine collection of casts for modeling purposes, a splendid public library, containing 140,000 volumes, and a rare collection of manuscripts, medals, and antiquities; it has also attached to it an observatory and a botanical garden. Besides the Ambrosian (q.v.), there are several large private libraries. Among the scientific and artistic institutions of Milan are the museum of natural history, the schools of surgery and medicine, especially that of veterinary practice, the celebrated conservatory or school of music, and a military geographical institute, well known for the excellence of the maps it has issued. The educational establishments include four gymnasia, besides normal schools, technical schools, conventual schools, and a seminary. The charitable institutions are numerous and splendidly endowed, having an aggregate property of upwards of £7,000,000 sterling; the Ospedale Maggiore, or Great Hospital, founded by the ducal house of Sforza in 1456, accommodates 2,000 patients, and annually admits upwards of 20,000. The Trivulzi hospital, endowed by the Trivulzio family, maintains and clothes 600 aged pensioners. The Milanese places of amusement are on as grand a scale as the other public buildings of the city, the first in point of celebrity being the theater of La Scala, which can accommodate 3,000 spectators. The Corso, or chief street of Milan, is the universal fashionable promenade of the inhabitants: and the famous arcade, or Galleria di Cristofori, with its brilliant shops and cafés, is also a favorite place of evening resort, and on account of its gay appearance has been called “Little Paris.” Milan carries on an immense inland trade in silk, grain, rice, and cheese, and has considerable manufactures of silk goods, ribbons, cutlery, and porcelain.

Milan (Lat. Mediolanum) was originally a t. or village of the Insularian Gauls. It was conquered by the Romans 222 B.C., received the Latin franchise about 89 B.C., and the full Roman franchise 49 B.C. Under the Romans it became a conspicuous center of wealth and civic influence: its citizens were noted for their refined manners and literary tastes, and the public buildings for their beauty and elegance. In the beginning of the 4th c. it was selected as the residence of the imperial court by Maximian. Milan was sacked by the Huns (under Attila) in 452, by the Goths (under the brother of Vitiges) in 539, and passed to the Longobards and Franks previous to its subjection by the German empire. After 961 it was long governed by dukes in the name of the emperors. The feuds of the Guelphs and Gibellines distracted Milan, like all the other Italian cities. Supreme power became eventually vested in the Gibelline Visconti, by whom the ascendency of Milan was extended over the whole of Lombardy. From 1545 to 1714 Milan was subjected to the successive predominance of France and Austria. Under Bonaparte it declared the capital of the Cisalpine republic, or the Italian republic, and, finally, of the kingdom of Italy. In 1815 Milan was restored to Austria, and continued the capital of the Austro-Italian kingdom until the annexation of Lombardy to Piedmont, in 1859, by the peace of Villafranca.

MILAN, ARCHBISHOPRIC of. Of its early history we have no certain knowledge. There is a tradition that the apostle Barnabas established the Christian church at Milan, and was its first bishop. The first bishop of Milan of whom we have any knowledge is
Auxentius, 355-74. He was the leader of the Arians in the western church. The orthodox bishops, who at a synod assembled at Rome in 369 condemned Arianism, feared to pronounce against Auxentius because he was protected by the emperor Valentinian I, and, though the synod was prevailed upon by Athanasius to condemn him, he remained in his see till his death. The contest arising from the Arian heresy rendered the election of a new see very difficult, and Ambrose, the consulat prefect, found it necessary to proceed to the church at Milan for the purpose of restoring order. At the close of his speech both the orthodox and the Arians united in a demand that he should be their bishop. He accepted, and acquired great influence with the people and the emperor Valentinian. He vigorously opposed the Arians, and in 382 presented at a synod which deposed the Arian bishops Palladitus and Secundianus. All the bishops who succeeded Ambrose were succeeded by the orthodox after the deposition of the Arian bishops. The archbishops of Milan, on account of the hostility between the people and the Lombards, their conquerors, resided at Geneva. But afterwards the Lombards became enthusiastic friends of the church, and the archbishops returned to Milan. Though the first bishop in the kingdom, and having the power even of crowning the king with the so-called iron crown, the archbishop was yet subject to the king, and the church was subordinate to the state. After the overthrow of the Longobard kingdom, the power of the archbishops of Milan was much reduced, but they subsequently became more independent than before, large feudal estates being bestowed upon them, and they were the most influential allies of the German emperors. Eriberto di Argago, archbishop of Milan 1019-45, organized in 1034 a revolt against the emperor Conrad the Salic, and was expelled. After his death, in the excitement prevailing over the election of his successor, the popular chief Erlandibaldo persuaded the people to select four candidates, from whom a choice should be made. These were sent to the emperor Henry II. to make the appointment, but instead of the appointment the emperor granted to Guiot his second. The appointment was disliked, both by the people on whom he was forced, and by the disappointed candidates. Milan was at one time independent of the popacy, the spiritual and temporal power being granted by the emperor. But the German popes began to interfere. Pope Leo IX. and his successors attacked the Milanese clergy, who at that time were allowed to marry, and in a council held at Rheims in 1049 laws were enacted against clerical marriage. Archbishop Guido defended the clergy both by Scripture and by a decision of Ambrose which he cited. The popes sent their emissaries, who excited great tumults in Milan, which Guido, who argued in favor of the married clergy, was unable to quell. The people rose in arms and resisted the papal faction, which resulted in fights and bloodshed. Nicholas II., then pope, sent Hildebrand and Anselm to allay the strife. Auselm was conciliatory, but Hildebrand demanded unconditional submission to Rome. In 1059 another papal legation was sent with full power to compel submission from the archbishop and clergy. These ecclesiastics at first earnestly denied the authority of Rome, but finally acknowledged it, signing a paper in which they expressed their penitence in humiliating terms. But when in 1061, after the death of Nicholas, their fellow-citizen Anselm was elected pope under the name of Alexander II., the church of Milan endeavored to regain its independence. A council of German and Lombard bishops convened at Basle and elected Cadalus, who was bishop of Parma, pope under the title of Honorius II. The German bishops, under the influence of Hanno, archbishop of Cologne, sided with Alexander, and in 1064 the synod of Mantua deposed Honorius. Guido, the archbishop, was excommunicated by the pope in 1066, but disregarding the deposition he appeared at the altar to officiate at the services of Pentecost day. The papal party attacked him in the church. His followers rallied for his defense, but he was nearly killed by the papists. A few months later Guido reorganized his party, and the war continued for several years. Hildebrand finally, in 1099, proposed that the Milanese clergy and laity should take an oath that in future their archbishops should apply for confirmation to the pope, not to the German emperor. Guido, weary of strife, resigned his archepiscopate to his subdeacon. He was confirmed by Honorius IV., but the Milanese refused to receive him, and to save his life he escaped from the city. The papal appointee was also rejected, and compelled to swear that he would not attempt to enter the see. Milan was thus without an archbishop. Hildebrand, who succeeded Alexander, issued an interdict against it. The Milanese, disregarding the interdict, appealed to Henry IV. for an archbishop. He nominated Tedaldo, who was consecrated. He was the leader of the disaffected bishops who, at the synod of Pavia in 1076, excommunicated pope Gregory himself. He remained in his see till his death, notwithstanding the frequent excommunications from Gregory. With him ceased the independence of the Milan archiepiscopal. The clergy of Milan now largely belong to the Old Catholic party. The reforms which they seek are the election of priests by the parish, the use of the vernacular in the church service, the cessation of the worship of Mary and the saints, the marriage of priests, etc. E. Serra Gropelli is the leader of the reform party.

**MILAZZ0** (anc. *Mylae*), a fortified seaport on the N. coast of the island of Sicily, 18 m. w. of Messina. Pop. 72, 7,744. Its situation is unhealthy. The chief exports are tanny, wine, silk, fruits, corn, oil, and liquors. The town is irregularly built, and is considered almost impregnable, owing to the great natural strength of its position and the extent of its military works and citadel. Garibaldi, with 2,500 men, defeated 7,000 Neapolitans here on July 20, 1860, and compelled the garrison to evacuate the fortress.
MILBURN, William Henry, b. Philadelphia, 1823; studied at Illinois college. In boyhood he lost totally the sight of one eye, and partially that of the other, and the skill of the most distinguished oculists in America and Europe failed to restore it. At the age of twenty he was admitted a preacher in the Methodist Episcopal church, his field of labor being chiefly in the southern states, and his pastorates at Montgomery and Mobile, Ala. He is said to have traveled in the period of his itineracy over 200,000 miles. In 1856 he was chaplain to the house of representatives at Washington. In 1859 he visited England with bishop Simpson and Dr. McClintock, where he delivered lectures with great success in the principal cities. On his return he was confirmed in the Protestant Episcopal church, but returned to the Methodist church in 1872. He is well known as the blind preacher, and as an eloquent lecturer. He has published Rifle, Axe and Saddlebags; Ten Years of Preacher Life; Pioneers, Preachers, and People of the Mississippi Valley.

MILDEW (Ger. Mehltan, meal-dew), a term of somewhat vague application to certain diseased states of plants caused or characterized by the growth of small parasitical fungi, and also to spots on cloth, paper, etc., and even on the surface of glass and other inorganic substances, produced by the growth of minute fungi. The mildew fungi are numerous, and the mildew is often given to many that are also known by other names, as Blight, Brand, Bunt, Rust, etc.; see these heads; see also Bothrytis and Oidium. Different species or families of plants have their own peculiar parasites; several kinds of parasitic fungus being, however, often known to infest one plant. Probably, the name mildew originally belonged to those molds which form white mealy patches on leaves. Some of these belong to the genus Erysiphe, which exhibits fleshy somewhat gelatinous masses, becoming globose sporangia, filled with spore-containing ascospores, and surrounded by a fleshy mycelium, often spreading widely over the leaves and other parts of plants. Maples are sometimes covered with a mildew of this kind, so as to be quite hoary. Similar mildews are often seen on peas and other leguminous plants; also on umbelliferous plants. Sulphur has been found effectual in curing some of these mildews. Many of the most destructive mildews are of a red or brown color, as the mildew of the pea, Aecidium cancellatum, that of the barberry, Aecidium Berberidis, etc.; whilst some are almost black, as the corn mildew, Puccinia graminis, by which the crops are in some years greatly injured. Whether mildew is the consequence of unfavorable weather and of fungi attacking an already weakened plant, or is the consequence of infection by spores of fungi brought through the air or soil to a plant previously healthy, is not yet well ascertained; and probably the one may be sometimes the case, and sometimes the other. There is no doubt that many kinds of mildew appear chiefly toward the close of summer on leaves in which vegetable life has already in a great measure lost its power.

MILE, the largest terrestrial measure of length in common use among the British and most continental nations, is derived from the Roman mile, which contained 1000 paces (mille passuum) of 5 Roman ft. each, the pace being the length of the step made by one foot. The Roman foot being between 11.65 and 11.62 English in., the Roman mile was thus less than the present English mile by from 142 to 144 yards. The length of the modern mile in different countries exhibits a remarkable diversity, not satisfactorily accounted for. Before the time of Elizabeth, scientific writers made use of a mile of 5,000 English ft., from the notion that this was the Roman mile, forgetting the difference in value between the English and Roman foot. The present statute mile was incidentally defined by an act passed in the 25th year of the reign of Elizabeth to be "8 furlongs of 40 perches of 16½ ft. each"—i.e., 1760 yards of 3 ft. each; and it has since retained this value. The geographical or nautical mile is the 60th part of a degree of the equator, and is employed by the mariners of all nations; but in Germany, the geographical mile denotes 1/100th part of a degree of the equator, or 4 nautical miles. The following table gives the length, in English statute miles, of the various miles that have been or are commonly used:

and 29 kil. = 18 English statute miles nearly.
MILES, Nelson A., b. Mass. 1839; received an ordinary education, and took a position in a store in Boston in 1856. When the war of the rebellion broke out, he accepted a commission as first lieu. 25th Mass. volunteers, under date Oct. 1861, and was in the seven days' battles, and the engagement at Charles city cross-road. He was wounded in the battle of Fair Oaks, and again at Malvern hill. Between Fair Oaks and the change of base to Harrison's landing, he acted as adjt. gen. of the 1st brigade, 1st division, 3d army corps. Sept. 30, 1862, he was made colonel of the 61st N. Y. volunteers, and led that regiment at the battle of Fredericksburg. At Chancellorsville, he was dangerously, and, as was supposed, fatally wounded, and carried from the field; he however recovered, and during the campaign before Richmond in 1864, he commanded the brigade in which he had been acting as adjt. gen. His commission of brig. gen. was dated May 12, 1864; and he was brevetted maj. gen. Dec. 1864, for gallantry at the battle of Ream's Station. On Oct. 21, 1865, he was commissioned maj. gen. (volunteers); in July 1866 appointed colonel 40th infantry; transferred to 6th infantry Mar. 15, 1869; and brevetted brig. and maj. gen. U. S. army, Mar. 2, 1867. Since the close of the rebellion, gen. Miles has gained high praise as an Indian fighter, being engaged on the frontier, in the protection of the settlements, and in preserving order among the tribes in and out of the reservations.

MILETUS, anciently, the greatest and most flourishing city of Ionia, in Asia Minor. It was situated at the mouth of the Meander, and was famous for its woolen manufactures, and for its extensive trade with the north. Before being forcibly colonized by the Ionians, it appears to have been inhabited by Carians. Miletus early founded a number of colonies on the Black sea and in the Crimea, possessed a fleet, which sailed to every part of the Mediterranean, and even ventured into the Atlantic, and maintained long and expensive wars with the Lydian kings. The "Mileians" were believed to be the purest representatives of the Ionians in Asia. After the conquest of Lydia by the elder Cyrus, it was subdued with the whole of Ionia. It continued, however, to flourish till it was excited to rebellion against the Persians in the Ionian war, and was destroyed 494 B.C. It was rebuilt, but never reacquired its former importance. Miletus has an honorable place in the history of Greek literature, being the birthplace of the philosophers Thales, Anaximander, and Anaximenes, and of the historians Cadmus and Hecateus.

MILFORD, a t. in s. Connecticut, on the s. shore, with a harbor on Long Island sound, a station on the New York, New Haven, and Hartford railroad, and another at the junction of the Naugatuck railroad with that road; pop. '80, 3,347. It is divided by the Wopewag river, emptying into the sound; and the Housatonic river celebrated for its beautiful scenery washes its w. border. It is 11 m. s.w. of New Haven, and contains the factories of the Automatic book-sewing machine company, and manufactories of straw goods, boots and shoes, and carriages. It has excellent public schools, 1 newspaper, 1 savings-bank, 5 churches, and 2 hotels.

MILFORD, a village of Mass., 3 m. s.w. of Boston, having 6 churches, a manufactory of machinery, and large boot and shoe manufactures. Pop. '70, 9,890.

MILFORD (ante), a t. in e. Mass., on the Boston and Albany railroad, Milford branch, at its junction with the Milford, Woonsocket (R. I.) and Hopkinton railroad; pop. '80, 9,310. It is 18 m. s.e. of Worcester, and 14 from South Framingham. It has 2 banks (1 national), a town-house, 1 newspaper, a public library, and several tanneries. The township includes Milford Center, North, East, and South Milford, and Hopedale, all thriving villages.

MILFORD, a parliamentary borough (contributory to Pembroke) and sea-port of south Wales, in the county of Pembroke, on the n. shore of the haven of the same name, 7 m. e.n.e. of St. Ann's Head. The haven is said to be unequaled as a harbor by any other in the world. It is formed by an estuary running inland for 17 m. to Langwin (which is easily reached by vessels of 2,000 tons), and varying from 1 to 2 m. in breadth. It is protected from winds by a girdle of undulating hills, is deep (from 15 to 19 fathoms in most parts, while the spring-tides rise 25 ft.), easy of access, and capable of anchoring the whole fleet of England in safety. Its distance, however, from the channel, the highway of British commerce, is a serious disadvantage. The merits of the haven have been recognized from the earliest times; but the rise of the town of Milford may be said to have been developed in the present century, when docks and quays, together with a mail packet station for Ireland, a dock-yard, ship-building slips, and an arsenal, were established here, only, however, to be removed in 1814. Since that time, with only occasional gleams of prosperity, Milford has been in a declining condition; but the opening of the Milford railway, and the construction of docks and wharfs, have given an impetus to its progress; though the trade of the place is little developed as compared with the capabilities of the haven and the mineral resources in the neighborhood. In 1875, 1262 vessels, of a burden of 263,804 tons, entered the port, and 1173, of 228,080 tons, cleared. Pop. '71, 2,836.

MILFORT, Le Clerc, 1750-1817; better known by his given name, a French adventurer, b. near Mâzères, and d. there. First a fugitive from justice in France he took refuge among the Creeks of Louisiana, where he acquired the title of "great warrior." During the revolution of 1789 he returned to France, and occupied various military posi tions in the army, where he distinguished himself often by the resources and bravery of
MILHAY, or MILLAI, a t. of France, in the department of Aveyron, in a rich and fertile dale on the right bank of the Tarn, 55 m. n.w. of Montpellier. During the 16th and 17th centuries it was one of the strongholds of the Calvinists. Leather and gloves are manufactured, and there is a good trade in wool, timber, hides, cheese, and wine. Pop. '76, 14,482.

MILITARY ACADEMY. Royal, an establishment at Woolwich, through which must pass all candidates for the royal artillery and royal engineers. The age for entrance is 17, and the vacancies are open to public competition. The pupils are denominated military cadets, and the parents or guardians have to make a considerable payment in regard to each, so long as they remain at the academy; the annual charge for the son of a civilian being £120, that for the son of a naval or military officer less, according to the rank of the father. When the term of instruction—which comprises the subjects of a thorough general education, the higher mathematics, fortification, gunnery, and military duty—is completed, the cadets compete for the vacancies in the engineers and artillery, those who pass the best examination being allowed the refusal of the former corps. Those who obtain commissions in the engineers proceed to Chatham for further instruction (with military pay, however) in their professional functions. The artillery cadets at once join the royal artillery as lieutenants. The vote for the royal military academy for the year 1879-80 was £31,287, of which sum about three-fourths would be made up to the exchequer by the payments for pupils and a contribution from the Indian government.

MILITARY ACADEMY, U. S. See United States MILITARY ACADEMY.

MILITARY ASYLUM, ROYAL, an educational government institution at Chelsea, near, but wholly distinct from, the royal hospital for pensioned soldiers. Its object is the suitable education for trade, etc., of 500 male children—generally orphans—of British soldiers. For these there are a model school and an infant school, and the boys have a completely military organization, with scarlet uniform, band, etc. As a result of their training, a large proportion of the pupils ultimately volunteer into the army. The school was originally established in 1803 by the late duke of York, whence it is still commonly known as the "duke of York's school." Originally a similar school for soldiers' daughters was included, but was not found to answer, and has been discontinued. Attached to the school is a training establishment for military schoolmasters, known as the normal school. The total cost of the whole institution is about £11,500 per annum.

MILITARY LAW. See Court MARTIAL; MARTIAL LAW.

MILITARY FRONTIER (Ger. MILITÄRGRENZE), the former name of a narrow strip of land along the Turkish frontier of the Austro-Hungarian empire. It had a special military constitution, and formed a separate "crown-land." Of late, however, the peculiar institutions of the Military Frontier have been abolished; portions of the territory have been incorporated with adjoining provinces; and since 1873 the remainder of the Military Frontier, now officially termed the Croato-Slavonic Border-land, forms, along with Slavonia and Croatia, a dependence of the Hungarian crown. The constitution, civil and military, is now accordingly similar to that of the other provinces of the Hungarian part of the empire. The area of the Military Frontier was about 7,500 sq. m., and its pop. in 1869 was 690,800. The breadth of the territory once known under this name is considerable towards the western extremity, but diminishes to only a few miles at the eastern. The surface has an average elevation of upwards of 2,000 feet. All the important rivers flow eastward. The climate is severe in the highlands of the w., but mild in the lower districts towards Slavonia. Maize, wheat, oats, fruits, and vegetables are the principal productions.

The Military Frontier owes its origin as a crown-land to the necessity of having a permanent body of defenders on the borders during former wars, and especially during wars with the Turks. In the 15th c. the Austrians had gained from the Turks certain tracts of territory on the banks of the Save and Danube. These tracts they colonized, making it, however, a condition that the colonists must render military service against the Turks. Thus originated the capitanate of Zengg, during the reign of Mathias Corvinus. The Warasdin Frontier originated in the same manner in the 16th, and the Banat Frontier in the 17th century. The constitution of the Military Frontier, as it existed till 1873, has been thus described: "The military stations along the frontier serve a threefold purpose—the defense of the country, the prevention of smuggling, and the prevention of the spread of contagious disease into the territories of the Austrian empire. The inhabitants of this crown-land enjoy peculiar privileges. Their immigrant ancestors received only the temporary use of lands consigned to them; but in 1850 a law was passed making over the land to the occupiers as their own property. This right of property does not belong, however, to individuals, but to the family in a united sense. The oldest member of a family (called the hauswirt) is intrusted with the management of the land; his partner (the hausvater) ranks equal with him, and they each receive a double share of the profits for the year as recompense for the management of the estate. A family of this sort is called a border-house (grenzhaus). All who are able to bear arms are sworn to the service from their 20th year. The soldier of the frontier, who is clothed as well as
armed and supplied with ammunition by government, finds it his duty not only to watch and protect the frontier, but to preserve peace and order in the interior, and to go on foreign service when required. Only the smaller portion of the forces of the Military Frontier is retained in readiness for active service, while the remainder pursue their ordinary employments. To facilitate the accomplishment of the purposes aimed at by the Military Frontier, the cordon, a series of guard-houses along the whole frontier, affording accommodation to from 4 to 8 men, as well as larger ones, accommodating 12 men and a junior officer, has been instituted. Within this line are the officers' posts. Without announcing himself at the posts, no one is allowed to pass the boundary; and after permission is given, the passenger must remain a longer or shorter time at the quarantine establishment, in order that all introduction of disease may be prevented.

MILITARY ORDERS, religious associations which arose from a mixture of the religious enthusiasm and the chivalrous love of arms which almost equally formed the characteristics of medieval society. The first origin of such associations may be traced to the necessities of the Christian residents of the Holy Land, in which the monks, whose first duty had been to serve the pilgrims in the hospital at Jerusalem, were compelled, by the necessity of self-defense, to assume the character of soldiers as well as of monks. See John (St.), Knights of. The order of the templars (q.v.) was of similar origin. Those of Alcantara and Calatrava in Spain had for their immediate object the defense of their country against the Moors. These orders, as well as that of Avis in Portugal, which was instituted with a similar view, followed the Cistercian rule, and all three differed from the templars and the knights of St. John in being permitted by their institute to marry once. The same privilege was enjoyed in the Savoyard order of knights of St. Maurice and the Flemish order of St. Hubert. On the contrary, the Teutonic knights, who had their origin in the crusades (see Grand Master), were bound by an absolute vow of chastity. With the varying conditions of society, these religious associations have at various times been abolished or fallen into disuse; but most of them still subsist in the form of orders of knighthood, and in some of them attempts have recently been made to revive, with certain modifications, the monastic character which they originally possessed.

MILITARY PUNISHMENTS, those which are inflicted upon soldiers regularly enlisted, or non-commissioned or commissioned officers, for infractions of discipline or breaches of military law. Among the ancient Greeks the commander of an army was empowered, in case of sedition or mutiny, to cause the ringleaders to be seized and instantly put to death. Thus, we read in the Iliad that Agamemnon threatened deserters with death; and Alexander the great, when a mutiny took place partly in consequence of the jealousy excited by the favor which he showed the Persians, caused thirteen of his Macedonians to be executed without a trial. The military law of Athens prescribed the punishment of death for the crime of desertion while on service. Among the Lacedemonians, cowards and deserters were either put to death or publicly disgraced; offenders who were not guilty of the extreme penalty were made wanderers. At home they were obliged to wear a particular dress, and were obliged to submit in silence to any insult which the meanest citizen would like to offer. Disgrace was also attached to any soldier who had the misfortune to lose his shield. Said the Spartan mother to her son, "Return, my son, with your shield, or upon it." The ancient Romans punished crimes committed by the soldiery with great severity. For the gravest offenses they were beheaded or crucified; and under the Pagan emperors, some were burned alive, while others were exposed to wild beasts; but this may have been in the cases of those who professed the Christian religion. On the occurrence of a mutiny, every tenth, twentieth, or hundredth man engaged in it was selected for punishment; though sometimes only the ringleaders were chosen. Frequently, in the case of deserters or seditious persons, they were first scourged and afterwards sold into slavery; and sometimes such an offender was condemned to lose his right hand, or was bled nearly to death. If a soldier absconded himself from his post when doing guard duty, he was fined, and if the theft or insult for which he was arrested was serious, he was sentenced to the bastinado. Sometimes the culprit was permitted to escape, if able, while a shower of blows was being visited upon him; but in such instances he became an outcast, whom no one dared harbor. Punishments for theft, or for giving false testimony, and slight breaches of discipline, were lighter, though frequently of a similar character. Sometimes the culprit was temporarily deprived of his pay, forfeited his arms, or was degraded in rank. Again, he was sentenced to remain outside the camp, subject to the danger of being captured by the enemy; or he was made to stand in the pretorium exposed in an unmilitary dress. Or he was sentenced to a period of hard labor, reduced to an inferior rank, or dismissed the service in disgrace. Cowardice, or loss of arms, always subjected the Roman soldier to punishment. A centurion who committed a breach of discipline was condemned to surrender his emblem of authority, a vine branch. The power of life and death rested in the hands of a dictator, who could sentence to death on any offense against the regulations, and the Roman consuls had the power of exercising summary jurisdiction in capital cases. Punishments were ordered by the legionary tribunes and by the prefects, with the concurrence of a council. The Roman system of punishments continued in vogue among the nations of modern Europe, so far as military offenses were con-
curred, until a recent date. Besides the infliction of a certain number of lashes with cords, soldiers convicted of theft, marauding, or any other breach of discipline not punishable with death, were sentenced to run the gauntlet [gaunlet, or gaanglet; from gang, a passage, and the root to "run," found in eloipe]. For the execution of this sentence the regiment was drawn up in a double line, and each man being furnished with a small stick, generally of osier (except the grenadiers, who used the belts), the culprit, naked to the waist, was either marched slowly or allowed to run as fast as he could, according to circumstances, from the head to the rear extremity between the two lines, each man striking him as he passed along. In certain cases the offender was afterwards expelled from the regiment, and sometimes also from the town or district, with a charge never to appear there again under pain of death. The punishment of the knout in the Russian army is inflicted with a leathern strap or belt, having a wooden handle, and is applied on the naked back of the offender. Cavalry soldiers were formerly frequently punished by the picket, as it was called; this consisted in the man being made to hang by his hands from a beam during a certain time, a stake, with its upper end sticking in the ground, being planted in the ground under him, so that, when from weariness he could no longer keep himself up, his foot was pierced with the stake; this kind of punishment has been long abolished. Confinement without relief during a certain number of hours was, and still is, a frequent punishment for being absent without leave from parade, either on account of drunkenness or from any other cause. Formerly the pillory was a punishment awarded to offenses of this nature. Besides the punishments of death and transportation, which for great crimes are within the scope of military law in the British army, breaches of discipline are visited by temporary imprisonment, extra drills, extra guards, and the performance of fatigue duties; but punishments consisting of protracted periods of confinement to barracks accompanied by laborious employments, inflicted at the discretion of commanders of regiments, have been abolished for many years, not, however, before the most serious mortality in consequence had made it absolutely necessary. While an army is in the field, breaches of discipline must be punished properly with a view to discipline, and with more than usual severity. It might be presumed that acts of treachery will seldom be committed to a greater extent by the same and enemy do, however, occasionally take place; but the more usual crime is quitting the ranks on a disgraceless expedition of plunder, generally accompanied by gross acts of outrage and often murder, against the defenseless people of an invaded or occupied country. In such cases, it is generally conceded that the offenders should be, and they usually are, shot or hanged on the spot. Even when the crime is less heinous, the well-being and perhaps the safety of an army may be peril in consequence of resentment excited among the surrounding inhabitants, and punishment should be swift and certain. In the presence of an enemy there can scarcely be a more serious offense than intoxication; miscarriage of an enterprise, and defeat, with the loss of numbers of gallant men in an action, may be the fatal consequences of indulgence under such circumstances. Whatever may be the defense in other instances, there can be none in this, and the punishment is therefore always immediate and without recourse. The punishment of the lash is one that is now given up by civilized to the demoralization of the men. Moreover, and particularly in the British army, a terrible frequency to the demoralization of the men. Gen. sir Charles Napier has stated that in the beginning of this century, when flogging was common, he had frequently seen from 600 to 1000 lashes given under sentence by merely regimental courts-martial; and in those days a man who had suffered a part of his sentence was often brought from the hospital, before his wounds were entirely healed, to receive the remainder. The power of public opinion proved so strong in England, and was so manifestly opposed to flogging in the army and navy, that it gradually fell into disuse, until a regulation issued in 1866 practically abolished it. By the existing law, a man has to be convicted of one disgraceful offense before he becomes liable to flogging for the next one, and fifty lashes is the extreme penalty; see FLOGGING. In the United States this practice does not exist. Punishment by military law is confined, except in the case of the death-penalty, when engaged in war, to imprisonment, expulsion from the service, and minor penalties.

**MILITARY SCHOOLS.** As regards the British army, are divisible into several classes 1. Those for the education of officers already in the service; of these there are the staff college (q. v.) and the establishment at Chatham for training engineer officers. 2. Professional schools common to officers and men will be found under GUNNERY, SCHOOL OF, and MUSKETRY, SCHOOLS OF. 3. Schools for the professional education of candidates for commissions; for these reference should be made to MILITARY ACADEMY, ROYAL, and to SANDHURST MILITARY COLLEGE. 4. The schools for men in the ranks and for their children are described under SCHOOLS, REGIMENTAL; while the instruction provided for their sons or orphans is shown under MILITARY ASYLUM, ROYAL.

The military schools of foreign countries deserve considerable attention, especially those of France, where a military commission is one of the best scholastic prizes looked forward to. In France no attempt is made to impart general education at the military seminaries; a boy is required to have a thorough general knowledge before he can be admitted to these institutions. Being open to universal competition, and being the only channel—or nearly so—to the best employment under the state, the great military
schools, by the high standard required for them, give great impetus to general education throughout the empire and the lycées, or public schools, adapt their course of instruction to the anticipated competition. In the army, two-thirds of the line commissions and one-third of those for the scientific corps are given to non-commissioned officers, but very few of these rise beyond the rank of captain; the remaining commissions in the line and scientific corps, and all appointments to the staff, are given by competition, after a careful course of professional education. The candidates in open competition are placed according to merit either in the infantry school of St. Cyr or the celebrated Polytechnique; at both colleges they have the right, if they need it, to partial or entire state support. From the school of St. Cyr the more promising pupils pass to the staff school, and thence, after a thorough course, to the état major of the army; the remaining appointments pass as subalterns into the line. The pupils of the Polytechnique, which is entered after the age of 17 years, have annually about 160 valuable prizes open to them. The first 30 to 40 candidates usually select civil employment under the state, such as the "ponts et chaussées;" those next in merit choose the artillery and engineers, and pass through a technical course at the school of application. The remaining students either fail to qualify and leave the school, or have to content themselves with commissions in the line, subordinate situations in the government, civil or colonial service, or they retire into civil life altogether.

In actual service there are schools for the men, who are also taught trades and singing. The standard of education among French soldiers is far higher than among their English brethren, as the conscription draws the men from all classes of society. The Prussian system of military education differs from that of France in that competition is but sparingly resorted to; and the object is to give a good general and professional education to all the officers, rather than a specially excellent training to a selected few. Aspirant officers must enter in the ranks, and within six months pass a good examination in general and liberal knowledge; if, however, the candidate has been educated in a cadet-house—which is a semi-military school for youths—and has passed properly out of it, this examination is dispensed with. After some further service, the aspirant goes for nine months to one of three "division schools," where he completes his professional education. If he pass the standard here required, he is eligible for the next vacancy, but cannot be commissioned unless the officers of the corps are willing to accept him as a comrade. The artillery and engineer schools do for those services what the division schools do for the line. The culmination of Prussian military education is the staff school, open to competition for all the officers of the army, and presenting the highest prizes in the profession. In all the schools, the candidates study at the expense of the state, or receive great auxiliary grants.

The Austrian system is very elaborate, and commences at an early age; boys intended for military service beginning their professional almost contemporaneously with their general education. There are schools for training for non-commissioned officers and for officers, and senior departments for imparting more extended instruction to both classes. Candidates for appointment as non-commissioned officers pass by competition through the lower houses, where they remain till 11 years old; the upper houses, which detain them till 15; and the school companies, whence, after actual apprenticeship to service, a few pupils pass to the academies for aspirants for commissions, and the others are drafted into the service as non-commissioned officers. For officers, boys are deemed to the service by their parents at the age of 11, when they are placed in cadet-schools; after which the state takes charge of them. At about 16 the boys pass, according to qualification, to the line or scientific-corps academies, and four years later into those services themselves. The young officer's chance of entering the staff school—and therefore the staff—depends upon his place at the final academic examination. The competition observed throughout the course of military education is said to impart great vigor to instruction.

In the Italian army the system so nearly approaches that of France that a separate description is unnecessary. It need only be stated that the educational status of the Italian officers is considered high.

MILITARY SECRETARY, an officer on the personal staff of generals in high command. His duties are to conduct the correspondence of his chief, and to transact a great amount of confidential business which would dangerously occupy the time of the general himself. The military secretary to the officer commanding-in-chief at the war office receives £1300 per annum, and is usually a general officer. The military secretary to the commander-in-chief in the field is for the most part below that rank, and receives only the staff pay of £346 15s.; while to a general commanding a division only, an assistant military secretary, at £173 7s. 6d. per annum, is allowed. This staff pay is of course additional to the officer's regimental or unattached pay.

MILITARY TRAIN, formerly a highly important corps of the army, of which the function was to transport the provisions, ammunition, and all other material, together with the wounded in time of battle. It was formed after the Crimean war, on the dissolution of the land-transport corps (q.v.). It comprised six battalions, in all 1840 officers and men, and its annual cost for pay, etc., was about £71,000. The corps ranked after the royal engineers, and was classed as mounted infantry, the officers receiving
infantry rates and the men cavalry rates of pay. The commissions were purchasable, as in the line. The men were armed with carbine and sword, but rather for defensive than aggressive purposes. Attached to each battalion were 106 horses, with proportionate wagons and ambulances.

It is proper to observe that the military train constituted only the nucleus of a transport service for a large army, and that in time of war it would be expanded by the addition of thousands of horses or mules and the incorporation of many hundred drivers, etc. The advantage of possessing even a few men ready trained and capable of directing the movements of others was amply demonstrated by the failures of the Crimean in 1854 to 1856; so that parliament voted ungrudgingly the expense of this corps, although in time of peace it was comparatively without employment. The military train was disbanded in 1870, as being too military in its formation. Its functions were transferred to the transport section of the army service corps, a purely non-combatant organization.

MILITEL'LO, a city of Sicily, in the province of Catania, and 21 m. s.w. of the town of that name. Pop. '72, 9,978. It stands on a mountain in a somewhat unhealthy situation. In its vicinity there are important salt-lagoons.

MILITIA (Lat. miles, a soldier) has now the acquired meaning of the domestic force for the defense of a nation, as distinguished from the regular army, which can be employed at home or abroad in either aggressive or defensive operations. Every nation has a reserve, under its law military, upon which its defense would fall, on the discomfiture of the regular army; but the system differs in each country, and, with the exception perhaps of the United States during peace, none are formed on the model of the British militia.

The militia is a constitutional force raised under the sanction of parliament, in which the people—in theory, at least—wage their own bodies for the defense of their own soil, and in which they depute the sole leadership and command of the foreign and the crown nominees. Organized by counties and cities, it is essentially a local force: the selection of candidates for first commissions by the lord-lieut. of the county connects it with the land, while the command of the sovereign effectually combines in it the interests of the three estates. Under the Anglo-Saxons all men were required to bear arms, as a sort of body-rent for the land they held; but no special organization being adopted, efficiency was rarely attained in the use of arms. This the nation found to its cost when the Danes overran it during Alfred's reign. That great king, to prevent a similar occurrence, established the militia or fyrd, making land the basis of numbers, but the family system that of discipline: so many families were a tything, ten tythings a hundred, and hundreds were united into county powers, each under its heretoch, dux, or duke. Each section of the community had not only to furnish its quota in time of war, but also to provide arms, keep them in repair, and to undergo so many days' training every year. This arrangement subsisted in more or less vigor until the conquest; then the feudal troops at first rendered the militia unnecessary; but it never ceased wholly to exist. When the crown began to contend with the Norman barons, it naturally found its most powerful instrument in reviving the Saxon militia, and the English yeomanry became henceforth the fear of England's enemies, and a guarantee for the gradual enfranchisement of the people. Henry II. established "an assize of arms," at which every holder of land was bound to produce one or more men fully equipped, and capable of fighting in the national defense. The arms were annually inspected, and it was illegal to sell, lend, or pawn them. This annual assembly of the fyrd or militia is first recorded after the conquest in 1181; by the statute of Winchester in 1285 Edward I. revised the scale of arms for the several ranks. Further alterations to suit the advances in the art of war took place in 1538 (4 and 5 Ph. and M. c. 2). In 1604 James I. (1 Jac. c. 25) abolished the fyrd, and substituted "trained (commonly called train) bands," to the number of 100,000 men—a force partaking of the nature of militia and volunteers, but deficient in discipline and drill. During the civil war of Charles I. the train bands or militia mostly sided readily with the parliament. Up to this time the command had never by treaty been definitely assigned to the crown or to any other body. After the restoration, the loyal parliament of Charles II. immediately reorganized the militia—essentially on its present footing—and declared as law that "the sole supreme government, command, and disposition of the militia is, and by the laws of England ever was, the undoubted right of his majesty and his royal predecessors." As, however, the crown from this time began to depend for its support upon a mercenary army, and as the local status of the militia officers must always render the militia a force dependent on parliamentary influence and ties, the militia was much neglected until 1737, when a large portion of the regular army being absent in the seven years' war, it was carefully organized for the defense of the kingdom. Several militia acts have been subsequently passed, but rather with a view to consolidating the militia laws of England, Scotland, and Ireland, and to effect minor changes necessary for the growth of the institution, than to remodel in any essential degree the constitution of the force. The acts under which the militia is now organized are the 42 Geo. III. c. 90 and 91; 49 Geo. III. c. 120; 15 and 16 Vict. c. 50; 17 and 18 Vict. c. 13, 105 and 106; 18 and 19 Vict. c. 57, 100, and 106; and 38 and 39 Vict. c. 69, consolidating previous acts. The present law stands thus: The sovereign appoints lords-lieut. of counties, who nominate to first commissions in their county regi-
The militia force through the counties, known as the "quota," is fixed by government in proportion to the population, etc. The numbers must be provided in some way. In practice they are raised by voluntary recruitment; but should volunteering fail, a levy by ballot would be made upon all the inhabitants of the locality between the ages of 18 and 35. The power of making this ballot always exists, and would have by law to be enforced but for the militia ballot suspension act, which, when the measure is unnecessary, is passed from year to year. Many classes are exempt from the ballot, as peers, soldiers, volunteers, yeomanry, resident members of universities, clergymen, parish schoolmasters, artizans, apprentices, seafaring men, crown employees, free watermen of the Thames; in England any poor man with more than one child born in bedlock; in Scotland any man with more than two lawful children, and not possessed of property to the value of £50; in Ireland any poor man not worth £10, or who does not pay £5 per annum for rent, and has more than three lawful children under the age of 14.

The militia are bound, when called upon by the crown, to assemble annually for any period not exceeding three months, for training purposes; and the government can embody the whole or part of the force at any national crisis. The regiments were embodied almost without exception during the Russian war of 1854-56, and to a considerable extent at the time of the Indian mutiny, 1857-59. The quota of the United Kingdom is 200,000 men, but not above two-thirds of that number can be considered as effective. They may not be sent out of the kingdom, except they volunteer, and then only by special permission of parliament. As a defensive or garrison force, setting free the regular army for aggressive operations, the militia is a most valuable institution; and in times of war it has ever been found an admirable training-school whence soldiers volunteer into the permanent forces.

A militia volunteer receives bounty, payable partly on joining and partly in installments after each training period. When out for training, or embodied for permanent duty, the officers and men receive the same pay as regular troops of corresponding arms of the service, and are under the mutiny act and articles of war, except that no punishment can extend to life or limb. The officers rank with, but junior to, their brethren of the regular army; the great distinction in appearance between regular and militia troops being that the former the appointments are all of gold-lace, and in the latter of silver; the buttons being similarly distinguished. The force is divided into heavy, light, rifles, and Highland infantry, and into artillery, the latter being generally limited to coast counties, and being highly esteemed by the authorities.

The celebrated local militia was instituted in England and Scotland in 1808, and suspended in 1816. It consisted of a force for each county six times as numerous as the proper militia quota, comprising, of course, many classes, which, from age or other circumstances, were ineligible for the militia. These troops could only be marched beyond their respective counties in the event of actual invasion. Their numbers reached, in 1811, to 213,000 men.

The cost of the militia for the year 1879-80 amounted to £1,259,650, the number of officers and men provided for being 137,556 (including permanent staff and militia reserve). As a constitutional precaution, the estimates were formerly prepared—at least nominally—by a committee of the house of commons; but as the check was of no real advantage, it was abolished by a resolution of the house in 1863, and thenceforward the minister of war includes the charge among the many services provided for in his department.

MILITIA (ante). The militia system of the United States arose from that jealousy of standing armies which has always characterized the Anglo-Saxon peoples. After the revolutionary war congress determined to limit the regular army to the actual requirements of immediate necessity, and supplement it by a state militia. The president is commander-in-chief of the militia of the several states, and organized into the actual service of the United States. He has the power to call out these forces, by orders to any officers of the militia he may address, in case of invasion or rebellion against the authority of the United States. The militia may be required to serve for a period not exceeding nine months. The troops receive during this time the pay and rations of soldiers of the regular army, and the officers rank next after officers of the same grade in the regular service. The majority of the state constitutions require the passage of laws for the organization and equipment of their militia. The governor is the commander-in-chief, and subject to his orders are the necessary officers, chosen by various methods in the different states. It was customary for many years to have annual drill days for all the state troops, who were compelled to attend under penalty, but the laws providing for them have been repealed or fallen into disuse. Voluntary organizations are now formed, which select their own uniforms and the branch of the service they desire to be attached to. They receive small state bounties to perfect their drill and keep themselves in good condition for an emergency. These organizations form only a small part of the whole militia, but quite sufficient for the government in time of peace. The actual militia of the United States consists of these volunteer troops and all other
able-bodied male citizens of the age of 18 and under 45, with the exceptions provided by national and state laws, all of whom are subject to be summoned to perform military duty according to the laws of congress or of their respective states.

The state militia was often called out during the revolution, and the "whisky insurrection" of 1794 was put down by the militia of Pennsylvania, New Jersey, Maryland, and Virginia. During the war of 1812 disputes arose between the national and state authorities regarding the right of the president to determine whether the emergency had arisen which authorized his calling them out, the right to place them under officers of the president's appointment, and the right to march them beyond the limits of the state. The courts decided in favor of the president, and his right to decide whether the militia shall be summoned, and his right to place them under the command of a federal officer ranking their own officers is no longer disputed. During the civil war, the first call of the president for 75,000 men was principally filled by the militia, and the total number of volunteers, drafted men, and militia troops during the whole war was 2,690,401. There were 1,000,516 men in the field at the proclamation of peace, and of these soldiers about 978,000 were volunteers or drafted men.

MILK is an opaque white fluid secreted by the mammary glands of the females of the class Mammalia, after they have brought forth their young, and during the period in which their offspring are too immature to live upon ordinary food. It is devoid of odor, except for a short time after its extraction; is of a slightly sweet taste, most commonly of a slightly alkaline reaction (except in the Carnivora, in which it is acid); and its average specific gravity (in the case of human milk) is 1.032.

When milk has been allowed to stand for some time, a thick, fatty, yellowish-white stratum (the cream) forms upon its surface. When this is removed, the fluid below (popularly known as "skim-milk") is found to be of greater specific gravity, and of a more bluish-white tint. Milk does not coagulate on boiling, but a membrane or film of coagulated casein, containing fat corpuscles, forms upon its surface. If milk be allowed to stand for some days exposed to air at the ordinary temperature, it gradually begins to exhibit an increasing acid reaction, from the formation of lactic acid from the milk-sugar; while the casein being coagulated by the action of the lactic acid, is separated in the form of "curds," and the fluid gradually assumes the form of a thickish pulp. The ordinary means of obtaining the casein (which exists in solution in the milk) in the form of curds is by the addition of a piece of rennet (the dried stomach of the calf), which acts as powerfully as any acid. The curds thus separated form the basis of cheese, while the fluid portion left after their removal is known as the "whey."

When examined under the microscope, the milk appears as a clear fluid, containing fat globules (the milk globules, as they are usually called) in suspension. They commonly vary from .0012 to .0018 of a line in diameter. They are each invested with a delicate coat of casein, which prevents their sticking together. By churning, the surrounding envelopes become ruptured, and the contents are made to unite, forming butter. In addition to milk globules, colostrum globules (see Calosrrxun), which are irregular conglomerations of very small fat globules, occur in the milk for the first three or four days after delivery.

The following table, which is based on the researches of Vernois and Becquerel, represents the density and composition of 1000 parts of milk in various animals:

The actual caseine which in the preceding analyses is associated with the undefined group of substances termed extractive matters, ranges from 27 to 35 in 1000 parts of healthy human milk, while in the colostrum it amounts to 40; in the milk of the cow it is somewhat higher; while in that of the bitch, and probably of all carnivorous animals, it is more than trebled. It is found in the case of women that the quantity of the caseine increases with the free use of animal food, and diminishes upon vegetable diet.

The fatty matters range from 25 to 43 in 1000 parts of women's milk, while in cows' milk they average, according to Lehmann, 45; and in bitches' milk, rise to 110. These fatty matters, which collectively form butter, consist of an admixture of 68 per cent of margarine, 30 per cent of oleine, and 2 per cent of an admixture of fats, which, on saponification, yield butyric, caproic, caprylic, and capric acids. The milk which is last yielded is much richer in fat than that which is first drawn.

U. K. IX.—53
The sugar, or lactine, whose properties are described in the article SUGAR OF MILK, varies in human milk from 32 to 62 in 1000 parts, and in cows' milk from 34 to 43. The milk of bitches, when fed on a purely animal diet, often contains no traces of sugar; but if they are fed on vegetable or mixed food, a considerable quantity of sugar is found. The salts in women's milk range from 0.6 to 2.5 in 1000 parts, and in cows' milk from 3.5 to 5.5. That a peculiar selective power is exerted by the mammary gland, is shown by the following table, which shows the comparative analyses of the ashes of cows' milk and of cows' blood, each reckoned for 100 parts:

Why the potassium and sodium compounds stand in this inverse relation to one another in these two fluids, is not accurately known. The abundant supply of phosphoric acid, lime, and magnesia in the milk is doubtless for the purpose of building up the infant skeleton.

The milk is liable to tolerably regular changes at different periods of lactation; for example, the sugar is deficient during the first month, and is in excess from the eighth to the tenth month; the caseine is in excess during the first two months, and is most deficient between the tenth and eleventh month; the butter is considerably in excess during the first month, and slightly so for the next two months; while the salts are most abundant during the first month, but present no regular law of decrease. Hence, it will readily be seen that in the selection of a wet-nurse, one of the leading requirements should be that her milk should be of the same age as that of the mother. Various medicines, as, for example, iodide of potassium, iodide of mercury, and quinine, have been detected in the milk, after being taken by the mother; and many cases are on record in which strong mental impressions, as fear or anger, acting on the mother, have so far poisoned the milk as to cause immediate convulsions in the infant.

The daily quantity of milk is dependent upon various conditions, such as bodily constitution, food, etc. Lamperriere determined the quantity of milk secreted in definite times by a large number of women, and found as a mean for each breast between 50 and 60 grammes (the gramme being 15.4 grains) in the course of two hours, assuming that the secretion continues at a uniform rate.

In those cases in which a wet-nurse cannot be obtained, it is expedient to feed cows' milk, so as to make it resemble that of women. The main differences are, that the former contains more caseine and less sugar and water than the latter. By exposing cows' milk to a gentle heat in a wide open vessel, we obtain a film of caseine which may be removed (more than once, if necessary); on then adding sugar (sugar of milk, if procurable) and water, we obtain a good imitation of the human secretion.

In the article on D I S E A S E, the uses of the leading ingredients of the milk in relation to nutrition are sufficiently noticed. The milk of cows is extensively used as an article of diet both for healthy persons and invalids, and it enters largely into all hospital, prison, and workhouse diets. In patients with a tendency to consumption, or in whom that disease has already manifested itself in its early form, cream is often of great service, especially when the stomach cannot bear cod-liver oil.

The adulterations to which milk is often subjected are noticed in the article FOOD, and the instruments used for testing the purity of this fluid are briefly referred to in the article GALACTOMETER. Water is by far the commonest adulteration, and if it has been added in large quantity, the fraud may be detected by evaporating a small weighed quantity of milk (say 500 grains) to dryness, and ascertaining whether the due proportion of solid constituents is left.

Various methods have been proposed for the preservation of milk for sea voyages, etc. Moore's essence of milk is prepared by the addition of a little sugar and the evaporation of the fluid at a temperature of 110°, to one-fourth of its bulk, when it is put in small tin cases, soldered down, steeped in boiling water for a time, and taken out to cool. This preparation keeps good for a long time. Blatchford's solidified milk is prepared by mixing 112 lbs. of milk with 28 lbs. of white sugar and a little bicarbonate of soda. The mixture is evaporated under certain conditions till it assumes the form of a creamy powder, which is cooled, weighed into parcels of 1 lb. each, and compressed into brick-shaped masses, which must be triturated and mixed with warm water when required for use. Grimwade's desiccated milk is prepared by mixing the fluid with a little sugar and alkali, and evaporating it till it is as thick as dough; it is then dried, crushed, and bottled. At the meeting of the British association in 1859, the abbé Moigno described four methods employed in France for the preservation of milk, of which the most valuable seemed those of Maber and De Pierre. For details regarding these methods, we must refer to the abbé's paper. He found milk prepared by Maber's process perfectly good after having been kept between five and six years. The milk pre-
pared by De Pierre's process, unlike the other preparation, is liquid. A specimen of it, the age of which was not stated, which the abbe brought to Aberdeen, was found to be perfectly fresh. The preparation of condensed milk is now conducted on a large scale in Switzerland.

MILK-FEVER, in the lower animals, comes on within a few days after parturition. One variety common to most animals consists in inflammation of the membranes of the womb and bowels, and is produced by exposure to cold, overdriving, or injury during labor; it is best treated by oil and laudanum, tincture of arsenic, and hot fomentations to the belly. The other variety, almost peculiar to the cow, attacks animals in high condition, that are good milkers, and have already borne several calves; it consists in congestion and inflammation of the brain and large nervous centers, and impairs all the vital functions, leading to dullness, loss of sensation and motion, and stupor. Blood must be drawn out of the heart whilst the cow is still standing and sensible. Later, it only hastens death. A large dose of physic, such as a pound each of salts and treacle, a dram of calomel, an ounce of gamboge, and 2 ounces of ginger, should at once be given, solid food withheld, oysters of soap, salt, and water thrown up every hour, cloths wrung out of boiling water applied along the spine, the teats drawn several times daily, and the animal frequently turned. Although treatment is uncertain, prevention is easily insured by milking the cow regularly for 10 days before calving, feeding sparingly on laxative unstimulating food, giving several doses of physic before, and one immediately after calving, and when the animal is in very high condition and prone to milk-fever, bleeding her a day or two before calving.

MILK-FEVER (ante), the fever which accompanies or precedes the secretion of milk in women recently delivered. The most common time of its appearance is about the third day after parturition, the symptoms being a quick pulse, increased heat, redness of the face, a diminution or temporary suspension of the lochial discharge, and swelling of the breasts, with a feeling of tension and oppression. There is a tendency to this condition in all women, and perhaps it may be regarded as a normal one, as it is difficult to suppose that so important a phenomenon as the establishment of the secretion of milk could take place without a certain degree of constitutional disturbance, and without there being any real pathological state of any of the organs. There are women, however, who suffer but little constitutional disturbance comparatively. Those who suffer the most, among healthy women, are the plethoric and robust, and those whose minds are much occupied. Those who are subjects of chronic diseases will be affected in various ways, and no rules of prognosis can be relied on. The natural tendency is for the symptoms to pass away without any special treatment, but a judicious diet of bland articles, with the administration, when indicated, of salines and mild laxatives should not be disregarded.

MILL. This word is now used in a general way as a name for almost all kinds of manufactories, as well as for grinding-machinery; but we shall only describe here the arrangements of an ordinary flour-mill, adding a brief notice of the edge-mill in use for grinding oil-seeds and some other substances.

From time immemorial corn has been ground by a pair of stones. The earliest and rudest handmills were no doubt somewhat like one sent home by Dr. Livingstone, the African traveler, from the banks of the Shire in South Africa. He describes it as "a mill such as Sarah used, when told by her lord to do the thing handsomely and in a hurry for the strangers—i.e., a big stone worn hollow by the operations of grinding. The upper stone is grasped by both hands, and the weight of the body brought down on it as it is shoved to the lower part. . . . The meal is made very fine." The next step in advance of this was the quern or handmill still in use in the Shetland isles, the Faroes, and other places. The old quern scarcely differs from a pair of modern millstones, except in the stones being small enough to allow of the upper one being turned by the hand instead of by wind, water, or steam power.

The millstones which are now all but universally used for grinding corn are made from buhr-stone, a form of silica like flint in hardness, but not so brittle. This rock is only found in abundance in the mineral basin of Paris and some adjoining districts, and belongs to the tertiary formation. It is of a cellular texture, and is frequently full of silicified shells and other fossils. Millstones are usually from 4 to 6 ft. in diameter, and are each made up of a number of pieces strongly cemented and bound together with iron hoops. One 6 ft. in diameter, of fine quality, will cost about £50. The grinding surface of each stone is furrowed or grooved, the grooves being cut perpendicularly on the one side, and with a slope on the other. A pair of stones are used together, and
both being furrowed exactly alike, the sharp edges of the grooves on the one come against those on the other, and so cut the grain to pieces.

Fig. 1 shows a section of a flour-mill reduced to its simplest elements. The millstones are at a, the lower of which is firmly fixed, it being a matter of importance to have this done securely; and the upper is made to revolve, on a shaft which passes up through the lower one, at a speed of one hundred revolutions per minute, more or less. Motion is communicated by the spur-wheel b, which is driven by a water-wheel or other power. The corn, previously cleaned, is supplied to the millstones by means of the hopper e, connected with which there is a valve, d, for regulating the supply. Passing through a hole in the center of the upper millstone, it comes in between the two, where it is ground, and thrown out on all sides by means of the centrifugal force. The millstones are, of course, inclosed, and the flour passes down through the spout e, to the worm at f, which, while it cools the ground corn, carries it along to elevators g. These raise it up to the floor on which the silk dressing-machine, h, is placed. This is a cylinder, which was formerly made of wire-cloth of various degrees of fineness, and consequently separated the flour into different qualities—the finest passing through the first portion, the second passing through the next, and so on; but no part of it large enough in the openings to let through the bran, which passed out at the end. Silk is now preferred to wire-cloth for dressing the flour. Hoppers, i, are placed below the dressing-machine, by means of which the flour and bran are filled into sacks; No. 1 being fine flour; No. 2, seconds; and No. 3, bran.

One of the largest flour-mills in Great Britain is the one belonging to Messrs. Tod at Leith. It is about 150 feet long, 50 feet broad, and 65 feet high. At one end of it is placed a steam-engine of 350 horse-power, which works all the machinery of the mill. This communicates motion to a series of shafts and wheels occupying the ground-floor, belts being used as much as possible for driving the wheels instead of spur gear, so as to avoid a shaking motion. On the second floor are placed 86 pairs of millstones, arranged in two lines along the room, the wheat being supplied silently to them by centrifugal feeders. On the third floor are situated the hoppers for feeding the millstones. The fourth floor contains iron rollers for partially crushing the wheat before being supplied to the millstones. This floor also contains silk and wire dressing-machines. On the fifth floor are placed the first silk dressing-machine, and also smut-machines for cleaning the wheat previous to grinding, which are somewhat similar to thrashing-machines. The sixth and highest floor also contains smut-machines. All these machines are connected in the most skillful manner by means of elevators ascending through all the floors; and along each, where necessary, there runs, in a horizontal direction, a revolving screw, so that the grain or the flour can be conveyed to any of the machines without the assistance of hand-labor.

This mill converts wheat into flour at the rate of about 500 sacks a day of 24 hours—a quantity nearly sufficient to supply bread for the entire population of a city like Edinburgh. [The above description applies to Messrs. Tod’s mill as it stood in 1863. It was subsequently greatly extended; and, after being destroyed by fire in 1874, has been completely refitted.] The great government mill of St. Maur is the most remarkable mill in France.

There is a form of mill in use for some purposes where the millstones are vertical, and called the edge-stone mill. It is sometimes, though rarely, used for grinding corn; but is much employed for crushing oil-seeds and for grinding dye-stuffs, sugar, chemicals, and a multitude of other substances. The stones are generally of some hard rock, such as granite or sandstone, and from 5 to 7 feet in diameter. For such purposes as grinding clay or loam they are usually made of cast iron, and of a smaller size. The stones revolve in opposite directions, sometimes upon a fixed stone or metal bed, and at other times it is the bed-plate itself which revolves, and in so doing turns the edge stones which rest upon it.

Among the recent improvements in our flour-mills which have attracted considerable attention are: 1. The patent process of dressing the grinding surface of the millstones by means of a peculiar kind of diamond, which rapidly covers it with fine grooves. This is still, however, more largely, and perhaps more efficiently, done by the slower process with
the n Didging hammer; 2. The keeping down of the temperature of the millstones by means of a current of cold air; and 3. The introduction of Carr's patent disintegrater, which grinds wheat and other substances by means of two vertical iron disks about five feet in diameter, and a few inches apart, in each of which are several concentric rows of steel pegs, so arranged that those on the one disk overlap without touching those on the other. The disks are made to revolve rapidly in opposite directions, so as to grind the wheat by percussion.

**MILL, in law.** The owner of a mill situated on the bank of a stream is entitled to have the use of the stream undiminished in volume; and if the other riparian owners above interfere with the stream by diminishing its volume, thereby causing injury to the mill, the mill-owner has a right of action against the party so acting.

**MILL, JAMES, was the son of a small farmer, and was b. in the neighborhood of Montrose, Scotland, April 6, 1773.** He studied, with a view to the church, at the University of Edinburgh, where he distinguished himself in Greek and in moral and metaphysical philosophy. He was licensed to preach in 1798; but instead of following out the ministry, he went to London in 1800, where he settled as a literary man. He became editor of the *Literary Journal*, which after a time was discontinued; and wrote for various periodicals, including the *Eclectic* and the *Edinburgh Review*. In 1806 he commenced his *History of British India*, which he carried on along with other literary work, and published in the winter of 1817-18. The impression produced by this masterly history on the Indian authorities was such that, in 1819, the court of directors of the company appointed him to the high post of assistant-examiner of Indian correspondence, notwithstanding the then unpopularity of his well-known radical opinions. The business assigned to his care was the revenue department, which he continued to superintend till four years before his death, when he was appointed head of the examiner's office, where he had the control of all the departments of Indian administration—political, judicial, and financial; managed by the secret committee of the court of directors. Shortly after his appointment to the India House he contributed the articles on government, education, jurisprudence, law of nations, liberty of the press, colonies, and prison discipline to the *Encyclopaedia Britannica*. These essays were reprinted in a separate form, and became widely known. The powers of analysis, of clear statement, and of the thorough-going application of principles, exhibited in these articles had probably never before been brought to bear on that class of subjects. In 1821-22 he published his *Elements of Political Economy*, a work prepared primarily with a view to the education of his eldest son, John Stuart Mill. In 1829 his *Analysis of the Human Mind*, appeared. His last published book was the *Fragment on Mackintosh*, brought out in 1835. He was also a contributor to the *Westminster Review* and to the *London Review*, which merged in the *London and Westminster*.

Not long after he settled in London he made the acquaintance of Jeremy Bentham, and for a number of years lived during the summer in Bentham's country-house. Although he must have derived much benefit from his intercourse with the great law-reformer, he was not a mere disciple of Bentham, but a man of profound and original thought, as well as of great reading, in all the departments of moral, mental, and political philosophy. His conversations were so impressive to a remarkable degree, and he gave a powerful intellectual stimulus to a number of young men, some of whom (including his own son and Mr. Grote, the historian of Greece) have since risen to eminence. He took a leading part in the founding of University college, London. He died at Kensington, June 23, 1836. See *Autobiography of J. S. Mill*, and an interesting Biography by prof. Bain in *Mind*, 1876-78.

**MILL, JOHN, 1645-1707; b. Shapp, Westmoreland, Eng.; graduated at Queen's college, Oxford, in 1669; was soon after elected a fellow and became eminent as a tutor; entered the ministry, and became distinguished as a preacher; became rector in 1681 of Blechington, Oxfordshire; was made chaplain to Charles II., and received the degree of D.D., the same year. In 1685 he was made principal of St. Edmund's hall; in 1704, by queen Anne, prebendary of Canterbury. The work for which he is the most distinguished is his new edition of the Greek Testament, on which he spent 30 years, finishing it only 14 days before his death. It was undertaken at the advice and expense of Dr. Fell, bishop of Oxford, but after the bishop's death Mill continued it at his own expense, and repaid to the executors what he had received. It was published the year that he died. The text which Mill adopts is that of Robert Stephens of 1550, and contains 30,000 various readings collected from manuscripts, commentaries, and writings of the fathers, etc. Dr. Whitby attacked the work in his *Eranum variantium lectio non Joh. Millii: but Dr. Bentley approved the labors of Mill, and Macheilis, Marsh, and other critical scholars acknowledged the value of the edition. It was taken up for a different purpose by Antony Collins in his discourse on *Free Thinking*, in which he contends that "these numerous variations destroy the authority of the New Testament," a book which was ably answered by Whiston and Bentley who show that the variety of readings is only the necessary result of the number and variety of manuscripts. Mill's text has long been held in high esteem by scholars.

**MILL, JOHN STEUART, was b. in London May 20, 1806.** He was educated at home by his father. In 1820 he went to France, where he lived for upwards of a year, making
himself master of the French language, and occasionally attending public lectures on science. He lived for some time at Paris, in the house of the French economist Jean a Diste, where he made the acquaintance of many men distinguished, then or afterwards, in letters and in politics. He spent part of his time in the s. of France, in the house of sir Samuel Bentham, brother to Jeremy Bentham. During this stay in France he laid the foundation of his great familiarity with, and interest in, the politics as well as the literature of the French nation. In 1823 he left the French hotel, and become a clerk in the examiner's office, where his father was assistant examiner. For thirty-three years he continued to be occupied in the department of the office named the political, or the transactions of the company with the native states. In 1831 he was appointed assistant examiner, and in 1836 he was placed at the head of the department. He energetically opposed the transfer of the India government to the crown in 1858. On the score of failing health he declined a seat at the new Indian council, and retired from office in October of the same year, on a compensating allowance. At the general election of 1865 Mill was returned to parliament for Westminster; and till he lost his seat at the election of 1868 he acted with the advanced liberals. He died May 8, 1873, at Avignon, where he had spent most part of the last years of his life.

Mr. Mill became an author at a very early age, and may be looked upon as one of the foremost thinkers of his time. His first publications consisted of articles in the Westminster Review. He took an active part in the political discussions that followed the revolution of 1830 in France and the reform bill movement in England; and from 1833 to 1840 was editor, and along with sir W. Molesworth proprietor, of the London and Westminster Review, where many articles of his own appeared. In 1843 he published his System of Logic; in 1844, Essays on some Unsettled Questions of Political Economy; in 1848, Principles of Political Economy; in 1859, an essay on Liberty; in 1869, Discussions and Dissertations; in 1863, a small work on Utilitarianism; in 1865, Comte and Positivism and the Examination of Sir William Hamilton's Philosophy; in 1867 (when Mill was rector of St. Andrew's university), his Inaugural Address; in 1868, England and Ireland; and in 1869, The Subjection of Women. After his death appeared his Autobiography (1873), read with intense interest; Three Essays on Religion (1874); and a second volume of Discussions and Dissertations (1875).

MILLAIL, JOHN EYVERT, R.A., a celebrated English painter, was b. at Southampton in 1829, entered the royal academy at the age of eleven, and in 1847 carried off the gold medal for his picture of "The Tribes of Benjamin seizing the Daughters of Shiloh," exhibited in the following year, at the British institution. Before this period he had acquired a considerable reputation among younger painters by his avowed antipathy to the principles of art which then prevailed. His views were shared in by other students, such as Holman Hunt (q.v.), Dante Rossetti (q.v.), and Charles Collins, and a sort of artistic fraternity was formed, which obtained the name of the Pre-Raphaelite School. Millais's principal paintings are: "Our Savior" (1850); "Marina in the Moated Grange" (1851); "The Huguenot and She" (1852); "The Order of Release" and "The Proscribed Royalist" (1853); "The Roscian" (1856); "The Happy" (1858); "Spring Flowers" (1860); "The Black Brunswicker" (1861); "My First Sermon" (1868); "My Second Sermon" (1864); "Joan of Arc" (1865); "Sleeping," "Waking," "Jephtha" (1867); "Moses" (1871); "Chill October" (1871); "Day Dreams" (1874); "Sound of Many Waters" (1877), etc. Whatever opinions may be held of Millais as an artist, no respectable critic denies the subtlety of his imagination and depth of sentiment. He is profoundly poetical, and has probably never been surpassed in representing intense feeling and thought by means of color and composition; but his perverse affectation and contempt for "conventionalism" have marred his finest productions.

MILLARD, a co. in w. central Utah, bordering on Nevada. It is drained by the Sevier river, flowing into the lake of the same name, which is found in the central part of the co., and which has no visible outlet; pop. '70, 2,733–1,974 of American birth. Though of large area—160 m. in length and 65 m. wide—the greater part of the surface is either mountainous or a barren desert. Some small sections are fertile, and here Indian corn and wheat are raised. Chief town, Fillmore City.

MILLARD, DAVID, 1794-1873: b. N. Y.; was the son of a revolutionary officer, and spent his early life in farming. His education was entirely self-acquired. He studied theology, and in 1818 became pastor of a church in West Bloomfield, N. Y., where he remained until 1833. He then edited the Gospel Luminary, a religious monthly, and in 1837 settled in Portsmouth, N. H. He occupied for several years the professorship of biblical antiquities and sacred geography in the Unitarian theological school at Meadville, Penn.; and published The True Messiah in Scripture Light and Travels in Egypt, Arabia, Persia, and the Holy Land. His life was published in 1874 by his son, Rev. D. E. Millard.

MILLAU, or MILLAUD. See MILLAU, ante.

MILLBURY, a t. in Worcester co., Mass., 6 m. s. of Worcester, 37 m. n.w. of Providence, on the Blackstone river, the Providence and Worcester, and the Millbury branch of the Boston and Albany railroads; pop. '70, 4,529. The chief business is the manufact
ture of cottons and woolens. There are also boot and shoe, whip, carriage, stocking, and cutlery factories, and machine-shops.

MILLEDGE, JOHN, 1757-1818; b. Ga.; was an active supporter of the revolutionary cause, being one of Habersham's party which made a prisoner of gov. Wright of Georgia—the first act of open revolt in that state. At the capture of Savannah, Milledge escaped and was present at its siege by the colonial forces under gen. Lincoln. In many other scenes of the revolution he played a prominent and gallant part, but before the close of the war was asked to take the position of attorney-general, which he did in 1780. He served nine times as the representative of Georgia in congress; from 1802 to 1804 he was governor of the state, and filled a short term as U. S. senator, 1806-9. The town of Milledgeville, in Baldwin county, formerly the capital of the state, was named after him. To the establishment of the state university and its seat, Athens, he contributed liberally, and was in fact the founder of both town and college.

MILLEDGEVILLE, the former capital of Georgia, U. S., on the w. bank of the Oconee river, 150 m. n.w. of Savannah, in a rich cotton country. Among its edifices are the former governor's residence and state buildings, and several churches. Pop. '70, 2,750.

MILEDOLER, PHILIP, D.D., 1775-1853; b. Rhinebeck, N. Y. His father emigrated from Bern, Switzerland, to America about 1751. Philip graduated in 1798 at Columbia college; studied theology, and was licensed to preach at the age of nineteen; became pastor of the German Reformed church, Nassau street New York, in 1795, preaching in German and English. His eloquence drew large audiences. In 1800 he was called to the Third, or Pine street Presbyterian church, in Philadelphia. In 1803 he succeeded the pastor of the Presbyterian church in Rutger street New York. In 1813 he transferred his relations to the Reformed church, and became pastor of the Collegiate Dutch church in New York. In 1825 he was elected professor of polemic and didactic theology in the seminary at New Brunswick, N. J., at the same time president of Rutgers college, and professor of moral philosophy; which offices he retained until 1841, when he retired to private life. He declined several offers of high position in the church. He was one of the founders of the American Bible society. Dr. Miledoler was a man of great unctious and power in the pulpit, and uncommonly gifted in the conduct of public prayer.

MILLE LACS, a co. in e. central Minnesota, bounded on the n. by lakes of the same name; drained by Rum river; 570 sq.m.; pop. '80, 1591-242 of foreign birth. The surface is undulating, and mostly covered with forests. Wheat, corn, and hay are raised, but the chief industry is in getting out and sawing lumber. Chief town, Princeton.

MILLENIARIANS (Millennium, ante), in a general sense all who believe that Christianity will attain in the future a marked degree of prevalence through the world. Their faith in this rests on many prophetic descriptions and promises. But that the triumph will be for a limited period is founded on a declaration in the Apocalypse that Satan will be confined in the bottomless pit for a thousand years, and that during the same period the souls of the martyrs and others will live and reign with Christ. Some interpret this period literally; others think that the definite period is put for one indefinitely long; and a third class suppose that a day stands for a year, and consequently that an event occurring four years prior be marked out. But while these differences of opinion are found among the general class, a more radical difference divides modern millennarians into two great classes: the one affirming that the period of a thousand years will be introduced by and follow the second visible coming of Christ; the other declaring that the second coming will be after the millennium, and will introduce the end of the world. The first are called strictly premillennarians but in popular usage the title millenarians is almost entirely restricted to them. They hold that the second coming of Christ will be in order to reign visibly on the earth to subdue the obstacles that now restrict the extension of his kingdom, and to destroy the personal enemies of it and of himself. And simultaneously with his coming they believe there is to be a resurrection of a part or of the whole of those who have died in Christ, but that the resurrection of the remainder of mankind will not take place until the end of the world. This point is of vital importance to their whole system. If it be true, much that they teach with it must be admitted; if it be false, the whole system falls to the ground. Their belief in the first partial resurrection rests on three passages of Scripture. The first is: 1. Thess. iv. 16, "The dead in Christ shall rise first." Here, they argue, the distinction drawn is between the dead who are Christians and those who are not; and it is declared that the Christians shall rise first. But to this those who hold the contrary opinion reply that the distinction which the apostle draws is between two classes of Christians—those who have died or will die before the coming of the Lord, and those who then will be living on the earth. The latter, he affirms, shall not prevent (shall not have any priority or advantage over) their brethren who are dead; but that at the coming of the Lord first the dead in Christ will rise, and afterwards those who remain alive shall together with them be caught up to meet the Lord in the air. In this passage, therefore, those who are not premillennarians find no intimation that one portion of the dead will rise before other portions. The second passage, supposed by some to teach that the resurrection of Christians
will preceede that of other men, is 1. Cor. xv. 22-24, "For as in Adam all die, even so in Christ shall all be made alive. But every man in his own order: Christ the firstfruits; afterwards they that are Christ's at his coming. Then cometh the end, when he shall have delivered up the kingdom to God." Here, premillenarians say, it is taught that the resurrection takes place in the following order: (1) That of Christ. (2) That of his people. (3) That of other men. And, as between the resurrection of Christ and that of his people a long interval is placed, so there may be a period of less or greater extent between the resurrection of believers and that of unbelievers. To this the other side reply that Paul speaks throughout the passage only of the resurrection of believers. This some among the Corinthians denied, and this, therefore, he undertook to prove, making no reference to the resurrection of other men, knowing that the one sufficiently involved the other. And the "end" of which he speaks, refers, they say, not to the resurrection, but to the completion of the work of redemption, when Christ shall have put down all opposing rule, authority, and power. But the passage which apparently favors the pre-millenarian view most strongly, and without which the others probably would not be supposed to have much force, is Rev. xx. 4-6: "I saw the souls of them that were beheaded for the witness of Jesus, and for the word of God, and which had not worshipped the beast, neither had received his mark upon their foreheads, or in their hands; and they lived and reigned with Christ a thousand years. But the rest of the dead lived not again until the thousand years were finished, this is the first resurrection. Blessed and holy is he that hath part in the first resurrection; on such the second death hath no power, but they shall be priests of God and of Christ, and shall reign with him a thousand years." Premillenarians, interpreting this passage literally, regard it as teaching that a thousand years before the end of the world, when Christ shall come to reign visibly on the earth, there will be a resurrection of Christians from their graves to dwell here, and share with Christ the glories of his reign. To this those on the other side reply that the passage is to be understood not literally, but as a symbolic representation of the actual event. At the beginning of the book it is said that God signified the revelation to his servant John; that is, represented it by signs or symbols. Accordingly, the book contains a succession of symbols in which the actual meaning is set forth with striking impressiveness. There are 7 stars, 7 golden lamps, 4 horses and their riders; and so on through the book. Some of these symbols, e.g., the stars, the lamps, and the golden censer; others the reader is left to study out for himself. At the beginning of chap. xx. there are two principal symbols employed. 1. The binding of Satan in which the bottomless pit, the key, the chain, are symbols of the suppression of Satan's power over the souls of men. 2. John says that he saw certain classes of souls, that he describes, and that they lived and reigned with Christ a thousand years. That which he saw was—as those who argue against a literal resurrection think—a symbol of the actual event intended to be foretold, viz. the zeal for Christ that his disciples would display. This would be so remarkable that the souls of martyrs would be an appropriate symbol of it; a symbol worthy to be ranked among those employed in this book of revelation. Tried even by this high standard, what symbol, it is asked, could be more significant of devoted zeal than that here employed? How could the piety of a man be more highly commended than to say he has the soul of a martyr? What could be said more expressive of power in a church than that all its members manifest the spirit of those who had forfeited their lives for the testimony of Jesus? How could irresistible power in Christendom be more strikingly expressed than by saying that where or by no person is any other spirit manifested than the spirit of martyrs? Yet, according to this interpretation, John says this will be the case in the millennium. "The rest of the dead lived not again until the thousand years were fulfilled." There will be none like them in all that time. The souls of the wicked, of the worldly, of double minded, half-hearted, or timid Christians, are not an appropriate symbol of Christians in millennium times. And these devoted ones, it is added, shall reign with Christ during the thousand years. They shall not only be devoted to him, but also happy with him. The martyr's zeal will be united with the prosperity of triumphant times. The symbol having been given, the interpretation is added: "This is the first resurrection." That is, the new life of the soul which comes with faith in Christ. This is experienced before the resurrection of the body, and is therefore called the first resurrection. The Savior foretold both together, and placed this first. "The hour is coming, and now is, when the dead shall hear the voice of the Son of God, and they that hear shall live." This describes the resurrection of the soul which was even then taking place. After that comes the description of the general resurrection—even of all that are in the graves. And all through the epistles this resurrection of the soul is affirmed, and its importance is magnified as by the power of Christ, the source of all the life of Christianity in the church. This, therefore, is actually "the first resurrection," separated from the general resurrection by the whole period between the first preaching of the gospel and the last day. And besides this, those who are not premillenarians say there is nothing else foretold in Scripture to which the name, first resurrection, is to be applied. It is probable that neither of these interpretations is found satisfactory in every point by the great mass of the nominal adherents to either view. On each side a few leaders are enthusiastically sure; but the common Christian feeling is that in each view there is some strength and much weakness; that while the strict premillennial view from a flat
Literal interpretation of a few texts, tends to an externalism and a gross materialism in the handling of noble spiritual facts, the opposite and more usual view tends to dissolve all spiritual facts for a vast sea of symbolism, and this on a principle of interpretation by which any words in Scripture may be turned to almost any meaning. The usual expedient of seeking a view carefully limited between the two extremes and antagonizing both, seems scarcely feasible in this case. This is not the place to say more than that the truth will probably be found not between, but combining both—not so much rejecting either, as solvent and comprehensive of both in some higher range of thought.

MILLENNIUM (Lat. a thousand years' time) designates a certain period in the history of the world, lasting for a long indefinite space (vaguely a thousand years), during which the kingdom of Messiah will, according to tradition, be visibly established on the earth. The idea originated proximately in the Messianic expectations of the Jews; but more remotely, it has been conjectured, in the Zoroastrian doctrine of the final triumph of Ormuzd over Ahriman, and was connected by the Christians with the Parousia, or Second Coming of Christ. The notion of a golden age, preserved by the converts from heathenism to Christianity, as well as the oppression and persecutions to which they were long subjected by the state authorities, were naturally calculated to develop and strengthen such hopes. The chief basis of the millenarian idea in Judaism as well as in Christianity, however, is the ardent hope for a visible divine rule upon earth, and the identification of the church with that of which it is merely a symbol. In the 1st c. of the church, millenarianism (the Greek equivalent of which, chiliastia, from chilioi, a thousand, is the term employed by the fathers) was a widespread belief, to which the book of Daniel, and more particularly the pictorial predictions of the Apocalypse (chaps. xx. and xxi.), gave an apostolical authority; while certain prophetic writings, composed at the end of the 1st and the beginning of the 2d c.—such as the Testament of the Twelve Patriarchs, the Fourth Book of Esdras, the Revelation of Saint Peter, etc.; also the Christian Sibylline Books, the Epistle of Barnabas, the Shepherd of the Pseudo-Hermas, several Midrashim, Targums, and other works of a partly legendary character embodied in the Talmud—lent it a more vivid coloring and imagery. The unanimity which the early Christian teachers exhibit in regard to millenarianism, proves how strongly it had held of the imagination of the church, to which, in this early stage, immortality and future rewards were to a great extent things of this world as yet. Not only the heretic Cerinthus, but even the orthodox doctors—such as Papias, bishop of Hierapolis, Irenaeus, Justin Martyr, etc.—delighted themselves with dreams of the glory and magnificence of the millennial kingdom. The Sibylline Books, for instance, hold that the earth will be cultivated throughout its length and breadth, that there will be no more seas, no more winters, no more nights; everlasting wells will run honey, milk, and wine, etc., etc. Papias, in his collection of traditional sayings of Christ (Kuriâkôn Logion Ecêgeîn), indulges in the most monstrous representations of the rebuilding of Jerusalem, and the colossal vineyards and grapes of the millennial reign. Every vine will bear 10,000 branches, every branch 10,000 shoots, every shoot 10,000 spring—every spring 10,000 bunches, every bunch 10,000 berries, every berry 30 times 25 gallons of wine; and if a Saint come to pluck a berry, they will all cry out: "Pluck me, O Saint, I am better, and praise the Lord through me." The Talmud calculates the height of the throne of the millennial Messiah, or of Christ, at 3,00—9,000 cubits; the moon shall be, according to a prophetic dictum, like the sun; the sun shall be increased 343 times; and every Israelite will beget as many children as there were Israelites going out from Egypt—60,000. Each grape will be large enough to fill the biggest ship. Above all, however, the land of Israel will be free again, and the primitive worship restored with unheard-of splendor. "Such a chiliasm," Neander justly remarks, could only "promote a fleshly endaimonism;" and indeed ere long it called into more energetic activity the opposition of Gnostic spiritualism. According to the general opinion, which was as much Christian as Jewish, the millennium was to be preceded by great calamities, reminding us in some degree of the Scandinavian Ragnarök (or "Twilight of the Gods"). The personification of evil appeared in Antichrist, the precursor of Christ (identified, during 1st c., with Nero), who would provoke a frightful war in the land of Magog (Ezek. chaps. xxxviii. and xxxix.) against the people of Gog, after which the Messiah—some say a double Messiah, one the son of Joseph, vanquished in the strife; the other, the victorious son of David—would appear, heralded by Elias, or Moses, or Melchizedek, or Isaiah, or Jeremiah, and would bind Satan for a thousand years, annihilate the godless heathen, or make them slaves of the believers, overturn the Roman empire, from the ruins of which a new order of things would spring forth, in which the "dead in Christ" would arise, and along with the surviving saints enjoy an incomparable felicity in the city of the "New Jerusalem," which was expected to descend literally from heaven. To the innocence which was the state of man in Paradise, there was associated, in the prevalent notions of the millennium, the finest physical and intellectual pleasures.

In the Mosaic account of creation, we find the primitive ground for making the victorious era of the church last a thousand years. That account was regarded by the Jews and by the Judaic Christians as a type of the destines of creation. Now, by a strictly literal interpretation of the 4th verse of the 90th Psalm, it was supposed that a day of God was arithmetically equal to a thousand years; hence the 6 days of creation were
understood to indicate that the earth would pass through 6,000 years of labor and suffering, to be followed by a 7th day—that is, 1000 years of rest and happiness. In the Book of Revelation (chap. xx.) this view is presented. Still, the rabbinical traditions differ widely among themselves as to the duration of the happy period. Instead of 1000 years, some of them count 40, 70, 90, 365, 400, 600, 2,000, or 7,000, or so many years as have elapsed from the creation of the world or the flood. The Gospel of Nicodemus makes it 500 years, etc. In fact, the systems of apocalyptic chronology were of a varied and somewhat arbitrary cast; according as their originators laid greater stress upon the Apocalypse, the Book of Daniel, the Song of Songs, the Jewish "Gematria," or Computation of Letters—a very pliable art in itself—or on astronomy, astrology, "natural phenomena," and the like.

The lapse of time chilling the ardor of the primitive Christian belief in the nearness of the parousia had without doubt also the tendency to give a more shadowy, and therefore a more spiritual aspect to the kingdom over which the expected Messiah was to reign. The influence of the Alexandrian philosophy contributed to produce the same result. Origen, for example, first started the idea that instead of a perpetual opposition of paganism to Christianity—instead of a final and desperate conflict between the two—instead of an insolent triumph on the part of the saints, and a servile submission on the part of the unbelievers, the real progress and victory of Christianity would consist in the gradual spread of the truth throughout the world, and in the voluntary homage paid to it by all secular powers. This was an immense advance on the views previously entertained. It is owing largely to Origen and his disciple Dionysius that more spiritual conceptions of the millennium finally established themselves in the church; at all events, they furnished the fathers with the majority of their arguments. Yet even in the Egyptian church, millenarianism, in its most literal form, was widely diffused, and was only eradicated by the great wisdom and moderation of Dionysius. The Montanists (q.v.) generally, as might be expected from the enthusiastic tendencies of the sect, were extreme millenarians or chilists, and, being considered a heretical sect, contributed largely to bring chiliasm into discredit, or, at all events, their own carnal form of chiliasm, which Tertullian himself attacked. Caius, the presbyter, in his "Disputation" against the Montanist Proculus, traces its origin to the hated heretic Cerinthus, whom he accuses of forging a certain revelation, which he passed off as the work of an apostle. From his description of this revelation it is almost certain that it was a mixture of the Old and New Testament, and so it appears to have been. In the same historical judgment, Lactantius, in the cenotaph of the 4th c., was the last important church father who indulged in chiliasm, but while among its earlier advocates may be mentioned chiefly Nepos, Methodius, Korakion, Apollinar,us, Victorinus, etc. In the 5th c. St. Jerome and St. Augustine expressly combated certain fanatics who still hoped for the advent of a millennial kingdom whose pleasures included those of the flesh. But from this time the church formally rejected millenarianism in its sensuous "visible" form, although the doctrine every now and then made its reappearance, especially as a general popular belief, in the most sudden and obstinate manner. Thus the expectation of the last day in the year 1000 A.D. re-invested the doctrine with a transitory importance; but it lost all credit again when the hopes, so keenly excited by the crusades, faded away before the stern reality of Saracenic success, and the predictions of the Everlasting Gospel, a work of Joachim de Floris, a Franciscan abbot (died 1212), remained unfulfilled.

At the period of the reformation, millenarianism once more experienced a partial revival, because it was not a difficult matter to apply some of its symbolism to the papacy. The pope, for example, was Antichrist—a belief still adhered to by some extreme Protestants. Yet the doctrine was not adopted by the great body of the reformers, but by some fanatical sects, such as the Anabaptists and by the Theosists of the 17th century. During the civil and religious wars in France and England, when great excitement prevailed, it was also prominent. The fifth monarchical men of Cromwell's time were millenarians of the most exaggerated and dangerous sort. Their peculiar tenet was that the millennium had come, and that they were the saints who were to inherit the earth. The excesses of the French Roman Catholic Mystics and Quietists terminated in chiliasm views. Among the Protestants it was during the thirty years war that the most enthusiastic and learned chilists flourished. These may—broadly—be brought under the three chief heads of exegetical chilists, who, by some biblical dates, endeavored to compute the predicted time; alchemistic or eschatological chilists, who endeavored to hasten the appearing of the expected Messiah; and philosophical chilists, who endeavored to reduce the governments of the world to a biblical standard. See Anabaptists, MILLER, the awful suffering and wide-spread desolation of that time led pious hearts to solace themselves with the hope of a peaceful and glorious future. Since then the penchant which has sprung up for expounding the prophetical books of the Bible, and particularly the Apocalypse, with a view to present events has given the doctrine a faint semi-theological life, very different, however, from the earnest, practical faith of the first Christians. Among the foremost chilist teachers of modern centuries are to be mentioned Ezechiel Meth, Paul Felgenhauer, bishop Conenius (Luz in Tenebris, 1657); prof. Jurien (L'Accomplissement des Propheties, 1866); Serarius (Assertion du Regne de Mille Ans, etc., ab. 1670); Poiret (Economie Divine, 1687); J. Mede (Clav. Apocal. 1627); while Thomas Burnett and W. Whiston endeavored to give chiliasm a geological foundation, but with-
out finding much favor. Spener, on account of his Hofnung bessere Zeiten, has been accused of chiliasm; no less Joachim Lange (Licht und Recht); and Swedenborg employed apocalyptic images to set forth the transfigured world of the senses. Latterly, especially since the rise and extension of missionary enterprise, the opinion has obtained a wide currency that after the conversion of the whole world to Christianity, a blissful and gloriously world will ensue; but not much stress—except by extreme literalists—is now laid on the nature or duration of this far-off felicity. In fact, the common Christian conception of a millennium without a visibly present Christ, as held at the present day, is little different, so far as results are concerned, from the belief of philosophers in the perfectibility of the race. The essence of both conceptions is the cessation of sin and sorrow, the preva

lence of holiness and happiness. But this departs widely from the "ancient hope of the church"—a kingdom of visible majesty, with Jesus and the saints ruling the world from Jerusalem, the central city of the earth!

Great eagerness and not a little ingenuity have been exhibited by many persons in fixing a date for the commencement of the millennium. The celebrated theologian, Johann Albrecht Bengel (Erklaerte Offenbarung; Reden fürs Volk), who, in the 18th c., revived an earnest interest in the subject among orthodox Protestants, asserted from a study of the prophecies that the millennium would begin in 1836. This date was long popular. Bengel's general millenarianism was adopted by Oetinger (d. 1782), and widely spread throughout Germany in a more or less poetical form by Hahn, Crusius, Jung Stilling, Lavater, and Hess (Briefe über die Offen. Joh.). Some of the greatest of the more recent German theologians are millenarians, such as Rothe, Delitzsch, Hoffman, Kurtz, Hebart, Thiersch, Nitzsch, P. Lange, and Ebrard. Swedenborg, to whom reference has already been made, held that the last judgment took place in 1757, and that the new church, or "Church of the New Jerusalem," as his followers designate themselves—in other words, the millennial era, then began. In America, considerable agitation was excited by the preaching of one William Miller, who fixed the second advent of Christ about 1843. Of late years, the most noted English millenarian is Dr. John Cumming, who originally placed the end of the present dispensation in 1866 or 1867; but as that time drew near without any millennial symptoms, he was understood to have modified his original views considerably, and now conjectures that the beginning of the millennium will not differ so much after all from the years immediately preceding it, as people commonly suppose. See Corrodi's Kritische Geschichte des Chiliasmus (Zürich, 1794. 4 vols.); Calixtus, De Chiliasm cum antiqua tum pridem renato Hist. (1803, 4t0); Klee, Tentam Hist, crit. de Chil. prím. sec. Hrbrp. (1825); Münster, Dogmeengeschichte, etc. A really good history of chiliasm, however, is as yet a desideratum.

MILLEPEDE, a popular name of many kinds of myriapoda, of the order chilognatha, and chiefly of the families julidae (see JULIUS) and Polydesmida. In the latter family, the feet are arranged in numerous groups along both sides; otherwise, they much resemble the julidae. The largest species are found in warm climates, and some of them are brightly colored; but small species of both families are common in Britain; and some of them, as Polydesmus complanatus—which is lilac-colored, flattened, and from a quarter to half an inch in length—are very destructive to the roots of plants. Doubt has been expressed if they attack roots perfectly healthy; but at all events, they take advantage of incipient decay, and greatly extend and accelerate it. The application of salt, lime, nitrate of soda, etc., has been often recommended as a preventive of their ravages. The name Polydesmida is given to this order, from the Greek words polydesmoi, meaning "many feet." The family Chilognatha, to which the millipede belongs, is placed in the order Glomerida, which, when disturbed, roll themselves up into an almost globular form, like the crustacean called armadillo. Glomeris marginata is common in Britain, under stones and among moss. Some of the tropical species are large and finely colored.

MILLEPORE, a genus of hydrozoa which have recently been placed in a new subclass, hydroida, by Mr. Moseley. It contributes largely to the formation of coral reefs in the West Indies and Pacific. The calcareous skeleton is mostly in the form of laminar expansions having the surface studded with minute holes of two sizes, the larger being the fewest. The larger openings are the mouths of tubes which are divided by transverse calcareous partitions into a number of compartments, only the most superficial of which contain the animals. The smaller tubes are similarly constructed, and the general tissue of the skeleton is composed of trabecular traversed by a series of anastomosing canals which place the tubes occupied by the zooids in direct communication. On account of some resemblance in the skeleton the millepora were formerly classed with the tabulate corals. The late Prof. Agassiz was the first to examine the living animals, and he at once referred the genus to the hydrozoa. Mr. Moseley arrived at the same conclusion, and has recently had opportunities of examining the living animal minutely. According to him the colony of millepores consist of two kinds of zooids. The larger, or gastrozooids occupy the larger tubes of the skeleton, while the smaller, or dactylozooids occupy the smaller tubes, which are generally placed around the larger ones. The smaller zooids are the more numerous, and are long and slender, carrying on their sides numerous short, edentate tentacles. They perform the functions of prehension for the colony, and supply food to the stomach bearing gastrozooids, which perform the work of digestion and assimilation for the family. The nutritive fluid thus elaborated is distributed to the colony through branched
canals which ramify in every direction. The reproductive process is still unknown. See Invertebrate Animals.

MILLER, a co. in s.w. Georgia, drained by Spring creek, a branch of the Chattahoochee river, and intersected by the Atlantic and Gulf railroad; 260 sq.m.; pop. '80, 3,720—1893 colored. The surface is hilly and moderately productive; corn, oats, sweet potatoes, butter, molasses, and cotton, are the staples; of the last the annual yield is about 1700 bales. Chief town, Colquitt.

MILLER, a co. in s. Missouri, drained in the n. by the navigable Osage river; 600 sq.m.; pop. '80, 9,507—9,561 of American birth, 230 colored. Its surface is hilly and nearly equally divided between woodland and prairie; the timber including walnut and sugar-maple trees. In some sections, and along the river bottoms, the soil produces corn, wheat, oats, tobacco, and maple-sugar; and five stock is raised to some extent. The Osage river furnishes water-power, and lead and iron are mined. Lumber is manufactured. Capital, Tuscumbia.

MILLER, CINCINNATI, HEINE (JOAQUIN MILLER), b. Ind., 1841; while still a boy was taken to Oregon by his parents, and practiced mining in California. He now led an adventurous life, beginning as a volunteer with gen. Walker's Nicaragua expedition in 1855; continuing among the Indians of the Pacific coast; and concluding with his appointment to a county judgeship in Oregon in 1866. In 1860 he had made some attempts at the law; and in the following year edited a paper at Eugene City, Or., which was suppressed by the authorities for disunion sentiments. In 1870 he visited the eastern states, and thence went to England; where, in the following year, he published his Songs of the Sierras, which caused him to be accepted for a time as a "lion" in London society. The poems contained in this volume had previously been published in the United States, where they had made very little impression. Mr. Miller afterwards published other volumes of poetry, and achieved a considerable reputation. He is the author of The Danutes, which was successful in the United States and England.

MILLER, EDWARD, 1760–1812; b. Del.; son of the rev. John Miller, who was settled over a Presbyterian society in Dover, Del., 43 years, and brother of Samuel Miller, D.D., late professor in the theological seminary at Princeton, N. J. Having acquired a classical education, he attended a course of medical lectures at the university of Pennsylvania and had a year's experience at the military hospital at Baskingridge, N. J. He was surgeon's mate in the U. S. army in 1780, and in 1782 crossed the ocean as surgeon of a French ship of war. Retiring to private life in 1783, he had a successful practice in Frederick, Del., and in Maryland. In 1788 he received the degree of M.D. from the university of Pennsylvania. In 1797, associated with Dr. Samuel L. Mitchill and Elihu N. Smith, he established the Medical Repository in the city of New York, the first American medical journal, and was connected with it at the time of his death, witnessing the publication of the 14th vol. and a part of the 15th. He and his coeditors were members of the Friendly club, whose list bore the names of Dunlap, Brown, Bleeker, and Kent. In 1803 he was appointed city physician of New York. He was a member of the American philosophical society, and published a Treatise on the Yellow Fever of New York in 1805, taking the ground that it was not contagious. He was connected with the University of New York in 1807 as professor of the theory and practice of medicine, and in 1809 with the New York hospital as clinical lecturer. He was very popular in the profession and had a large acquaintance. He was associated with his brother Samuel in his Brief Retrospect of the Eighteenth Century. He advocated temperance principles, and deprecated the use of tobacco. In 1814 a memoir of him was published by his brother Samuel in connection with his medical works; and in the American Medical and Philosophical Register has appeared a biographical notice by John W. Francis, M.D., of New York. He was distinguished for his learning as a scholar, his generosity and humanity as a physician, and held a high rank among American men of science.

MILLER, HENRY, 1751–1884; b. Penn.; originally intending to practice law, he became a member of the bar, but before becoming established the revolutionary war broke out and he left for the rendezvous with a lieutenant's commission, and marched with his company to Boston. He was soon promoted to col. of the regiment, and led his command in the New Jersey campaign. At the battle of Monmouth, June 28, 1778, between the American forces under Washington and the British under sir Henry Clinton, he had two horses shot under him, and he bore a record for dauntless bravery through the war. He was at one time quartermaster-gen., and at the close of the war turned his attention to mercantile pursuits, doing business in Baltimore. In the second year of the war of 1812 he held the position of brig. gen., commanding the defenses at Baltimore. On the restoration of peace he was appointed, among other offices of trust under government, to be superintendent of revenue for the district of Pennsylvania.

MILLER, HENRY, 1800–74; b. Ky.; studied medicine in Lexington with the celebrated surgeons Dudley and Caldwell, and, having taken his degree of M.D., commenced the practice of medicine in Glasgow, pursued it in Harrodsburg, and finally, in 1835, settled in Louisville as professor of obstetrics and diseases of women and children in the university school of medicine. He made frequent contributions to the prominent medical journals, and was much respected by the profession. In 1849 he published Human
Parturition, and in 1858 The Principles and Practice of Obstetrics, the latter work being a revision of the former enlarged and rewritten, adding the views of Dubois, Cazeaux, Simpson, W. Tyler Smith, and others to his own valuable experience, and giving the results of the obstetric schools of America, Paris, London, and Edinburgh—adapting the knowledge so gained to the wants of students. In 1859 he was elected president of the American medical association, and afterward professor emeritus in the Louisville medical college.

MILLER, HOMER V. M., b. Pendleton co., S. C., 1814; studied medicine at the state medical school of South Carolina, and graduated with high honors in 1835. He then spent three years in the further study of his profession in Paris, began practice in Cassville, Ga., and soon became known not only as a very skillful physician, but also as a public speaker and propagator of education and religion. He occupied a medical professorship at both Memphis, Tenn., and Augusta, Ga.; at the outbreak of the civil war became a surgeon in the confederate army, and was promoted to the rank of division surgeon and then medical director of the Georgia military department. From 1865 to 1869 he was a professor in the Atlanta medical college, and now resides in that city. In 1869 he was elected U. S. senator from Georgia to fill an unexpired term, and took an active part in the acceptance by the state of the reconstruction acts.

MILLER, HUGH, a distinguished geologist, was b. in Cromarty, in the north of Scotland, Oct. 10, 1803. He was descended from a family of sailors, and lost his own father by a storm at sea when he was only five years of age. In consequence of this misfortune he was brought up chiefly under the care of two of his mother's uncles, one of whom ("uncle Sandy") imbued him with a taste for natural, and the other ("uncle James") for traditional, history. He acquired a good knowledge of English at the Cromarty grammar-school. Before his 11th year he had read those glorious romances of childhood, Jack the Giant-Killer, Jack and the Beanstalk; Sindbad the Sailor, The Yellow Dwarf, and Aladina at the Wonderful Lamp, besides other of his beloved literary pretensions. As he grew older he became extremely fond of the great English poets and prose writers. From his 17th to his 34th year he worked as a common stone-mason, devoting his leisure hours to independent researches in natural history, and to the extension of his literary knowledge. In 1839 he published a volume entitled Poems written in the Leisure Hours of a Journeyman Mason, which was followed, a few years afterwards, by Scenes and Legends of the North of Scotland. His attention was soon drawn to the ecclesiastical controversies which were agitating Scotland, and his famous Letter to Lord Brougham on the "Auchterarder case" brought him prominently into notice. In 1840 he went to Edinburgh as editor of the Witness, a newspaper started in the interest of the non-intrusion party in the church of Scotland, and in the course of the same year published in its columns a series of geological articles, which were afterwards collected under the title of The Old Red Sandstone, or New Walks in an Old Field. These articles were very remarkable, both in a scientific and literary point of view. They contained a minute account of the author's discovery of fossils in a formativ which believed, until then, to be destitute of them, and written in a style which was a harmonious combination of truth, beauty, and polish. At the meeting of the British association in the same year (1840) he was warmly praised by Murchison and Buckland, and in fact his discoveries were the principal topic of discussion among the savans. His editorial labors during the heat of the disruption struggle were immense, and so seriously injured his health that for some time he had to give up all literary activity. About 1846 he resumed his pen, and became the most vigorous and eloquent writer in the service of the newly constituted free church. After ten years of hard, earnest, fagging toil his brain gave way, and in a moment of aberration he put an end to his own existence, at Portobello, near Edinburgh, on the night of the 23d or morning of the 24th Dec., 1856. Miller's principal works, besides those already mentioned, are: First Impressions of England and its People; Footprints of the Creator, or the Asteropeia of Stromness, designed as a reply to the Vedutes of the Natural History of Creation; My Schools and Schoolmasters, or the Story of My Education; and Tom Bowling of the Rocks, the last of which is an attempt to reconcile the geology of the Pentateuch with the geology of the rocks, by the discovery of the lost chapter of Genesis, the first chapter of Genesis do not represent the actual duration of the successive periods of creation, but only the time occupied by God in unrolling a panoramic vision of those periods before the eyes of Moses.

Miller's services to science have undoubtedly been great, but he is even more distinguished as a man than as a savant. Honest, high-minded, earnest, and hugely industrious, a true Scot, a hearty but not a sour Presbyterian (for he loved Burns as much as he revered Knox), there are few of whom Scotland has better reason to be proud than "the stone-mason of Cromarty." Besides his autobiography quoted above, see Life by Peter Bayne (2 vols., 1871).

MILLER, JAMES, 1778-1851; b. N. II.; was educated for the bar, but when not far from 30 years old entered the army as maj. and took part in the frontier warfare, where he displayed great gallantry. In 1812 he was made col. by brevet, and in 1814 took part in the Canadian invasion in command of the 21st infantry. In the battles of Chippewa and Lundy's Lane he did material service. The latter contest was virtually decided by his gallant charge on a British battery. These services were recognized by congress: a
gold medal was presented him, and he was promoted to the rank of brig-gen. From 1819-25 he was governor of Arkansas, then a territory; and from that time until he reached the age of 73 was collector of the port of Salem, Mass.

MILLER, JOAQUIN. See MILLER, CINNATIUS HEINE.

MILLER, JOSEPH, 1684-1738, an English actor of low comedy, whose name can be found in the casts of Congreve's plays. He was noted for his wit off as well as on the stage, and his name was given to a collection of jokes printed by one John Motley in 1739. The term "a Joe Miller" is now in common use to denote an ancient or stale witicism. The tomb of the original Joe Miller may still be seen in St. Clement's churchyard in the Strand, London.

MILLER, PATRICK, 1730-1815; b. Dalwinston, Scotland. A man of wealth and of a mechanical turn of mind, he began in 1785 to experiment in the construction and propulsion of a vessel in a lake near his estate, and in 1788 gave an account of a vessel which he had made, maintaining in a pamphlet that the steam-engine could be made to work the wheels. With the aid of James Taylor he propelled a boat 5 m. an hour by the steam-engine. But for some reason the experiment was unsatisfactory, and was abandoned.

MILLER, SAMUEL, D.D., 1769-1850; b. Delaware, son of the rev. John Miller, who was a native of Boston and pastor of the Presbyterian church at Dover, Del. The son was graduated at the university of Pennsylvania in 1789 with the highest honors of his class; commenced the study of theology with the guidance of his father and finished the course under Dr. Neshit, at Dickinson college; was licensed to preach in 1791; in 1793 was colleague pastor with Drs. McKnight and Rogers, of the first Presbyterian church, New York city, and afterwards of the Wall street church until 1813. He was active in establishing the theological seminary at Princeton, N. J., in which he was professor of church history and government from 1813 till his death. His admirable natural qualities of person, mind, and heart were highly improved by assiduous culture. His manners were remarkably dignified and urbane. In character and attainments he was eminently qualified to be one of the founders and builders of a theological school, and his influence, combined with that of his distinguished colleague Dr. Archibald Alexander—the one being an admirable complement to the other—on successive classes of students can hardly be over-estimated. His preaching was luminous and earnest, his lectures were learned, catholic, enthusiastic, and enlivened with wit and literary grace. He was prominent in the councils of the Presbyterian church. Among the many works which he published may be mentioned: Letters on the Constitution and Order of the Christian Ministry; Letters on Unitarianism; On the Eternal Sonship of Christ; Clerical Manners and Habits; On the Utility and Importance of Creeds and Confessions; On the Office of Ruling Elder; On Baptism; Letters from a Father to his Son in College; Thoughts on Public Prayer.

MILLER, THOMAS, 1807-74; b. Gainsborough, Lincolnshire, Eng. At first a farmer's boy, then a basket-maker, he spent his leisure in study, and wrote pieces in poetry and prose on rural life and scenery, which attracted attention, and were noticed with favor by Moore, Campbell, and Rogers. By the help of Rogers he became a bookseller. His principal novels are Rosyon Gover; Fair Rosamond; Lady Jane Grey; Gideon Gils the Roper; Godfrey Malvern. Among his popular books are those pertaining to the country, including A Day in the Woods; Beauties of the Country; Rural Sketches; Pictures of Country Life; Country Scenes. His poems are entitled, Common Wayside Flowers; Poetical Language of Flowers; Original Poems for my Children; Songs for British Riflemen. He wrote also a History of the Anglo-Saxons, and Lives of Turner, Beattie, and Collins.

MILLER, WILLIAM, 1781-1849; b. Mass.; served during the war of 1812 as a volunteer with the rank of captain, on the Canadian frontier. He was a farmer, and his education limited, but he applied himself to the study of the prophecies, and in 1833 began to lecture on the second coming of Christ, and to predict the destruction of the world in 1843. The very day was named either by himself or by his followers. For 10 years he continued his prophecies, and his converts in the United States, Canada, and Great Britain, called Millerites, Adventists, or Second Adventists, were estimated at 50,000. In consequence of the repeated failure of his predictions his followers gradually forsook him. They, however, regarded him as a man of more than ordinary intellectual power, a cool and honest reasoner, and a sincere devoted Christian. This may be conceded, though he evidently was a blind and ignorant guide.

MILLER, WILLIAM ALLEN, 1817-70; b. England, was a student first at the merchant tailor's school, and having served five years in apprenticeship to his uncle, who was hospital surgeon at Birmingham, took his degree at King's college, London, studying chemistry with Dr. Daniell, under whose direction he investigated the electrolysis of salts. He afterward went to Giessen and studied in the laboratory of Liebig. In 1840 he became demonstrator of chemistry in King's college, London, and in 1845 professor of chemistry there. He has contributed valuable scientific articles to medical and philosophical journals, and in 1851 was appointed assayer at the mint and bank of England, and water commissioner. He was elected president of the chemical society, and vice
president of the royal society; and published in 1850 Elements of Chemistry, Theoretical and Practical.

MILLER, WILLIAM HALLOWES, b. in 1801 in Carmarthen, Wales; educated at St. John's college, Cambridge, and after graduating in 1826, became a fellow and tutor of the college; in 1833 was appointed professor of mineralogy; in 1838 was elected a fellow of the royal society, and since has been elected a member of all the great scientific and philosophical societies of Europe and America. From 1845 to 1854 prof. Miller was engaged as member of a government commission in replacing the standards of weight and measure, which had been destroyed by fire, taking as his share of the work the standard of weight; in 1867 he was again placed on a commission to examine the exchequer standards, and in 1867 on the "commission internationale du metre". The reports of these bodies all gave the credit of their success in great part to prof. Miller's accuracy and scientific experience. He was one of the first to employ the Wallaston goniometer in measuring the angles of crystals, and among his many contributions to the Proceedings of the Royal Society, and other scientific publications, are several articles on the subject of crystallography. In 1865 the degree of LL.D. was bestowed upon him by Dublin university, and in 1876 Oxford made him a doctor of civil laws; he was for 17 years secretary of the royal society.

MILLERITES. See ADVENTISTS, ante; SEVENTH DAY ADVENTISTS; MILLER, WILLIAM.

MILLER'S FALLS, a village in Massachusetts, partly in the township of Montague and partly in Erving, in the county of Franklin. It was originally called Grout's Corners; and is pleasantly situated on Mill river, which lends valuable water power near the point where it empties into the Connecticut. It is at the junction of the New London Northern and the Vermont and Massachusetts railroads. It has extensive factories, where tools are made; and it has an increasing trade.

MILLER'S THUMB. See BULLHEAD.

MILLET, a grain, of which there are several kinds, the produce of species of panicum, setaria, and allied genera. The genus panicum contains many species, natives of tropical and warm temperate countries, and some of which, as Guaranee grass (q.v.), are amongst the largest fodder grasses. The flowers are in spikes, racemes, or panicles; the glumes very unequal, one of them often very minute; each spikelet containing two florets, one of which is often barren. The genus setaria has a spike-like panicle, with two or more bristles under the glumes of each spikelet. Common Millet (panicum millaceum) is an annual grass, 3 or 4 ft. high, remarkably covered with long hairs, which stand out at right angles. It has a much branched nodding panicle; the spikelets are oval, and contain only one seed. It is a native of the East Indies, but is extensively cultivated in the warmer parts of Europe and other quarters of the world. It succeeds only in those climates in which wine can be produced. It is called varree, cheena, and kadi-kane in India. The grain, which is very nutritious, is only about one-eighth of an inch in length. It is used in the form of groats, or in flour mixed with wheat-flour, which makes a good kind of bread; but bread made of millet alone is brittle and full of cracks. Poultry are extremely fond of millet. The straw is used for feeding cattle. Other species, P. miliarum, P. verticillatum, P. distichum, and P. scrobiculatum, are cultivated in different parts of India, chiefly on light and rather dry soils, yielding very abundant crops. German Millet, or Mohar (setaria Germanica), and Italian Millet (S. italicum), regarded by many as varieties of one species, and probably originally from the east, although now naturalized in the south of Europe, are cultivated in many of the warmer parts of Europe, in India, and other countries. Italian millet is 3 or 4 ft. in height; German millet much dwarfer, and its spike comparatively short, compact, and erect; and less valuable as a corn-plant. The grains of both are very small, only about half as long as that of common millet; but they are extremely prolific, one root producing many stalks, and one spike of Italian millet often yielding 2 oz. of grain. The produce is estimated as five times that of wheat. Italian millet is called koongonie, kala-kangree, and kora-kang in Indin. The grain of these millets is imported into Britain for feeding cage-birds, and for use as a light and pleasant article of food, although for this purpose it is little used in Britain, whilst it is very extensively used in soups, etc., in the south of Europe. It does not make good bread. To the same tribe of grasses belong the genera paspalum, panicetum, penicillaria, digitalia, and milium-species of which are cultivated in different parts of the world for their grain. Rassalum exile is the fundi (q.v.) of Africa; and P. scrobiculatum is the koda of India, where it is cultivated chiefly on poor soils. Penicillaria speciosa, or panicetum typoidium, is very extensively cultivated in Africa, and to a considerable extent in India. Its cultivation has been introduced into the south of Europe. It succeeds best on light soils. Its Indian name is bijve. It often receives the names EGYP'TIAN MILLET and GUINEA CORN. It has a somewhat spiked cylindrical panicle. Panicetum distichum abounds in central Africa, on the southern borders of the Great Desert, where it is called uzok, and is described by Barth as causing much inconvenience to the traveler, the little bristles which are attached to its seeds making them stick like burs to the clothes; they also pierce the skin, and cause sores, so that it is necessary to be provided with small pincers for their extraction, and none even of the wild roving
natives is ever without such an instrument. But its seed is a common and pleasant article of food, in some places the principal food of the people, and a pleasant beverage is made from it. *Digitaria sanguinalis* is called Polish Millet, being cultivated in cottage gardens in Poland, where the grain is used like rice. It is a common grass in many parts of Europe, although very rare in Britain. The spikes in this genus are compound, and from their appearance give it the names *digitaria* and *finger-grass*. The Millet Grass (*Echinochloa effusum*) of Britain, occasionally found in shady woods, is a very beautiful grass, 3 or 4 ft. high, with a spreading pale panicle of small flowers; and has been much recommended for cultivation as a forage grass, and for the sake of its very abundant small seeds, an excellent food for game. Another species of the same genus (*M. nipponica*) is the *Matsue de Guine* of Peru, where its seeds, after being dried by heat, and ground into a very fine flour, a pleasant article of food; and a beverage called *ullpa* is made from them. The name Indian Millet is sometimes given to *durra* (q.v.), but it belongs to a different tribe of grasses from the true millets.

**Millet, Amé**, b. in Paris about 1816; son of a distinguished French painter; after studying painting under his father he studied sculpture under David d’Angers, and has become famous. Imaginative busts, female figures, busts of distinguished men, and lastly colossal figures for bronze, have indicated his genius from the commencement of his career. "L’Ariane," a female figure exhibited in 1857, regarded as one of his greatest works in marble, was bought by the government. His statue of "Mercure" for the court of the Louvre, exhibited in 1859, and "Vercingetorix," a colossal statue in bronze, finished in 1865, are among his later best works. "Apollo," the statue which crowns the grand opera house of Paris, is by him. Millet’s scientific knowledge of the human form is said to equal his grace and skill in its molding.

**Millet, Jean François**, 1815–75; student of painting with Delaroche in Paris. He commenced exhibiting pictures in 1844 with *la Laitière et la Légion d’Équitation*; in 1845 exhibited *Édipe détaché de l’Arbre*; in 1848 *les Juifs à Babyloine*. From that time a marked change came over his style, and from methods of representation distinguished for rough vigor, he became painter of pastoral pieces of the greatest refinement of thought and execution. Of this class are the *Sémeur, La Paysanne Assis*, and *Les Botteleurs*, exhibited in 1849 and 1850. He has since become one of the greatest landscape painters in France by representations of field, peasant, and animal life the most quiet, simple, and noble. Among these are the *Berger Moissonneurs, Tondeurs de Moutons*, 1852; *Paysan se Rposant sur sa Houe*, 1863; *Bergère avec son Tronpeau*, 1864; and *Femme Battant le Beurre*, 1870. All his works are favorite subjects for engravings, and have thus become familiar works everywhere.

**Millet, Pierre**, 1631–1708; a French missionary who died in Quebec. He came to America in 1666, and labored among the Onondagas and Oneidas till 1684. Afterwards chaplain at Ft. Frontine (Kingston, Canada), from which he was lured, and taken prisoner by Indians in the service of the English. The Christianized Oneidas adopted him into their tribe, much to the chagrin of the English governor of New York, who was suspicious of his French influence with the Indians. The French governor of Canada was quite content with the situation. The narrative of his captivity was preserved and published in New York in 1805.

**Millier.** See Metric System.

**Mili, Giannina**, b. in 1828 in Italy. When but a child she began to practice the composition of verses, and when a girl of seventeen or eighteen became a pupil of the poet Regaldi, the greatest of Italian improvisators, and soon developed considerable power in improvising popular and amatory verses. As is the custom with artists of this class, she traveled and gave public exhibitions of her skill in various parts of Italy and Sicily. Medals of gold and silver were awarded her, and after her trips through Tuscany and upper Italy (1857–60) a pension was bestowed upon her by Garibaldi. Since that time she has been engaged as instructress and superintendent in the schools of Naples and Rome. A number of her best efforts have been collected and published.

**Milligham.** See Metric System.

**Millister.** See Metric System.

**Millimeter.** See Metric System.

**Millbind, or Fer de Moulin, in heraldry, a charge meant to represent a milliron, originally a mere variety in designating the cross moline, but accounted a distinct charge by some heralds.

**Mills, a co. in s.w. Iowa; drained by the Missouri, which bounds it on the w., and by the Nishnabotena river and Keg creek, and intersected by the Kansas City, St. Joseph and Council Bluffs, and Missouri River railroads; 460 sq. m.; pop. ’80, 14,135—12,860 of American birth. The surface is in great part prairie, but there are extensive woodlands. Hay, wheat, oats, Indian corn, and pork are the chief products. Co. seat, Glenwood.

**Mills Charles, 1788–1825; b. near Greenwich, Eng.; admitted to the bar in 1809, but devoted himself chiefly to historical study. He is the author of History of Moham-
MILLIS, Clark, b. in Onondaga co., N. Y., 1815, of poor parents; learned the trade of plasterer; and practiced it in Charleston, S. C., for nine years. Developing a taste for sculpture, in 1846 he completed a bust of John C. Calhoun, which was purchased by the city of Charleston for the city hall. In 1848 he furnished a design which was accepted, for an equestrian statue of gen. Jackson, to be placed in Lafayette square, Washington. There being no bronze-foundry for such work in the United States, Mills, after spending two years in modeling the statue, set to work to learn the art of such castings, and erected in Washington an experimental foundry, where, after many mishaps and trials he at last succeeded in Oct., 1852, in producing a perfect cast. It was accepted formally Jan. 8, 1853—the anniversary of the battle of New Orleans. Congress made an extra appropriation of $30,000 to cover his losses, and remunerate him for his time. He was next engaged on the colossal equestrian statue of Washington, which was formally received Feb. 22, 1860. For this he received $50,000. Mr. Mills's last great work was the casting of the colossal statue of Liberty, finished in 1863, which crowns the dome of the city at Washington. This was modeled by Crawford. There has been much harsh criticism of Mills's equestrian statues. Doubtless the work of one without schooling in the great art of sculpture compares unfavorably with that of masters. But there are now enough poor works in the United States by those who have had the highest advantages to show that Mills had the genius for great and good work. He was always costly in endeavoring to render his subjects too striking, too expressive. This is especially the case with the statue of gen. Jackson, in which the horse is made to balance reared on its hind feet, and the gen. appears equally excited. Continued through many decennial periods, the pose becomes ridiculous.

Mills, Samuel John, Jr., 1783-1818; b. Conn.; graduated at Williams college in 1809. While in college he formed an association among those students who were considering the question of entering upon foreign missionary work. After spending a short time in the study of theology at New Haven, he entered Andover theological seminary in 1810, where, being deeply impressed with the importance of foreign missions, he endeavored to awaken the same spirit among his fellow students. With Judson, Hall, Newell, and Nott he united in a memorial to the General association of Massachusetts (Congregational), which resulted in the formation of the American board of commissioners for foreign missions. He was licensed to preach in 1812, and spent two years in mission work in the southern and western states with Messrs. Schermerhorn and Smith. On his return he was ordained June 21, 1815. He published an account of his tour. Finding great destitution of the Bible in those states, he suggested at the close of his report the formation of a national Bible society, which resulted in the organization of the American Bible society. To him was due the formation of the United foreign mission society, and also the African school at Parsippany near Newark. Through his exertions in conjunction with Dr. Finley, the American colonization society was formed in 1817, and he was associated with Dr. Burgess to visit England in behalf of the society, and to explore the west coast of Africa for a suitable colony for a colony of colored people from America. He sailed in Nov., 1817, and wonderfully escaped shipwreck on the coast of France. Embarking from England for Africa Feb. 2, 1818, he arrived on the coast Mar. 12. After faithfully exploring it, he embarked for the United States in the brig Success May 22, 1818. Having taken a severe cold which was followed by fever, he died at sea June 16. He is called the "father of foreign missions in America." A memoir of him was published by the Rev. Dr. Gardiner Spring.

MILLSTONE. See Buur-stone, ante.

MILLSTONE GRIT, a species of conglomerate composed of silicious sand and small pebbles. It is named from its frequent use for millstones in England. Its geological position is at the commencement of the coal formation or the terrestrial period. The beds along the Appalachian range in Pennsylvania are very coarse and are over 1200 feet thick. The rock here is a light-colored silicious conglomerate, interstratified with some sandstone, and thin beds of carbonaceous shells. In Virginia the beds are sometimes 1000 feet thick, but here it is principally sandstone, containing, however, deep beds of conglomerate. In Alabama the rock becomes quartzose, is of great thickness, and is used there for millstones. Millstone grit also extends into the southern tier of counties in New York, sometimes attaining a thickness of 50 or 60 feet. In Cattaraugus and Alleghany counties it has a cuboidal structure, which in the course of time has had portions worn and washed away leaving large blocks standing alone, and having various shapes which have suggested such names as "Rock city" and "Pulp city." Fossil plants found in the formation are ferns, calamites, lepidodendrons, and sigillaria.

MILLOTOWN, a v. in Washington Co., Maine, on the St. Croix river. The chief business is the manufacture and shipment of lumber. It is on the St. Croix and Penobscot railroad, and is a part of the city of Calais.

MILLOTOWN, a t. in Charlotte co., New Brunswick, on the St. Croix river, opposite Milltown, Maine. Pop. 2,000. It has 8 churches, a library, and an academy. The principal business is the sawing and shipment of lumber, of which great quantities are sold.
exported. There is also a tool-factorv. The St. Croix river is here spanned with several bridges.

MILLVILLE, a city in s. New Jersey, on the West Jersey railroad; pop. 70, 6,101.
It is at the head of navigation on the e. bank of the Maurice river 40 m. from Philadelphia and 6 m. s. of Vineland; in a fine agricultural region, with a large local trade. It contains a fine city hall and post-office, 9 churches, a national bank, 4 hotels, and 2 weekly newspapers. Its leading industries are manufactures of lumber, cotton, iron, window glass, and hollow glass-ware. Water and gas pipes are made, and turbine water-wheels; immense wheels for water-works being exported to northern cities. It has excellent public schools.

MILMAN, HENRY HART, D.D., an English poet and ecclesiastical historian, was the youngest son of sir Francis Milman, physician to George III., and was b. in London, Feb. 10, 1791. He was educated at Eton, and afterwards at Brasenose college, Oxford, where he took the degree of m.a., obtained the Newdegate prize in 1812, published Fazio, a Tragedy (which was successfui brought upon the stage at Covent garden), in 1815, took orders in 1817, and shortly after was appointed vicar of St. Mary's, Reading. In the following year appeared his Sanmof, Lord of the Bright City, an Heroic Poem, which was followed in 1820 by the Fall of Jerusalem, a beautiful dramatic poem, with some fine sacred lyrics interspersed. In 1821 Milman was chosen professor of poetry at Oxford, and published three other poems in the course of the same year—The Martyr of Antioch, Belsazar, Anne Boleyn. His Sermons at the Bampton Lecture appeared in 1827, and his History of the Jews (8 vols.) in 1829. The last of these works did not bear the author's name; it was written in so liberal and tolerant spirit that occasion of the stricter sort could hardly fail to be offended. Its weak point was a want of adequate learning, especially in the department of biblical criticism. A new edition, greatly improved and more critical, yet still far from being very accurate or built on solid foundations, with an interesting pre face, was published in 1863. In 1840 appeared a collected edition of his Poetical Works, containing some other pieces besides those already mentioned. The same year witnessed the publication of his History of Christianity from the Birth of Christ to the Abolition of Paganism in the Roman Empire (3 vols.). In 1849 he was made dean of St. Paul's; and in 1854 published his masterpiece, History of Latin Christianity, including that of the Popes to the Pontificate of Nicholas V. (3 vols.). It is a work of great learning, liberality, and chaste nd eloquence; it displays a broad grasp of human nature in its religious workings: besides a philosophic and poetical sympathy with the different men and opinions which it reviews. The work secured for its author a position in the first rank of English historians. Milman edited Gibbon, and contributed extensively to the Quarterly Review. He died in 1868. A posthumous work contains his Essays on St. Paul, Savonarola, Erasmus, etc.

MILMORE, MARTIN, b. Mass., 1845; began his studies in sculpture under the direction of Thomas Ball. His first effort which attracted public attention was his modeling of the alto-relief Phosphor, an ideal subject, which gained the favor of patrons of art. He produced a statuette of Devotion, and was given commissions for an ideal of Miranda, and the busts of George Ticknor, Long fellow, gen. Thayer, and others. In 1864, and in that year he commenced work on the granite statues surmounting the front of Horticultural hall in Boston, and those of Flora and Pomona, ornamental figures, which were placed in position in 1866. In the following year he designed a bronze statue for the soldiers' monument at Forest Hill cemetery, Boston highlands, and was the sculptor of the army and navy monument on Flagstaff hill, Boston common, 90 ft. in height, erected at a cost of $75,000, dedicated Sept. 17, 1877. On the four sides of the plinth are bronze mezzo-relievoles, one representing the departure of troops, one symbolical of the sanitary commission, another the return from the war, and the fourth to commemorate the achievements of the navy, the departure, and the naval engagement. Above this plinth, 9 ft. high, rises a shaft of white Maine granite of the Roman-Doric order, surmounted by a bronze ideal statue of the genius of America. Bronze figures representing peace, history, the army, and the navy stand on the pedestals at the four corners, and about its base are grouped figures in alto-relievo representing the four sections of the union, north, south, east, and west.

MILNE, WILLIAM, D.D., 1789-1822: b. England. In 1813 he visited China under the London missionary society, traveled extensively in China, Malacca, and other islands of the Indian archipelago. In 1815 he went as missionary to Malacca, translated the Scriptures, superintended the publica- tion of religious works and of a monthly magazine, and presided over the Anglo-Chinese college on which Dr. Morrison had bestowed much labor. He also took part in translating the Old Testament into Chinese, and established a quarterly publication entitled Indo-Chinese Gleaner. He published Retrospect of the Protestant Mission to China.

MILNE-EDWARDS, HENRI, the most eminent living representative of the French school of natural history, was born at Bruges in 1800. His father was an Englishman. Milne-Edwards studied medicine at Paris, where he took his degree of m.d. in 1823, but abandoned medicine to devote himself to natural history. He was first appointed professor of natural history in connection with the Lycée Henri Quatre, and afterwards to the
Museum and the Faculté des Sciences, of which he is now president. In 1888, he was elected a member of the Academy of Sciences (section of Anatomy and Zoology); and in 1854 was chosen a member of the Académie de Médecine. He is also a member of many other societies, French and foreign, and a commander of the Legion of Honor. Milne-Edwards is distinguished for his extensive knowledge of comparative anatomy and physiology well as of zoology. Passing over some of his early works, which, though valuable, are thrown into the shade by his later ones, we come to his Monograph on the Crustacea (1837-44). In this epoch-making work of precise scientific method, not only the correctness of detail, but also for the value of the general doctrines relating to homologies, development, geographical distribution, and other points of the highest physiological interest. In 1840, an improved edition of his Elements of Zoology, a work in 4 vols., and containing 600 illustrations, began to appear. In 1841 he published his researches on the Compound Ascidian Mollusca, which have led to an entirely fresh appreciation of some of the most important points in the history of that group, such as, that propagation by gemmation, which had been previously supposed to be a zoophytic character, is equally true of the lower mollusca. In other departments of science, Milne-Edwards has been equally successful; but it is to the invertebrate animals that his chief attention has been given, and in each of the three Cuvierian sub-kingsoms, Articulata, Mollusca, and Radiata, his researches have been so important, that what he has accomplished for either alone would suffice to establish for him a high scientific reputation. In 1856 Milne-Edwards obtained the Copley Medal of the Royal society of London. His later works include Lectures on Zoology and on the Comparative Anatomy of Men and Animals (1855-57); History of the Mammalia (1872, et seq.); etc.

MILNER, JOHN D.D., 1732-1836; b. London; educated at Edgbaston and Douai; took orders, and in 1779 had charge of Winchester chapel. Though a zealous Roman Catholic he refused to join in the attempt in 1788 and 1791, to obtain from parliament the repeal of the laws against the Roman Catholics. He was devoted to the study of archæology, in which he published several works, for which he was admired, although there can be no doubt as to the narrowest kind of the royal antiquarian society. He was engaged in several religious controversies both with Protestant theologians and the Roman Catholic clergy. In 1808 he was appointed vicar-apostolic of the midland district and bishop of Cashel. His chief publications are History Civil and Ecclesiastical, and Survey of the Antiquities of Winchester, 2 vols.; The End of Religious Controversy; Letters to a Prebendary; A Dissertation on the Modern Style of Altering Cathedrals; Treaties on the Ecclesiastical Architecture of England during the Middle Ages; Divine Right of the Episcopacy; Notes on Ireland. His works are numerous, but none are more highly valued by Roman Catholics than his End of Controversy and Letters to a Prebendary. He was a man of great learning and acuteness.

MILNER, ISAAC, an ecclesiastical historian who once occupied a respectable place in literature, was born near the town of Leeds, in Yorkshire, Jan. 2, 1744. He studied at Catharine Hall, Cambridge, where he took the degree of B.A. in 1766, and afterwards became head-master of the grammar-school at Hull. In this capacity, his success was very great. Shortly after, he was appointed lecturer in the principal church of the town, and in 1797, vicar of Holy Trinity church. He died Nov. 15th of the same year. Milner's principal work is his History of the Church of Christ, of which he lived to complete 8 vols., reaching to the 13th c. (1794); a fourth volume, reaching to the 16th c., was edited from his MSS. by his brother Dr. ISAAC MILNER, dean of Carlisle, who also published a complete edition of his brother's works in 8 vols., 1810. The principles on which the History of the Church of Christ is written are of the narrowest kind; the scholarship is poor, the literary merit still poorer, and the critical insight poorest of all. It deserves mention only for the estimation in which it was formerly held, at a time when the English church seemed sunk in ignorance and superstition.

MILNES, RICHARD MONKTON, BARON HOUGHTON, English poet and politician, descended from an old Yorkshire family, was born in 1809, and educated at Trinity College, Cambridge. He entered parliament as M.P. for Pontefract in 1837, and continued to represent that borough until the close of the parliamentary session of 1863, when he was called to the upper house by the title of Baron Houghton. In the house of commons he began life as a conservative, but afterwards allied himself to the liberal party, and was a faithful follower of Lord Palmerston, when his foreign policy and high-handed dealings at the foreign office led to the temporary estrangement of that statesman from the whigs. Milnes has distinguished himself, however, rather by his philanthropic labors, and his speeches on behalf of the Italians, Poles, and other oppressed nations, than by his devotion to party politics. He has been the advocate of public education and religious equality. He carried, in 1856, a bill for establishing reformatories, and has taken a great interest in the reform of the criminal classes. Milnes has also cultivated the muses with grace and success. He has traveled much in oriental countries, and is the author of Memorials of a Tour in Greece, and also of poems called Palm Leaves, in which a poetical halo is thrown around the manners and domestic institutions of the East. His Poems of Many Years, and Poems Historical and Legendary, contain many simple and elegant effusions. In 1849, he edited the Life, Letters, and Literary Remains of John Keats. He has also written Thoughts on Purity of Election; Monographs, Personal and Social (1873-76); etc. His Collected Poetical Works appeared in 1876.
MILNOR, JAMES, D.D., 1773-1844; b. Philadelphia; studied in the university of Pennsylvania, but without completing the course, entered on the study of law and became a practitioner first at Norristown, Penn., and, from about 1797, in Philadelphia. Having by his marriage forfeited his birth-right in the Society of Friends, he attached himself to the Episcopal church, of which his wife was a member. While practicing law he was prominent in the civil councils of the city and, 1810-18, was one of its representatives in congress. Having, 1812, become a communicant of the church he prepared for the ministry, and, 1819, was ordained as a deacon, and 1819, as a priest. He was soon after chosen a minister of the united Episcopal churches in Philadelphia, Christ's church, St. Peter's, and St. James's. From 1816 until his death he was rector of St. George's church in New York city; his active service there being, however, interrupted, 1880, by a visit to Europe as a delegate from the American to the British and Foreign Bible society. He was a man of eminent piety, benevolence, wisdom, and dignity, exerting a great influence through the attractiveness of his Christian character. His published writings were chiefly occasional sermons.

MILO, the ancient Melos, a Greek island in the Cyclades group in the archipelago, about 65 m. e. of the Peloponneseus, in lat. 36° 20' n., long. 24° 23' e.; 85 sq. m.; pop. about 3,500. The surface is mountainous, showing traces of volcanic action; and Mt. Calamos is still occasionally active. Mt. St. Elias, in the n.w., the highest point, is 3,338 ft. above the sea level. The soil in the valleys is fertile, and produces wine, corn, oil, fruits, and cotton; but many portions are sterile, and the lowlands uncultivated and malarious. The ancient Melos, of which extensive ruins still exist, was situated on a deep bay in the n. coast. It was a colony of Phenicia, and afterwards of Lacedaemon. During the Peloponnesian war it was captured by the Athenians, who put the adult males to death and enslaved the women and children. The statue "Venus of Milo" was found near Melos, in 1820.

MILO, of Croton, in Magna Graecia (q.v.), an athlete famous for his great strength, who lived, according to Herodotus, in the time of Darius Hystaspes, about 520 B.C. Among other displays of his strength, he is said to have on one occasion carried a live ox upon his shoulders through the stadium of Olympia, and afterwards to have eaten the whole of it in one day; and on another (reversing the story of the Hebrew Samson), to have upheld the pillars of a house in which Pythagoras and his scholars were assembled, so as to give them time to make their escape when the house was falling. He is said to have lost his life through too great confidence in his own strength, when he was getting old, in attempting to split up a tree, which closed upon his hands, and held him fast until he was devoured by wolves.

MILO, Titus Annius Papianianus, 95-48, n.c., b. Italy; belonged to a distinguished family, and married a daughter of Sylla. Few details of his life are known, till his election as tribune of the people in 57. He was then a partisan of Pompey, and attempted to bring about the recall of Cicero from exile. This measure, which was warmly supported by the Pompeian party was bitterly opposed by Clodius, who, as tribune of the people, had been instrumental in passing the law condemning Cicero to exile. Milo attempted to have Clodius condemned as a violator of the public peace, but the proceedings were quashed. Both Milo and Clodius now hired a body-guard of gladiators, and armed collisions between their retainers became almost every-day occurrences. About this time Milo, who had greatly reduced his fortune by the splendid spectacles which he had displayed to the people during his tribunate, married Sylla's daughter, Fausta, for her fortune. Sallust, the historian, was afterwards discovered in adultery with her, and after being severely handled was allowed to escape with his life only on paying a considerable sum of money to Milo. Meanwhile Cicero had come back, and both he and Pompey were continually attacked by Clodius. The latter was elected curule edile in 56, and in his turn accused Milo of being a violator of the public peace by keeping a force of armed retainers. Pompey conducted the defense of Milo, but no decision was ever reached. In 53 Milo offered himself as a candidate for the consulsip. Clodius opposed the candidature of Milo, who was defended in the senate by Cicero in a speech of which some fragments are still extant. On Jan. 20 of the next year Milo was on his way to Lanuvium from Rome, accompanied by his usual band of armed gladiators. Clodius, also with an armed company, met him near Boville. Milo was dictator of Lanuvium, where he was going to take part in some religious ceremonies, with his wife and a friend, and a number of slaves. Clodius had about 30 slaves with him. Milo and Clodius passed each other without trouble; but some of Milo's followers picked a quarrel with the slaves of Clodius, who attempted to interpose, and was at once stabbed in the shoulder by one of Milo's men. Clodius was taken to a tavern in Boville, but was dragged out to the streets of Milo and put to death. The corpse of Clodius was placed on the rostra of the forum in Rome, and aект was set fire to the senate house. These acts of popular violence created a reaction in favor of Milo, who ventured to return to Rome. But the disturbance in Rome soon became so great that Pompey was made subconsul. Milo was tried for the murder of Clodius, and though defended by Cicero, he was condemned to exile. He went to Marseilles, and while there received a revised copy of the speech which Cicero had intended to make in his favor. On reading it, he is said to have remarked that he was glad it had not been delivered. "For if so, I should
not now be eating such fine mullets at Marseilles." In his absence he was tried and condemned on charges of violence, of bribery, and conspiracy. In 48 he went back to Italy without permission, to join Marcus Cælius, an expelled senator, who was attempting to excite a rebellion in s. Italy, and he was killed before a fort near Thurii.

MILREE', MILREI, or MILREA, a Portuguese silver coin and money of account, contains 1000 rees, and is valued at 4s. 8s. 4d. sterling. The coin is commonly known in Portugal as the coroa, or "crown," and is (since April 24, 1855) the unit of the money-system in that country. It is used in Brazil. The half-coroa, or half-milrei, of 500 rees, is also used in both countries. The name "milrei" was used in Portuguese accounts long before any coin representing its value existed.

MILTIADES, a celebrated Athenian general, "tyrant of the Chersonese," yet, as Byron sings, "freedom's best and bravest friend." Forced by Darius to flee from his dominions, he took refuge in Athens, and on the second Persian invasion of Greece, his military talents being at a high premium, he was, chosen by the general. He particularly distinguished himself by the great victory which he gained at Marathon (q.v.) with a small body of Athenians and 1000 Plataeans (Sept. 29, 490 B.C.) over the Persian host, under Datis and Artaphernes. By this victory the Greeks were emboldened for the heroic struggle which they made in defense of their country and their liberty. Miltiades being intrusted with the command of an armament for the purpose of retaliating on the Persians, made an attack on the island of Paros in order to gratify a private enmity; but failing in the attempt, he was, on his return to Athens, condemned to pay a heavy fine as an indemnification for the expenses of the expedition. Unable to do this, he was thrown into prison, where he died of a wound received at Paros. The fine was exacted after his death from his son Cimon (q.v.).

MILTON, a co. in n. central Georgia, drained by the Chattahoochee river, which forms its s. boundary; 150 sq. m.; pop. '80, 6,261-777 colored. The Piedmont Air Line railroad passes near Warsaw in the s.w. part of the county. The surface is rolling and fairly productive; Indian corn, sweet-potatoes, and wheat are the chief products. Chief town, Alpharetta.

MILTON, a t. in e. Massachusetts on the Old Colony railroad; pop. '80, 3,206. It is 7 m. from the old city limits of Boston, which is reached by a horse railway, and is on the Neponset river, which furnishes water-power for several manufactories; among them a paper mill and Baker's chocolate factory. The latter is an old land-mark, standing near the bridge that spans the river, on the opposite bank of which is the Dorchester district of Boston. Country produce is sent to the Boston market, and ice is exported. Leather and rubber goods are manufactured. It has excellent public schools, 3 churches, and many fine large estates, approached by long drives from the turnpike; and from the crest of one of the famous Milton Blue hills, following this fashionable drive, a view of the harbor. Boston light, Deer island, fort Warren, etc., may be obtained. Its roads are celebrated, being made of the dust of Quincy granite taken from ledges in the vicinity. It includes Milton Lower Mills, having 2 churches, a paper mill, and a granite quarry.

MILTON, a t. in Rock co., Wis., the post village of which is 62 m. by rail s.w. of Milwaukee, at the junction of the Monroe branch of the Milwaukee and St. Paul railroad with the Prairie du Chien division; pop. '70, 2,010. Milton college, established in 1867 by the Seventh-Day Baptists, is its chief institution.

MILTON, John, an English poet, was b. in Bread street, London, on Dec. 9, 1608. His father was of an ancient Catholic family, but was disinherited on becoming Protestant. He followed the occupation of a scrivener, by which, according to Aubrey, "he got a plentiful estate," and was a man of great musical accomplishment, being the composer, among other things, of the two well-known psalm-tunes Norwich and York. From him his son derived his matchless ear, and that strict integrity of character for which he is so famous as for his verse.

Milton was carefully nurtured and educated. He was first placed under the care of a private tutor named Young, a Scotchman by birth and education; and at the age of 12, was sent to St. Paul's school, London, and afterwards to Christ's college, Cambridge. According to the university register, he was admitted Feb. 12, 1624-25. He took his degree of A.M.; and having relinquished the idea of following divinity or law, he left Cambridge in 1632, and went to live at his father's house at Horton, in Buckinghamshire. There, in serenity of mind and passion, he lived five years, reading the Greek and Latin poets, and composing Comus, Lycidas, Arcades, L'Allegro, and Il Penseroso. On the death of his mother in 1637, he went abroad, visiting the chief Italian cities, and making the acquaintance of Grotius and Galileo. While traveling, being made aware that clouds were gathering in the political atmosphere at home, he returned in 1639, and engaged himself with the tuition of his nephews—on which portion of Milton's life, Dr. Johnson could not help looking with "some degree of merriment." In 1641 he engaged in the controversies of the times, and in the course of that and the following year he issued the treatises Of Reformation. The Reason of Church Government urged against Prelacy, Prelatical Episcopacy, and an Apology for Smectymnnus. In 1648 he married rather suddenly Mary, daughter of Richard Powell, an Oxford-hire royalist, but the union did
not at first prove happy. His wife, who had been accustomed to "dance with the king's officers at home," found her husband's society too austere and philosophic for her gay tastes. After the severe honeymoon was over, she obtained permission to visit her relatives till Michaelmas; but when Michaelmas came, she refused to return. Stern and proud, Milton repudiated her at once; and the matrimonial disagreement made the world the richer by four Treatises on Divorce. A reconciliation, however, took place, which, we have no reason to doubt, was both genuine and permanent. Mary Powell died in 1652–53, leaving him three daughters, Ann, Mary, and Deborah, of whose undutifulness and ingratitude we have latterly many complaints. In 1644 he produced his Tractate on Education and his Areopagitica—a flame of eloquence at which one may warm one's hands yet. After the execution of Charles, he was appointed Latin secretary to the council of state, with a salary of £290. In his new position his pen was as terrible as Cromwell's sword. In Eikonoklastes he made a savage but effective reply to the famous Eikon Basilike; and in his Pro Populo Anglicano Defensio he assailed his opponent, Claude de Saumaille, better known as Salmasius, with such a storm of eloquence and abuse that the latter, who died at Spa in 1638, is believed to have lost his life through chagrin. Milton at least flattered himself with having "killed his man."

His second wife, whom he married Nov. 12, 1656, was a daughter of capt. Wood-cock of Hackney. She died in childbed in Feb. 1658, and his husband has ensnirled her memory in an exquisitely pure and tender sonnet.

Unceasing study had affected his eyesight, and about 1654 Milton became totally blind. After the restoration, he retired from affairs; he was obnoxious to the reigning power, and it is said that he was once in custody of the sergeant-at-arms. On the publication of the act of oblivion, he married his third wife, Elizabeth Minshull, and shortly after removed to a house in Artillery walk, when he was busy with Paradise Lost. This great poem was originally planned as a mystery; then some idea of treating it as a drama haunted the author's mind; finally, however, he resolved to write an epic poem on the Fall of Man. The poem was published in 1667. He received five pounds from his publisher, and a promise of other five pounds with 1800 copies should have been sold. In 1670 he published his History of England. Next year he printed Paradise Regained and Samson Agonistes. He died on Sunday, Nov. 8, 1674, and was buried next his father, in the chancel of St. Giles, at Cripplegate. He left property to the value of £1500.

Milton was, above all English poets, stately and grandiose. He arrived early at the knowledge of his powers, and did not scruple, in one of his prose tracts, to inform his readers that he proposed to write a poem which would be considered one of the glories of his country. Drawn away for a time by the heats of controversy and by official tasks, he never forgot his pledge, and redeemed it at last in old age, blindness, and neglect. In comparison, other poets are like sailing-ships, at the mercy of the winds of passion and circumstance; he resembled the ocean-steamer, which, by dint of internal energy, can pierce right through the hurricane. Never, perhaps, was a mind more richly furnished. His careless "largess" is greater than the fortunes of other men. His Love is the very morning-light of poetry; while in his great epic there is a massiveness of thought, a solidity of imagination, a depth of sound and of snow, which bursting of cathedral choirs, which can be found nowhere else. His great passages echo in the mind as if loath to die. Of all great writers, he is perhaps the one for whom we are conscious of the least personal affection, and this arises from a certain hauteur and severity which awes—which repels some natures; yet he infects his reader with his own seriousness. See Pattison's short life (1879); Stern's Milton u. seine Zeit (1878); and Mason's Life and Times of Milton, 6 vols. (1838–80).

MILUTIN, or MILYUTIN, NIKOLAI ALEXEYEVITCH, 1818–72; b. Russia; educated at the lyceum of Moscow, graduating in 1855, at the expense of the czar Nicholas, who gave him a free scholarship at the university of St. Petersburg, where he finished his studies in 1838. In 1844 he was appointed chief of the press bureau, but left it to revise the Russian municipal laws. He was appointed by the czar on a committee concerning the serfs, and afterwards was under-secretary of the interior. When Alexander I came to the throne in 1863, he was his confidential adviser. He countersigned the ukase of emancipation, Mar. 3, 1861, and prepared the laws required by that act. He was made secretary of the interior, and to him are due in Russia the criminal code, the press law, and trial by jury.

MILWAUKEE, a co. in s.e. Wisconsin, having lake Michigan for its e. boundary; 240 sq.m.; pop. '80, 138,523—83,469 of American birth, 319 colored. It is traversed by the Chicago, Milwaukee and St. Paul railroad, the Chicago and Northwestern, Detroit, Grand Haven and Milwaukee, the Milwaukee, Lake Shore and Western, the Western Union, and the Wisconsin Central. It is drained by the Menomonee, Root, and Milwaukee rivers. Its surface is hilly, and the soil is very fertile, having a lower stratum of limestone. It produces grain and dairy products, and is adapted to stock-raising. It has manufactures of lumber and wool, machine shops, rolling mills, basket factories, etc. The Milwaukee river furnishes extensive water-power. Wheat is largely exported, and steamers cross the lake in every direction laden with its products and merchandise.
MILWAUKEE, a city of Wisconsin, on the western shore of Lake Michigan, at the mouth of Milwaukee River or creek, which forms its harbor. The town, beautifully built with light yellow bricks, crowns a high bluff on the lake, and contains county buildings, custom-house, and post-office, 60 churches, public schools, female college, banks, insurance companies, asylums, hospital, and many daily and weekly papers. Several railways connect the city with a country of great fertility. In extent of marine commerce, Milwaukee ranks fourth among the cities of the union; and it has great advantages as a manufacturing center. The grain received at Milwaukee in 1873 amounted to 33,963,315 bushels. Pop. '60, 45,254; '70, 71,440.

MILWAUKEE (aude), the 19th city in population of the United States; pop. '80, 115,578. Lat. 43° 3' 45" n.; long. 87° 57' w. It is 90 m. n. of Chicago, and 80 m. e. of Madison, on the Milwaukee, which flows into the lake from the n. and is navigable for 2 m. from its mouth. The Menomonee discharges into the Milwaukee about 1/4 m. from the mouth of the latter. The city harbor is 6 m. long and 3 m. wide, and has been extensively improved by the government, so as to be one of the best harbors on the lakes. The city lies on both sides of the river. Its streets are regular, and the architecture has a pleasing appearance, the most common building material being the cream-colored brick manufactured in the city. The business part of the city is in its center, near the rivers; the higher parts to the e. and w. are occupied by residences. The streets are lighted with gas, and well-paved, and there is a good sewage system. The county court-house is an elegant sandstone building, erected at a cost of over $400,000; the U. S. courts are held in the marble post-office, which is used for a custom-house. The county jail and workhouse are here. There are 25 public and 50 private schools, a number of academies, an industrial school, 4 orphan asylums, and 2 hospitals. There is a college for women in the city, and a Franciscan college and Capuchin monastery in the suburbs. There is a public art gallery, a public library connected with the young men's association, and a German library and museum. There are 3 theaters, and 47 periodicals, of which 20 are in German; 7 are dailies. The city has 71 churches, a Roman Catholic and an Episcopal cathedral. The former is the seat of the archbishop. Milwaukee is the terminus of 6 railroads: the Chicago and Northwestern; Wisconsin Central; Western Union; Milwaukee, Lake Shore and Western; Detroit and Milwaukee; and Chicago, Milwaukee and St. Paul. It is the greatest wheat market in the world, and the port from which are shipped the agricultural products of the three great states of Wisconsin, Minnesota, and Iowa. The receipts of wheat in 1877 were 19,355,469 bush.; of flour, 1,003,454 bbls.; of oats, 1,564,263 bush.; of corn, 3,444,454 bush.; of butter, 8,898,875 lbs.; of wool, 2,528,843 lbs.; of cheese, 8,289,701 lbs. The shipments of wheat for the same year were 18,204,253 bush., and of flour 2,286,796 bbls. There is storage for 6,000,000 bush. Another article of extensive export is lumber, of which 136,429,000 ft. were shipped in 1877, besides 177,189,000 shingles. The Milwaukee river furnishes an abundant water-power for manufacturing purposes. A dam 3 m. from its mouth brings the water up 12 ft. above high-water mark, and a canal 1 1/2 m. long, runs from this dam along the w. side of the river. Manufactory and mills are built along the canal, and their wares can be loaded directly into steamers without another transfer. The most important manufacturing establishments are the iron and rolling mills, with a capital of nearly $4,000,000, and employing over 2,000 men. There are 13 flouring mills with a capital of over $1,500,000. Over $8,000,000 is invested in the manufacture of beer, and $1,300,000 in the manufacture of leather. Large amounts are invested in the pork-packaging business. Among the smaller manufactures are woolen cloth, boots and shoes, sashes and blinds, wagons, barrels, brooms, furniture, tobacco and cigars, soap and candles, paper, and white lead. There are 14 banks, and a number of insurance companies. The boarding asylum for invalid soldiers is about 3 m. from the city. It is a government institution, and contains some 600 soldiers. A line of steamers runs across the lake, connecting with the Detroit and Milwaukee railroad. The tonnage of vessels belonging to Milwaukee is nearly 70,000. Milwaukee has a very large German population, and many Scandinavians and Bohemians are settled there. It is divided into 13 wards, each of which elects 1 alderman and 2 common councilmen. The city is furnished with water from the lake. Its first white settler was a Frenchman named Jumeau, who came there in 1895 to engage in the fur-trade, and was afterward mayor. It was incorporated as a city in 1846.

MIMANSA (from the Sanskrit māṇa, to investigate; hence, literally investigation) is the collective name of two of the six divisions of orthodox Hindu philosophy. See Sanskrit Literature. The Mimansā is distinguished as Pārva- and Uttara-mimāṃsā, the latter being more commonly called Veddanta (q.v.), while the former is briefly styled Mimāṃsā. Though the Mimāṃsā is ranked, by all native writers, with the five other philosophical systems, the term philosophy—as understood in a European sense—can scarcely be applied to it; for the Mimāṃsā is neither concerned with the nature of the absolute or of the human mind, nor with the various categories of existence in general—topics dealt with more or less by the other five philosophies; its object is merely to lay down a correct interpretation of such Vedic passages as refer to the Brāhmaṇic ritual, to solve doubts wherever they may exist on matters concerning sacrificial acts, and to reconcile discrepancies—according to the Mimāṃsā, always apparent only—of Vedic texts. The foundation of this system is
therefore preceded by a codification of the three principal Vedas—the R̄iś, Black-Yājū, and Sāman—and by the existence of schools and theories which, by their different interpretations of the Vedic rites, had begun to endanger, or, in reality, had endangered a correct, or at least authoritative understanding of the Vedic texts. It is the method, however, adopted by the Mīmāṃsā which imparted to it a higher character than that of a mere commentary, and allowed it to be looked upon as a philosophy; for, in the first place, the topics explained by this system do not follow the order in which they occur in the Vedic writings, especially in the Brāhmaṇa portion of the Vedas (q.v.); they are arranged according to certain categories, such as authoritativeness, indirect precept, concurrent efficacy, co-ordinate effect, etc.; and secondly, each topic or case is discussed according to a regular scheme, which comprises the proposition of the subject-matter, the doubt or question arising upon it, the prima-facie or wrong argument applied to it, the correct argument in refutation of the latter, and the conclusion devolving from it. Some subjects treated of in the Mīmāṃsā, incidentally as it were, and merely for the sake of argument, belong likewise more to the sphere of philosophic thought than to that of commentatorial criticism, such, for instance, as the articulation of articulate sound with sense, the similarity of words in different languages, the inspiration or eternity of the Veda, the invisible or spiritual operation of pious acts, etc. The reputed founder of this system is Jaimini—of unknown date—who taught it in twelve books, each subdivided into four chapters, except the third, sixth, and tenth books, which contain eight chapters each; the chapters, again, are divided into sections, generally comprising several subheadings, but sometimes only one. The extant commentary on this obscure work is the Bhāshya of Sūrāśṭarāṇi, which is critically annotated by the great Mīmāṃsā authority, Kumārila-bhaṭṭācārya. Out of these works, which, in their turn, quote several others, apparently lost, has arisen a great number of other writings, explaining and elucidating their predecessors. The best compendium amongst these modern works is the Jaiminiya-nyāya-mādīv-vidyā, by the celebrated Madhavachārya (q.v.).

MIMES, the name given by the ancients to certain dramatic performances, in which, with little attempt at art, scenes of actual life were represented, sometimes in improvised dialogue. The Greek mimmes appear to have been invented by the Greeks of Sicily and southern Italy. They were a favorite amusement of convivial parties, the guests themselves being generally the performers. Sophron of Syracuse, about 420 B.C., composed many in the Doric dialect, which were much admired, and which Plato was accustomed to read.—The Roman mimes were not borrowed from the Greek, but were of native Italic growth. They were not only far ruder and coarser, but in some respects they were essentially different—the dialogue occupying a smaller place, and mere gesture and mimcry predominating. The humor and satire, however, were often genuine, though rough, and even indecent, and they were greatly relished by all classes; even the patrician Sulla was fond of them.

MIMNER'BUS, n. c. about 635-600; b, probably at Colophon or Smyrna, but little is known of his life except as disc of d in his poems. As an elegiac poet he is spoken of by ancient critics with great admiration, but of his work only a few fragments remain. These are partly erotic, and in part treat of such subjects as the short-livedness of pleasure, fleeting youth, etc.; and all his topics are tinged with melancholy. He was the first to adapt the elegiac verse to this kind of composition. The best of his existing poems is Namnna, a love song to a young musician.

MIMO SE.Z, a suborder of leguminose, one of the largest natural orders of exogenous plants distinguished by regular flowers and petals valvate in bud. About 1000 species are known, all natives of warm climates, a few only extending beyond sub-tropical regions in the southern hemisphere. The genera acacia (q.v.) and mimosa are the best-known. To the latter genus belongs the sensitive plants (q.v.). Some of the larger species of mimosea are valuable timber trees. The Talha (mimosea ferruginea) is one of the most common trees of central Africa. They are also trees of great beauty. Some of the species of the genus prosopis, natives of the western parts of South America, are remarkable for the abundance of tannin in their pods.

MIM'ULUS, a genus of plants of the natural order scrophulariaceae, having a prismatic 5-toothed calyx, a somewhat bell-shaped corolla, of which the upper lip is bifid and the lower trident, the lobes not very unequal, two long and two short stamens, and a stigma of two lamellae, which close together upon irritation. The species are mostly herbaceous plants, natives of America. Some of them are very frequent in flower-gardens, and many fine varieties have resulted from cultivation. They sometimes receive the name of monkey-flower. One species, M. lutes, a native of Peru and Chili, has become naturalized in many parts of Britain. The little yellow-flowered Mesk Plant, now so common in gardens and on window-sills in Britain, is M. moschatus, a native of Oregon and other north-western parts of America.

MINA, or MNA, the name of a Greek weight and money denomination, derived from an oriental word, maneh, signifying “weight.” The mina contained 100 drachmas (q.v.), and was the sixtieth part of a talent; consequently, as a weight, it was equivalent to about 1½ of a pound avoirdupois, varying in different districts to the extent of one-
third of a pound more or less, following the fluctuations of the talent itself. As a money of account, it preserved the same relation to the talent, and was worth £4 1s 3d. See TALENT.

Mina, Don Francisco Esponz y., 1782-1836: b. Spain; first distinguished himself in 1809 by guerrilla warfare, organizing bands of mountaineers in Catalonia to repel the French invaders. In 1810 he became commander-in-chief of the Catalonian army, and noted for his incessant activity and remarkable presence of mind. In 1812 he was made commander in Aragon, with the rank of general, and assisted in gaining the victories of Salamanca and Vittoria, and conducted an efficient blockade of Pamplona. Discovering, when peace was made, in 1814, that he had been laboring in the interest of the despotic policy of Ferdinand III., he made an ineffectual attempt to gain over the garrison of Pamplona to the cause of freedom, and then sought an asylum in France. While resident in Paris he was arrested by a French commissary of police, employed by the Spanish ambassador. On this occasion Louis XVIII. acted with great magnanimity. He dismissed the commissary, demanded the recall of the Spanish ambassador, and not only released Mina but gave him a pension of 1000 francs. In 1822, when the army of Cadiz proclaimed the constitution of 1812, and began a new revolution, gen. Mina repaired to Navarre, where he learned that the king had accepted the new constitution, and accordingly ceased an aggressive movement which he had already undertaken. He was appointed capt. gen. of the armies of Navarre, Catalonia, and Aragon; but on Ferdinand recanting his assurance of adherence to the constitution, he again retired from Spain, and went to England. After the accession of Isabella II., under the regency of queen Christina, he became prominent in the operations against don Carlos; and on these ending, the charge of educating the young queen was allotted to gen. Mina and his wife.

Mina, Xavier, 1759-1816: b. Spain; nephew of Francisco; educated for the priesthood. He was with his uncle in the guerrilla warfare of 1809-09, was taken prisoner in 1810, and detained four years at Vincennes. In 1814 he was again in arms, and forced to flee to France. Thence he went to England, where he interested himself in the cause of Mexican patriots struggling for independence, and by the aid of some prominent Englishmen chartered a vessel, purchased arms, organized an expedition, and sailed for America, arriving on the coast of Virginia in the summer of 1816, with his party. In the United States he received sympathy and substantial support, and took 200 volunteers with him, arriving at Galveston in November, but soon afterwards crossing over to New Orleans obtained more assistance, and after being reinforced by 100 Americans at Galveston, landed at Soto la Marina, province of Tabaripas, April, 1817. He now marched at the head of 500 men towards the capital, fighting his way through such bodies of Spaniards as he met. He was successful in a number of engagements, but was at length surprised at night, captured, and put to death in front of the fortress of Remedios, Oct. 27, 1817.

Mina Bird, Enalbes Indicus or Gracula Indica, a species of grackle (q.v.), or of a nearly allied genus, a native of many parts of the East Indies, about the size of a common thrush, of a deep velvety black color, with a white mark on the base of the quill-feathers of the wings, yellow bill and feet, and two large bright yellow wattles at the back of the head. The bill is large, conical; the upper mandible a little curved and sharp at the point. The tail of the male mina bird consists of fruits and insects. It is very lively and intelligent, and possesses a power of imitating human speech excelled by none of the parrots. It has sometimes been trained to repeat sentences of considerable length. It is therefore in great request, and is often brought to Europe,—Another and larger species is found in Sumatra and some of the other eastern islands; possessing the same power of articulation. It is highly prized by the Javanese.

Minamoto, or Gen, the name of an ancient noble family in Japan, whose members for many centuries were military vassals of the mikados. Under the leadership of the Minamoto generalizes the whole of eastern and northern Japan, above the 36th parallel n. lat, was conquered, and the aboriginal tribes brought under the government of the imperial court at Kioto, and the brocade banner of the mikado was borne even into Yezo. The Minamoto family was founded by two grandsons of the 57th mikado, Selwa, who reigned 899-76. From these princes, in two branches, have descended the hundreds of illustrious military characters whose names and exploits fill the annals of Japan. Among their living descendants are seventeen families of nobles of the imperial court, of whom are Iwakura, now premier, Ohara, Higashi, Kuze, and other prominent rulers. Their crest consists of three bamboo leaves surrounded by gentian flowers. See Youzuru.

Minaret. — Minar, a tall turret, used in Saracenic architecture. It contains a stair-case and is divided into several stories, with balconies from which the priests summon the Mohammedans to prayer—bells not being permitted in their religion—and is terminated with a spire or ornamental finial. The minarets are amongst the most beautiful features of Mohammedan architecture, and are an invariable accompaniment of the mosques (q.v.). In India, minars, or pillars of victory, are frequently erected in connection with mosques; some of these are lofty and splendid monuments, that of Kootub, at Old Delhi.
being 48 feet 4 in. in diameter at base, and about 250 feet high. They are often built on a plan of a star-like form, and are divided into stories by projecting balconies, like the minarets.

MINAS GERAES, an interior province in c. Brazil, bounded on the n. by Bahia, on the e. by Porto Seguro and Espirito Santo, on the s. by Rio Janeiro and Sao Paulo, and on the w. by Goyaz, 237,481 sq. m.; pop. 72, 2,039,735. It is an elevated table-land, intersected by many mountain chains, which send out offshoots in all directions. The highest peaks are Itambé, 5,930, and Itacolomi, 5,750 ft. above the level of the sea. Between the mountain ridges are sloping and well-watered valleys. There is an abundance of small streams, which flow into the Sao Francisco, or the tributaries of the Para. The Sao Francisco rises in the s. of the province, flows through almost its entire length, forms the boundary line between Bahia and Pernambuco, and between Sergipe and Alagoas, and finally falls into the Atlantic ocean. The Doce and the Jequitinhonha flow e. to the Atlantic, and the Rio Grande and Rio Parnaiba unite to form the Para. Other rivers of importance are the Verde Grande, Paranahyba, Rio das Velhas, and Mucurry. On account of its elevation the climate is much milder than that of districts within the same parallels of latitude. The soil is fertile, and produces the ordinary cereals of the temperate zones, besides the crops characteristic of a warmer climate, such as tobacco, cotton, sugar, coffee, and indigo. Ipecacuanha, manioc, and jatap are produced largely. The productions of the country are exported to the neighboring provinces, from which imports of wine, salt, and flour are made. The valleys between the mountains are used for grazing purposes, and cattle are raised in large numbers. The mines were formerly among the richest in Brazil, yielding large quantities of gold, but they are for the most part abandoned, though gold is still found in paying quantities. Diamonds were discovered in the province in 1746, and diamond-washing is extensively pursued. Other varieties of precious stones are found in the rivers. The mineral deposits are extensive, including, besides gold and silver, iron, lead, mercury, bismuth, antimony, alum, and sulphur. The want of railroads makes transportation, which is dependent on mules, difficult and expensive. Cotton and woollen manufactories, foundries, and other manufacturing industries have been introduced. Capital, Ouro Preto.

MINATITLAN, a t. on the isthmus of Tehuantepec, Mexico, 125 m. s.e. of Vera Cruz, on the w. side of the Coazacoalcos. It is in a flat country, and is often exposed to floods. Mahogany grows in the region, and is considerable is exported. This t. is the proposed terminus of the Tehuantepec ship canal and railroad.

MINCH, the channel which separates the island of Lewes from the counties of Cromarty and Ross, in the n.w. of Scotland. Its shores are exceedingly irregular, and its average width is about 28 miles. The Little Minch, which separates the island of Skye from that of North Uist and the neighboring islands in the outer Hebrides, is upwards of 15 m. in width.

MINCIO (anc. Mincius), a river of n. Italy, a continuation of the Tyrolean stream, the Sarea, emerges from lake Garda at Peschiera, and after a course of about 38 m. through the province of Mantua, which it separates from Verona, falls into the Po, 8 m. below the city of Mantua. The Mincio has constituted an important basis of operation during the wars between Italy and Austria.

MIND. Having adverted in various other articles—EMOTION, INTELLECT, WILL, etc.—to the chief component parts of our mental constitution, all that is necessary under the present head is to consider the definition or precise demarkation of mind as a whole. In this subject we cannot resort to the common method of defining, which is to assign something more simple and fundamental than the thing to be defined; as when we define gravity to be an attractive force, the notions of force and attraction being supposed to be more intelligible than gravity. Mind can be resolved into nothing more fundamental than itself; and therefore our plan must be to call attention to those individual facts or experiences, that are pointed at by the name, and to circumscribe, in some way or other, the whole field of such experiences. For an example of mind, we should probably refer each person to his pleasures and pains, which are a class of things quite apart and peculiar; we should also indicate thoughts or ideas as mental elements; also exercises of will or voluntary action. There is a sufficient community of nature in those various elements to cause them to be classed by themselves under a common designation, namely, mind. If any one could be made aware of all the phenomena that have received this designation, he would, of course, know the meaning in the detail; but this is not enough. Mind being a general or comprehensive name, we ought to see distinctly the common character or attribute pervading all those particular phenomena; the recognition of this common character is the knowledge of mind in general, or the determination of its defining attribute. For the settling of this common attribute we have another great resource, besides comparing the individual facts, that is, to determine the opposite, or contrast of mind. Now, the usually assigned contrast is matter; but more strictly, it is everything or the extended, including both inert matter and empty space. When we are conscious of anything as having the property of extension, our consciousness is occupied with the object world, or something that is not mind. When we are feeling pleasure or pain, remembering or willing, we are not conscious of anything extended; we are said to be
in a state of subjective consciousness, or to be exhibiting a phenomenon of mind proper. Hence, philosophers are accustomed to speak of the intemperate mind, as distinguished from the outer or object world. In one sense everything that we can take cognizance of is mind or self; we cannot by any possibility transcend our own mental sphere; whatever we know is our own mind; hence the idealism of Berkeley, which seemed to annihilate the whole external universe. But this large sense of mind is not what is usually meant, and whatever view we take of the reality of the external world, we must never merge the distinction between the consciousness of the extended—which is also coupled with other truly object properties, as inertia, for matter—and the consciousness of the intemperate, as constituting our feelings and thoughts. This opposition is fundamental and inerasable, and is expressed in language by a variety of designations—mind and not mind, subject and object, internal and external. The laws and phenomena of the extended are set forth in the sciences of the external world—mathematics, mechanics, chemistry, etc.; the laws of the mind proper, or the subject consciousness, are quite distinct in their nature, and are embodied in a separate science, called mental philosophy, psychology, etc.

MIND, GOTTFRIED, 1768-1814, b. Switzerland; educated at Pestalozzi's charity school. His education, however, except in the art of design, was extremely limited. He was naturally eccentric, and a deformity to which he was subject increased his peculiarities, and made him avoid society. He was fond of cats, his pictures of which are his most characteristic works. He was also successful in the delineation of children and beggars. He died poor, but some of his pictures have since been sold at very high rates.

MINDANAO. See PHILIPPINE ISLANDS.

MINDEY, a Prussian t. in the province of Westphalia, lies on the Weser, is a prosperous, closely-built city, with a population of (1875) 17,088. It was till lately a fortress of the second class. Minden, which ranks as one of the oldest towns in Germany, has a stone bridge across the river, originally erected in 1513, and possesses several ancient churches, the most noteworthy of which is the present Roman Catholic church. Built in the second half of the 11th c. it was till 1811 an episcopal cathedral. A battle was fought near Minden in 1759, in which the French were defeated by an army of Anglo-Hanoverian troops.

The Hanoverian town of Minden or Minden is situated in the district of Hildesheim, within the province of Göttingen, and at the confluence of the Fulda and Werra. Pop. 75,561. Minden lies in one of the most picturesque and fruitful parts of Hanover. It has 3 breweries, and manufactures of china, earthenware, sugar, tobacco, and linen, with a noted linen-market. There are alum-works and good coal-mines in the immediate neighborhood; and it has an extensive river transport-trade in millstones, corn, and timber. Minden possesses several architectural remains, indicative of its former more prosperous condition.

MINDORO. See PHILIPPINE ISLANDS, ante.

MIN DSZENT, a t. of Hungary, in the county of Csongrad, near the left bank of the Theiss, and just below the mouth of the Saros, 19 m. north from Szegedin. Pop. '69, 9,414.

MINE. See MINES: MINING; ante.

MINE, o. a t. of the island of Sicily, in the province of Catania, 82 m. s.w. of Messina. It is supposed to occupy the site of the ancient Mena, founded by Duceitius, 459 B.C. Pop. 9,500.

MINER, a co. in s.e. Dakota, drained by Sand Hill creek and Marsh creek, affluents of the Dakota river; about 504 sq. m.; pop. '80, 393-299 of American birth. It is principally slightly undulating prairie land, little cultivated, but with a soil of exceptional fertility.

MINER, ALONZO AMES, D.D., b. N. H. 1814; principal of the military and scientific academy at Unity, New Hampshire, 1835-39 In the latter year, he was ordained to the Universalist ministry. He has been pastor of Universalist churches at Methuen, Lowell, and Boston, an overseer of Harvard college, a member of the Massachusetts board of education, and president of Tufts's college, Medford, from 1869 to 1874, when he re-elected the pastorate of the second Universalist church, Boston. He is an advocate of total abstinence, and has been the candidate of the "prohibitory" party for governor of Massachusetts. He was also prominent in the antislavery agitation.

MINER, THOMAS, 1778-1841; b. Conn.; a graduate of Yale, and a physician who gained some distinction in his profession by the publication in 1825 of Essays upon Yellow Fever and other Medical Subjects and a treatise on Typhus Sanguinalis. He was also one of the founders of the Yale medical institute, and the Connecticut retreat for the insane. His autobiography was published in the New Englander, vol. ii.

MINERAL, a co. in n.e. West Virginia, having the n. branch of the Potomac river, the Baltimore and Ohio railroad, and a ridge of the Alleghany mts. for its w., n., and n.e. boundaries, separating it from the state of Maryland: 259 sq. m.; pop. '80, 8,620-8,170 of American birth, 436 colored. Its surface is mountainous with wide fertile valleys,
and is drained by Patterson's creek. The soil is adapted to the cultivation of grain and potatoes; its dairy products are considerable, and live stock is raised. Iron and bituminous coal are mined, and largely exported. The Chesapeake and Ohio canal follows the course of the river and the railroad on its n.e. border, and the Cumberland and Pennsylvania railroad terminates at Piedmont. Capital, Keyser.

MINERAL ACIDS, in medicine. The ordinary mineral acids are sulphuric (oil of vitriol), nitric (aqua fortis), hydrochloric (muriatic acid), phosphoric, chromic, and carbonic acids. Of these the latter only is usually regarded as a gas, that being its ordinary condition, but all the others are gases or vapors at certain temperatures, except phosphoric and chromic which on being heated change in composition. Concentrated sulphuric acid boils (in other words becomes a vapor) at 630° F., and concentrated nitric at 154° F. The latter acid is a saturation of a gas in water, and has constantly varying degrees of strength. An aqueous solution boiling at 230° F. gives off a vapor which contains 20.22 per cent of anhydrous acid gas dissolved in 79.78 per cent of water, which may be condensed in a receiver. A more concentrated solution when heated yields at first only gas; as it gets weaker by parting with the gas, water begins to pass off along with it. These acids have various uses in medicine. Sulphuric, nitric, chromic, and hydrochloric acids in a concentrated state are powerfully corrosive, and on this account nitric acid is used in surgery as an escharotic, to destroy warts and other excrescences or diseased growths or unhealthy tissues. It has the property of only injuring the tissue as far as it destroys it, leaving a wound which heals easily. Sulphuric acid, on the contrary, produces an inflammation which does not readily subside, while hydrochloric acid used as an escharotic produces sloughing, sometimes of a dangerous character. Chromic acid which is ordinarily a crystalline solid of a beautiful crimson color is soluble in water and is used in various forms of surgery. Sulphuric acid is generally preferred to nitric acid, being rather more manageable. It is also used, in weaker solutions, as an application to the gums in serofulous patients, when there is a tendency to ulceration, and in other ill-conditioned states of the system, and also as a styptic for arresting surface hemorrhage. It is not administered internally. Sulphuric acid in a diluted form is sometimes employed as a tonic, and its various salts are many of them valuable medicines. See sulphates in sulphuric acid, ante. Dilute nitric acid is given as a medicine in several affections. It sometimes succeeds in intermittent fever when quinine is contra-indicated, and has been given in dysentery, on the recommendation of Hope. In some forms of dyspepsia and mal-assimilation it is useful in assisting digestion and improving nutrition. In combination with hydrochloric acid, in the form of diluted aqua-regia, it is often successfully used in cases of jaundice, and also in some forms of dyspepsia, hydrochloric acid being a natural ingredient of the gastric juice. Dilute nitric acid has been used with benefit in diabetes mellitus, and it is stated that in large doses, largely diluted in water, it has cured several cases of diabetes insipidus. It has also been successfully used in scrofula and glandular enlargements. See carbonic acid, nitric acid, hydrochloric acid, and phosphoric acid in phosphorus.

MINERAL CHAMELEON. See Manganese.

MINERAL DEPOSITS. This term is generally understood as a collection of metalliferous ores occurring in geological formations where they have been deposited by the processes of nature, and in which, with some exceptions, undergoes a double or triple alteration, either in composition or position, by subsequent changes. Sometimes the ore is a native metal, but is more frequently a mixture of compounds of different metals. A single metal may be the principal one, the associated metals forming a mixture which is called a gangue, the principal ore and the gangue constituting the deposit. In general, ores may be classified as follows: compact, when the structure is close and fine-grained; granular, when composed of visible particles; micaceous or finely laminated, when existing in the form of minute scales, as, for example, micaceous specular iron ore; disseminated, when scattered throughout the gangue in laminae or coarse grains; porphyritic, when distributed in distinct crystals; banded, when the principal ore, or the gangue, or both, are arranged in parallel layers, or bands. Sometimes the bands are arranged concentrically, when the deposit is said to be concentric-banded; brecciated, when the deposit contains fragments of other rock or of older ore, these fragments often forming nuclei around which the ore or the gangue has formed further deposits or crystals; and it is called drusy when there are many cavities lined with crystals. Mineral deposits may also be divided into superficial, stratified, and unstratified deposits. Superficial deposits are those in which the materials lie in a more or less consolidated or loose condition where they have been washed from cliffs and mountain slopes whose rocks contained metals, ores, or gems. The surface gold deposits of California, Australia, and the Urals are examples, as also the platinum beds of Oregon and Siberia, and the stream tin of Cornwall, Australia, and Durango, and the diamond, sapphire, and ruby "mines" of Brazil, South Africa, and the Indies. The ease with which such deposits are worked renders them as a rule the most profitable when first discovered. Stratified deposits have their examples in the coal beds, and many beds of iron, such as the clay iron-stone of the coal measures; and the schistose copper beds in the triassic sandstones of New Mexico. Unstratified deposits have their examples in those meta-
morphosed rocks which have been much disturbed by geologic forces, as the iron ores of Missouri, lake Superior, and the Alleghanies. These deposits were formerly supposed to be of eruptive origin, but it is now understood that they are principally stratified deposits which have been subjected to great disturbance and to metamorphism. The vast deposits of metallic copper in the lake Superior region were once supposed to have been formed from subterranean fusion, but it has been pretty clearly demonstrated that the metal was deposited from solution under the influence of galvanic or magnetic action. There are, however, eruptive rocks which contain minerals in disseminated condition, such as the volcanic rocks containing the amygdaloid copper of lake Superior, and the volcanic rocks in Japan, from which large quantities of copper are obtained. Among the unstratified deposits are what are called contact deposits. These occur at the junction, or surface of contact, of two different formations, as where sedimentary have been displaced by igneous rocks. Concretions and sheets of ore are thus found at the junction of trap and sandstone. Deposits occur also as impregnations, where the metalliferous mineral is diffused through a mass of rock in irregular streaks of more or less richness, as is generally the case with deposits of quicksilver. Fahlbands is a name given to deposits where the ore is diffused through certain layers which become more softened or rotten, or faid, than the other strata. Examples of fahlbands are more frequently met with in mines in Scandinavia than elsewhere. Stockwork is a kind of deposit where the rock is penetrated in every direction, so that the ore must be taken out with the mass of the metalliferous rock. Some of the great iron ore deposits of the world are tabular masses, which at Tagilsk in the Ural and the hematite of the Missouri iron mountain are examples, as also the copper mines of lake Superior, and the silver mines of Norway, Saxony, and Nevada.

Mineral veins are sheets of metalliferous matter, which are divided into three principal varieties—gush veins, segregated veins, and fissure veins. Gash veins are those which have been formed in fissures that have resulted from the shrinking of the rock, and are limited to one rock, generally to one bed. Examples are seen in the lead mines of the upper Mississippi, where the ore is confined to the Galena limestone, a lower Silurian formation. It usually occurs in vertical fissures of little depth, but sometimes in horizontal fissures, often opening into caves or chambers lined with ore; indeed, gash veins are often the commencements of cave formations. Segregated veins are those which are interposed between the strata, and always occur in metamorphic rocks, metamorphism being the cause of the segregation by the separation of the metalliferous materials from the surrounding rock. These have no certain limit to the fissure from which the fissure vein (to be described) are, and are generally composed of quartz, often rich in gold. All the granitoid rocks of the Alleghanies are of this character, and contain more or less gold. Iron, and also copper, and less frequently nickel, are common associates. Fissure veins, true veins, or lodes, are formed in fissures which have been produced by volcanic or earthquake action. The displacements caused by these forces result in the formation of fissures because of the inability of the strata to return to their former relational position from the interposition of wedges of rock or other causes. The subsequent filling of the fissure by metalliferous material forms the vein or lode. As a consequence of the mode of formation, a fissure-vein is usually of unequal thickness, having the form of a wedge. They usually send out minor fissures, generally at acute angles, which are called branches, and sometimes feeders. The horizontal direction of a vein is called its strike or course, and is expressed by degrees of the quadrant in relation to points of the compass. The vertical angle which it makes with the horizon is called the dip. Geological disturbances are a frequent cause of displacement of parts of veins, forming what are called faults. The ores contained in fissure-veins are various, such as silver, copper, lead, tin, zinc, antimony, and other metals. Gold is less common than in segregated veins, and it is usually only worked in them as a side product. Silver is the most valuable constituent, and these veins constitute the great silver repositories of the world. The Comstock lode and various others in Nevada are examples. Various theories have been advanced to account for the filling of mineral veins. The earliest was the plutonic theory, which supposed that the materials were injected into the fissures in a state of fusion. An irresistible objection to this theory is that such a method would have necessitated the production of alloys to a much greater extent than is found to obtain. A later theory regarded the formation as the result of aqueous deposition, or sedimentation, in the manner of limestone and other sedimentary rocks. An overwhelming objection to this theory is the fact that veins are not horizontally stratified, but the materials are often deposited in vertical positions against the walls of the fissures. The theory of lateral secretion or transfusion has been proposed, that the materials sent through the walls of the veins from the adjacent rocks; but a fatal objection to this theory is the fact that the composition of a mineral vein is often the same throughout its extent, or in passing through various strata, whereas it ought to vary if the theory were true. Again, two veins of dissimilar constitution often traverse the same stratum adjacent to each other. This theory demands that they should be alike. The chemical precipitation theory regards the deposition as due to precipitation from superheated solutions under great pressure. These solutions, coming from subterranean sources, part with heat in passing into the fissures. The deposits made by thermal springs are instances as affording illustrations of this mode of
production. Water containing salts of various kinds is capable, when under great pressure and at a high temperature, of dissolving most minerals; and if it came in contact with silicic acid charged with sulphur, many metals with which it came in contact in its passage through the fissures would be reduced to sulphides and deposited on cooling. Illustrations embracing the action of solutions of various saline and other bodies are carried to a greater or less extent in systematic works. Most mineral veins are more or less decomposed when situated at or near the surface, and, indeed, this condition usually extends downwards to the permanent water level, below which the ore is usually in its original state, which is, generally, a sulphide. In Cornwall the decomposed portion of a mineral vein is called a gossan, and this term is generally used among miners who speak the English language. In the gossan, silver ores are usually converted into chloride, bromide, etc., associated with various-shaped masses of native silver. Sulphide of copper is converted into oxides, and then into malachite, azurite, the green and blue carbonates, and into chrysocolla, the green hydrous silicate. On account of the disintegration which has taken place the gossan is more economically worked than that part of the vein which lies below the water level, and is in its natural state, and therefore the first workings of mineral veins are generally the most profitable.

MINERAL KINGDOM, the inorganic portion of nature. Under this term, however, are not included the inorganic products of organic beings, as sugar, resins, etc., although substances more remotely of vegetable or even animal origin are reckoned among minerals, as coal, fossils, etc. To the mineral kingdom belong liquid and gaseous, as well as solid substances: water, atmospheric air, etc., are included in it. All the chemical elements are found in the mineral kingdom, from which vegetable and animal organisms derive them; but many of the compounds which exist in nature belong entirely to the vegetable and animal kingdoms, and are produced by the wonderful chemistry of life.

MINERALOGY (Fr. miner, to dig; mine; Gael. mein; Wel. men, ore, mine), the science which treats of minerals. But it does not embrace all that relates to the mineral kingdom. Simple minerals alone, or homogeneous mineral substances, are regarded as the subjects of mineralogy; rocks formed by the aggregation of simple minerals, and their relations to each other, are the subjects of geology (q.v.). This limitation of the term mineralogy is comparatively recent. Geology or geognosy was formerly included in it. The arrangement and description of simple minerals according to their external characters has been called by Werner and others orthogonosity, but the term has fortunately fallen into disuse. Nor is the study of mere external characters sufficient in mineralogy. The chemical composition of minerals equally demands attention. In the classification of minerals, some mineralogists, as Mohs and Jameson, have regarded only the external characters, and some, as Berzelius, only the chemical composition; but the results have been unsatisfactory, and the present tendency is in favor of a system which seeks to constitute natural groups by having regard to both.

Some minerals being of great use, and others highly valued for their beauty, have received much attention from the earliest ages. But the ancient naturalists describe few minerals. The first attempt at scientific mineralogy was by George Agricola in the 16th century. The systems of the Swedes Wallerius and Cronstedt, in the latter half of the 18th century, were the first worthy of the name. That of Werner followed, and was extensively adopted. The discoveries of Haüy in crystallography, and the progress of chemistry, gave mineralogy a new character, and then sprung up two schools of mineralogists, one resting chiefly on external characters, and the other on chemical composition.

The chemical classification of minerals is rendered difficult by the endless variety of combination and proportion in the elements of which they are composed, the presence of substances not essential to the mineral, and yet more or less affecting its characters, and the frequent impossibility of determining what is to be deemed essential, and what accidental. Chemical purity is almost never found in nature. Even the purest diamond, when burned, leaves some traces of ash; and the various colors of diamond, quartz, and other minerals are due to the presence of substances which are often in so small quantity as not to affect their crystalline forms or other physical properties. Again, some minerals of identical chemical composition differ in their crystallization, so that an arrangement founded upon it would separate them too widely. There are also many minerals which are often found in an uncrystallized state, and others which are always so. In the arrangement of minerals into natural groups, their chemical composition, although not alone to be regarded, is of the first importance, so that the place of a new mineral in the system can never be determined without analysis; and in determining the nature of a mineral, chemical tests, such as the application of acids, are continually resorted to. It is also necessary to know its specific gravity, and how it is acted upon both by a moderate heat and by the blowpipe. An examination of the crystalline forms, with measurement of the angles of the crystals, is often sufficient to distinguish minerals which have otherwise much resemblance. The cleavage of crystals is also important, a readiness to split in planes parallel to certain of their faces only, by which the primitive form of the crystal may be ascertained. Minerals not crystallized exhibit important varieties of structure, as laminated, fibrous, granular, etc. Certain peculiarities of form
are also frequently characteristic of uncrystallized minerals, as mamillary, botryoidal, etc. Minerals exhibit, when broken, very different kinds of fracture, as even, conchoidal, splintery, etc. Opaqueness, translucency, and transparency are more or less characteristic of different kinds: electric and magnetic properties demand attention; and very important characters are derived from luster, which in some minerals is metallic, in others semi-metallic, in others pearly, vitreous, etc. Color is not generally of much importance, but in some minerals it is very characteristic. Hardness and tenacity are very important, and are of all various degrees. A few fluid, and even a few gaseous substances, are included in mineralogical systems. Unctuosity and other peculiarities to be ascertained by the touch, are very characteristic of some minerals; peculiarities of taste and smell belong to others.

Mineralogy has very important relations with geology, which cannot be studied without regard to the mineral constituents of rocks. The mineral composition of soils greatly affects vegetation and agriculture. The economical uses of minerals are also very important and various. It is enough merely to allude to coal, lime, salt, and the metallic ores. Naphtha, petroleum, bitumen, asphalt, etc., are of well-known utility; and a high value has always been attached to gems and other ornamental stones.

MINERAL POINT, a city in s. Wisconsin, the n. terminus of the Mineral Point railroad a branch of the Illinois Central; pop. '70, 3,035. It is 45 m. w. of Madison, 180 m. from Chicago, 190 m. from Milwaukuee, and 36 m. n.e. of Dubuque, Iowa. Large quantities of lead are taken from mines in the neighborhood, the surrounding country being a rich mineral region; and a vast amount of copper and lead is annually exported. It has zinc smelting furnaces, lead furnaces and foundries, 2 banks, a number of excellent public schools, a seminary, 6 churches, 2 hotels, 3 newspapers, and a car factory. It is a market for grain and general produce supplied by a tract of country 15 m. square.

MINERAL RESINS. See Resins.

MINERAL TALLOW, or HATCHETINE, a remarkable substance found in several places in Britain, Germany, Siberia, etc., soft and flexible, yellowish white, or yellow, resembling wax or tallow, often flaky like spermaceri, inodorous, melting at 115°-170° F., and composed of about 86 carbon and 14 hydrogen.

MINERAL WATERS. This term is usually applied to all spring waters which possess qualities in relation to the animal body different from those of ordinary water. Mineral waters have been used as remedial agents from a very early period. The oldest Greek physicians had great faith in their curative power, and the temples erected to Esculapius were usually in close proximity to mineral springs; they had recourse to the sulphurous thermal springs of Tiberias (now Tabareah), which are still used by patients from all parts of Syria in cases of painful tumor, rheumatism, gout, paley, etc., and to the warm baths of Calirrhoe, near the Dead sea, which are mentioned by Josephus as having been tried by Herod in his sickness. We are indebted to the Romans for the discovery not only of the mineral thermal springs in Italy, but of some of the most important in other parts of Europe, amongst which may be named Aix-la-Chapelle, Baden-Baden, Bath, Spa in Belgium, and many others; and Pliny, in his Natural History, mentions a very large number of mineral springs in almost all parts of Europe.

The therapeutic action of mineral waters, or of spas, as they are frequently termed, depends chiefly upon their chemical composition and their temperature, although a variety of other circumstances, as situation, elevation, climate, geological formation, mean temperature, etc., have an important bearing upon the success of the treatment.

The best time for undergoing a course of mineral waters is, in the majority of cases, the months of June, July, August, and September. There are, however, exceptions depending upon climate; for example, at Gastein, celebrated for its thermal springs, the weather is changeable and stormy in June and July, but pleasant in May, August, and September. Early rising is usually advisable during a course of mineral waters, and, as a general rule, the water should be drunk before breakfast, at intervals of about a quarter of an hour between each tumbler, moderate exercise being taken in the intervals. In many cases bathing is of even greater importance as a remedial agent than drinking. Baths are generally taken between breakfast and dinner; and should never be taken soon after a full meal. The time during which the patient should remain in the bath varies very much at different spas, and the directions of the local physician should be strictly attended to on this point. It is impossible to determine beforehand how long a course of mineral waters should be continued, as this entirely depends upon the symptoms observed during treatment. As a general rule the treatment should not be protracted beyond the space of six weeks or two months, but on this point the patient must be solely guided by the physician resident at the spa. It cannot be too forcibly impressed upon the patient, that indulgence in the pleasures of the table, and excesses of any kind, frequently counteract the salutary effects of the waters, while perfect mental relaxation is an important auxiliary to the treatment. It will be seen from remarks on the nature of the cases likely to receive benefit from the various kinds of mineral waters that spas are only suitable for patients suffering from chronic disorders.

No classification of mineral waters based upon their chemical composition can be
strictly exact, because many springs are, as it were, intermediate between tolerably well characterized groups. The following classification, which is adopted by Dr. Althaus, in his *Spas of Europe* (Lond. 1862), is perhaps the most convenient: 1. Alkaline waters; 2. Bitter waters; 3. Muriated waters; 4. Earthy waters; 5. Indifferent thermal waters; 6. Chalybeates; 7. Sulphurous waters.

1. The alkaline waters are divisible into (a) Simple alkaline acidulous waters, of which the chief contents are carbonic acid and bicarbonate of soda. The most important spas of this class are the thermal springs of Vichy and the cold springs of Fachingen, Geilnau, and Bilin. These waters are useful in certain forms of indigestion, in jaundice arising from catarrh of the hepatic ducts, in gall-stones, in renal calculi and gravel, in gout, in chronic catarrh of the respiratory organs, and in abdominal plethory. *Vichy* (q.v.) may be taken as the representative of this class of springs. (b) Muriated alkaline acidulous waters, which differ from the preceding sub-group in additionally containing a considerable quantity of chloride of sodium. The most important spas of this kind are the thermal springs of Ems, and the cold springs of Solters, Luhatschowitz, and Salzbrunn. They are useful in chronic catarrhal affections of the bronchial tubes, the stomach, and the intestines, and the harynx; and the Ems waters possess a high reputation in certain chronic diseases of the womb and adjacent organs. (c) Alkaline saline waters, of which the chief contents are sulphate and bicarbonate of soda. The most frequented of these spas are the warm springs of Carlsbad and the cold springs of Marienbad. Patients suffering from abdominal plethory are those most frequently sent to these spas, which often prove of great service if the stagnation of the blood is owing to habitual constipation, pressure from accumulated faces, or congestion of the liver, unconnected with diseases of the heart or lungs. These waters, especially those of Carlsbad, afford an excellent remedy for the habitual constipation which so frequently arises from sedentary occupations; the result being much more permanent than that produced by strong purgative waters.

2. The chief contents of the bitter waters are the sulphates of magnesia and soda; and the best-known spas of this class are those of Pullna, Saidschitz, Sedlitz, Friedrichshall, and Kissingen: although there are two English spas—namely, the bitter water of Cherry Rock, near Kingswood, in Gloucestershire, and the Burton spa, near Swindon, in Wiltshire—which are, by their chemical composition, admirably suited for the treatment of many cases of the above and other diseases, they are not to be considered as continental spas of this class.”—Althaus, op. cit. p. 360. These waters act both as purgatives and diuretics, and may therefore be used advantageously in the numerous cases in which it is advisable to excite the action both of the bowels and kidneys.

3. The muriated waters are divisible into (a) Simple muriated waters, of which the chief contents are a moderate quantity of chloride of sodium, or common salt. The chief spas of this class are Wiesbaden and Baden-Baden, which are hot; those of Soden (in Nassau), of Mondorf (near Luxembourg), and of Cansatt (near Stuttgart), which are tepid; and those of Kissingen, Homburg, and Cherlenham, which are cold. They are chiefly employed in cases of gout, rheumatism, scrofula, and abdominal plethory. (b) Muriated lithia waters, of which the chief contents are the chlorides of sodium and lithium. The discovery of lithia in some of the Baden-Baden springs is so recent that there is as yet no sufficient experience concerning their therapeutic action. In gout they first aggravate the pain, but then give relief; and in periodic headache they have been found serviceable. (c) Brines, whose chief contents are a large amount of chloride of sodium. Amongst the spas of this kind those of Rehme, in Westphalia, and Naundorf, in Hesse, have the greatest reputation. They are mostly employed for bathing, and are often of much service in scrofula, anaemia, rheumatism, certain forms of paralysis, and catarrh of the mucous membranes. (d) Iodo-bromated muriated waters, in which, besides a moderate quantity of chloride of sodium, the iodides and bromides of sodium and magnesia are contained in an appreciable quantity. Kreuznach is the most celebrated of the spas of this class. Its waters are used both for drinking and bathing, and are of service in scrofulous infiltrations of the glands, in scrofulous ulcers, in chronic inflammation of the uterus and ovaries, etc. The waters of Hall, in Austria proper, are also of this class, and have a high reputation in cases of bronchocele or goiter.

4. Earthy waters, of which the chief contents are sulphate and carbonate of lime. The most important waters of this class occur at Wildungen, Leuk, Bath, Luca, and Pisa. The Wildungen water, which is exported in large quantities, is, according to Dr. Althaus, “a capital diuretic, and not only promotes the elimination of gravel and renal calculi but by its tonic action on the mucous membranes of the bladder prevents the formation of fresh concretions. It is also much used for chronic catarrh of the bladder, neuralgia of the urethra and neck of the bladder, dysuria, and incontinence of urine.” The baths of Leuk, in which many patients remain nine hours daily (viz., from 4 a.m. to 10 a.m., and from 2 p.m. to 5 p.m.), until an eruption appears, are chiefly used in chronic skin diseases. The waters of Bath, Pisa, and Luca, which are thermal, are useful in chronic skin diseases, scrofula, gout, rheumatism, etc.

5. Indifferent thermal waters, which usually contain a small amount of saline constituents. Of the spas of this class, the most important are Gastein (95° to 118°), Toplitz (120°), Wildbad (96°), Warmbrunn (100°), Clifton (86°), and Buxton (82°). Their most
striking effects are to stimulate the skin and excite the nervous system. "They are especially used in chronic rheumatism and atomic gout; in diseases of the skin, such as prurigo, psoriasis, lichen; in neuralgia and paralysis due to rheumatic and gouty exudations, to parturition, or to severe diseases, such as typhoid fever and diptheria; in hysteria; and in general weakness and marasmus."—Althaus, op. cit. p. 421.

6. Chalybeate waters, which are divisible into (a) Simple acidulous chalybeates, whose chief contents are carbonic acid and bicarbonate of protoxide of iron; and (b) Saline acidulous chalybeates, whose chief contents are sulphate of soda and bicarbonate of protoxide of iron. These waters are considered in a special article. See CHALYBEATE WATERS.

7. Sulphurous waters, which contain sulphured hydrogen or metallic sulphides (sulphurates), or both. The most important sulphurous thermals are those of Aix-la-Chapelle, Baden (near Vienna), Barèges, Eaux-Chaudes, and Bagnoles de Luchon; whilst among the cold sulphurous springs, those of Neunndorf (in Hessen-Nassau) and Harrogate are of great importance. They are extensively used in chronic diseases of the skin, and are of service in many cases in which exudations require to be absorbed, as in swellings of the joints, in old gunshot-wounds, and in chronic gout and rheumatism. In chronic laryngeal and bronchial catarrh, they frequently give relief, and in chronic poisoning by lead or mercury, they favor the elimination of the poison, although to a far less degree than iodide of potassium taken internally. The sulphurous waters are employed externally and internally, and mineral mud-baths are believed by many physicians to form a valuable auxiliary to this treatment.

For further information on this subject, the reader is referred to the work of Dr. Althaus (of which free use has been made in this article), and to the Dictionnaire Général des Eaux Minérales et d'Hydrologie Médicale of MM. Durand-Fardel, Le Bret, and Lefort.

MINERAL WATERS, ARTIFICIAL. See Aerated Waters, ante.

MINERSVILLE, a borough in e. Pennsylvania, on a branch of the Philadelphia and Reading railroad at its junction with the Schuylkill Haven and Mine Hill railroad, and the terminus of the People's railway to Mount Carbon; pop. 70, 3,699. It is on the West Branch of the Schuylkill river, in the center of the anthracite coal mining region, not far from Broad mount, 46 m. n.e. of Harrisburg, and 4 m. w. of Pottsville, in the southern or Schuylkill coal field. Other mineral deposits are sandstone, shale, and limestone. It is in a valley surrounded by hills seamed with iron ore and covered with the rough and dangerous apparatus of anthracite coal mining. It has a newspaper, 10 churches, a public library, water works, a well-organized fire department; there are machine shops and iron foundries, an anthracite furnace, a car factory, soap and shoe factories, and flour and saw mills.

MINERVA, the name of a Roman goddess, identified by the later Classical Romans with the Greek Athene, whom she greatly resembled, though, like all the old Latin divinities, there was nothing anthropomorphic in what was told concerning her. Her name is thought to spring from the same root as mens (the mind) and monere (to warn or advise); and the ancient Latin scholar and critic, Varro, regarded her as the impersonation of divine thought—the plan of the material universe of which Jupiter was the creator, and Juno the representative. Hence all that goes on among men, all that constitutes the development of human destiny (which is but the expression of the divine idea materialized), is under her care. She is the patroness of arts and trades; and was invoked alike by poets, painters, teachers, and physicians, and all kinds of craftsmen. She also guides heroes in war; and, in fact, every wise idea, every bold act, and every useful design, owes something to the high inspiration of this virgin goddess. Her oldest temple at Rome was that on the Capitol, but she had another on the Aventine. Her festival was held in March, and lasted five days, from the 19th to the 23d inclusive.

ATHENE, or PALLAS ATHENE, the Greek goddess corresponding, as we have said, to the Roman Minerva, was one of the few truly grand ethereal divinities of Greek mythology. Different accounts are given of her origin and parentage, probably from the jumbling together of local legends; but the best known, and in ancient times, the most orthodox version of the myth represented her as the daughter of Zeus and Metis. Zeus, we are told, when he had attained supreme power after his victory over the Titans, chose for his first wife Metis (Wisdom); but being advised by both Uranus and Gaea (Heaven and Earth), he swallowed her, when she was pregnant with Athene. When the time came that Athene should have been born, Zeus, in great pains in his head, and caused Hephaestus ( Vulcan) to split it up with an axe, when the goddess sprang forth—fully armed, according to the later stories. Throwing aside the thick veil of anthropomorphism which conceals the significance of the myth, we may see in this account of Athene's parentage an effort to set forth a divine symbol of the combination of power and wisdom. Her father was the greatest, her mother the wisest of the gods. She is literally born of both, and so their qualities harmoniously blend in her. It is possible that the constant representation of her as a strictly maiden goddess, who had a real, and not a merely prudish antipathy to marriage, was meant to indicate that qualities like hers could not be married, and that, because she was perfect, she was doomed to virginity. She was not, however, a cold unfeeling divinity; on the contrary, she warmly and
actively interested herself in the affairs of both gods and men. She sat at the right hand of Zeus, assisting him with her counsels; she helped him in his wars, and conquered Pallas and Encelados in the battles of the giants. She was the patroness of agriculture, invented the plow and rake, introduced the olive into Attica, and (in harmony with her character as the personification of active wisdom) taught men the use of almost all the implements of industry and art; and is said to have devised nearly all feminine employments. Philosophy, poetry, and oratory were also under her care. She was the protectress of the Athenian state, was believed to have instituted the court of justice on Mars' Hill (the Areopagus). As a warlike divinity, she was thought to approve of those wars only which were undertaken for the public good, and conducted with prudence; and thus she was regarded as the protectress in battle of those heroes who were distinguished as well for their wisdom as their valor. In the Trojan wars, she favored the Greeks—who, in point of fact, were in the right. Her worship was universal in Greece, and representations of her in statues, busts, coins, reliefs, and vase-paintings were and are numerous. She is always dressed, generally in a Spartan tunic, with a cloak over it, and wears a helmet, beautifully adorned with figures of different animals, theegis, the round Argolic shield, a lance, etc. Her countenance is beautiful, earnest, and thoughtful, and the whole figure majestic.

MINERVINO, a t. of southern Italy, in the province of Bari, called the Balcony of Pegala, from the extensive view it commands of several cities. It stands on a fine hill, and enjoys excellent air. Pop. 18,800.

MINES, in law. In England and Ireland the crown has the right to all mines of gold and silver; but where these metals are found in mines of tin, copper, iron, or other baser metal, then the crown has only the right to take the ore at a price fixed by statute. As a general rule, whoever is the owner of freehold land has a right to all the mines underneath the surface, for his absolute ownership extends to the center of the earth. When the land is gotten by war, or when a tenant for life reverts to the crown on the death of the reversion, then the tenant for life is held to be entitled not to open mines which have never before been opened, but to carry on such as have been open, and are going mines. So in the case of a lease of lands for agricultural purposes, if nothing is said as to mines, the tenant is not entitled to open any mines, for that would be committing waste. It is not uncommon for one person to be owner of the surface of the land and another to be owner of the mines beneath; or several persons may be owners of different kinds of mines lying above each other in the different strata. Many questions have been raised lately between railway companies and mine-owners as to their respective rights and liabilities. When a railway passes through a mining country it is generally optional with the owner to sell the company merely the surface of the land, reserving to himself the mines beneath; and it is usually provided that, if ever the owner work his mines so near to the railway as to endanger its stability, the company must have notice of that fact, and then, if necessary, may purchase the mines immediately under the railway. But the courts have determined that even though the owner of the land reserve his right to miners, he is nevertheless prevented, by common law, from working the mines immediately under the railway, so as to endanger the use of the railway. In these matters the law of Scotland does not at all differ, though, as to other points of the common law, some differences of no great importance occur. See Paterson's Compendium of English and Scottish Law.

The practical working of mines and collieries in any part of Great Britain has been controlled by certain recent acts of parliament, with a view to insure the greater safety of the persons working them, and to prevent the employment of women and children. Thus, the owners of mines are prohibited, by the mines regulation acts, 1872 (repealing prior acts), from employing any female or boy under 10 underground. Boys under 16 can only be so employed ten hours per day, and boys under 12 must attend school at certain times. No owner or worker of a mine or colliery is allowed to pay the wages of the men at any tavern, public-house, beer-shop, or place of entertainment, or any office or out-gate, except to an inspector, to be employed at the entrance of any mine, to have charge of the stoppings, or planking, or plating, and to be allowed for letting down and bringing up the men. Inspectors are appointed by government for the express purpose of visiting mines, and seeing that the statutes are complied with. The statutes in question now apply not only to coal-mines and collieries, but to metalliferous mines of all kinds. Whenever an inspector, on examination, finds anything dangerous or defective in the mine, he is bound to give notice to the owner, so that it may be amended. In case of accidents occurring in the mine, caused by explosion, and resulting in loss of life or bodily injury, the owner is bound, within twenty-four hours thereafter, to send notice to the secretary of state, and to the district inspector of mines, specifying the probable cause of the accident.

MINES, MILITARY, constitute at once one of the most important departments in military engineering, and a very formidable accessory both in the attack and defense of fortresses. A military mine consists of a gallery of greater or less length, run from some point of safety under an opposing work, or under an area over which an attacking force must pass, and terminating in a chamber which, being stored with gunpowder, can be exploded at the critical moment. Mines are of great use to the besiegers in the overthrow
of ramparts and formation of a breach; the countermines of the besieged in undermining the glacis over which the assaulting column must charge, and blowing them into the air, or in destroying batteries erected for breaching, are equally serviceable. But far above the actual chief wrought by the mine—often very great—is its moral influence on the troops, and especially on the assailants. The bravest soldiers, who advance without flinching on the question which they suppose to be undermined, and on which they may be dashed to destruction in a moment, without the power of averting the unseen danger. The first employment of mines was very ancient, and merely consisted in obtaining an entrance to the interior of towns by passing beneath the defenses; but this soon fell into disuse, the chances of success being merely those of introducing a body of men before the besieged discovered the mine. The next use occurred during the middle ages, and was more destructive. The miners went no further than beneath the wall, then diverged to either side, and undermined the wall, say for about 100 feet. During the process, the wall was sustained by timber-props; and these being ultimately set on fire, the wall fell; and the besiegers, who had awaited the opportunity, rushed in at the breach. This use of mines of attack necessitated those of defense, which obtained in medieval times and have ever since kept the name of "countermines." The earliest subterranean defense consisted of a gallery surrounding the fort in advance of the foot of the wall, and termed an "envelope-gallery." From this the garrison would push forward small branches or tributary galleries, whence they could obtain warning of the approach of hostile miners, and by which they succeeded, at times, in overthrowing the battering-rams or towers of the besiegers.

Two centuries appear to have elapsed between the introduction of gunpowder into European warfare and its application to subterranean operations. The first instance of this occurred in 1508, at the siege of the Castello del' Uovo, in the bay of Naples, which a French garrison had succeeded in holding for three years against the combined Spanish and Neapolitan forces. At length, a Spanish capt., Pedro Navarro, devised a gallery into the rock, which he stored with powder, whereof the explosion, hurling portions of the rock and many of the besieged into the sea, caused the immediate capture of the place. At once the use of mines of attack spread throughout Europe; and so irresistible were they soon considered, that it was not unusual for the besieger, after preparing his mine, to invite the besieged to inspect it, with the view of inducing the latter at once to surrender. Defense soon availed itself of the new power, and, retaining the envelope-gallery as a base, ran small countermines in many directions, to ascertain by hearing the approach of the enemy's sappers—his work being audible, to a practiced ear, at a horizontal distance of 60 feet. Small charges were then exploded, which, without creating surface disturbance, blew in the approaching gallery, and buried the sappers in its ruins. Thus commenced a system of subterranean warfare, requiring the greatest risk and courage, in which the operator was in constant danger of being suffocated. Of course, in such a system, the balance of advantage lay with the besieged, who had ample opportunities before the siege commenced, of completing his ramifications in every direction, and, if desirable, of revetting them with masonry, which much diminished the chance of being blown in, while the assailant, no longer able to cross the glacis by an open zigzag trench, was compelled to engage in a most uncertain subterranean advance. The French engineer, Belidor, in the 18th c., restored the advantage to the attack, by demonstrating that the explosion of a very large mass of powder in a mine which had not yet entered the labyrinth of the enemy's mines, effected the destruction of the latter for a great space round, clearing the way with certainty for the hostile advance. Although the primary purpose of a mine is the explosion of a charge of powder, they are often used as a means of communication between different works, or between different parts of the same work, some being constructed of size sufficient to permit the passage of four men abreast, of horses, and of artillery.

It is, of course, impossible, in such a work as this, to give even an outline of the professional part of military mining; but the article would be incomplete without some allusion to the main principles. Mines are either vertical—when they are called shafts—horizontal, or inclined, in either of which cases, they are "galleries," the word "ascending" or "descending" being added if there be inclination. The dimensions range from the "great gallery," 6 ft. 6 in. by 7 ft., to the "small branch"—the last diminutive of the gallery—which has but 3 ft. 6 in. height, with a breadth of 3 ft. The most frequent work is the "common gallery," 4 ft. 6 in. by 3 ft., which is considered the easiest for the miner.

The sapper's tools are numerous, but most in request are his shovel, pickaxe, and, above all, his "push-pick," he has besides a barrow, a small wagon, a lamp, and other accessories. As he advances, it is necessary to line his gallery, always at the top, and almost always at the sides. This he does either by frames—which resemble doorframes, and serve to retain horizontal planks or "sheeting" in position against the earth—or by cases somewhat resembling packing-cases, of little depth, which are used to form the sides and top. With cases, galleries are supposed to advance one foot and a half per hour; while with frames, the progress is barely more than half that amount.

When a mine is exploded, the circular opening on the surface is called the crater; the line of least resistance is the perpendicular from the charge to the surface; the half-
diameter of the crater is its radius; and the radius of explosion is a line from the charge to the edge of the crater, on the hypothesis of the triangle, the revolution of which would form the cone. When the diameter equals the line of least resistance, the crater is called a one-lined crater; when it doubles that line, a two-lined crater; and so on. The common mine for ordinary operations is the two-lined crater; and for this the charge of powder should—in ground of average weight and tenacity—bein pounds a number equal to one-tenth of the cube of the line of least resistance in feet, for example, at a depth of 18 ft., the charge should consist of 583 pounds. In surcharged mines, or globes of compression, as introduced by Belidor, vastly greater charges are employed, and craters of six lines are sometimes produced. The rules, in these cases, for computing the charges vary exceedingly, according to different engineers, and in every case are very complicated. Previous to the explosion, the gallery is filled up behind the charge, or tamped, with earth, sand-bags, etc., to prevent the force of the powder wasting itself in the mine. This tamping must extend backwards for one and a half or twice the length of the line of least resistance. The mine is commonly fired by means of a powder-hose, composed of strong linen, inclosed in a wooden pipe laid carefully through the tamping, or by wires from a volatile battery.

In the countermine, the magistral gallery is immediately within the wall of the counterscarp, through orifices in which it derives light and air, and by its loopholes, the defenders can take in rear any enemy who might obtain momentary possession of the ditch. Further in advance, and reached by galleries of communication is the envelope-gallery from which radiate the listeners. To prevent the enemy’s advances, these listeners should not be more than about 34 feet apart. Besides listening, they are used for aggressive purposes, such as driving branches and blowing in or up hostile works. Modern engineers subjected to the envelope-gallery, as affording too good a base to the enemy, should obtain possession of it; and either dispense with it altogether, or make short sections. At suitable points among the mines, small magazines for tools and powder are formed; and at about every 30 yards, loopholed doors of great strength are made, to stop the advance of an enemy, should he break into the galleries.

In the course of their excavations, hostile miners frequently meet, or approach within a few feet. It becomes, then, merely a question of time which shall destroy the other; shells, pistols, pikes, and petards, as well as small mines, being used with murderous effect.

Provision is made for pumping foul air out of mines; but such military works are in general badly ventilated.

**MINGHETTI, CAVALIERE MARCO**, a distinguished Italian writer and statesman, and for a time prime minister of Italy, was born at Bologna, on Nov. 8, 1818. He belonged to an opulent commercial family, and on the termination of his studies, entered on an extensive continental tour, with the object of closely investigating the political, social, and economical institutions of France, Germany, and more especially of Britain. On his return from traveling, he published his maiden essay, incalculating the great commercial advantages of free trade, as existing in England, and espousing with warmth the economical views of Richard Cobden. In 1846 Minghetti opened his political career by starting a journal of liberal tendencies, soon after the advent of Pius IX. to power; in 1847 he was elected member of the Consulta delle Finanze, and in 1849 became minister of public works. Having speedily lost faith in papal progress, Minghetti withdrew from office, and joined the army of Char es Albert in Lombardy, where he was warmly received by the king, and appointed capta n. After the battle of Goito he was promoted major; and for his bravery in the engagement of Custoza, he received from the king the cross of the knights of St. Maurizio. On the conclusion of the war, Minghetti resumed his study of political economy, and gained the confidence of Cavour, by whom he was consulted during the conferences of Paris. He subsequently became secretary for foreign affairs, and only resigned with Cavour on the peace of Villafranca. Minghetti became minister of the interior in 1860, and premier in 1863. On leaving the ministry, he went as ambassa dor to London in 1868, and was subsequently, for a short time, minister of agriculture. In 1873 he became premier of a new ministry. His chief work is *Della Economia pubblica e delle sue Attinenze con la morale, e Col diritto* (1859).

**MINGRELIA**, the name of a division of Russia in Asia, on the Black sea; partly bounded by Circassia; 2,600 sq. m.; pop., 240,000. It is a rugged, mountainous country, but, in the southern part, fertile slopes lie along the river Rion, the most important stream in this part of Russia. Extensive forests of valuable timber cover the mountains, and there are mines of copper, some of which are worked; gold has also been found. The country is peopled by Georgians; not, however, of as fine a type as those who inhabit the Caucasus. It was formerly a part of Georgia, and, at a later period, was ruled by native princes; one of whom, in 1867, ceded his rights to Russia, on being paid the sum of 1,000,000 roubles. Mingrelia was the ancient Colchis, where was the mythical golden fleece, in pursuit of which occurred the expedition of the Argonauts (q.v.). It was also the birth-place of Medea. The productions are tobacco, maize, rice, wool, honey, and wine. Silk is manufactured to some extent.

**MINHO.** See ENTRE DouRO e MINHO
MINHO (Span. Miño, anc. Minibus), a river of Spain and Portugal, rises in the n.e. of Galicia, in lat. about 45° 20' n., long. about 7° 15' w. Its course is s.w. through the modern Spanish provinces of Lugo and Orense, after which, continuing its course, and forming the northern boundary of the Portuguese province of Minho, it falls into the Atlantic Ocean. Its length, exclusive of windings, is 190 m., and it is navigable for small craft 23 m. above its mouth.

MINIATURE-PAINTING, or the painting of portraits on a small scale, originated in the practice of embellishing manuscript books. See MANUSCRIPTS, ILLUSTRATION OF. As the initial letters were written with red lead (Lat. minium), the art of illumination was expressed by the low-Latin verb miniare, and the term miniatura was applied to the small pictures introduced. After the invention of printing and engraving, this delicate art entered on a new phase; copies, in small dimensions, of celebrated pictures came to be in considerable request, and, in particular, there arose such a demand for miniature-portraits that a miniature, in popular language, is held to signify "a very small portrait." Soon after their introduction, miniature-portraits were executed with very great skill in England. Holbein (b. 1498, d. 1554) painted exquisite miniatures, and having settled in London, his works had great influence in calling forth native talent. The works of Nicholas Hilliard (b. at Exeter 1547, d. 1619) are justly held in high estimation. Isaac Oliver (b. 1536, d. 1617) was employed by queen Elizabeth and most of the distinguished characters of the time; his works are remarkable for careful and elaborate execution; and his son, Thomas Hilliard, achieved even greater fame. The Flitman (b. 1633, d. 1688) painted good miniatures. Samuel Cooper (b. London 1600, d. 1672), who was, with his brother Alexander, a pupil of his uncle, Hoskins, an artist of reputation, carried miniature-painting to high excellence. Cromwell and Milton sat to him—he was employed by Charles II.—and obtained the highest patronage at the courts of France and in Holland. Till within these few years miniature-painting continued to be successfully cultivated in Britain; but it has received a severe check since photography was invented, and most of the artists of the present time who exercised their talents in this exquisite art have left it for other branches of painting. As to technical details, the early artists painted on vellum, and used body-colors, that is, colors mixed with white or other opaque pigments, and this practice was continued till a comparatively late period, when thin leaves of ivory, fixed on card-board with gum, were substituted. Many of the old miniature-painters worked with oil-colors on small plates of copper or silver. After ivory was substituted for vellum transparent colors were employed, in faces, hands, and other delicate portions of the picture, the opaque colors being only used in draperies and the like; but during the present century, in which the art has been brought to the highest excellence, the practice has been to execute the entire work, with the exception of the high lights in white drapery, with transparent colors. In working the general practice is to draw the picture very faintly and delicately with a sable-hair pencil, using a neutral tint composed of cobalt and burned sienna. The features are carefully made out in that way, and then the carnations, or flesh-tints, composed of pink, madder, and raw sienna, gradually introduced. The drapery and background should be freely washed in, and the whole work is then brought out by hatching, that is, by painting with lines or strokes, which the artist must accommodate to the forms, and which are diminished in size as the work progresses. Stippling, or dotting, was a method much employed, particularly in early times; but the latest masters of the art preferred hatching, and there are specimens by old masters, Perugino, for instance, executed in that manner.

MINIÉ, CLAUDE ÉTIENNE, b. Paris, 1810; entered the army as a volunteer, and served in Algeria during several campaigns. He was made capt. in 1849, and in 1852 was appointed by Napoleon III. superintendent of the school of ordnance at Vincennes. In 1858 he resigned this post, and was appointed by the Egyptian government to superintend a manufactory of armaments and a school of gunnery at Cairo. His invention of the Minié rifle was made about 1853, and adopted by the French government. It was the first practical introduction of the principle of expansion in the manufacture of firearms, and gave to the bullet a precision and range previously unknown to gunnery.

MINIM, the name of one of the notes in modern music, the value of which is the half of a semibreve.

MINIMS (Lat. fratres minimi, least brethren), so called, in token of still greater humility, by contrast with the fratres minores, or lesser brethren of St. Francis of Assisi (q.v.), an order of the Roman Catholic church, founded by another St. Francis, a native of Paula, a small town of Calabria, about the middle of the 15th century. Francis had, as a boy, entered the Franciscan order; but the austerities of that rule failed to satisfy his ardor, and on his return from a pilgrimage to Rome and Assisi, he founded, in 1458, an association of hermits of St. Francis, who first lived in separate cells, but eventually were united in the conventual life in 1474, and established in several places in Calabria and Sicily. Francis was also invited into France by Louis XI., and founded houses of his order at Amboise and at Plessis-les-Tours. In Spain the brethren took the name of "Fathers of Victory," in memory of the recovery of Malaga from the Moors, which was ascribed to their prayers. It was not till very near the close of the life of Francis that he drew up the rule of his order. It is exceedingly austere, the brethren being debarred
MINING is a general term for the underground operations by which the various metals and other minerals are procured. It has been practised to some extent from the remotest times, as is proved by the reference to it in the 28th chapter of the book of Job. In its proper sense, the art was certainly known to the ancient Phoenicians and Egyptians, and also to the Greeks and Romans. Mining operations were carried on in Britain by the latter at the time of the Roman conquest. After the Norman conquest, Jews, and, at a later time, Germans were largely employed in our mines. The introduction of gunpowder as a blasting material in 1620, led the way to many improvements in mining; so also did the introduction of powerful engines for pumping water, about the beginning of the 18th century.

There are two principal methods of mining: one of which is adopted where the mineral occurs in veins or lodes, as copper and lead ore; and the other where the mineral occurs in more or less parallel beds, as coal. Mining in alluvial deposits is a third method, largely practiced in the gold regions of California and Australia, and includes the novel process of "hydraulic mining." 15

In mines like those of Cornwall and Devonshire, where most of the copper and tin of Great Britain, and also some of the lead, are obtained, the ores occur in veins filling cracks or fissures in the rocks. Such veins are termed lodes, to distinguish them from veins of quartz and other non-metallic minerals. Lodes are very irregular in size, and in the directions they take, though they usually follow one general line.

A lode consists of a main or "champion" lode and branches, called feeders, shoots, and strings. Mineral veins sometimes extend for several miles through a country; but they expand and contract so much, and split up into so many branches, that it is perhaps uncertain whether the same lode has ever been traced for more than a mile. Veins seldom deviate more than 45 degrees from a perpendicular line, and descend to unknown depths. They penetrate alike stratiﬁed and unstratiﬁed rocks. Those veins which run e. and w. have been observed to be the most productive.

Fig. 1 shows a section of a Cornish mine across the lodes l, l, l, l; a is the engine-shaft, in which are the pumps and the ladders for ascent and descent; b, b are winch-shafts for raising the ore, which is done by means of buckets. The adit, or day-level, is a long passage to which the water of the mine is pumped up and conveyed away. Some adits are made to traverse several mines. The great adit which drains the mines of Glennap and Redruth, in Cornwall, is 30 m. long. At c, c, c, are cross cuts, by which the workings on the different lodes are connected.

A horizontal section in the direction of a lode would show the horizontal galleries, termed levels, which are driven upon the lode, and small upright shafts, called winces. Levels are generally about ten fathoms (60 ft.) apart. They are rarely perpendicular above each other, as they follow the inclination of the vein. In the section, the richer portions of the lode, termed "bunches," are shown indicated; and where these have been removed, and their place filled with rubbish, angular fragments are represented. This is necessary to prevent the sides of workings from falling in. The bottom of the engine-shaft is the lowest portion of the mine. It is called the sump, and is the place where the water from the various levels and workings collects, in order to be pumped up to the adit. The galleries and shafts in an extensive mine are very numerous, making it altogether a very complicated affair. The shafts, however, have all distinct names, and the levels are known by their depth in fathoms, so that particular places are as easily found as streets in a town. The underground workings of the Consolidated mines, which are the largest in Cornwall, being a
conjunction of four mines, are 55,000 fathoms, or 63 m., in extent. In working out the lode between one level and another, the miner usually goes upwards, it being easier to throw down the ore than to raise it up. He works with the light of a candle, stuck with clay to the side of the mine. His tools are few—namely, a pick, a hammer, and some wedges where the vein is soft and friable; but it is generally hard enough to require blasting, in which case he uses a borer or jasper, and some smaller tools for cleaning and stemming the hole which is made. The ore is filled into wagons, and then drawn along the gallery to the shaft, to be raised to the surface in kibbles.

A vein may be 30 or 40 ft. thick, and so poor in ore as not to be worth working; again, it may be only a few inches thick, and yet its richness may amply repay the labor of extracting it. Three or four feet may be taken as the average of several kinds of veins. In extensive mines, portions of the ore are here and there left in the lode, so as to furnish a steady supply when other parts are unproductive. These are called eyes, and when they are afterwards removed, the operation is termed picking out the eyes of the mine.

The old plan of ascending and descending the mines by ladders, so destructive to the health of the miners, is still largely in use. The ladders are now about 25 ft. long, and set with a slope. There is a platform at the bottom of each called a sollar, with a manhole in it leading to the next ladder beneath. Some of the Cornish mines are half a mile deep, so that it takes the miner an hour to reach the surface after he is done with his work; most of the journey being accomplished on wet, slippery ladders. The bad effects of the fatigue so produced are augmented by the fact that the men come from a constant temperature of 40° F. below to one of perhaps 80° or 90° on the surface. Dr. J. B. Sanderson states, as the result of recent inquiries, that 90° F. is the highest limit of temperature consistent with healthy labor in a mine.

A great improvement on the ladder system is now in operation in several of the deep Cornish mines. It is a method first introduced into the deep mines of the Harz, and called the fahr-kunst. The plan of this "man-engine" is this. Two rods descend through the depth of the shaft, and upon these bracket-steps are fixed every 12 ft. The rods move up and down alternately through this distance by means of a reciprocating motion. If the miner wishes to ascend, he places himself on the lower step of the first rod, and is raised by the first movement of this rod to the level of the second step on the second rod, to which he now crosses. The next movement raises the second rod, and brings the second step up to the level of the third step of the first rod, to which he next crosses; and so, ascending stage by stage, he reaches the top. The descent is, of course, accomplished in the same way.

Some of the Cornish pumping-engines are very large and powerful. The cylinder of one of the largest is 7 ft. 6 in. in diameter. With the expenditure of one bushel of coal, it can raise 100,000,000 lbs. weight one ft. high; this is called its "duty." It lifts nearly 800 gallons of water per minute, and its cost was about $8,000.

In Cornwall the miners are divided into two classes: one of them called tributers, who take a two months' contract of a portion of the lode: the other called tutmen, who are employed in sinking shafts, driving levels, etc.

A detailed analysis of one of the largest Cornish copper mines, published some years ago, shows that in that year it produced, in round numbers, 16,000 tons of ore, realizing $50,000, and yielding a net profit of about $16,000. It employed about 700 miners, 300 laborers, 300 boys, and 300 women and girls. The cost for coal was $1800; for malleable iron and steel, $1300; for foundry castings, $2000; for ropes, $1000; for candles, $1800; for gunpowder, $2000; and for timber, nearly $3000. The last mines regulation acts were passed in 1872 (amended in 1875). See Mines in Law.

Mining for Coal.—The minerals of the carboniferous formation, at least those which occur in beds or strata, as coal and clay ironstone, are mined, as has been already said, in a different way from metallic veins. Originally deposited in a horizontal position, they have been so altered by movements in the earth's crust, that they are rarely found so now. They are more generally found lying in a kind of basin or trough, with many minor undulations and dislocations. But however much twisted out of their original position, the different seams, more or less, preserve their parallelism, a fact of great service to the miner, since beds of shale, or other minerals, of a known distance from a coal seam, are often exposed when the coal itself is not, and so indicate where it may be found.

The great progress made of late years in the science of geology has made us so minutely acquainted with all the rock formations above and below the coal measures, that it is now a comparatively easy matter to determine whether, in any given spot, coal may or may not be found. Nevertheless, large sums are still occasionally, as they have in past times been very frequently, wasted in the fruitless search for coal, where the character of the rocks indicates formations far removed from coal-bearing strata.

When there are good grounds for supposing that coal is likely to be found in any particular locality, before a pit is sunk the preliminary process of "boring" (q.v.) is resorted to, in order to determine whether it actually does exist there, and if in quantity sufficient to make the mining of it profitable. The usual mode of "winning" or reaching the coal is to sink a perpendicular shaft; but sometimes a level or cross-cut mine, and at other times an inclined plane or "dook," is adopted. Before the introduction of
pumping-engines, all coal-workings were drained by means of a level mine called a day-level, driven from the lowest available point on the surface, and no coal could be wrought at a lower depth than this, because there were no means of removing the water.

When the shaft has been sunk to the necessary depth, a level passage, called the dip-head, or main-level, is first driven on each side, which acts as a roadway or passage, and, at the same time, as a drain to conduct the water, which accumulates in the workings, by means of a gutter on one side, to the lodgment at the bottom of the shaft. This level is the lowest limit of the workings in the direction of the dip, and from it the coal is worked out as far as is practicable along the rise of the strata. There are two principal methods of mining the coal. One is termed the "post-and-stall" or "stoop-and-room" system, and is used for thick seams; the other is called the "long-wall" system, and is adopted for seams under 4 ft. in thickness. In a mine wrought on the post-and-stall plan, the coal is taken out in parallel spaces of say 15 ft. wide, intersected by a similar series of passages at right angles. Between these "rooms," as they are called, "stoops" of coal, about 30 ft. each way, are left for the support of the "roof" of the seam. Larger stoops are left at the bottom of the shaft, in order to secure greater stability there. There is a modification of this plan adopted at Newcastle, called the "board-and-pillar" method, by which a certain number of the stoops or pillars are removed altogether, after which the roof falls in, and forms a mass of ruins, termed a "goaf."

The long-wall system consists in extracting the entire seam of coal at the first working, the overlying strata being supported by the waste rock from the roof of the workings. It is necessary, however, to leave large stoops at the bottom of the shaft for its support, as in the stoop-and-room method. In long-wall workings, roads of a proper height and width require to be made for communication with the different parts of the mine.

The collier's usual mode of extracting the coal from its bed is this: With a light pick, he undercuts the coal-seam, technically termed "holing," for 2 or 3 ft. inwards, and then, by driving in wedges at the top of the seam, he breaks away the portion which has been holed. Blasting is occasionally, but not often resorted to. For the past ten years, machines, some for "holing" only, and others for both "holing" and hewing down coal seams, have been more or less in use. They usually work with compressed air, but sometimes with steam or water. It is still premature, however, to express any decided opinion as to their efficiency as compared with hand-labor. The coal, when separated from its bed, is put on tubs or hutches, which are generally drawn by horses, but sometimes by engine-power, along the roads to the bottom of the shaft, and hoisted to the surface.

The shaft is perhaps the most important portion of a coal-pit, and the principal parts of one are shown in fig. 2. The upper part shows the pit-head arrangements, the central part shows the force-pump, etc., and the lower part shows the pit-bottom arrangements. To make the section complete, the reader must imagine a great depth to intervene at the gaps A and B. There are four divisions in this shaft: the two center ones, a, a, are used for sending up and down the men and the coal; the one on the right side, b,
contains the pump; and the remaining one on the left, \( e \), is for withdrawing the vitiated air from the mine, and has usually a furnace at the bottom of it. In some pits a special shaft is applied to the ventilation, for which mechanical contrivances, such as ventilating fans, are now also partially introduced. Since the dreadful accident at the Hartley Colliery, in January, 1862, caused by the beam of the engine breaking and closing up the shaft, an act of parliament has been passed making it imperative to have two shafts, or at least two outlets, to every coal-mine, as a means of escape, in case of an accident to one of them.

The cages \( d, d \), by which the colliers ascend and descend, are also used for raising the coal. They are merely square plats of timber, with rails across them, for the convenience of running the coal-hutches, \( e \), and with a light iron frame, by which they are suspended to a flat wire-rod. On each cage there are clamps, which slip up and down on guide-rods. In the figure, two miners are shown standing on one cage at the bottom of the shaft, and the other is at the top, with a coal-hutch upon it. The accidents resulting from the raising and lowering of the cages are numerous; many of them happen by the carelessness of the engine-man in not stopping the cage when it reaches the mouth of the pit, and so allowing it to be upset by over-winding. Many accidents also happen from the rope breaking. To prevent this, numerous "safety-cages" have been invented, most of which depend on the action of a spring, which is held in a certain position while the cage is suspended by the rope; but should the latter snap, the spring is suddenly relieved, and then grasping the guide-rods, prevents the cage from falling. Other safety cages act by levers and clutches, but it is still disputed whether there is, on the whole, a decided advantage in using any of them, since they are all liable to get out of order. The man-engine, although not used in British collieries, is adopted in several on the continent, and is certainly the safest way of putting up and down men in a pit.

The steam-engine, \( E \), works the pumps, in this case by a direct action, the pump-rods being attached to the piston-rod. The engine also winds up the cages, one of which ascends while the other descends—the barrel and other arrangements for which are shown in the figure.

The proper ventilation of any mine, but especially of a coal mine, is of very great importance. It clears the mine of the dangerous gases, fire-damp and foul-damp, dries the subterranean roadways, and furnishes the miners with a supply of pure air. Some idea of the general mode of ventilating a mine will be obtained by referring to Fig. 2, where the arrows pointing downward indicate the downcast shaft, and the arrows pointing upward, the upcast one. A number of doors and stops secure the traveling of the current in a proper direction, so as to reach the furthest recesses of the mine. It then returns by the upcast shaft, where, as has been already stated, it is usual to keep a furnace burning, to aid in withdrawing the impure air. It is very difficult, however, to secure efficient ventilation through many of the zigzag windings of a mine; hence the frequent and sometimes terrible explosions of fire-damp, or light carbureted hydrogen, which explodes when mixed with a certain proportion of atmospheric air; hence, also, the occasional accumulation of foul-damp (carbonic acid) in some pits, which suffocates any one breathing it. This deadly gas is always produced in large quantity by an explosion of fire-damp, and chokes many who have survived the violence of the explosion. Many collieries are so free of fire-damp, that the miners work with naked lights, but in others it is necessary to use the safety lamp (q.v.).

Besides the already mentioned sources of accident, there is the sudden falling-in of pieces from the roof of the workings. The following summary, made up from H. M. inspector's returns, shows the number of lives lost, in proportion to the quantity of coal raised:

<table>
<thead>
<tr>
<th>Total tons of mineral raised in Great Britain for the year 1876</th>
<th>148,929,588</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total number of lives lost in 1876</td>
<td>498</td>
</tr>
<tr>
<td>Average tons of mineral raised to each life lost</td>
<td>300</td>
</tr>
</tbody>
</table>

To show the magnitude of some of the large coal-mines, it may be stated that the Hatton colliery, in Durham, yields 800,000 tons in the year, employs about 1000 men and 300 boys underground, and 500 people at the surface. The Monkwearmouth pit, near Newcastle, is 1000 ft. deep, and its face-workings are 2 m. from the bottom of the shaft. Rosebridge colliery, near Wigan, has the deepest shaft in England, being nearly 2,500 ft. deep. The sinking of some of the more difficult shafts has cost from £50,000 to £100,000 each.

MINING. See Appendix.

MINING CORPORATIONS, companies incorporated under national, state, or colonial law, to mine for the precious metals or other minerals. Such companies are sometimes permitted also to manufacture, or to do a milling or reduction business, in connection with mining; or to engage in transportation—as of coal from the mine to the market. Mining property is held by purchase and absolute ownership, or by lease. In the Dominion of Canada leases are granted by the queen, and a royalty on the yield paid to the government. The number of mining companies in the United States in good standing, reported on Jan. 1, 1881, was 212, divided as follows as to the location of the mines: California 37, Colorado 80, Montana 4, Dakota 11, North Carolina 5, Nevada 31, Ari...
These mining properties were capitalized in the sum of $3,000,000,000. As an illustration of the extent to which mines were over-capitalized, it may be noted that the market-value of the properties of 95 of these mines capitalized in over $750,000,000, estimated on the selling prices of the various stocks, was (in round numbers) $60,000,000, or eight per cent of the capital; amounting to the fact that the stocks in question were at the time when the figures were procured selling on the mining-stock exchange of New York city at the discount of 92 per cent.

MINISTER, a public functionary who has the chief direction of any department in a state. See Ministry. Also the delegate or representative of a sovereign at a foreign court to treat of affairs of state. Every independent state has a right to send public ministers to, and receive them from, any other sovereign state with which it desires to preserve relations of amity. Semi-sovereign states have generally been considered not to possess the jus legationis, unless when delegated to them by the state on which they are dependent. The right of confederated states to send public ministers to each other, or to foreign states, depends on the nature and constitution of the union by which they are bound together. The constitution of the United Provinces of the Low Countries and of the old German empire preserved this right to the individual states or princes, as do the present constitutions of the German empire and Swiss confederation. The constitution of the United States either greatly modifies or entirely takes away the jus legationis of each individual state. Every sovereign state has a right to receive public ministers from other powers, unless where obligations to the contrary have been entered into by treaty.

The diplomatic usage of Europe recognizes three orders of ministers. Ministers of the first order possess the representative character in the highest degree, representing the state or sovereign sending them not only in the particular affairs with which they are charged, but in other matters: they may claim the same honors as would belong to their constituent, if present. This first class of diplomatic agents includes papal legates and nuncios, and ambassadors ordinary and extraordinary. A principle of reciprocity is recognized among the members of the diplomatic agents sent. States enjoying the honors of royalty send to each other ministers of the first class; so also in some cases do those states which do not enjoy them; but it is said that no state enjoying such honors can receive ministers of the first class from those who are not possessed of them.

Ministers of the second and third order have not the same strictly representative character; their representation is not held to go beyond the affairs with which they are charged. They are, however, the natural protectors of the subjects of the state or country sending them in the country to which they are sent. Ministers of the second class include the envoys, whether these are simply so styled, or denominated envoys extraordinary, and also ministers plenipotentiary. The second class of ministers does not differ from the second in the degree of their representative character, but only in the diversity of their dignity, and the ceremonial with which they are received. This class comprehends ministers, ministers resident, ministers chargés d’affaires, such consuls as are possessed of a diplomatic character, and those chargés d’affaires who are sent to courts to which it is not thought necessary to send ministers of the first class. These envoys have, for the most part, no letters-creditable from the sovereign; and are accredited only by letters to the foreign minister or secretary of the country to which they are sent.

Besides these orders of ministers, there are other diplomatic agents occasionally recognized—such as deputies sent to a congress or confederacy of states, and commissioners sent to settle territorial limits or disputes concerning jurisdiction. These are generally considered to enjoy the privileges of ministers of the second and third order. Ministers-mediators are ministers sent by two powers, between which a dispute has arisen, to a foreign court, or congress, where a third power, or several powers, have, with the consent of the two powers at variance, offered to mediate between them.

Diplomatic agents, except, as already mentioned, those of the third class, are accredited by a letter to the sovereign of the country to which they are sent. The letter of credence is usually dispatched under a cachet volant—i.e., a seal which does not close the letter: or else, in addition to the principal letter, an authenticated copy is sent, which the diplomatic agent on his arrival presents to the minister or secretary for foreign affairs, as his right to demand an audience of the sovereign; the original is presented to the sovereign. Ministers sent to a congress or diet have usually no credentials, but merely a full power, of which an authenticated copy is delivered into the hands of a directing minister, or minister-mediator. A minister of the first class is received to both public and private audiences by the sovereign to whom he is accredited; a minister of the second class generally to private audiences only. Diplomatic agents are entitled to conduct negotiations either directly with the sovereign, or with the minister or secretary for foreign affairs. The latter course is the more usual, and generally the more convenient.

The title 'excellency' has since the peace of Westphalia been accorded to all diplomatic agents of the first class; and in some courts it is extended to ministers of the second class, or at least those sent by the great powers. See Ambassador, Envoy, Consul. Under Ambassador the immunities and privileges enjoyed by diplomatic agents are explained.

MINISTER, CHRISTIAN. See Clergy, ante.
MINISTER.—MINISTRY (ante). I. FUNCTIONARY DIPLOMATIC. By the American system ministers to exercise diplomatic functions near foreign courts are appointed by the president and confirmed by the senate of the United States. They are accredited by letter to the sovereign of the country to which they are appointed, and are permitted certain duties and privileges pronounced to be excepted by the constitution from the operation of municipal law. The United States send no envoys of the rank of ambassadors, permanently accredited to foreign courts; but have not infrequently conferred the rank and authority in the case of special missions. See AMBASSADOR, ante. II. FUNCTIONARY EXECUTIVE. In the United States government the executive offices are under the immediate official direction and control of the heads of the departments, including those of state, treasury, interior, war, post-office, navy, justice, and agriculture. Seven of these officials have seats in the cabinet or council of advisers of the president, and are termed "the cabinet." They are the secretaries of state, war, the treasury, the navy, and the interior; the postmaster-general, and the attorney-general, or head of the department of justice. These officials are appointed by the president and confirmed by the senate; their duty is to administer or execute the functions of their respective offices under the direction of the president, to whom they are immediately responsible and to whom they report annually; and from time to time on special subjects if so desired by him. They hold their offices at the will of the president, who may request their resignations if the good of the public service shall seem to require it. As an advisory council, they assemble at the call of the president, or at stated times, for conference, to enunciate opinions or to answer questions. There is nothing, however, in the constitution or elsewhere in American law which renders it obligatory on the president to employ them in this manner, though custom has made it usual and convenient so to do. Excepting to the president for the proper performance of their official duties, they have no responsibilities; and in no particular except in the nature of these duties do they resemble the ministers of Great Britain or those of the European powers. See CABINET, ante.

MINISTRY, the body of ministers of state, or persons to whom the sovereign or chief magistrate of a country commits the executive government. It is a principle of the constitution of Great Britain, that "the king can do no wrong," that is to say, the sovereign personally is irresponsible for his acts, the real responsibility resting with the administrative government. The "king's council," or PRIVY COUNCIL, were the earliest advisers of the sovereign in matters of state; but when this body came, in the course of time, to be found too large for the dispatch of business, its duties were transferred to a small committee of privy councilors selected by the king. As late as in Charles I.'s time, all the more important resolutions of the crown were taken after deliberation and assent of the privy council. An unsuccessful attempt was made in the reign of Charles II. to restore the council to its original functions. Its numbers were limited to thirty; and it was intended that this limited council should have the control of the whole executive administration, superseding any interior cabinet. But the council was found too extensive for an effectively working ministry, and the former arrangement was restored. The CABINET or MINISTRY is now but a committee of the privy council; and its exclusive right to discuss and determine the plans and measures of government is sustained only under the protection of the constitution. The position which was thus occupied by Lord Campbell, who maintained that, "by our constitution, it is in practice a defined and acknowledged body for carrying on the executive government of the country." Proclamations and orders still issue from the privy council; and it is occasionally assembled to deliberate on public affairs, when only those councilors who are summoned attend. The cabinet is a merely deliberative body; its members collectively have no power to issue warrants or proclamations; but all important measures which engage the attention of the government, whether regarding matters domestic, foreign, or colonial, and all plans of action, whether purely administrative, or to be carried out in parliament, must be proposed, considered, and adopted by the cabinet. The sovereign intrusts the formation of a ministry to a statesman, who selects for the members of his cabinet those who are attached to his political views. He generally places himself at the head of the government as first lord of the treasury, and in popular language, is called the premier, or prime minister. The council of the exchequer, the secretaries of state for home, foreign, colonial, and Indian affairs, the secretary at war, and the president of the council, are necessarily members of the cabinet; and with them are associated the heads of various other important departments of government, including generally the first lord of the admiralty, the president of the board of trade, the postmaster-general, the president of the poor-law board, the chancellor of the duchy of Lancaster, and occasionally the chief secretary for Ireland. The premier has sometimes held the office of chancellor of the exchequer in conjunction with that of first lord of the treasury. A privy councilor of great political weight is sometimes called into the cabinet without office, and takes the post of lord privy seal. Her majesty's ministers include the following, who have usually no seat in the cabinet: the chief secretary for Ireland, the first commissioner of works, the vice-president of the board of trade, the vice-president of the committee on education, the commander-in-chief, the lord chamberlain, the steward, the master of the horse, the
master of the hounds, the comptroller of the household, the lord lieutenant of Ireland, the attorney-general and solicitor-general of England, the lord advocate and solicitor-general of Scotland, and the attorney-general and solicitor-general of Ireland. Occasionally, but exceptionally, the commander-in-chief, and the lord chief justice of England, have been members of the cabinet. A ministry is often spoken of as the ministry of the person who is at its head.

Meetings of the cabinet are held on the summons of any one of its members, usually at the foreign office. Its proceedings are secret and confidential, and no record is kept of its resolutions, which are carried into effect by those of its members to whose departments they severally belong. As the acts of a ministry are at all times liable to be called in question in parliament, it is necessary that the heads of the chief departments should hold their seats in either house, in order to be able, when required, to give prompt explanations.

A government exists only so long as it can command the confidence of parliament. The sovereign has the power to dismiss his ministers whenever they cease to possess his confidence, but such a change would be useless without the support of the house of commons, who, by withholding their support, could paralyze all the functions of government. A sovereign has sometimes got rid of a ministry with whose policy he was dissatisfied, by dissolving parliament, and appealing to the country. When a ministry cannot command the confidence of parliament, they resign, and a statesman of some other political party is sent for by the sovereign, and authorized to form a new cabinet. All the adherents of a ministry filling political offices resign along with it, as also the great officers of the court, and those officers of the royal household who have seats in either house of parliament. Sometimes officers holding lucrative appointments which do not necessitate residence, have retired, as a manifestation of adherence to their political friends. In addition to the ministers already named, the following adherents of the ministry go out of office on a change of government: the three junior lords of the treasury, the two secretaries of the treasury, the four parliamentary under-secretaries of state, the pay-master-general, the master-general of the ordnance, the surveyor-general of the ordnance, the five junior lords of the admiralty, the first secretary of the admiralty, the chief commissioner of Greenwich hospital, the president and parliamentary secretary of the poor-law board, the president of the board of health, the vice-chamberlain, the captain of the gentlemen-at-arms, the captain of the yeomen of the guard, the lords in waiting, the mistress of the robes, the treasurer of the household, the chief equerry, or clerk marshal, the judge advocate-general, and the lord chancellor for Ireland. The private secretary to a minister loses office on a change, his appointment being a purely personal one; and changes are generally, though not always made in ambassadors extraordinary.

In 1838, when viscount Melbourne's ministry resigned, sir Robert Peel, who was intrusted by the queen with the formation of a new ministry, proposed that, in order to give public proof of her majesty's confidence, the change should include the chief appointments held by the ladies of her majesty's household. The queen, counseled by lord Melbourne, refused her consent to this proposal, on the ground of its being contrary to the latest precedents of the reign of queen Anne. Sir Robert, however (with whose opinion the duke of Wellington expressed concurrence), considered the change a necessary one; and as he refused to undertake the formation of a government without its being adopted, the result was that lord Melbourne and his colleagues were reinstated. At a council held on their resuming office, it was resolved "That for the purpose of giving to the administration the character of efficiency and stability, and those marks of the constitutional support of the crown that are requisite to enable it to act usefully to the public service, it is reasonable that the great offices of the court, and situations in the household held by members of parliament, should be included in the political arrangements made in a change of the administration. But they are not of opinion that a similar principle should be applied or extended to the offices held by ladies in her majesty's household."

MINIUM (Lat. red-lead). See LEAD.

MINK, Mustela lutreola, a species of weasel inhabiting the northern parts of Europe and Asia; very similar to which in characters and habits is another species, by some regarded as only a variety of the same, the mink or VISON (M. VISON) of North America, abundant in almost every part of that continent. Both inhabit the neighborhood of streams, lakes, and marshes; have semi-palmated feet, are expert swimmers and divers, and prey on fishes, frogs, and other aquatic animals, as well as on birds, rats, mice, etc. They are covered with a downy fur, interspersed with longer and stronger hairs: the color is brown, with more or less of white on the under parts. The American mink is generally larger than that of the old world, being often more than 18 in. from the nose to the root of the tail, whilst the latter is seldom more than 12. It has also a more bushy tail. It is very active and bold, and often commits great depredations in poultry-yards, carrying off a fowl with great ease. Unlike most of its congeners, it is easily tamed, and becomes much attached to those who care for it. In domestication it ceases to regard the inmates of the poultry-yard as prey. It emits an unpleasant odor only when irritated or alarmed. The fur of the mink is valuable. See WEASEL.
MINNEAPOLIS, a city in s.e. Minnesota, incorporated 1857; enlarged by the annexation of the city of St. Anthony, 1873; situated at the falls of St. Anthony, 10 m. w. of St. Paul; pop. '80, 46,887. It is built on a broad plateau, through which flows the Mississippi river, overlooked by bold bluffs, which command a view of the surrounding country, noted for its picturesque scenery. At the falls of St. Anthony the river makes a descent of 50 ft. within a mile (80 ft. within the limits of the city), and has a perpendicular descent of 18 feet. It is crossed by 4 bridges, including a suspension bridge built in 1876; and in the vicinity are lakes Cedar, Calhoun, and Harriet. It is supplied by means of the river with extensive water-power, which is utilized by immense manufactories and mills. The value of the lumber sawed in one year was $2,948,355; that of flour made in one year was $7,320,410. It has grocers who do a business of from $4,000,000 to $5,000,000 a year; and large dry-goods and commercial houses. There was expended in the city, for building and improvements, in one year, $1,729,700. The leading industries and manufactures are flour and flour, and among its float-mills is one with 48 runs of stock. The largest in the country. Two buildings of grain is used for other industries are in the manufacture of iron machinery, engines and boilers, water-wheels, agricultural implements, sashes, doors, and blinds, beer, cotton and woolen goods, furniture, barrels, boots and shoes, paper, linseed-oil, etc. It has pork-packing establishments, and a large number of saw-mills. It has been a city of rapid growth, and has an important wholesale trade, which is constantly increasing. It is on the Chicago, Milwaukee and St. Paul railroad, at the junction of the St. Paul and Pacific and the Lake Superior and Mississippi with the Minneapolis and St. Louis line, all of which roads transport a large amount of freight, which is increasing yearly. It has a line of steamers to St. Cloud. It is regularly laid out, with avenues 80 ft. wide, crossed by streets at right angles, which are laid by two rows of trees; is lighted by gas; is well sewered; and has a public park. It has 10 wards, a mayor, and board of aldermen of two members from each ward, a police force, and a fire department. There are 11 banks—6 national, with an aggregate capital of $1,035,500. Among public buildings are a court-hall erected in 1873, an academy of music, and an opera-house. There are 65 churches. The atheneum has a library of 8,000 vols. Minneapolis is the seat of the university of Minnesota (non-sectarian, and open to both sexes), organized in 1858, and having a library of 10,000 vols.; and the Augsburg theological seminary (Lutheran), established by the Scandinavians of the n.w., with a library of 1100 vols.; also Hamline university (Methodist). It has 14 newspapers—2 Norwegian, 1 German; and 2 semi-monthly periodicals, 1 Norwegian. The falls of Minnehaha (laughing water) are 3 m. distant.

MINNEHAHA, a river and fall in s.e. Minnesota, near the station of Minnehaha on the St. Paul and Pacific railroad, one-half mile from the Mississippi river and a short distance from Minneapolis. Considerable interest attaches to this cascade, it being the scene of a legendary romance wrought into the story of Longfellow's poem of Hiawatha. The river Minnehaha flows over a limestone cliff, making a sudden descent of 60 ft., and the story runs that Minnehaha, an Indian maiden crossed in love, here took the fatal leap. Minnehaha, in Dakota language, signifies laughing water.

MINNEHAHA, a co. in s.e. Dakota, having the state-line of Minnesota for its c. boundary; drained by the Big Sioux river and small affluents; 800 sq.m.; pop. '80, 8,252—5,502 of American birth, 48 colored. It has Beaver lake and other small lakes in the n.w. Its surface is generally rich level prairies with little timber, but very productive where under cultivation. It is intersected by the Sioux City and St. Paul railroad, and its county seat contains a U. S. land office. Capital, Sioux Falls.

MINNESINGERS, a designation applied to the earliest lyric poets of Germany in the 12th and 13th centuries, and derived from the word minne, or love, which was at first the predominating, and almost sole subject treated of in their productions. The works of the minnesingers are for the most part superior to those of their more generally known contemporaries, the troubadours, both in regard to delicacy of sentiment, elegance and variety of rhythmical structure, and grace of diction. He a Minnesinger flourished in the beginning of the 13th century, in the court of the Swabian, Frederick Barbarossa, emperor of Germany, is regarded as the father of the minnesingers, and Walther von der Weide, who was born about 1170, as the last of this great vocal band, which included emperors, princes, nobles, and knights. Many of their productions have of course perished, although, in addition to a very large collection of poems by anonymous minnesingers, we still possess some remains of the songs of more than 150 known composers. Among the most celebrated of these, special notice is due to Wolfram von Eschenbach (q.v.), Henry von Ofterdingen, Hagenane, Hartmann von der Aue (q.v.), Gottfried von Strassburg (q.v.), Otto von Botenlauben, Truchsess von St. Gall, and Ulrich von Lichtenstein—men of noble houses, who, although they belonged to every part of Germany, wrote almost exclusively in the Swabian dialect, which, during the brilliant days of the Fredericks and Conrads of the house of Swabia, was the language of the court in Germany. Among the few other forms of German employed by the minnesingers, the one next in favor was the Thuringian, adopted by the Ulrichs Urs Graf of Thuringia, who, next to the princes of the Swabian dynasty, was the most munificent patron of the minnesingers during the period of their renown, in the early part of the 13th century. Besides songs in praise of women, the minnesingers composed odes on public or private
occasions of lament or joy, distiches or axioms, and *vokhtlieder*, or watch-songs, in which the lover was represented as expostulating with the watchman, who kept guard at the gate of the castle within which his lady-love was imprisoned and trying to persuade him to grant him admittance to her presence. These songs and odes were recited by the composer, to his own accompaniment on the viol; and as few of the minnesingers could write, their compositions were preserved mostly by verbal tradition only, and carried by wandering minstrels from castle to castle throughout Germany, and even beyond its borders. As the variety of rhythm and complicated forms of versification affected by the minnesingers, more especially towards the decline of their art, rendered it difficult to retain by memory the mass of minnesong which had been gradually accumulated, these itinerant musicians finally made use of written collections, a practice to which alone we are indebted for the many beautiful specimens of early German lyrical poetry which we yet possess. The glory of the minnesingers may be said to have perished with the downfall of the Swabian dynasty, under which greater liberty of thought and word was allowed among Germans than they again enjoyed for many ages; and in proportion as the church succeeded in reasserting its sway over the minds of men, which it had lost under the rule of the chivalric Fredericks, freedom of speech and action was trammeled, and song and poetry contemned. Paraphrases of Scripture, hymns, and monkish legends, took the place of the chivalric songs of the nobly born minnesingers, and German poetry was for a time almost annihilated.

In the 14th c., the art of minnesong was partially revived, although under a rude and clumsily elaborated form, by the *master-singers*, a body of men belonging to the burgher and peasant classes, who, in accordance with their artisan habits, formed themselves into guilds or companies, which bound themselves to observe certain arbitrary laws of rhythm. Nuremberg was the focus of their guilds, which rapidly spread over the whole of Germany, and gained so firm a footing in the land, that the last of them was not dissolved at Ulm till 1839. As the title of master was only awarded to a member who invented a new form of verse, and the companies consisted almost exclusively of uneducated persons of the working-classes, it may easily be conceived that extravagances and absurdities of every kind speedily formed a leading characteristic of their modes of versification; attention to quantity was, moreover, not deemed necessary, regard being had merely to the number of the syllables, and the relative position and order of the verses and rhymes. Their songs were lyrical, and sung to music; and although, as before remarked, each master was bound to devise a special *stole* or order of rhymes for each of his compositions, these stoles were subjected to a severe code of criticism, enacted by the *tablatur*, or rules of the song-schools. Among the few masters who exhibited any genuine poetic feeling, the most noted were Heinrich Mügeln, Michael Behaim, and the Nuremberg shoemaker, Hans Sachs, who prided himself on having composed 4,275 bar or master songs. See Tieck’s *Minnelieder* (1803); Taylor’s *Lays of the Minne and Master Singers* (Lond. 1825); and Von der Hagen’s *Minnesänger* (4 vols. 1888).
